benefit to mitigate indirect source emissions related to their operation (e.g., filtration projects in nearby schools, homes, etc.). The mitigation fees would be used to incentivize NZE and ZE trucks, and ZE charging and fueling infrastructure. Based on communications with truck and engine manufacturers of NZE trucks, there are no limitations to how many can be produced relative to their conventional diesel counterparts. ZE truck production is just beginning, however those trucks are expected to become more commercially available as orders are placed. See Master Response 2c. ZE charging / fueling infrastructure can serve ZE trucks that are already in commercial service. PR 2305 was designed to be flexible and offer different methods of complying with the WPCO. Options such as solar panel systems, air filters, and infrastructure can help facilitate emission reductions by supporting cleaner technologies and assist in the transition to cleaner technologies in goods movement or reduce exposure to remaining emissions in the community.

Response to Comment 40-17

The comment is noted.

Response to Comment 40-18

The statement that PR 2305 constitutes an illegal tax is incorrect. See Master Response 7 and Response to Comment 39-1 (comment letter 39, response 1) for a discussion of taxes in relation to PR 2305.

Response to Comment 40-19

To comply with PR 2305, warehouse owners or operators can choose to complete WAIRE Menu actions, pay a mitigation fee, implement an approved Custom WAIRE Plan, or a combination of any of the three.

Response to Comment 40-20

The comment that states that ZE and NZE technologies are not commercially available on a scale to enable warehouse operators to satisfy their compliance obligation is incorrect. Many of the ZE/NZE technologies are commercially available for sale now. For example, South Coast AQMD has incentivized more than 1,200 NZE trucks,⁹⁹ and NZE engine and truck manufacturers have stated that there are no limits to producing these trucks relative to their conventional diesel counterparts.¹⁰⁰ ZE trucks are commercially available below Class 7 today, and are expected to be commercially available starting in late 2021, before the start of the first compliance period.¹⁰¹ PR 2305 also includes a five year phase-in period that will also ensure that technologies will continue to grow in their commercial availability. Please refer to Master Response 2 for a discussion on feasibility and the commercial availability of NZE/ZE truck engines. See Appendix B of the PR 2305 Final Staff Report, which contains information on the commercial availability of technology on the WAIRE Menu. PR 2305 includes an optional

⁹⁹ These trucks have been funded since the AQMP was published in 2017. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/combina-hd-trucks-carb-biz-aqmp-presentations-1-26-21.pdf#page=69> (slide 69)

¹⁰⁰ For example, see comments from Tom Swenson with Cummins. <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-apr2-020.pdf>

¹⁰¹ See <https://globaldrivetozero.org/tools/zero-emission-technology-inventory/> for a summary of truck manufacturer announcements.

mitigation fee that warehouse operators may choose to pay the to comply with their WPCO, but is not a requirement. To comply with PR 2305, warehouse owners or operators can choose to complete WAIRE Menu actions, pay an optional mitigation fee, implement an approved Custom WAIRE Plan, or a combination of the three.

Response to Comment 40-21

The funds generated from the mitigation fee will be used to provide incentives for the purchase of NZE or ZE trucks, or for the installation of fueling and charging infrastructure, with priority given for projects in the communities near warehouses that paid the mitigation fee. Please refer to Master Response 2 for a discussion on feasibility and the commercial availability of NZE/ZE trucks and Response to Comment 40-20. See Appendix B of the PR 2305 Final Staff Report, which contains information on the commercial availability of technology options in the WAIRE Menu. Staff is unaware of any shortfall in the opportunity to fund NZE trucks, ZE trucks, and ZE charging and fueling infrastructure, even if all warehouse operators only complied with PR 2305 by paying a mitigation fee. To the contrary, the level of funding identified in the 2016 AQMP to turn over the truck fleet to meet air quality standards was identified as \$4.2 billion.¹⁰² Further a recent report from the California Energy Commission identified that 141,000 50 kW charging stations and 16,000 350 kW charging stations could be needed statewide to support the 180,000 medium and heavy-duty on-road vehicles that would need to be deployed to meet air quality standards by 2030.¹⁰³ More than half of these vehicles could be needed in South Coast AQMD. Cost estimates have not yet been developed for this level of infrastructure buildout, but at minimum the cost is expected to be many billions of dollars.¹⁰⁴ As shown in Table 7 of the Final Staff Report, the level of incentive funding in the worst case scenario over a ten year period is anticipated to be no more than \$5.3 billion and a more realistic mitigation fee scenario would only collect about \$1 billion. This level of funding is well short of the level needed to offset emissions from warehouses.

Response to Comment 40-22

In the worst-case example of every warehouse operator paying the mitigation fee and then not earning any WAIRE Points for the trucks incentivized by the WAIRE Mitigation Program, the cost could total up to about \$670 million per year. A more realistic scenario involving a mitigation fee based compliance approach (where warehouse operators earn WAIRE Points for incentivized trucks) results in total costs of about \$114 million per year. In fiscal year 2019-2020, South Coast AQMD administered about \$200 million in incentive funding, but only about \$60 million in fiscal year 2016-2017.¹⁰⁵ The comment that the South Coast AQMD budget was only \$173 million does not account for this additional pass-through incentive funding.¹⁰⁶ PR 316 includes additional fees that must be paid by warehouse operators to offset

¹⁰² http://www.aqmd.gov/docs/default-source/clean-air-plans/socioeconomic-analysis/final/appfinal_030817.pdf#page=44 (page 2-A-42)

¹⁰³ <https://efiling.energy.ca.gov/getdocument.aspx?tn=236237#page=56>

¹⁰⁴ As an example, through the CALeVIP program DC fast chargers have cost about \$2,000/kW (Ibid, pg. 74). Multiplying this value through the 141,000 50 kW chargers and 16,000 350 kW chargers yields a cost of about \$25 billion statewide.

¹⁰⁵ <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/combine-hd-trucks-carb-biz-aqmp-presentations-1-26-21.pdf#page=62>

¹⁰⁶ http://www.aqmd.gov/docs/default-source/finance-budgets/fy-2019-20/cafr-2020_for-web-upload.pdf#page=38

the cost of staffing and administering the mitigation program. Therefore, the staffing support needed to administer the WAIRE Mitigation Program will be able to ramp up and down relative to the level of incentive funding received, similar to how it has scaled quickly in recent years. The annual average \$114 million expected in a more realistic scenario if every warehouse operator paid the mitigation fee (which still is expected to significantly overestimate how many operators will choose this compliance option) would therefore not be more than South Coast AQMD could spend. See also Response to Comment 44-21.

Response to Comment 40-23

See Response to Comment 40-21 and 40-22 on the ability of the WAIRE Mitigation Program to spend mitigation funding to incentivize NZE and ZE trucks and ZE charging and fueling infrastructure. See also Master Response 2 on the availability of ZE and NZE trucks. The comment correctly identifies some of the materials that have been provided on the proposed WAIRE Mitigation Program. Additional discussion has occurred with the South Coast AQMD Mobile Source Committee,¹⁰⁷ and requirements for the WAIRE Mitigation Program will be included in the Board Resolution accompanying PR 2305 and PR 316. Future details of the WAIRE Mitigation Program will be developed in a public process as funding becomes available. Exact details of the WAIRE Mitigation Program will not be available until the level of funding is known, including in each geographic region. This information is critical to design an effective structure for spending the fees. All solicitations for project funding and project awards will be brought to the South Coast AQMD Governing Board for approval.

Response to Comment 40-24

The funds generated from the mitigation fee will be used to provide incentives for truck owners to purchase NZE or ZE trucks, or for the installation of fueling and charging infrastructure, with priority given for projects in the communities near warehouses that paid the fee. Other funding programs also incentivize these same actions, and the funding from PR 2305 mitigation fees would only be combined with other programs to the extent that both programs would look to reduce NOx and PM related to warehouse operations, either through directly funding NZE and ZE vehicles, or through funding facilitating measures such as ZE charging and fueling infrastructure.

PR 2305 and PR 316 does not impose a tax, and the mitigation fee is one of many compliance options. Please see Master Response 7 and the Response to Comment Letter 39 for a discussion of taxes and regulatory fees in relation to PR 2305.

Response to Comment 40-25

The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses from the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. This is the very purpose

¹⁰⁷ <http://www.aqmd.gov/docs/default-source/Agendas/Mobile-Source/msc041621.pdf#page=7>,
<http://www.aqmd.gov/docs/default-source/Agendas/Mobile-Source/msc031921.pdf#page=17>,
<http://www.aqmd.gov/docs/default-source/Agendas/Mobile-Source/msc021921.pdf#page=5>,
<http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-mar5-025.pdf>,
<http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-apr2-020.pdf>

of an indirect source rule. As shown in the Emissions Inventory of PR 2305 Warehouses section from Chapter 1 of the Final Staff Report, there are many sources of emissions associated with warehouses, but trucks are indeed the largest source, constituting about 90% of the total NOx emissions. Therefore, many compliance options focus on reducing emissions from this category. However there are other emission sources that are also addressed by PR 2305 besides trucks (including yard trucks, TRUs, passenger cars to the extent that charging infrastructure is installed/used to support them, and power plant emissions). Consequently, warehouse operators can essentially offset emissions from trucks through measures from non-truck sources.

Response to Comment 40-26

See Master Responses 7 regarding South Coast AQMD authority for PR 2305.

Response to Comment 40-27

See Master Responses 8 and 9 regarding CARB's role in reducing mobile source emissions, and the state of technology adoption for on-road trucks in California. Further, it is unclear to what the \$1 billion per year figure cited by the commenter refers to. The trucking industry spends about \$7.5 billion already every year in California on new truck sales,¹⁰⁸ yet is still only ranked 40th out of 50 states in the penetration of 2010 truck engine standards into its fleets statewide.¹⁰⁹

The analysis included within the Final Staff Report already accounts for all CARB regulations to the extent that they can be quantified and concludes that additional emission reductions of about 1.5 to 3 tons per day of NOx are anticipated with PR 2305 after considering the effect of all CARB regulations.

Response to Comment 40-28

Appendix C of the Final Staff Report documents that an estimate 40% of warehouse operators own a truck fleet. In addition, many others directly contract with at least some trucking companies that visit their warehouses. Though an estimate is not available for this last situation, it is not inconceivable that a majority of warehouse operators either own trucks, or directly contract with trucking companies. The option of acquiring trucks is therefore realistic for at least 40% of warehouse operators. Similarly, warehouse operators can contract with trucking companies to, at least to the extent that they already do this, to have NZE or ZE trucks visit their warehouse. While the action to have third-party NZE and ZE trucks visit a warehouse may not be standard industry practice today, this does not mean it is infeasible. See Master Response 2c.

Response to Comment 40-29

The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. Purchasing and using ZE and NZE trucks (as

¹⁰⁸ <https://www.nada.org/WorkArea/DownloadAsset.aspx?id=21474861283>

¹⁰⁹ <https://www.dieselforum.org/California>

opposed to diesel) contributes towards this purpose, and thus are included as WAIRE Menu actions. However, purchasing and using ZE and NZE trucks are not required to comply with PR 2305; there are many other options available to achieve rule compliance, including many other WAIRE Menu actions unrelated to truck purchase or use, implementing an approved Custom WAIRE Plan, paying a mitigation fee, or doing any combination of WAIRE Menu actions, Custom WAIRE Plan, and/or paying a mitigation fee.

Staff took great care to ensure that PR 2305 can use incentive funding to the extent possible, a rare phenomenon with regulations. Further, sufficient levels of incentive funding have not been identified to achieve the level of emission reduction needed to meet federal and state air quality standards, therefore additional regulations must also be pursued, such as PR 2305. The claim that PR 2305 will disincentivize the purchase of lower emissions vehicles is incorrect. Rather, by imposing a broad requirement, the expectation is that many in the goods movement industry will see that trucking options can allow warehouse operators to comply with PR 2305 and will take actions accordingly to provide those options. The proposed rule would therefore provide an important market signal to encourage the adoption of these lower emissions trucks.

PR 2305 itself does not prohibit the use of incentive funds. Individual incentive funding programs themselves each have their own prohibitions, including how those funds can or cannot be used to comply with regulations. Warehouse operators are encouraged to use incentive funds to lower the purchase costs if allowed by the incentive program. Warehouse operators (and owners who opt in) should consult with the incentive programs they are seeking funding from to ensure funds can be used with PR 2305, should it be approved by the Board.

Due to existing statutory or regulatory prohibitions, most state incentive funding programs used to offset the higher purchase price of zero emission NZE/ZE vehicles and equipment cannot be used to aid in complying with state or federal law or South Coast AQMD rules or regulations (For example Health and Safety Codes 44281(b), 44391.4(a), 44271(c), CCR Title 13, Ch. 8.2 Sec. 2353 (c)(4), Moyer Guidelines Ch. 2, CA Beneficiary Mitigation Plan). In practice, this means that NZE/ZE trucks acquisitions with incentive funding by warehouse operators or owners cannot be used to comply with PR 2305, thus no WAIRE Points can be earned from these acquisitions. However, because PR 2305 requires use of those trucks at specific locations to reduce local emissions, and because PR 2305 does not apply to trucking companies, but rather to warehouse operators, the use of incentivized trucks is not prohibited by incentive programs with a program like PR 2305. In other words, the use of an NZE or ZE truck per the WAIRE Menu may earn a warehouse operator or owner WAIRE points, regardless if incentive funding was used to purchase the truck. Warehouse operators will therefore not be required to determine if an NZE or ZE truck that visits their warehouse is incentivized, and will not be required to determine if any usage is surplus.

Response to Comment 40-30

The comment that there are not commercially available Class 8 trucks is incorrect. See Master Response 2d. Also see Appendix B of PR 2305 and PR 316's Final Staff Report, which contains information on the commercial availability of every technology in the WAIRE Menu.

The comment also focuses solely on Class 8 ZE trucks, which account for just two out of 32 options in the WAIRE Menu (with additional options available in a Custom WAIRE Plan and a

mitigation fee). Warehouse operators can choose any of the options to comply, not just the Class 8 ZE trucks the commenter is focused on.

Response to Comment 40-31

The statement that most truck fleets are owned by small business operators with 1-5 trucks is misleading. While most fleets are small, most trucks are in larger fleets of 20 trucks or more as shown in the figure below.¹¹⁰

Further, warehouse operators do not have to purchase any trucks to comply with the proposed rules and neither do small truck fleet owners. PR 2305 was designed to allow flexibility in allowing a warehouse operator to choose from 32 actions and investments off the WAIRE Menu, implement an approved Custom WAIRE Plan, pay the optional mitigation fee, or any combination of the three. Purchasing ZE or NZE trucks are options in the WAIRE Menu actions, but warehouse owners or operators are not required to do so for rule compliance, it is just one of the choices provided to make PR 2305 flexible to the various warehouse business models.

Response to Comment 40-32

The report mentioned in the comment is available online for download by the research team that conducted it.¹¹¹ The findings from this study supports the approach included in PR 2305. The study used several methods to evaluate how ZE Class 8 trucks could work for specific cases in southern California. This study used hypothetical modeling to conclude that if a fleet converted mostly (e.g., up to 96%) to battery-electric trucks that more than one ZE truck would be needed for every diesel truck replaced. However, at lower levels of adoption (e.g., 15%), and in future years with more advanced technology (2025 and 2030) the total fleet size is nearly

¹¹⁰ https://www.energy.ca.gov/sites/default/files/2019-12/06%20MacMillan_South%20Coast_11.14.19%20DAWG%20Presentation_ada.pdf

¹¹¹ <https://ncst.ucdavis.edu/research-product/developing-markets-zero-emission-vehicles-short-haul-goods-movement>, <https://escholarship.org/uc/item/1jw9m352>

identical. The fleet size was found to not change at all for natural gas hybrid trucks. Importantly, the study also included two case studies with detailed travel data from fleets. These two studies revealed that trucks have a range of distances they travel every day. For both fleets, 22-40% of trucks travel less than 80 miles per day (well within the range of current ZE truck technology). This finding is consistent with more comprehensive data recently presented by CARB.¹¹²

This chart shows that 29% of all in-state tractors travel less than 100 miles per day. Because PR 2305 would only require about 10% of visits to be from Class 8 ZE trucks, warehouse operators are expected to find the most favorable duty cycles first (e.g., lower mileage) if they choose to use this method to earn WAIRE Points. Based on the data presented in the NCST study mentioned by the commenter and in data presented by CARB, this level of implementation will not require acquiring more ZE trucks than diesel trucks. The cost analysis used in the Final Staff Report and Socioeconomic Impact Assessment therefore provide reasonable estimates of expected outcomes of PR 2305 and PR 316.

The comment focuses on extreme use cases to argue that more than one electric truck would be needed to replace a diesel truck, but as the discussion above shows, there is a much higher fraction of electric trucks that could replace diesel trucks on a one-to-one basis using technology available today (between 29% to 63%) than the requirements for ZE truck visits (~10-15%) if that were chosen as the compliance requirement under PR 2305. Further, the study also concluded that NZE trucks powered by natural gas did not have any of the limitations of electric trucks.

The comment that economic estimates of the purchase cost of heavy-duty electric trucks is speculative is true to the extent that predicting the purchase price of any product into the future requires some level of speculation. The purchase prices of electric vehicles included in the Final Staff Report are consistent with information used in CARB's assessment for its Advanced Clean Trucks rulemaking. The purchase prices documented in Appendix B of the Final Staff Report and in the Socioeconomic Impact Assessment are the most reasonable estimates available given the information available at this time.

¹¹² https://ww2.arb.ca.gov/sites/default/files/2020-09/200918presentation_ADA.pdf

The comment that many firms do not want to quick charge during a shift due to impacts in productivity can hold true for some operations. Importantly, PR 2305 does not mandate that any zero emissions vehicles are used, nor does it require what kind of charging be performed. The flexibility provided by PR 2305 allows operators to find the most suitable technology for their operations, and to implement it at an incremental level, including allowing a phase-in through time. In this way, the impact on operations contemplated by the comment can be avoided.

See Master Response 9 for a discussion of the age of the California truck fleet.

Response to Comment 40-33

There is no requirement in PR 2305 forcing warehouse operators to build a charging station. If this option makes sense within their operational profile, then it may be an attractive option. Examples could include: if they plan to make the transition to electric trucks for their owned fleet, if they work with trucking companies directly and arrange for electric trucks to visit their site, or if they work with the goods owner who then arranges for trucking companies to visit their site with electric trucks. The comment that publicly accessible areas may be ‘the way to push turnover of the fleet’ is also allowed under PR 2305. Indeed the option for a Custom WAIRE Plan was added to the rule in part because of a request from some in industry to allow off-site charging stations to earn WAIRE Points.

Response to Comment 40-34

No warehouse operator is required to install a charging station by PR 2305. However, if a warehouse operator has arranged for ZE trucks to visit their facility (either with their own fleet or with a third-party fleet), then they may decide that adding a charging station is a good option to earn WAIRE Points. While truck drivers will likely choose where to recharge, having a convenient option to charge at a warehouse is likely to attract usage.

Response to Comment 40-35

There is no requirement that any warehouse operator install a charging station. In addition, an option was included into the rule that allows a warehouse owner to opt in to earn WAIRE Points (for example through the installation of charging infrastructure), and for warehouse owners to transfer WAIRE Points to warehouse operators located at the warehouse owners’ sites; warehouse operators can also transfer excess points between different warehouses within their control. Warehouse operators will understand their own operations and the time constraints and relationship they have with the warehouse owner under the terms of their lease. It is the warehouse operator’s choice to determine which compliance approach makes the most sense for their operations.

Response to Comment 40-36

There is no requirement that any warehouse operator install a charging station. PR 2305 also includes a phase-in schedule over a five-year period. About two thirds of warehouse operators

will not have any obligation to earn WAIRE Points until 2023, and the first third of warehouse operators will only be required to earn one third of their WAIRE Points in 2022. The leading organization working on a standard is CharIn, who is developing the Megawatt Charging System (MCS).¹¹³ The development of this global standard is progressing rapidly, and the final publication of the standard is expected in time for most charging stations that would be installed under PR 2305 to utilize it. This high power charger is also not yet included in the WAIRE Menu, but can be implemented through a Custom WAIRE Plan. In future technology reviews of the program (every five years), this infrastructure could potentially be added to the WAIRE Menu. Importantly, there are many smaller truck classes that will not need to rely on this MCS standard and can use more widely adopted standards like the Combined Charging System (CCS) or CHAdeMO.¹¹⁴

Response to Comment 40-37

There are currently commercially available heavy-duty trucks. Most of the WAIRE Menu options are commercially available and are in commercial service with the exception of ZE Class 8 on-road trucks which are in demonstration service but are not yet commercially available. NZE Class 8 trucks have been in commercial service for several years, and South Coast AQMD has incentivized approximately 1,200 NZE trucks. All but the ZE Class 8 trucks are commercially available and are in commercial service, with ZE Class 8 trucks projected to be available late 2021, with additional availability expected in 2022. Please see Master Response 3 for information on the commercial availability of NZE/ZE technology. Also see Appendix B of PR 2305 and PR 316's Final Staff Report, which contains information on the commercial availability of every technology in the WAIRE Menu.

Response to Comment 40-38

There is no requirement that any warehouse operator install a charging station. Some warehouses may be site constrained and would not have the space to install a charging station onsite, while other may have ample space. Warehouse operators are expected to take this into consideration, as well as any local building code requirements (similar to any construction project at a warehouse), prior to beginning any ZE charging station project. Also, as stated in Appendix C of the Final Staff Report, a warehouse facility's Floor Area Ratio "alone is not the sole determinant if a facility can install ZE charging/fueling infrastructure."

Response to Comment 40-39

The comment that drivers do not wait at warehouses is not always the case. As documented in the American Trucking Research Institute's 2019 study on Driver Detention Impacts on Safety and Productivity, 50% of respondents indicated that drivers were detained at their destination between 1 to 4 hours. There were many reasons cited for these delays, including lack of dock space, appointment issues, product readiness, dock-employee issues, etc. Therefore, there may be windows of opportunity that would be useful for truck drivers to take advantage of short

¹¹³ https://www.charin.global/media/pages/news/the-charin-path-to-megawatt-charging-mcs-successful-connector-test-event-at-nrel/12a6cecdf4-1615552637/201007_press_release_nrel_testing_final.pdf

¹¹⁴ Charging stations installed today for light duty vehicle commonly have both of these standards. A review of the South Coast AQMD region showed that 250 stations have ≥ 50 kW chargers with both CHAdeMO and CCS standards. <https://www.plugshare.com/>

‘opportunity charging’ to top off their battery. The availability of charging may thus allow a truck to go directly to another destination rather than returning to charge at its home base, which provides more efficient operations.

Response to Comment 40-40

The comment notes that coordination is needed between the warehouse operator or owner who wants to install charging infrastructure and their local utility. Utility stakeholders have also commented on this during rulemaking, and have indicated that they stand ready to assist customers who choose to pursue charging infrastructure. See Comment 41 for an example. Utilities have initiated programs to assist customers in charging stations for medium and heavy duty vehicles, including with SCE’s ChargeReady Transport program. This \$356 million program was authorized by the Public Utilities Commission to focus on installing charging infrastructure for medium and heavy duty vehicles. Additionally, the California Energy Commission is evaluating the grid needs, including by looking at wide-scale deployment of electric medium and heavy duty vehicles, and providing estimated grid impacts for utilities to use in the resource planning efforts.¹¹⁵ These efforts ultimately will be informed by customer demand, and individual warehouse operators will need to determine how charging infrastructure could work for their operations. PR 2305 does not require that any warehouse operator install charging infrastructure.

Response to Comment 40-41

Since the comment was submitted the requirements in PR 2305 have been changed from ‘using methods that contemporaneously record the truck trips and that are verifiable’ to ‘using methods that provide a verifiable and representative record’. As described in the WAIRE Implementation Guidelines included as Appendix A to the Final Staff Report (see section titled Truck Trip Counts for Determining WPCO), this updated method is designed to utilize existing practices by warehouse operators. As indicated by many warehouse operators during site visits and other conversations, trucks are already tracked as a security measure to ensure that goods are not loaded onto the wrong truck and are not stolen. Common information already recorded includes data such as: the trucking company, the license plate number of the truck, truck driver name, and when the truck arrived.

The comment mixes truck counting to determine a warehouse operator’s Weighted Annual Truck Trips (WATTs) for determining its WAIRE Points Compliance Obligation (WPCO) with tracking of NZE and ZE truck visits to earn WAIRE Points. At final stringency of PR 2305, if NZE and ZE truck visits are the only compliance option chosen, they may make up about 10-15% of truck visits to a warehouse. Methods that can be used to track NZE or ZE truck visits is also included in the WAIRE Implementation Guidelines in the NZE/ZE Truck Visits part of the WAIRE Menu section.

For multi-tenant warehouse operators, they are expected to have the same security procedures as operators who are single tenants in a warehouse. Truck counting to determine an operator’s

¹¹⁵ <https://efiling.energy.ca.gov/getdocument.aspx?tn=236237> (AB 2127 Report), <https://efiling.energy.ca.gov/getdocument.aspx?tn=237268> (Integrated Energy Policy Report)

WATTs does not require a check-in facility, and no trucks are expected to back up into the streets that weren't already doing so without PR 2305. Truck counting is designed to use a warehouse operators existing practices as much as possible. If additional data is needed, simple forms could be filled out by truck drivers, or trucking companies, to supply the requisite information for tracking NZE or ZE truck visits.

Response to Comment 40-42

South Coast AQMD Staff is recommending a stringency of 0.0025 WAIRE Points per WATT, which was a result of a thorough and extensive analysis of 19 WAIRE Menu compliance scenarios (see Final Staff Report, pp. 59-72). These scenarios provided an estimate of the range of potential costs and emissions reductions from implementation of PR 2305. Additional supporting analysis was included in the Socioeconomic Impact Assessment, including a warehouse relocation study. There is no mathematical equation governing the entire process, nor is an overarching governing equation required. The totality of the impact of the proposed rule has been considered for the recommended stringency of 0.0025 WAIRE Points per WATT. Higher and lower stringencies have also been analyzed, including 0.005 WAIRE Points per WATT and 0.0001 WAIRE Points per WATT, as well as another stringency approach that would phase in the stringency over five years from 0.0002 to 0.001.¹¹⁶

The benefits of the proposed rule at the recommended stringency include, but are not limited to:

- significant emission reductions of about 1.5 to 3 tons per day of NO_x, equal to about a 10-15% reduction (with a similar level of reduction for DPM),
- the encouragement of many facilitating measures to further enhance emission reductions from other programs including CARB rules and the ports' upcoming Clean Truck Program update,
- monetized public health benefits for most compliance scenarios that are about three times higher than the cost of compliance,
- compliance costs that are lower than normal cost increases that the industry experiences routinely in rent hikes (13 of the 19 scenarios analyzed had costs of \$0.23/sf/yr or less, which is only about half as much as rents have increased each year for the past decade),
- compliance costs that are well below the level found to potentially result in relocation of warehousing outside of South Coast AQMD (the warehouse relocation study by IEc found that no warehouses would relocate with PR 2305 costs less than \$1.50/sf/yr to \$1.75/sf/yr, which is about double the level of the highest mitigation fee scenario analyzed showing \$0.83/sf/yr at a stringency of 0.0025),
- a market signal for the goods movement industry to encourage adoption of NZE and ZE technologies on a more widespread basis than the unregulated market would provide – and much faster than CARB would require with its existing and proposed regulations,
- satisfying the requirements of control measure MOB-03 in the 2016 AQMP,
- satisfying the commitment in AB 617 Community Emission Reduction Plans, and
- reducing emissions for local communities located closest to warehouses who have experienced disproportionate environmental burdens just by living where they do.

¹¹⁶ <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/presentation-slides-10-30-2020.pdf>

The other levels of stringency evaluated by Staff would either result in higher compliance costs or lower emission reductions and public health benefits; the proposed stringency of 0.0025 represents an accommodation of those two considerations. A higher stringency of 0.005 results in increased costs, and a greater likelihood that some warehouses could decide to relocate out of the region, albeit with increased emission reductions and public health benefits. The lower stringency of 0.0001 would result in substantially less emission reductions and public health benefits, with lower costs. The Board may use its independent judgment to set the final stringency within the bounds of the analysis contained in the record before it.

Response to Comment 40-43

The comment that the ‘impact of the rule on any NO_x, PM, and ozone has not even been modelled’ is incorrect. Tables 15 and 16 in the Final Staff Report clearly document the range of potential NO_x and PM reductions expected from PR 2305. See also Master Response 3. Also, PR 2305 is part of a comprehensive strategy to meet federal and state air quality standards, and the 2016 AQMP includes a robust modeling analysis that determines how that strategy will achieve those standards. Consistent with all rules adopted by South Coast AQMD and CARB that are part of the State Implementation Plan (SIP), individual rule analyses as a practical matter evaluate emission reductions and detailed ozone and other secondary pollutant modeling is conducted in AQMPs or other SIP submittals.

Response to Comment 40-44

The commenter is confusing emission reductions from the previous comment with concentrations in this comment. Emissions are the mass of a pollutant that is emitted from a source during a set period, measured as tons per day for most emission reduction discussions for PR 2305. Concentrations are the mass of a pollutant measured relative to another mass, measured as parts per billion in the case of air quality standards for ozone. Predicted future emissions (or emission reductions) of a pollutant are based on expected activity levels multiplied by an emissions rate (for example grams per mile of vehicle travel multiplied by vehicle miles travelled). Predicted concentrations require significantly greater levels of detail, including meteorology, analysis of chemical reactions in the air, location of emissions, nature of the emissions source (for example tall, skinny stacks compared to wide areas), etc.

The determination of ozone, NO_x, and DPM concentrations is not possible with the flexibility provided by PR 2305. Emission reductions could occur from a variety of activities, at different times of day, in different geographic locations, etc. This level of analysis is beyond the scope required to determine the potential impacts of a proposed rule like PR 2305. Instead, the 2016 AQMP includes the detailed analysis described above, and considers all potential emission reduction strategies to predict future pollutant concentrations, including for ozone, PM, and NO_x.¹¹⁷ Due to the extensive analysis included in the 2016 AQMP, each measure included in the control strategy is tracked by its emission reductions, not by its concentration reduction.

¹¹⁷ DPM concentration reductions can be similarly modeled, but those analyses are typically limited to site specific health risk assessments (e.g., included as part of some CEQA analyses for warehouse development projects), or in the regional MATES study prepared by South Coast AQMD that evaluates toxic health risks across the entire region.

Therefore, it is not inconsistent for the Final Staff Report to say that the estimated emission reductions from PR 2305 is anticipated to be about 1.5 to 3 tons per day (as shown in Table 15 in the Final Staff Report), whereas the potential NO_x and subsequent ozone concentrations have not been modeled. PR 2305 will contribute to ozone concentration reductions to the extent that it's NO_x emission reductions are a component of the overall control strategy evaluated in the 2016 AQMP.

Response to Comment 40-45

The comment incorrectly characterizes what was stated in the Preliminary Draft Staff Report (PDSR). The actual sentence states, "With about 4,000 warehouse operators and dozens of options available for compliance, it is not possible to determine the precise cost or emissions impact of PR 2305 and PR 316." (page 59 of the PDSR)

As stated in the comment, emission reductions have instead been calculated using a bounding analysis. The purpose of a bounding analysis is to bracket the range of potential outcomes that can occur. Any hybrid of actions that might occur will be contained within the bounding scenario analysis included in the Final Staff Report. PR 2305 is designed to have a multitude of compliance options (implementing any of the 32 WAIRE Menu actions, implementing an approved Custom WAIRE Plan, paying the optional mitigation fee, or a combination of all or some of these options) so that warehouse owners and operators have the flexibility to decide what compliance options work best for their specific warehouses. Since there are so many options for compliance and thousands of warehouse operators, the most reasonable approach is to determine the potential bounds of what PR 2305 and PR 316 would impose. See also Response to Comment 43-2.

Response to Comment 40-46

See Response to Comment Letter 43.

Response to Comment 40-47

See Response to Comment 40-45. The cost analysis is based on the same assumptions used for the bounding analysis conducted for emission reductions. The statement that this analysis provides 'no information as to what the actual costs of PR 2305 will be' is incorrect. The range of potential costs of PR 2305 are included in Table 20 of the Final Staff Report and the resulting socioeconomic impacts are analyzed and described in the Socioeconomic Impact Assessment.

Response to Comment 40-48

The concern about SIP credit does not consider the full range of options normally available to fold emission reductions into the SIP inventory. These options are discussed in Appendix D of the Final Staff Report. As an example, the indirect source rule adopted by San Joaquin Valley Air District was approved into the SIP by EPA, but the approval did not include any 'SIP credit' for emission reductions. However, the emission reductions achieved by their rule are included as part of normal updates to the mobile source emissions inventory in regular updates by CARB. This is likely the primary process by which SIP creditable emissions reductions would be accounted for with PR 2305 as well. Other prospective SIP creditable emission reductions methods may be possible too with the WAIRE Mitigation Program once funds are received and

the program has been established. All measures that can be quantified at this time have been included in the emission reduction analysis included in the Final Staff Report. As shown in Appendix D of the Final Staff Report, there are additional unquantifiable measures that could overlap in the future, including mitigation funding, the ports updated Clean Truck Program, and future CARB regulations. These measures have the potential to receive prospective SIP credit on their own. However if PR 2305 is in place, it has the potential to enhance those measures to achieve additional emission reductions.

As an example, incentive funding programs currently provide about \$65,000 for a NZE Class 8 truck purchase. If PR 2305 is adopted, the interest in NZE trucks is expected to increase. Incentive funding will still be available, but the potential amount offered could be lowered, thus incentivizing more trucks. Prospective SIP credit may be claimed for all trucks incentivized by that program, however the reason that more trucks were incentivized would be due to the market conditions brought about by PR 2305. Ultimately, what is important is that emission reductions occur, and SIP credit assigned to PR 2305 or another program is ultimately the same. As shown in Table 15 of the Final Staff Report, based on the best information available, PR 2305 is expected to result in about 1.5 to 3 tons per day of NOx reductions that will be credited in the SIP.

Response to Comment 40-49

Per the scenario analysis (Final Staff Report pp. 62-63), implementing PR 2305 is estimated to result in approximately 1.5-3 tons per day NOx emission reductions beyond emission reductions resulting from CARB regulations (CARB's Advanced Clean Trucks, Low NOx Omnibus, and Heavy Duty I/M rules), which is 10-15% reductions from baseline of both NOx and PM. Please see Master Response 4 for an explanation of emission reductions from warehouse ISR. Emission reductions from rule compliance are based on a bounding analysis of 19 scenarios of rule compliance, designed to show a range of potential compliance outcomes. The scenarios were developed to show potential impacts from scenarios of all WAIRE Menu actions, and the use of the mitigation fee option (Final Staff Report, pp. 59-60). Installing solar energy systems reduces regional emissions associated with warehouses and thus helps fulfill the main purpose of the rule. While installing filters does not reduce pollution, it reduces exposure to remaining emissions and thus provides public health benefits, which is a legitimate goal for a WAIRE menu option.

Response to Comment 40-50

Solar panels are a source of electricity that does not produce NOx, unlike natural gas fueled power plants. Therefore, solar panels would reduce NOx by reducing the power that needs to be produced by NOx emitting power plants. See Response to Comments 43-26 for additional discussion of solar panels. Air filters are a mitigation measure that provides a public health benefit, albeit less than from direct emission reductions. This measure reduces the concentration and exposure to particulate pollution indoors, including particulate pollution caused by trucks travelling to warehouses. Air filters are expected to be chosen rarely as a compliance option to earn WAIRE Points due to their higher cost relative to other compliance

options as shown in Table 20 of the Final Staff Report. See Response to Comment 40-51 for solar panel SIP credit explanation.

Response to Comment 40-51

Air filters would not result in any emission reductions and would not achieve SIP creditable emission reductions under any program. Solar panels have the ability to reduce the reliance on natural gas fueled powerplants. The powerplants emit NO_x, and any reduction in their use and emissions has the potential to be SIP creditable. Those SIP creditable emission reductions could be obtained through a number of ways, including emissions inventory updates, stationary source requirements, or through later SIP crediting actions that account for activities put in place due to PR 2305.

Use and installation of solar panels and air filters are discussed in several places in the Final Staff Report, including in the WAIRE Program Implementation Guidelines (Final Staff Report, Appendix A, p. 102), which is provided to help warehouse owners and operators understand how to comply with PR 2305 and PR 316. PR 2305 is designed to have a multitude of compliance options (implementing any of the 32 WAIRE Menu actions, implementing an approved Custom WAIRE Plan, paying the optional mitigation fee, or a combination of all or some of these options) so that warehouse owners and operators have the flexibility to decide what compliance options work best for their specific warehouses. Per analysis completed by South Coast AQMD Staff in the Final Staff Report (Final Staff Report, Appendix C, p. 143), out of the estimated 2,902 warehouses expected to be required to earn WAIRE Points under PR 2305, 214 already have solar panels installed. However, warehouse owners or operators do not necessarily have to install solar panels on their warehouse roof to earn WAIRE points; solar panels can be located anywhere on warehouse property to earn WAIRE points. Additionally, solar panels have become lighter, more efficient, and more flexible with recent technological advancements, reducing installation cost and allowing them to be installed in more applications (Final Staff Report, Appendix B, pp. 136-137).

Response to Comment 40-52

Costs of installing and using air filters and air filtration systems were analyzed as part of the scenario bounding analysis in the Final Staff Report, which had an annual average cost of \$0.77 per square foot and \$0.79 per square foot, respectively (Final Staff Report, p. 72). These costs were within the range of costs of all the WAIRE Menu actions or mitigation fee, and are one of the more expensive options. The WAIRE Points cited by the commenter appear to be inadvertently flipped. A warehouse operator would earn 51 WAIRE Points for every 200 filters installed, or about one WAIRE Point for every four filters installed. While air filters may be among the more expensive options, they could be selected by a facility that does not want to use the truck related options or pay a mitigation fee, or who prefers to provide a tangible public benefit in the neighborhood.

Response to Comment 40-53

Information on the proposed rules' documents and hearing date has been updated since this comment letter was dated. Per guidance from South Coast AQMD's Governing Board, the proposed rules' hearing date is now May 7, 2021. The first draft of the Socioeconomic Impact Assessment and the first draft of the Staff Report (which contains the comparative analysis)

was available on March 3, 2021, and second draft of both available on April 7, 2021 (accessible here: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures>). The March 3, 2021 release date would have been 30 days before the previously anticipated hearing date of April 2, 2021, and the April 7, 2021 release date is also 30 days before the current hearing date of May 7, 2021. Rule language for PR 2305 and PR 316, and emissions and scenarios calculations have also been released on these dates as well. The WAIRE Program Implementation Guidelines have been released to the public on March 3, 2021 and April 7, 2021, as well (they are found within the Staff Report, Appendix A).

Response to Comment 40-54

The only remaining records that have yet to be produced as part of the public records requests are the requests for ‘all records of communications, including without limitation internal e-mail communications...’ This is a broad catch-all request that takes time to gather, review, and produce, and these records are not anticipated to affect the ability to review and provide comment on the proposed rule. All other records, data, calculations, and files included in the request have been produced.

Response to Comment 40-55

All responses to comments received on the Draft Environmental Assessment will be included in the Final Environmental Assessment, as required by CEQA.

Response to Comment 40-56

South Coast AQMD’s Governing Board has been given adequate updates during the proposed rules’ development. As discussed in Response to Comment 44-53, South Coast AQMD Governing Board (along with the general public) have received relevant rule documents in a timely manner, at least 30-days ahead of scheduled hearing dates. In addition, since May 2018 there have been seven Mobile Source Committee briefings, three Governing Board Updates, one Public Workshop, one Community Meeting, and 12 working group meetings. Following the set hearing vote of the Board on March 5, 2021, an extra month was provided before the Board will consider the proposed rule, now scheduled for May 7, 2021.

Response to Comment 40-57

Again, thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter 41 - SoCal Edison - March 2, 2021

Response to Comment 41-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 41-2

South Coast AQMD Staff appreciates the efforts of SCE to assist in the transition to transportation electrification as it has a critical role to play in the electric ecosystem in our region.

Response to Comment 41-3

The comment is correct that AB 617 Community Steering Committees have looked to PR 2305 as an important strategy to assist in meeting their communities' emission reduction needs. Community Emission Reduction Plans that have been approved for four different AB 617 communities have included the development of a warehouse Indirect Source Rule as an action, and PR 2305 would fulfill that commitment.

Response to Comment 41-4

SCE's Charge Ready Transport (CRT) and other electrification programs will serve as welcome measures to assist warehouse operators and owners to comply with PR 2305 if it is approved. Staff appreciates the feedback that SCE has provided during the development of PR 2305 on the details of these programs so that the proposed rule can work most effectively.

Response to Comment 41-5

The data sharing with companies such as SCE have helped in the development of the warehouse ISR, as information on the costs and the processes required to install ZE charging infrastructure is considered. As stated in previous comment responses there is a lot of work necessary to prepare for California's zero emissions future in the way of charger availability and grid electrical supply. PR 2305 in addition to reducing emissions toward the goal of attaining the federal ozone standards is a facilitative measure that will result in early compliance of other regulations for emission reductions. PR 2305 also supports California's zero emissions future by including the installation of ZE infrastructure, acquisition of ZE trucks, and the installation of solar panel systems on the WAIRE Menu. Throughout the rule development process, South Coast AQMD Staff has followed the CEC and CPUC activities to bring attention to planning ahead and anticipating more ZE vehicles plugging in to charge which would cause a significant draw on the existing grid.

In addition to the milestones mentioned in the comment, PR 2305 requires warehouse operators to prepare a one-time Initial Site Information Report (ISIR) the first year that they are at a warehouse and need to earn WAIRE Points. This ISIR requires early reporting from the warehouse operator that includes details about the site, including the number of existing charging stations, as well as initial advance planning for how they anticipate earning the required number of WAIRE Points for their first compliance period. This will serve as another important advance planning approach that can assist the operators and utilities as they plan for charging station installations and solar panel installations.

Response to Comment 41-6

Data submitted to South Coast AQMD would be public information unless specifically designated as trade secret or confidential by a warehouse owner or operator, and confirmed through South Coast AQMD's Guidelines for Implementing the California Public Records Act.¹¹⁸ If PR 2305 is approved, South Coast AQMD plans to develop a portal that will provide the public, and utilities, information about warehouse operator compliance. The development of that portal will include a public process and the commenter is encouraged to provide feedback on specific information you are interested in seeing at that time.

Response to Comment 41-7

Thank you for your comments and interest in the warehouse ISR.

¹¹⁸ <http://www.aqmd.gov/docs/default-source/default-document-library/Guidelines/pr-guidelines.pdf>

Response to Comment Letter 42 - Southwest Carpenters – 3/1/2021

Response to Comment 42-1

During the March 5, 2021 South Coast AQMD Board Meeting, the Board decided to delay the public hearing for PR 2305 by 30 days, postponing the public hearing until May 7, 2021. Additionally, a recent revision to the PR 2305 rule language was released on April 7, 2021 which delayed the rule implementation schedule by six months. South Coast AQMD Staff has prepared a Socioeconomic Impact Assessment (SIA) which analyzes the economic impacts of PR 2305. See the SIA and Master Responses 5 and 6 for a response to the concerns about economic impact and uncertainty.

Response to Comment 42-2

South Coast AQMD Staff agree that even during the COVID-19 pandemic the warehousing industry has grown. The increased warehousing activity has resulted in further decline of public health in the communities surrounding warehouses. See the response to Comment 42-1 and Master Response 4 for the response to concerns about the economy and the warehousing industry.

Response to Comment 42-3

As stated in Comment 42-1, the public hearing was delayed 30 days from the originally scheduled public hearing to allow more time to evaluate PR 2305. Thank you for your comments and interest in the warehouse indirect source rule.

Response to Comment Letter 43 – Ramboll – 3/2/2021

Response to Comment 43-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 43-2

As stated in the PR 2305 rule language the purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses, in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. Please see Master Response 3 regarding PR 2305 emission reductions.

Table 15 of the Final Staff Report presents the result of the scenario bounding analysis in which all 2,902 warehouses would comply with a single action from the menu from 2022 through 2031. In Table 15, only scenarios 15 and 16 have 0 ton/day NO_x emission reductions in years 2023 and 2031. Scenarios 15 and 16 are filter system installation and filter purchases which only reduce exposure to particulate matter. These two scenarios are among the most expensive options and it is highly unlikely that all warehouses choose these two high-cost menu items for compliance every single year. No single scenario in this bounding analysis is expected to occur. Rather, they present a bounding analysis of possible compliance outcomes and in reality, a hybrid of all scenarios (or other compliance approaches encompassed within the range of scenarios analyzed) is expected to occur and individual warehouses are expected to use different compliance options in a given year.

This analytical approach and resulting uncertainty in precise results is expected, especially when looking at other similar programs. Two examples include LEED and San Bernardino County's GHG plan which are both based on menu-based points systems. Below is a graph from a study that evaluated the performance of LEED certified buildings, with ranges between cities and within cities.¹¹⁹ This difference in performance reflects the different ways in which buildings comply with LEED using its menu-based points system.

¹¹⁹ Energy and Greenhouse Gas Savings for LEED-Certified U.S. Office Buildings, Energies, Jan. 2021.
<https://www.mdpi.com/1996-1073/14/3/749>

In addition, San Bernardino County's Greenhouse Gas Plan states, "...the precise amount of GHG emissions reductions cannot be estimated for new development on a measure by measure basis. Rather, the analysis examined feasible scenarios of reductions that would result from new development utilizing different reduction strategies..."¹²⁰

The bounding analysis shows the most impact any one compliance option could create; actual rule compliance for each compliance option will be within the impact shown in the bounding analysis (Final Staff Report, pp. 62-63). Per the scenario analysis, implementing PR 2305 is estimated to result in approximately 1.5-3 tons per day NOx emission reductions beyond emission reductions resulting from CARB regulations (CARB's Advanced Clean Trucks, Low NOx Omnibus, and Heavy Duty I/M rules), with some scenarios showing potentially higher reductions.

Response to Comment 43-3

Please refer to Master Response 2d regarding the technology availability of NZE and ZE trucks. Regarding Scenario 5 (ZE Class 8 Visits), in order to allow for the technology phase-in of ZE trucks, for the first compliance year (i.e., 2022), facilities are only assumed to comply through paying the mitigation fee, and are not assumed to have any ZE Class 8 visits until 2023. The emission reductions in 2023 is therefore a combination of ZE Class 8 visits as well as reductions from mitigation fees paid in 2022 (assuming \$100,000/ton consistent with Carl Moyer funding program cost-effectiveness) which resulted in 5.1 tons per day NOx emission reductions.

The commenter is correct that the emission reductions shown in 2031 from Scenario 7 are much higher than other scenarios, as this scenario is a bounding analysis to show the highest costs expected for mitigation fees (Scenario 7 results in about \$0.83/sf/yr). If all warehouses pay the mitigation fee in this worst-case cost scenario, annual average costs would be about \$670 million. This level of funding in the WAIRE Mitigation Program would result in a substantial turnover of trucks, and much higher public health benefits with emission reductions up to about 20 tons per day. However, because warehouse operators are expected to find ways to reduce their costs, it is expected that they would earn points from these incentivized trucks. A more realistic scenario showing the interaction between a mitigation fee-only scenario and the WAIRE Mitigation Program was modeled and included in the Final Staff Report (Scenario 7a). If warehouse operators earn points from visits from trucks incentivized by the WAIRE Mitigation Program, costs could be as low as \$0.14/sf/yr, similar to the costs warehouse operators would face if they took actions themselves to get NZE or ZE trucks to visit their facilities, with emission reductions of about 2.7 tons per day.

Response to Comment 43-4

Staff has taken comments in this letter into consideration and updated the calculation methodology for discounting impacts from CARB's regulation.¹²¹ Emission rates used for the calculation reflect impacts from CARB's Heavy Duty I/M program using factors from CARB's Mobile Emissions Toolkit for Analysis (META) for South Coast ("Parameters" Tab, in PR 2305 Draft Scenario Calculations_v3). The impact from CARB's Advanced Clean Truck

¹²⁰ <http://www.sbcounty.gov/Uploads/lus/GreenhouseGas/FinalGHGFull.pdf#page=181>

¹²¹ All spreadsheets are available for download at: www.aqmd.gov/fbmsm

(ACT) regulation is accounted for by considering the approximate number of ZE truck visits that each facility would receive as part of the baseline truck fleet with ACT in place. Warehouse operators were assumed to earn WAIRE Points from those ZE truck visits that would go towards their WAIRE Point Compliance Obligation (WPCO), even if they did not take any actions to cause those visits to occur. Any subsequent action taken would therefore be surplus and beyond CARB's ACT rule. Impacts from CARB's CA Low NOx Omnibus are accounted for in the PR 2305 Draft Baseline Emission Inventory. Because PR 2305 does not provide WAIRE Points for Low NOx Omnibus trucks, and emission reductions from NZE or ZE truck visits would be surplus.

Response to Comment 43-5

The comment states that substantial evidence has not been provided to show that PR 2305 will result in emissions reductions 'despite enormous costs'. The analysis included in the Final Staff Report, supporting appendices, and spreadsheets constitute a thorough and robust analysis and provides the evidentiary support to estimate the potential impacts of the rule. Further, the costs associated with implementing PR 2305 are almost entirely due to implementing lower emissions technologies. If the commenter's assertion that emission reductions are already going to occur with CARB rules were correct, then the costs associated with PR 2305 would also be substantially lower than shown in the Final Staff Report and Socioeconomic Impact Assessment (SIA) because those costs would already be included in the baseline (as costs attributable to CARB rules rather than PR 2305). The detailed calculations and analysis included in the Final Staff Report and SIA demonstrate that the comment's premise is incorrect, and additional emission reductions and costs are expected due to PR 2305. Please refer to Master Responses 3 and 8.

Response to Comment 43-6

Please refer to Master Response 3. Currently, South Coast AQMD's jurisdiction is classified as being in extreme nonattainment status for the federal National Ambient Air Quality Standards (NAAQS) ozone standards, and serious nonattainment for the federal fine Particulate Matter (PM_{2.5}) standards. As stated in Chapter 1 of the Final Staff Report, NOx is the primary pollutant that needs to be reduced to meet federal air quality standards as it is a precursor to ozone and fine PM. The AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting (STMPR) presentation on Jan 27, 2021 emphasized the significance of NOx emission reductions to attain federal ozone standards. At this meeting, South Coast AQMD Staff presented a modeling analysis for the early COVID-19 shelter-in-place period that occurred in spring 2020. The modeling analysis indicated that a marginal amount of NOx reductions in some instances can bring a temporary ozone increase due to the diminishing NOx titration of ozone. However, a significant amount of NOx reductions overcome the NOx disbenefit and will lower ambient ozone level, and are in fact the only pathway that can achieve federal air quality standards throughout the South Coast AQMD. As discussed during the STMPR meeting, NOx strategy is identified as the only viable path to attain the 75 and 70 parts per billion (ppb) NAAQS in South Coast Air Basin.

The cited article's finding, by Parrish et al (2017a)¹²², is based on using least squares fitting method to fit Ozone Design Values (ODV) from six air basins (South Coast, San Diego, South Central Coast, North Central Coast, Mojave Desert, and San Joaquin Valley) to an exponential function with a constant positive offset. The approximate 35 years required to reach the new NAAQS of 70 ppb in the Los Angeles area is based on the derived exponential formula assuming: a) the U.S. background remains constant and b) the previous rate of exponential decrease of the anthropogenic ozone enhancements into the future is maintained. The authors have acknowledged that the derived exponential equation provides robust description of past changes, however, there is no guarantee that future evolution would necessarily follow the same functional form and the use of the equation can only provide a guide for future thought. The fact that one study that does not use EPA-required modeling methods predicts a long timeframe required to meet NAAQS does not justify waiting to implement legally mandated measures to reduce NO_x. The Clean Air Act requires the adoption of a plan to attain the national ambient air quality standards, and if the study is correct, there would be even greater need for the reductions to be obtained from PR 2305 and other strategies. Furthermore, the same author [Parrish et al (2017b)], later in another article states, "Reducing the Nation's emissions of ozone precursors is the only effective tool available to improve local and regional air quality over the U.S. Emission reduction efforts over multiple decades have yielded dramatic improvement in ozone air quality, but many regions still do not meet the NAAQS. The extent of further reductions necessary for a given region to reach the standard is not quantitatively known, but the reversal of the long-term increase in baseline ozone entering the U.S. from the Pacific will certainly ease the difficulty of achieving further reductions in ozone concentrations." ¹²³ In this article Parrish et al., (2017b) indicate that background ozone concentrations are not constant, and the increasing trend in background ozone concentrations (resulting in the estimate of ~62 ppb ozone in the future in the first article, about 89% of the 70 ppb standard) ended in the early to mid-2000s, and the background concentrations have begun to decrease (with recent measured ozone around 35 ppb and declining in the second article) thus making achieving U.S. air quality goals easier than predicted in the article cited by the commenter. As further discussed in the article, recent analyses of satellite data showed that the decade-long increase in NO_x emissions in China has ended and that those emissions are now decreasing; this emission change may be at least partially responsible for the observed background ozone decrease.

The fact that author has shown in a separate article that the background ozone concentration is not constant and in fact decreasing makes the first assumption made in reaching the 35-year time-frame analysis not accurate. While control strategies from earlier AQMPs and SIPs have lowered ozone level successfully, they have also shifted the ratio of NO_x and VOC emissions that contribute to ozone formation. This change in the ozone formation regime also undermines a second assumption made in the Parrish et al. (2017a) analysis – that the previous rate of exponential decrease in anthropogenic ozone is not constant. The approach cited in Parrish et al (2017a) did not consider the decreasing background ozone trend nor incorporate the changes in ozone chemistry.

¹²² <https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1002/2016JD026329>

¹²³ <https://agupubs.onlinelibrary.wiley.com/doi/full/10.1002/2017GL074960>

A more accurate method of predicting ozone levels would quantitatively evaluate the changes in VOC and NO_x emission levels along with using up to date estimates of background ozone. This much more detailed and robust analysis is what was conducted as part of the 2016 AQMP. Because of this detailed analysis, which follows EPA's prescribed methods, EPA approved the modeled attainment demonstration in the 2016 AQMP, which is fundamentally based on a NO_x reduction strategy. With EPA's approval, South Coast AQMD and CARB are required to carry out the control strategies in the 2016 AQMP. Therefore, due to the best scientific analysis, and the now legal mandate to carry out the 2016 AQMP, PR 2305 has been designed to achieve additional NO_x reductions. No one rule can achieve air quality standard, but PR 2305 is part of the larger comprehensive strategy to meet those goals. The cost-effectiveness of PR 2305 is discussed in the Socioeconomic Impact Assessment and in Table 23 of the Final Staff Report.

Response to Comment 43-7

The commenter is correct that a new version of EMFAC was released in January 2021, and the technical documentation describing how the EMFAC2021 calculates emissions was released by CARB on March 26, 2021, after the First Draft Staff Report was released.¹²⁴ However, this version of EMFAC is not yet approved by U.S. Environmental Protection Agency (EPA). South Coast AQMD typically does not use versions of EMFAC that are not approved by U.S. EPA, as there could be updates to the model before final approval. For example, the development of the 2022 AQMP will use EMFAC2017 because approval of EMFAC2021 is not anticipated before the 2022 AQMP is due to U.S. EPA. The latest version approved by U.S. EPA is EMFAC2017 which has been used in this analysis. Further, post-processing of the EMFAC2017 model output was conducted following methods developed by CARB to include recent regulations, including CARB's Advanced Clean Trucks rule, Low NO_x Omnibus rule, and the Heavy Duty I/M rule. These enhancements were developed in CARB's META tool as part of its development of its draft Mobile Source Strategy.

Response to Comment 43-8

AQMD staff is aware of the new adjustments to the newly released EMFAC2021 model. See Response to Comments 43-7. Staff has accounted for emission reductions from CARB's ACT, Low NO_x Omnibus regulations and Heavy-Duty I&M Program using estimates provided by CARB that were developed in their version of Mobile Emissions Toolkit for Analysis (META) for South Coast as part of their Mobile Source Strategy development.¹²⁵ Staff has accounted for the abovementioned regulations in the baseline emission inventory as well as scenario calculations using emission reductions provided in META. Importantly, EMFAC2021 does not account for the Heavy Duty I&M program. However, it has been included in the PR 2305 scenario calculations and baseline emission inventory development because detailed estimates of its expected effects have been developed by CARB, and the regulation is sufficiently developed both in regulatory concept and per statutory requirement (SB 210 (2019), Health and Safety Code 44150 et seq.). If the Heavy Duty I/M program is not included in the analysis, then the baseline emissions inventory and the PR 2305 emission reductions would be higher at the same level of implementation and costs. By comprehensively accounting for these

¹²⁴ A subsequent version was released on April 30, 2021, further illustrating that the model is not yet final.
<https://content.govdelivery.com/accounts/CARB/bulletins/2d48287>

¹²⁵ <https://arb.ca.gov/emfac/meta/>

regulations, the analysis included in the Final Staff Report has ensured that no double counting of emission reductions has occurred.

Response to Comment 43-9

See Response to Comments 43-7 and 43-8. While EMFAC2021 does include updated methods (like every new version of EMFAC), these updates have not yet been approved by EPA. The analysis included in the Final Staff Report uses the most recent EPA-approved version of EMFAC, and then uses CARB methods to post-process the output to estimate the effect of their recent regulations. This analytical approach provides a robust and thorough analysis of expected emission reductions from PR 2305.

Response to Comment 43-10

The South Coast Air Basin version of CARB's META Tool was provided to the commenter on February 5th, 2021. Additional emission calculation spreadsheets are available at www.aqmd.gov/fbmsm, and methods are additionally described in the Final Staff Report. The methods used by CARB to prepare the META tool are available in the Draft Mobile Source Strategy¹²⁶ and in the spreadsheet provided to the commenter.

Response to Comment 43-11

South Coast AQMD received a Public Records Act request from Snell and Wilmer on behalf of NAIOP, seeking this information and South Coast version of META, was provided on February 5th, 2021. Staff has used the HD I/M factors provided in CARB's META Tool for South Coast. Further analysis of how Staff implemented the Heavy Duty I/M factors to truck emission rate calculations can be found in Draft Truck Emission Rate Calculations spreadsheet available on South Coast AQMD's website.¹²⁷

Response to Comment 43-12

The final approval for Advanced Clean Fleet (ACF) and Zero-Emission Drayage Trucks are not anticipated until late 2022. Moreover, the goals set by the executive order (EO)N-79-20 are not regulations or requirements on fleets but are instead directions for state agencies to pursue those goals, if feasible. Although the most recent concept for the ACF regulation includes a goal to get 100% of the drayage fleet to be zero emissions by 2037,¹²⁸ it is unclear if the proposed concept will result in any actual emission reductions in the 10-year period evaluated as part of the PR 2305 analysis. The current concept for drayage trucks in ACF prevents new non-ZE trucks from entering the drayage registry after 2023. Because the drayage market is composed of a significant fraction of used trucks,¹²⁹ there will be a significant cost differential between a new ZE truck, and an existing diesel truck. The most likely outcome is that used diesel trucks in the registry will be used as long as possible [up to 18 years per the requirements

¹²⁶ https://ww2.arb.ca.gov/sites/default/files/2020-11/Draft_2020_Mobile_Source_Strategy.pdf

¹²⁷ www.aqmd.gov/fbmsm

¹²⁸ Slide 18 at <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/carb-epa-presentations---hd-trucks-03-24-21.pdf>

¹²⁹ Ibid, Slide 15. See also <https://cleanairactionplan.org/documents/final-drayage-truck-feasibility-assessment.pdf/>

of SB 1 (2017)] to avoid the cost of purchasing a new ZE truck. As occurred during the previous drayage rule, short distance dray-offs will be the most likely mechanism of compliance. In this case, that would mean that the oldest diesel drayage trucks would shorten their trips out of the port to avoid racking up miles and hitting the 800,000 mile threshold for turnover. Diesel trucks would then be able to continue the drayage trip to its ultimate destination. This approach will ensure that the dirtiest trucks continue to call at the port for as long as possible, all while a ZE regulation is in place. There is no proposal we are aware of that would address how to enforce the optimistic emission reductions envisioned during the working group meetings. This outcome is entirely foreseeable given the recent history described above.¹³⁰

It is also unclear how the goals in the Ports Clean Air Action Plan are going to be met as no implementation date has been set, and no plan has been adopted as to how the \$10 per TEU will be used to subsidize the purchase of ZE/ NZE trucks. Given these limitations, it is speculative to determine precisely how much emission reductions the ports' anticipated new Clean Truck Program will achieve relative to PR 2305. However, using the following broad assumptions, the emission reductions at PR 2305 warehouses from a fully implemented Clean Truck Program (CTP) could be about 1-2%. Once the CTP is in place, it could raise about \$90 million per year.¹³¹ If those funds are spent on NZE trucks, at most it may turn over about 6% of the drayage fleet per year. That could be less because newer NZE trucks will be competing against lower cost used diesel trucks. The turnover could also be significantly lower if the ports focus their funding on ZE trucks, which are expected to be much more expensive than NZE trucks early in the program. About 65% of imported containers that do not go to an on-dock or off-dock rail yard could be assumed to go to a warehouse. Many warehouses that receive imported containers close to the ports are smaller than 100,000 sf and therefore not covered by PR 2305. Using the ratio of drayage activity compared to other Class 8 truck activity from EMFAC and the ratios above, a maximum of about 5% of all trips to PR 2305 warehouse are drayage trips coming from the ports. Using the 6% replacement rate for NZE trucks, and the 5% of trips, the maximum emission reductions from the CTP by 2031 would be about 1-2%. PR 2305 is estimated to provide about a 10-15% reduction, and this 1-2% estimate would be a subset of the total reductions. Because the emission reductions are a subset, the costs for these trucks would also be a subset and attributable to the port program rather than to PR 2305, and the cost-effectiveness of PR 2305 is not expected to materially change.

Finally, PR 2305 could enhance the emission reduction potential of the CTP. Because the CTP only applies at the ports, as a standalone program it is foreseeable that it would result in dray-offs, similar to what was described for the ACF drayage concept. If PR 2305 is in place, then it is much more likely that a NZE or ZE truck that picks up a load at the ports will take that load all the way to a warehouse so that the warehouse operator can earn WAIRE Points, rather than a short trip to a nearby facility to transfer the load to a diesel truck.

Response to Comment 43-13

¹³⁰ <http://www.caclutchandgear.com/carb-cracking-down-on-port-freight-loop-hole/>,
<https://www.freightwaves.com/news/l-a-port-tries-to-close-truck-program-loop-holes>,

¹³¹ https://www.portoflosangeles.org/references/news_022720_clean_truck_rate

The commenter is correct that truck trip lengths will vary by warehouse, and for each truck trip. However, obtaining actual warehouse truck trip lengths is not feasible in a universe of 2,902 warehouses, thousands of trucks, and millions of truck miles. Some trip lengths may be longer, and some may be shorter; therefore an average truck trip length is the most representative of all the trips occurring in the basin, especially in relation to a rule analysis that evaluates a broad swath of the trucking activity in the basin like PR 2305.¹³²

Further, based on Staff interviews with industry participants, many trucking companies indicated that they consider information about their vehicle miles traveled data and where they travel as business confidential, and do not want to disclose that to warehouse operators (who may be competitors). Further, some trucks carry goods to multiple warehouses on a single route, and assigning the mileage to each warehouse is impractical. Because of this, assigning specific differential mileage by warehouse is not a viable approach. Therefore, the use of average truck trip lengths is the most reasonable approach when considering the impacts of PR 2305.

Response to Comment 43-14

Using the trip lengths from the 2016 RTP is consistent with the 2016 AQMP analysis and with EMFAC2017, which are both used in the Final Staff Report. New trip lengths have not yet been determined using results from the 2020 RTP as those are prepared during the development of the subsequent AQMP, and not made final until after that AQMP's approval. In this case it will be the 2022 AQMP that is expected to be approved next year. The average trip lengths used in the analysis in the Final Staff Report are also representative of what is expected for warehousing activity based on conversations with individual warehouse operators as well as the range of trip lengths used in CEQA analyses reviewed by Staff for new warehouse projects. As an example, Class 8 trucks are assumed to travel 39.9 miles per trip in the analysis conducted in the Final Staff Report, which is based on modeling conducted for the 2016 RTP and the 2016 AQMP, and typical trip lengths used in warehouse CEQA documents is 40 miles. The enhancement the commenter suggests for passenger vehicle trips would not affect the emission reduction analysis because no scenario assumed emission reductions from employee cars.

Response to Comment 43-15

The internalization rate used in the Final Staff Report is the best available information, and the commenter did not provide any specific alternative data source that could be used. The commenter's claim that the internalization constant (i.e., the truck trips between warehouses) is applicable only to drayage is also incorrect. The rate is applicable to imported goods, whose first trip is a drayage trip coming from the port.¹³³ However the study evaluates where the goods go after the first drayage trip as well, which is how the percentage of trips between warehouses is actually determined. In conversation with SCAG staff about this approach, they

¹³² Using average trip lengths is common practice when calculating potential emission reductions of control measures, including the use of standard software like CalEEMod (<http://www.caleemod.com/>), and in SIP measures (<https://www.arb.ca.gov/planning/sip/imp2016sip/finalreport.pdf>).

¹³³ A drayage trip is one which has an origin or destination at the port.

concurred that the use of the internalization rate from their study is reasonable, and they are unaware of other sources of information which could be used.¹³⁴

Response to Comment 43-16

For the analysis of yard truck emissions staff has used proprietary data purchased from Powersys which is considered confidential. The information that is not business confidential and the calculations have been provided in the spreadsheets available at www.aqmd.gov/fbmsm.

Response to Comment 43-17

The requested data was provided to the commenter on February 5th, 2021. Some of the information provided as part of the business survey is considered business confidential, and aggregated results were provided. This data is considered the most reliable information available as it is specific to warehouses in the South Coast AQMD. Therefore the analysis conducted using this data is not arbitrary. The data included in the public release on the website was limited to warehouses >200,000 sf due to the focus of that study on larger warehouses. The original dataset included smaller facilities too, which is the data that was used in the analysis in the Final Staff Report.

Response to Comment 43-18

As mentioned in Final Staff Report Chapter 1 Table 2, the TRU calculations are based on CARB methods available on their website.¹³⁵ These are the best available estimates of emissions from this category of equipment, and are not arbitrary to include as part of the PR 2305 analysis. The comment states that unspecified details are not available, however the spreadsheet calculations that are used to support the Final Staff Report analysis includes all detailed calculations used in the analysis, based on CARB's methodology. The comment then refers to yard trucks at the end, but it is not clear if this is a typographic error since the rest of the comment is about TRUs. Regardless, detailed yard truck calculations have been performed and are documented and included in the Final Staff Report in Appendix B.

Response to Comment 43-19

The errors in the emission rate calculations noted by the commenter have been updated in the Final Staff Report and are included in the spreadsheets available at www.aqmd.gov/fbmsm.

The updated calculations have been included with other updates Staff has made appropriate corrections in the baseline emissions inventory and updated the 2019 NOx and DPM emissions in the Draft Staff Report released on March 3rd, 2021.

Response to Comment 43-20

¹³⁴ Personal communication with Annie Nam, SCAG Goods Movement and Transportation Finance Manager, April 2021.

¹³⁵ <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/tru-meetings-workshops>,
https://ww2.arb.ca.gov/sites/default/files/classic/cc/cold-storage/documents/hra_emissioninventory2019.pdf

TRU emission calculations for cold storage warehouses in the baseline emission inventory have been updated based in part on this comment and in part to more accurately reflect the proportion of warehouses that are expected to be cold storage relative to non-cold storage. This update used a linear regression and data from two SCAG studies.¹³⁶ Details of the updated calculation can be found in PR 2305 Draft Baseline Emissions Inventory, “Cold Storage” tab available at www.aqmd.gov/fbmsm.

Response to Comment 43-21

The analysis conducted for the baseline inventory and the scenario calculations is as consistent as possible, but necessarily differs because different activities are expected to occur with and without the rule. Both the baseline and scenario calculation analyses utilize EMFAC2017 as a base, and both account for recent CARB regulatory activity including Advanced Clean Trucks, Low NOx Omnibus, and Heavy Duty I/M.¹³⁷

Some updates have been included in the most recent scenario analysis to ensure that recent CARB regulations are appropriately analyzed. However, because these three rules will not be treated the same under PR 2305, the method of including them is different. For example, trucks that comply with ACT would earn WAIRE Points, but trucks that meet the Low NOx Omnibus standards or that comply with the Heavy Duty I/M program would not earn Points. In the scenario analysis, the benefit from ACT is first determined by assigning WAIRE Points to truck visits from ACT trucks. This reduces a warehouse operators WAIRE Points Compliance Obligation. Then the remaining actions needed by the warehouse operator for each scenario is calculated, and the resulting emissions benefit are determined. In contrast, in the baseline emissions inventory, the emissions reductions from ACT are directly accounted for without calculating any Points.

Response to Comment 43-22

See Response to Comments 43-9 to 43-15 as the same responses apply to both the scenario calculations and the baseline emissions inventory.

Response to Comment 43-23

The baseline emissions inventory focused on the most significant sources of emissions related to warehouses. The emissions from providing power to warehouses does not materially affect those estimates, but an estimate is included in this response for completeness. An estimated

¹³⁶ https://scag.ca.gov/sites/main/files/file-attachments/task4_understandingfacilityoperations.pdf?1604268216, https://scag.ca.gov/sites/main/files/file-attachments/task2_facilityinventory.pdf?1604268149

¹³⁷ The analysis that was conducted for Heavy Duty I/M is conservative, in that the emission reductions from that program may be overstated by CARB. To the extent that they are the emission reductions due to PR 2305 would be greater. Examples include uncertainty whether the proposed lower emission rates anticipated for that program will apply equally to in-state vs. out-of-state trucks (which make up about 22% of PR 2305 emissions), whether the program will achieve its full emission reduction potential early during its implementation (e.g., in 2023), and whether pre-2014 trucks without on-board diagnostics (OBD) systems will achieve the same reductions as later trucks with OBD systems. For example, see comment letter from SCAQMD to CARB on their Draft Proposed Heavy-Duty Vehicle Inspection and Maintenance Program, 4/13/21.

750.9 million square feet of non-cold storage and 8.3 million square feet of cold storage warehousing will be subject to PR 2305 WAIRE Points requirements. Using information from the U.S. Energy Information Administration, these two types of warehouses use about 5.8 and 28.8 kWh/sf/yr.¹³⁸ This results in total energy usage of about 4.6 MWh/yr. Using the NOx emission rate for South Coast AQMD power plants of 0.087 lb/MWh¹³⁹ and the approximate 45% of power produced by natural gas power plants compared to all other sources (which predominantly do not emit NOx in South Coast AQMD),¹⁴⁰ the total NOx emissions from electricity use at warehouses is about 0.2 tons per day. This is <1% of total baseline emissions from PR 2305 warehouses in 2019. The NOx reductions from solar panels used to earn WAIRE Points in Scenario 11 results in 1.1 tons per day of emission reductions. The additional emission reductions achieved from this scenario are related to the use of mitigation fees that operators pay to make up any shortfall if they cannot earn enough WAIRE Points from solar. The solar panels installed in this scenario would more than offset the power plant related emissions from warehouses, but would still be substantially less than the total baseline emissions from PR 2305.

Response to Comment 43-24

The scenario calculations in the Final Staff Report have been updated, in part to address this comment and provide a more conservative treatment of CARB regulations relative to PR 2305. The results of that analysis is included in the Final Staff Report in Tables 15 and 16. For a discussion of how CARB's proposed Advanced Clean Fleets and the Ports' anticipated Clean Truck Program update would interact with PR 2305, see Response to Comments 43-12.

The updated scenario calculations account for points generated by CARB's ACT ZE trucks visiting the warehouses considered in PR 2305. Points earned from those ZE truck visits are subtracted from each facilities' WPCO and therefore, any actions taken and emission reductions achieved under each scenario would be considered above and beyond CARB's regulations. The Low NOx Omnibus regulation is accounted for in the baseline emissions inventory,¹⁴¹ but was not included in any scenario calculations as trucks that only meet the requirements of Low NOx Omnibus would not earn WAIRE Points. Trucks that meet the NZE definition in PR 2305 would earn WAIRE Points and the Low NOx Omnibus requirements, and several scenarios are included for this technology.

Response to Comment 43-25

While this comment refers to NZE trucks, those trucks are not required by any CARB regulation. However, the point remains as applied to ZE trucks. The scenario calculation analysis has been updated by adding a new scenario, Scenario 19. This scenario looks at visits

¹³⁸ <https://www.eia.gov/consumption/commercial/data/2012/c&e/cfm/pba4.php>

¹³⁹ Final Staff Report, Appendix B, Section 7b

¹⁴⁰ https://www.eia.gov/opa/open_data/qb.php?category=3390127

¹⁴¹ The analysis assumes equal levels of implementation of this regulation across the state. However this is an uncertain outcome as statewide measures do not always occur equally throughout the state, as indicated by the lower levels of light duty ZE passenger car adoption in South Coast AQMD relative to other counties, as shown in Figure 3 of the Final Staff Report.

from the population of ZE trucks from CARB's ACT to warehouses. The updated scenario calculations account for points generated by CARB's ACT ZE trucks visiting the warehouses considered in PR 2305. Points earned from those ZE trucks are subtracted from each facilities' WPCO and therefore, any actions taken and emission reductions achieved under each scenario would be considered above and beyond CARB's regulations.

The updated methodologies have resulted in reduced baseline emissions as well as reduced emission reductions, however the relative reduction of about 10-15% has remained approximately the same between previous versions of the scenario calculations, and the version included in the Final Staff Report.

Response to Comment 43-26

As stated in Response to Comments 43-28, the updated scenario calculations account for points generated by CARB's ACT ZE trucks visiting the warehouses considered in PR 2305. Points earned from those ZE trucks are subtracted from each facilities' WPCO and therefore, any actions taken and emission reductions achieved under each scenario would be considered above and beyond CARB's regulations. The Low NOx Omnibus regulation is accounted for in the baseline emissions inventory,¹⁴² but was not included in any scenario calculations as trucks that only meet the requirements of Low NOx Omnibus would not earn WAIRE Points, as they have higher emissions than the Lowest Optional Low NOx standard specified in PR 2305. Trucks that meet the NZE definition in PR 2305 would earn WAIRE Points and the Low NOx Omnibus requirements, and several scenarios are included for this technology.

Response to Comment 43-27

This comment has been addressed in the updated version of the scenario calculations. Heavy Duty I/M has been considered in both the population of trucks from CARB's regulations as well as the population in the scenario calculations and baseline emissions inventory. NOx and DPM Heavy Duty I/M factors were obtained from CARB's META tool and were applied to EMFAC2017 emission rates.

Response to Comment 43-28

Points earned from CARB's ACT ZE trucks are subtracted from each facilities' WPCO in all scenarios except Scenario 7. Scenario 7 represents an "inefficient" mitigation fee scenario in which warehouse operators would only pay the mitigation fee to comply with the rule, without any attempt to earn any WAIRE Points from CARB's ACT ZE truck visits or any NZE/ ZE truck visits incentivized by those mitigation fees in the WAIRE Mitigation Program. Trucks that only comply with CARB's Low NOx Omnibus and Heavy Duty I/M regulations would not be eligible to earn WAIRE Points.

Response to Comment 43-29

¹⁴² The analysis assumes equal levels of implementation of this regulation across the state. However this is an uncertain outcome as statewide measures do not always occur equally throughout the state, as indicated by the lower levels of light duty ZE passenger car adoption in South Coast AQMD relative to other counties, as shown in Figure 3 of the Final Staff Report.

The mismatch between the compliance year and emission rates has been corrected for Scenario 1 in the updated scenario calculations spreadsheet.¹⁴³ Even after the corrections, the rule still shows an emissions reductions of about 1.0 to 3.5 tons per day in the years 2024 through 2027.

Response to Comment 43-30

South Coast AQMD Staff acknowledges that through time the cost of cleaner technologies is expected to decrease and general fleet turnover to cleaner trucks will reduce the fleet mix emission rates. Further, updates to the emissions profiles of the on-road truck fleet, yard truck fleet, etc. may change beyond what has been calculated in the Final Staff Report and its appendices. The Board Resolution therefore includes an assessment of the state of technology for the WAIRE program every 5 years to reevaluate the associated annualized cost and emission reductions from WAIRE Menu options. Updates to the WAIRE Menu may be recommended to the Board at that time, if warranted. Although it is possible that the expected costs and/or emission reductions associated with technologies may change more rapidly than in the next five years, there is also value in maintaining regulatory stability for a period so that warehouse operators can plan ahead to comply with the rule. The commenter is also asking for forecasting costs, whereas Staff is proposing instead to report back to the Board every five years with an analysis of actual costs and then to recommend updates at that time, if necessary.

Response to Comment 43-31

While the commenter's concern about charging time and mileage range of battery electric trucks can be true for some cases, it is not necessarily broadly applicable. Because PR2305 does not require 100% turnover of trucks to zero emission trucks, not all trucks will have a duty cycle that requires more than a one-to-one replacement as suggested by the comment. Electric vehicles are advancing technologically very quickly, and the proposed five-year phase-in for PR 2305 allows technology to advance before final stringency is reached. Even at the final phase-in only a fraction of vehicles would choose to comply through zero emission truck options. For example, a 250,000 sf warehouse will have about 41 Class 8 truck visits per day and about 15 Class 2b-7 truck visits per day. They would have a WPCO of about 217 at final stringency. This warehouse operator would only be required to have about 4 Class 8 ZE truck visits per day to earn the required number of WAIRE Points (about 10% of all visits). Importantly, natural gas powered NZE trucks that do not have the same limitations on their duty cycle as ZE trucks are also available, but are ignored by the comment. In this same example, about 5 Class 8 NZE truck visits would be needed per day if that compliance option was chosen. This small fraction of implementation allows warehouse operators that choose to earn WAIRE Points through truck visits to focus on those that best meet the duty cycles and technologies that are suitable for their operations.

The comment includes reference to two studies to argue that more than one electric truck is needed for every diesel truck it replaces. The first study refers to a bus case study. Although buses are heavy duty vehicles, their duty cycle is different than for trucks (slower speeds with lots of stops), and the study can not be used to conclude how many ZE trucks would be needed compared to diesel trucks in the context of warehouses. The second study by the National Center for Sustainable Transportation used several methods to evaluate how ZE Class 8 trucks

¹⁴³ www.aqmd.gov/fbmsm

could work for specific cases in southern California. This study used hypothetical modeling to conclude that if a fleet converted mostly (e.g., up to 96%) to battery-electric trucks that more than one ZE truck would be needed for every diesel truck replaced. However, at lower levels of adoption (e.g., 15%), and in future years with more advanced technology (2025 and 2030) the total fleet size is nearly identical. The fleet size was found to not change at all for natural gas hybrid trucks. Importantly, the study also included two case studies with detailed travel data from fleets. These two studies revealed that trucks have a range of distances they travel every day. For both fleets, 22-40% of trucks travel less than 80 miles per day (well within the range of current ZE truck technology). This finding is consistent with more comprehensive data recently presented by CARB.¹⁴⁴

This chart shows that 29% of all in-state tractors travel less than 100 miles per day. Because PR 2305 would only require about 10% of visits to be from Class 8 ZE trucks, warehouse operators are expected to find the most favorable duty cycles first (e.g., lower mileage) if they choose to use this method to earn WAIRE Points. Based on the data presented in the NCST study mentioned by the commenter and in data presented by CARB, this level of implementation will not require acquiring more ZE trucks than diesel trucks. The cost analysis used in the Final Staff Report and Socioeconomic Impact Assessment therefore provide reasonable estimates of expected outcomes of PR 2305 and PR 316.

Response to Comment 43-32

The commenters assertion that the calculation of annual usage for each technology is arbitrary is incorrect. As shown below, each annual usage estimate is based on methods that are well documented in the WAIRE Menu Technical Report (Appendix B of the Final Staff Report).. The choice of what number to use for each usage is also not important, as the number of WAIRE Points scales up and down equally with the level of implementation. For example, if an operator earns 42 WAIRE Points for dispensing 165,000 kWh of electricity into ZE trucks, they would earn half that amount (21 WAIRE Points) for dispensing half the electricity (82,500 kWh).

¹⁴⁴ https://ww2.arb.ca.gov/sites/default/files/2020-09/200918presentation_ADA.pdf

The annualized metric for charging infrastructure usage was set at 165,000 kWh, equal to about 450 kWh per day, or enough for five separate two hour-long charging events per day on a 50 kW charger, or enough to recharge one truck with a 500 kWh battery.¹⁴⁵ Similar to all other WAIRE Menu items, the related cost, NOx reductions, and Diesel PM reductions were calculated for this level of implementation to determine the number of WAIRE Points that is associated with a usage of 165,000 kWh (see Section 3 from Appendix B of the Final Staff Report).

In order to be consistent with the NOx emission reduction benefits of charging a battery-electric Class 8 truck compared to a conventional Class 8 diesel truck, the equivalent amount of hydrogen a fuel cell Class 8 truck would need was back-calculated (see Section 4 from Appendix B of the Final Staff Report).

The average power draw for trailer TRUs is 7.3 kilowatts¹⁴⁶ based on CARB's Preliminary Cost Document for the Transport Refrigeration Unit Regulation.¹⁴⁷ The 4-hour average daily usage is also based on a 2011 inventory analysis survey by CARB in which it was shown the annual activity of trailer and truck TRUs are in the range of 1360 to 1697 hours per year.¹⁴⁸ A 4-hour daily average usage (about 1460 hours per year) is within this range of usage (see Section 6 from Appendix B of the Final Staff Report).

Response to Comment 43-33

Additional details about the WAIRE Mitigation Program are included in the Final Staff Report and the draft Board Resolution. The details requested by the commenter are not being finalized at the time of rule adoption because the exact design of the program can not yet be determined. A critical missing piece of information is determining what the level of funding will be overall, and how those funds will vary across the South Coast AQMD. As stated in Chapter 2 of the Final Staff Report, funds will be pooled from mitigation fees paid by all warehouses in a Source Receptor Area,¹⁴⁹ and funding will be focused on projects that will reduce emissions in that area. However, it is foreseeable that the funding program could vary each year, or potentially in different geographic areas, depending on the level of funding available. Future program solicitations and project awards will be developed in a public process and must receive South Coast AQMD Governing Board approval in a public meeting before the funding program can proceed. A funding program, once developed, will include details such as the application process, project eligibility and selection criteria, timeline, tracking, and verification. The South Coast AQMD has a long history of implementing various funding programs, including Carl Moyer, Prop. 1B, and the VW Mitigation Fund, and these criteria are regularly a part of the process.

¹⁴⁵ Final Staff Report, Appendix B.

¹⁴⁶ <https://ww2.arb.ca.gov/sites/default/files/2020-08/Preliminary%20TRU%20Cost%20Doc%2008202020.pdf>

¹⁴⁷ <https://ww2.arb.ca.gov/sites/default/files/2020-08/Preliminary%20TRU%20Cost%20Doc%2008202020.pdf>

¹⁴⁸ https://ww2.arb.ca.gov/sites/default/files/classic/cc/cold-storage/documents/hra_emissioninventory2019.pdf

¹⁴⁹ Map available here: <http://www.aqmd.gov/docs/default-source/default-document-library/map-of-monitoring-areas.pdf>

Regarding the cost-effectiveness of the WAIRE Mitigation Program, it is uncertain what will be the exact criteria chosen by the South Coast AQMD Governing Board in each subsequent funding cycle. However, if PR 2305 and/or other concurrent policy actions drive significant interest into the WAIRE Mitigation Program, it is possible that the program could become more cost effective than \$100,000 per ton if grants are able to be lowered. Conversely, cost-effectiveness in terms of dollars per ton of pollutant reduced are not traditionally associated with ZE charging and fueling equipment, and cost effectiveness could be higher in some instances. On balance, because current funding programs use a \$100,000 per ton threshold, it is reasonable to include that as an estimate in the scenario calculation analysis.

Finally, DPM cost-effectiveness was derived based on DPM emission reduced by replacing a 13-year-old T7 Tractor with a ZE truck consistent with Carl Moyer calculation guidelines. The value of \$247,600,000 is not designed to be a criteria used for funding. It is instead a math construct that is used to determine the level of DPM reductions based on an assumed level of incentive funding, and funding being used for NZE trucks at \$100,000 per ton of NO_x reduction.

Response to Comment 43-34

Thank you for your comments and interest in this rule development.

Response to Comment Letter 44 – California Trucking Association – March 2, 2021

Response to Comment 44-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. As explained below in Response to Comment 44-3, South Coast AQMD (the District) has ample statutory authority for the proposed rules, and they are not preempted by federal law.

Response to Comment 44-2

South Coast AQMD Staff understand that trucking is an important industry to the good movement industry in California. PR 2305 and PR 316 have been developed with industry's concerns have been taken into account.

Response to Comment 44-3

The comment contends that the District lacks statutory authority to adopt an indirect source rule (“ISR”) for existing, as opposed to new, indirect sources. In fact, the District’s broad regulatory authority includes the authority to adopt ISRs for both new and existing sources. The comment omits several sources of District authority and misconstrues the sources of authority it does cite.

Multiple provisions of the Health and Safety Code (“HSC”) give the District authority to adopt rules and regulations for sources of air pollution other than mobile sources as necessary to attain state and federal ambient air quality standards. *See* HSC §§ 40001(a), 40440(a), 40703; *see also id.* § 40000 (“The Legislature finds and declares that local and regional authorities have the primary responsibility for control of air pollution from *all sources*, other than emissions from motor vehicles.” (emphasis added)). These provisions are not limited to direct sources, nor are they limited to new as opposed to existing indirect sources. They are sufficient to authorize the District to adopt the proposed rule. Moreover, HSC section 40716 does specifically authorize air districts to adopt rules to reduce or mitigate emissions from “indirect sources,” with no limitation on whether the source is existing or new.

The comment contends that the District cannot point to a statute that “expressly” authorizes regulation of existing indirect sources. The argument mistakes the nature of the District’s authority. Regulation of indirect sources, both new and existing, comes within the plain meaning of the authorizing statutes just discussed, and in that sense they are authorized by the express terms of the statutes. That such regulations are not *specifically* authorized by these statutes is irrelevant. *Cal. Sch. Bds. Ass’n v. State Bd. of Equalization*, 191 Cal. App. 4th 530, 544 (“[T]he absence of any specific [statutory] provisions regarding the regulation of [an issue] does not mean that such a regulation exceeds statutory authority.” (alterations in original)). The statutes also do not specifically authorize the District to regulate lead smelters (Rule 1101), pharmaceutical manufacturing facilities (Rule 1103), or fluidized catalytic cracking units (Rule 1105), and yet the District regulates these sources and many more because they are sources of pollutants that impair the District’s attainment of ambient standards. The same is true of warehouses—both new and existing. The delegation of regulatory power to a local government, without limiting the mode of exercising that power, implies that the government may select any lawful and reasonable means to exercise that power. *San Diego Gas & Elec. Co. v. San Diego Cty. Air Pollution Control Dist.*, 203 Cal. App. 3d 1132, 1144 (1986). Therefore, since the

Legislature did not specify whether the District was limited to regulating new indirect sources, the District may regulate new sources, existing sources, or both.

The comment points to provisions of the federal Clean Air Act (“CAA”) addressing indirect sources, which the comment contends are limited to regulation of new or modified sources. *See* 42 U.S.C. § 7410(a)(5)(A) (CAA section 110). The CAA is irrelevant to the District’s authority to adopt the proposed rule. The District’s regulatory authority represents an exercise of the State’s police power. *Lees v. Bay Area Air Pollution Control Dist.*, 238 Cal. App. 2d 850, 856 (1966). This power is delegated to it by the State Legislature. *Orange Cty. Air Pollution Control Dist. v. Pub. Util. Comm’n.*, 4 Cal. 3d 945, 953 (1971). Thus, the District exercises the State’s police power as delegated by the Legislature; the CAA is not the source of the District’s authority. Indeed, the cited provision of the CAA limits the federal Environmental Protection Agency’s (“EPA”) ability to require ISRs to be included in a state’s state implementation plan (“SIP”); it is not a limit on a state or local government’s authority to adopt an ISR under state law.¹⁵⁰ That statute, and EPA’s interpretation of it, are thus not relevant to the scope of the District’s regulatory authority. The comment points to nothing in California law indicating that the Legislature intended that air districts’ authority to regulate indirect sources be limited by the federal CAA.

The comment also cites sections 40716 and 40440(b)(3) of the HSC, but it misinterprets those provisions. Neither provision supports the arguments made.

The comment contends that section 40716 requires any District ISR to both reduce ISR emission and reduce vehicle trips. Not so. In providing that “a district may adopt and implement regulations to accomplish both of the following,” it refers to regulations, plural. It provides that districts may adopt regulations that, collectively, serve both of the goals following that phrase. The statute does not demand that each individual regulation serve both of those goals. If the commenter’s interpretation were correct, then District rules reducing emissions from areawide sources, which are also authorized by section 40716(a)(1), would likewise be required to reduce the number or length of vehicle trips. CARB defines areawide sources as sources “where the emissions are spread over a wide area, such as consumer products, fireplaces, road dust, and farming operations.” CARB, *Emission Inventory Documentation*, <ww2.arb.ca.gov/emission-inventory-documentation>; *see also Cal. Bldg. Indus. Ass’n v. San Joaquin Valley Air Pollution Control Dist.*, 178 Cal. App. 4th 120, 128 (2009) (referring to “area-wide sources of emissions such as fireplaces, wood stoves and landscape equipment”). It would make no sense to demand that rules regulating consumer products or fireplaces also reduce vehicle trips.

The comment also points to HSC section 40440(b)(3), which refers to “provid[ing] for indirect source controls in those areas of the south coast district in which there are high-level, localized concentrations of pollutants or with respect to any new source that will have a significant effect on air quality in the South Coast Air Basin.” The comment erroneously assumes that section 40440(b)(3) both provides and limits District authority to regulate indirect sources to areas of localized pollutant concentrations or new sources. But subsection 40440(b) does not grant authority to the District to adopt regulations. Rather, it is a mandate—it identifies particular tasks that the District must undertake using the regulatory authority granted by subsection 40440(a): “The rules and regulations adopted pursuant to subdivision (a) shall do all of the

¹⁵⁰ CAA section 110 also cannot preempt state regulatory authority. Section 116 specifies the provisions in the CAA with preemptive effect, and it does not include section 110. *See* 42 U.S.C. § 7416.

following.”¹⁵¹ Nothing in subsection 40440(b) suggests that it is a limit on the District’s authority under 40440(a). Moreover, the comment ignores the fact that these terms in paragraph (b)(3) are missing from section 40716, which contemplates regulations that “[r]educe or mitigate emissions from indirect . . . sources of air pollution” generally, with no limit as to new sources.

Moreover, the comment omits from its quotation of section 40440(b)(3) the first half of the operative language, which includes no reference to new sources, but instead provides for indirect source regulation where there are high localized levels of pollutants. And the fact that the second half specifically refers to new sources shows that indirect source regulation is not inherently limited to new sources, since if it were, the word “new” in the second half would be superfluous.¹⁵²

The comment also erroneously suggests that the District is relying solely on a California Attorney General opinion as a basis for its authority. *See* 76 Ops. Cal. Atty. Gen. 11 (1993). The statutes cited above provide ample authority for the proposed ISR; the opinion has been cited only to show that indirect source measures could be required for already-constructed sources.

Indeed, the comment appears to recognize that the District may regulate existing indirect sources, but suggests that it may do so only for supposedly “traditional” indirect sources such as shopping centers or stadiums. It cites no authority for the proposition that warehouses are somehow a different type of indirect source that can only be regulated when newly constructed.

In sum, nothing in the provisions of the HSC authorizing the District to adopt pollution control regulations limit those regulations to the control of emissions associated with new, as opposed to existing, indirect sources.

Response to Comment 44-4

The comment contends that PR 2305 is preempted by section 209(a) of the federal CAA, which prohibits state or local regulations adopting standards relating to the control of emissions from new motor vehicles. 42 U.S.C. § 7543(a). The argument is based on the premise that the proposed rule in fact imposes a standard for emissions from trucks. That argument is precluded by the Ninth Circuit’s decision upholding another ISR program in *National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District*, 627 F.3d 730 (9th Cir. 2010) (“*NAHB*”), which the comment relegates to a footnote.

In *NAHB*, the court rejected a CAA preemption claim challenging part of an ISR adopted by the San Joaquin Valley Unified Air Pollution Control District. The ISR required real estate development projects to reduce emissions from construction equipment by specified

¹⁵¹ This language (“do all of the following”), which tracks that used in section 40716 (“accomplish both of the following”), also confirms the error in the comment’s interpretation of the latter section. If the comment were correct, *each* District rule must require best available retrofit control technology (40440(b)(1)), promote cleaner burning fuels (40440(b)(2)), provide for indirect source controls (40440(b)(3)), *and* provide transportation control measures (40440(b)(4)).

¹⁵² Indeed, the definition of “indirect source” in the CAA includes no limitation, express or implied, to new sources. 42 U.S.C. § 7410(a)(5)(C) (“‘indirect source’ means a facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution”).

amounts.¹⁵³ *Id.* at 732. The plaintiffs contended, like the commenter here, that the San Joaquin ISR was merely “a ruse adopted simply to regulate emissions from . . . vehicles.” *Id.* at 734. They argued it did so “because it commands developers to use construction equipment that reduces ‘baseline’ emissions by particular percentage, on pain of paying fees.” *Id.* at 735.

The Ninth Circuit concluded that even if the San Joaquin ISR imposed standards or requirements, they “do not relate to the control of emissions from construction equipment,” as necessary to be preempted by Section 209. *Id.* at 736; *see also id.* at 739. Rather, the rule regulated emissions from the *indirect* source: the construction site. *Id.* at 739 (“Because Rule 9510 is targeted at a development site as a whole, its standard or requirement relates to emissions from an indirect source, not from nonroad vehicles or engines.”). The court found it “crucial” that the rule was an ISR, which is expressly authorized by the CAA in section 110(a)(5). *Id.* at 736. The court noted that “Emissions from any indirect source come from the direct sources located there; that is precisely what makes an indirect source indirect.” *Id.* In other words, indirect source regulation inherently involves indirect regulation of mobile sources: “Every regulation of the emissions from an indirect source, then, will ultimately regulate direct sources.” *Id.* The court concluded that NAHB’s theory of preemption would have made the CAA’s provision for ISRs a nullity, because all ISRs would be preempted by section 209. *Id.*; *see also id.* at 737-38.

In a footnote (fn. 4), the comment attempts to dispose of *NAHB* by arguing that the San Joaquin ISR “considered emissions that were ‘site-based,’ rather than ‘engine- or vehicle-based,’” (quoting 627 F.3d at 737) while PR 2305, the comment contends, is based solely on emissions from trucks making trips to and from warehouses.¹⁵⁴ The comment misconstrues both *NAHB* and PR 2305. In the quoted language, the court was pointing out that the rule established baseline emissions for a development site based on emissions from all of the construction equipment used at the site, rather than emissions from individual vehicles or engines. 627 F.3d at 737. Here, PR 2305 establishes a warehouse’s WAIRE Points Compliance Obligation (“WPCO”) based on total truck trips to and from a warehouse. Like the ISR in *NAHB*, it is not based on emissions from individual vehicles.

Furthermore, the comment’s implication that PR 2305 targets only truck emissions is mistaken. In fact, the WPCO is not based on truck *emissions*; it is based on truck *trips*. The proposed rule uses truck trips as a proxy for total warehouse emissions when setting the compliance obligation because the number of truck visits is representative of the total activity at, and emissions associated with, a warehouse. Staff Rep. at 27 (truck trips “serve[] as a proxy for *overall* warehouse activity and emissions” (emphasis added)); *id.* at 35 (stating that “[t]rucks delivering or picking up goods from a warehouse are a proxy for total activity and emissions related to a warehouse” and structuring reporting requirements on that basis); *see also id.* at 12 (listing sources of emissions associated with warehouses, including, in addition to trucks, yard trucks, transport refrigeration units, passenger vehicles for warehouse employees, on-site stationary equipment, and power plants supplying warehouses with electricity). Accordingly, the case for preemption of PR 2305 is even weaker than that for the San Joaquin ISR in *NAHB*.

¹⁵³ Standards for construction equipment—non-road vehicles and engines—are preempted by another subsection of CAA section 209. 42 U.S.C. § 7543(e). The language is not meaningfully different from that of section 209(a). 42 U.S.C. § 7543(a).

¹⁵⁴ The plaintiffs asserted—and the Ninth Circuit rejected—this very argument in *NAHB*. 627 F.3d at 736-37 (noting that NAHB argued that the San Joaquin ISR “is directed at construction equipment and not the construction site itself”).

PR 2305 does not establish a “standard relating to the control of emissions from new motor vehicles or new motor vehicle engines.” 42 U.S.C. § 7543(a).

Because *NAHB* is squarely on point and dictates that PR 2305 is not preempted, the remaining arguments in the comment are similarly unavailing. The comment contends that PR 2305 represents a mandate for the purchase of trucks and is thus preempted under *Engine Manufacturers Association v. South Coast Air Quality Management District*, 541 U.S. 246 (2004). On the contrary, PR 2350 does not compel purchases of anything. In any event, the Ninth Circuit in *NAHB* expressly rejected the same argument, on the basis noted above. 627 F.3d at 738-39.

The comment also points to language in EPA’s decision approving the San Joaquin ISR for inclusion in California’s SIP under the CAA. *See* 76 Fed. Reg. 26,609 (May 9, 2011). EPA’s statement is the administrative equivalent of dictum because, citing *NAHB*, EPA recognized that San Joaquin’s ISR was *not* preempted. *NAHB* supplies the standard for determining whether PR 2305 is preempted. Applying that standard here, PR 2305 is not preempted.

In any event, EPA observed that the fact the rule provided options for compliance that do not involve any changes to construction equipment as further evidence that the rule was an ISR and not direct regulation of fleets or equipment.

[A] developer has numerous options to meet the emission reduction obligation. . . , including options that do not involve any changes to construction equipment The flexibility provided in the rule in meeting the emission reduction obligation . . . provides further evidence that the rule is intended to reduce emissions from construction sites as an indirect source of emissions, rather than to regulate the construction equipment directly, either as a fleet or as individual pieces of equipment.

76 Fed. Reg. at 26,611. The same is true here.

The comment also cites the district court decision in *Metropolitan Taxicab Board of Trade v. City of New York*, 633 F. Supp. 2d 83 (S.D.N.Y. 2009), *aff’d on other grounds*, 615 F.3d 152 (2d Cir. 2010). *Metropolitan Taxicab* is distinguishable because, unlike *NAHB* and unlike PR 2305, it involved direct regulation of the acquisition of motor vehicles, not an ISR. The case involved New York City’s adoption of rules governing lease rates for taxis that encouraged the adoption of hybrid taxis. As *NAHB* recognized, “rules that regulate[] emissions from vehicles” are distinct from ISRs, which “target[] emissions, and require[] emission reductions,” from an indirect source. 627 F.3d at 739. *Metropolitan Taxicab* did not involve an ISR and cannot show that PR 2305 is preempted by section 209.¹⁵⁵

The comment also suggests that the “intent” of PR 2305 is to “force” acquisition of low-emission vehicles. The District’s “intent” in adopting PR 2305 is irrelevant to the preemption analysis. *See Va. Uranium, Inc. v. Warren*, 139 S. Ct. 1894, 1906-07 (2019) (plurality opn. of Gorsuch, J.); *Puente, Ariz. v. Arpaio*, 821 F.3d 1098, 1106 (9th Cir. 2016) (for preemption, “it does not matter if [a state] passed the [challenged laws] for a good or bad purpose”). Indeed,

¹⁵⁵ The district court decision in *Metropolitan Taxicab* was affirmed on appeal based on preemption under the Energy Policy and Conservation Act, which is inapplicable here. *See* Response to Comment 44-6. The court of appeals thus did not opine on the district court’s CAA preemption theory.

the comment cites no case law supporting the contention that the District's intent in adopting PR 2305 is relevant to CAA section 209 preemption. On the contrary, the sole question here is whether the proposed rule adopts a standard relating to the control of new motor vehicle emissions. It does not, as explained above. In any event, the express purpose of the proposed rule is to reduce, and facilitate reductions of, local and regional emissions of NO_x and PM associated with warehouses. The proposed rule advances that purpose by providing covered entities flexibility to reduce emissions in a wide variety of ways.

Finally, the comment contends that PR 2305 is in effect a purchase mandate because the cost of other compliance measures is allegedly higher than acquiring low-emission trucks. This argument does not change the fact that, as *NAHB* demonstrates, PR 2305 does not adopt a standard relating to the control of new motor vehicle emissions, regardless of the compliance options provided by the proposed rule. It provides a standard—the WPCO—for emissions from the operation of warehouses, which are indirect sources.

Regardless, the comment's premise—that covered entities are coerced into choosing compliance options involving NZE/ZE trucks because they are allegedly the lowest cost compliance option in the Warehouse Actions and Investments to Reduce Emissions ("WAIRE") Menu—is flawed. Indeed, the California court of appeal rejected a closely similar argument in *California Chamber of Commerce v. State Air Resources Board*, 10 Cal. App. 5th 604 (2017) ("*CalChamber*"). *CalChamber* upheld the auction of greenhouse gas emission allowances under the State's cap-and-trade program against a claim that it imposed an unconstitutional tax. The court rejected the plaintiffs' argument that entities regulated under the cap-and-trade program were compelled to purchase allowances at the auction. The plaintiffs contended that it was impossible for them to remain in business without purchasing allowances, and that "it would be more expensive to buy allowances on the secondary market" than at auction. *Id.* at 643; *see also id.* ("purchasing allowances on the open market will 'be far more expensive' than purchasing them at auction from the Board"). The court noted that the program offered compliance options that did not involve the auction and concluded,

Although [plaintiff] Morning Star may ultimately make the business decision that it must pay for allowances in order to maintain its operations in California, making the business decision to pay is not the same as being compelled to do so by the state. . . . A number of requirements for businesses, whether taxes, safety regulations, minimum wage statutes, or command-and-control pollution control regulations, might cause a particular business to become unprofitable. This unfortunate reality does not translate into a *compelled* purchase of auction credits.

Id. at 644 (emphasis in original). Similarly here, that other compliance options could be more expensive than options involving NZE/ZE trucks does not make the cheaper options compulsory.

PR 2305 is not meaningfully different from the ISR that the Ninth Circuit upheld in *NAHB*. It is therefore not preempted by CAA section 209(a).

Response to Comment 44-5

The comment asserts that the proposed rules are preempted by the Federal Aviation Administration Authorization Act (“FAAAA”) because, the comment alleges, they could increase costs for warehouses and encourage changes to truck routes and services.

The FAAAA does not preempt the proposed rules because they neither compel nor prohibit the provision of a service, and, at most, they could affect prices, routes, or services in a peripheral manner with no significant impact on Congress’s deregulatory objectives. The FAAAA preempts state and local laws “related to a price, route, or service of any motor carrier . . . with respect to the transportation of property.” 49 U.S.C. § 14501(c)(1). This provision preempts state laws “having a connection with, or reference to” prices, routes, or services. *Rowe v. N.H. Motor Transp. Ass’n*, 552 U.S. 364, 370-71 (2008). A state law has a prohibited “reference to” prices, routes, or services where it “acts immediately and exclusively” upon a price, route, or service, or “the existence of [a price, route, or service] is essential to the law’s operation.” *Air Transport Ass’n of Am. v. City & Cty. of San Francisco*, 266 F.3d 1064, 1071 (9th Cir. 2001). A state law has a prohibited connection with rates, routes, or services if it binds the carrier to a particular price, route, or service. *Id.* at 1071-72. State laws affecting prices, routes, or services “in only a ‘tenuous, remote, or peripheral . . . manner with no significant impact on Congress’s deregulatory objectives” are not preempted. *Cal. Trucking Ass’n v. Su*, 903 F.3d 953, 960 (9th Cir. 2018); *Air Transport Ass’n*, 266 F.3d at 1071.

The proposed rules do not mandate or prohibit the provision of any particular service with respect to the transportation of property. Indeed, the proposed rules do not *require* any particular action at all, but instead provide a menu of compliance options, many of which are wholly unrelated to transportation (e.g., installing renewable energy systems on buildings, installing air filters for sensitive receptors, or adopting a custom plan).¹⁵⁶ Although the proposed rules may encourage certain behaviors (e.g., converting to ZE or NZE vehicles or reducing annual truck trips), such encouragement does not bring the proposed rules within the scope of FAAAA preemption. *See Dilts v. Penske Logistics, LLC*, 769 F.3d 637, 647 (9th Cir. 2014) (holding a law is not preempted “just because it shifts incentives and makes it more costly for motor carriers to choose some routes or services relative to others, leading the carriers to . . . make different business decisions”); *see also Bedoya v. Am. Eagle Express, Inc.*, 914 F.3d 812, 825 (3d Cir. 2019) (finding no preemption where a law, among other things, “does not mandate a particular course of action” and “offers carriers various options to comply.”). The flexibility of the proposed rules would allow regulated entities to select the most efficient and cost-effective mode of compliance, thereby encouraging innovation in keeping with the deregulatory intent behind the FAAAA. *See Rowe*, 552 U.S. at 371 (describing Congress’ goal as to promote competition, “thereby stimulating ‘efficiency, innovation, and low prices,’ as well as ‘variety’ and ‘quality.’”) (quoting *Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 378 (1992)).

The flexibility and choice built into the proposed rules removes them from the scope of FAAAA preemption for a related reason. Even if, for the sake of argument, a particular method of earning WAIRE points would be preempted by the FAAAA if that method were compelled by a stand-alone regulation, its inclusion in the proposed rules is not preempted because covered entities are not required to select that particular method. Given the presence of valid, non-preempted compliance options, the District may provide covered entities a choice to select

¹⁵⁶ Thus, unlike the rules preempted in *Rowe*, the proposed rules do not “require[] carriers to offer a system of services that the market does not now provide” or “freeze into place services that carriers might prefer to discontinue in the future.” *See Rowe*, 552 U.S. at 372.

compliance options that would be preempted if independently mandated. *See Ray v. Atl. Richfield Co.*, 435 U.S. 151, 172-73 (holding that, in light of a non-preempted option for compliance, a state law providing an alternative option that would have been preempted if applied on its own was not preempted).

The proposed rules are not preempted merely because they may increase the cost of doing business. *See Dilts*, 769 F.3d at 643, 646 (stating that laws that operate “several steps removed from prices, routes, or services” are not preempted “even if they raise the overall cost of doing business or require a carrier to re-direct or reroute some equipment.”). Courts have drawn a distinction between regulation of outputs—e.g., services at a particular price—and regulation of inputs. *Bedoya*, 914 F.3d at 821 (explaining that “[t]he FAAAA’s focus on prices, routes, and service[s] shows that the statute is concerned with the industry’s production outputs,” and not “resource inputs,” including “labor, capital, and technology, which may be regulated by various laws.”); *S.C. Johnson & Son, Inc. v. Transp. Corp. of Am., Inc.*, 697 F.3d 544, 558 (7th Cir. 2012) (same). Regulation of *inputs* may increase costs of doing business and may be a factor in decisions about routes, prices, and services, but they are generally not preempted. *See, e.g., Dilts*, 769 F.3d at 647 (wage and meal break laws not preempted); *Californians for Safe & Competitive Dump Truck Transp. v. Mendonca*, 152 F.3d 1184, 1189 (9th Cir. 1998) (prevailing wage law not preempted).

Regulations concerning pollution-control technology fall in the category of regulation of resource inputs that are generally not preempted. For example, the Eastern District of California rejected an FAAAA preemption challenge to a CARB rule that required heavy-duty trucks to install filters and upgrade engines to reduce particulate matter emissions. *Cal. Dump Truck Owners Ass’n v. Nichols*, No. 2:11-cv-00384, 2012 WL 273162 at *4-8 (E.D. Cal. Jan. 30, 2012) (concluding that plaintiff had failed to establish a likelihood of success on the merits). The court held that, even though the rule regulated the technology used in trucks, it did not bind motor carriers to a particular route or service, and the effect of any related cost increases on prices or services were too attenuated to trigger preemption. *Id.* at *7-8.

Here, as in *Nichols*, potential compliance options related to low emission trucks do not bind covered entities or motor carriers to a particular route, price, or service, and include compliance options that are completely unrelated to trucks. Moreover, the District’s proposed rules are even more remotely related to motor carriers’ prices, routes, and services than the rule in *Nichols* because the proposed rules do not *require* covered entities to adopt any particular compliance option. In short, like the rules in *Nichols*, *Dilts*, and *Mendonca*, the proposed rules concern inputs (here, technologies, facilities, equipment, etc.) and lack the prohibited connection to prices, routes, and services.

Response to Comment 44-6

The comment contends that the proposed rule is preempted by the Energy Policy and Conservation Act (“EPCA”), which preempts state and local standards relating to the fuel economy of “automobiles.” 49 U.S.C. § 32919(a). EPCA does not preempt the proposed rule because the rule does not address “automobiles,” which are defined in the statute to exclude the trucks addressed by PR 2305. The comment overlooks that definition.

EPCA defines “automobile” as “a 4-wheeled vehicle that is propelled by fuel, or by alternative fuel, manufactured primarily for use on public streets, roads, and highways and rated at less than 10,000 pounds gross vehicle weight.” 49 U.S.C. § 32901(a)(3). Further, that definition

exempts “work truck[s],” which the statute defines as a vehicle that is “rated at between 8,500 and 10,000 pounds gross vehicle weight; and . . . is not a medium-duty passenger vehicle.” 49 U.S.C. § 32901(a)(19). The combination of these two definitions dictates that EPCA’s preemptive scope excludes fuel economy standards for all trucks over 8,500 pounds gross vehicle weight. By contrast, the smallest truck referred to by PR 2305 has a minimum weight of 8,501 pounds gross vehicle weight. PR 2305(c)(4). Accordingly, EPCA’s preemption provision would be simply irrelevant to the proposed rule even if it could be construed to adopt fuel economy standards.

Even if heavy trucks were covered by EPCA, PR 2305 would not be preempted because it does not adopt fuel economy standards for such trucks. As noted in Response to Comment 44-4 with respect to CAA preemption, PR 2305 does not regulate vehicles; it limits emissions associated with the operation of warehouses. The Ninth Circuit’s rationale in *NAHB* applies as well to the comment’s EPCA preemption argument.

Response to Comment 44-7

The comment contends that the proposed rule’s in-lieu fee imposes an “improper regulatory fee” or a tax without a vote of the people in violation of Article XIII C of the California Constitution. The comment incorrectly applies Article XIII C to PR 2305.

The comment asserts that there are three categories of fees that will not be considered taxes. The cited case, *California Building Industry Association v. San Joaquin Valley Unified Air Pollution Control District*, 178 Cal. App. 4th 120 (2009), provides no support for this assertion. Although the identified categories of fees do not constitute taxes, they are not the *only* charges that are not taxes. *See Cal. Chamber of Commerce v. State Air Res. Bd.*, 10 Cal. App. 5th 604 (2017) (“*CalChamber*”).

Extensive responses to the contention that the in-lieu fee imposes a tax are included in Responses to Comments 39-1 through 39-7 submitted by the California Taxpayers Association (Comment Letter 39). As explained there, PR 2305’s in-lieu fee is not a tax as defined in Article XIII C, Section 1(e). Because the fee is voluntary, it is not “imposed” on payors, and payors receive a privilege—the ability to avoid implementing measures that would otherwise be required to reduce emissions. *See also CalChamber*, 10 Cal. App. 5th at 640 (charge that was paid voluntarily and in exchange for a regulatory compliance benefit was not a tax).

Response to Comment 44-8

The comment asserts that the goals of the proposed rules are presently infeasible due to a lack of supply of certain ZE vehicles and a lack of infrastructure to support ZE vehicles outside the District. As the commenter states, one of the goals of PR 2305 is to encourage and incentivize the transition to ZE trucks. The proposed rules’ Final Staff Report states that one goal is “to provide financial incentives for truck owners to purchase NZE or ZE trucks, or for the installation of fueling and charging infrastructure” (Final Staff Report, p. 6). The proposed rule accomplishes this goal by including the purchase and use of NZE and ZE vehicles on the WAIRE menu, and assigning appropriate WAIRE points to these activities. However, PR 2305 does not require any warehouse owner or operator to buy NZE or ZE trucks. Thus, the rule functions differently than the CARB rule, which imposed a sales mandate.

Most of the WAIRE Menu options are commercially available and are in commercial service with the exception of ZE Class 8 on-road trucks which are in demonstration service but are not yet commercially available. Currently, the WAIRE Menu includes both NZE and ZE on-road trucks because with ZE Class 8 trucks expected in late 2021 or 2022. By allowing NZE technology in part of the WAIRE Menu, NZE can provide at least a 90% reduction in NO_x emissions when compared to conventional diesel fueled trucks. South Coast AQMD has funded approximately 1,200 NZE trucks that are in commercial service since 2017. The reduction of diesel fueled trucks can produce emission reductions in the near term which can increase the public health of the communities surrounding the warehouse, as on-road ZE trucks and ZE charging and fueling infrastructure are developed and become widespread and commercially available. Please see Master Response 3 for information on the commercial availability of NZE/ZE technology. Also see Appendix B of PR 2305 and PR 316's Final Staff Report, which contains information on the commercial availability of every technology in the WAIRE Menu.

The Final Staff Report acknowledges that some WAIRE Menu actions are not considered technically feasible today, but will likely become commercialized in the near future. *See, e.g.,* Draft Staff Rep. at 81. In particular, ZE Class 8 trucks are just beginning to be commercialized (*id.*) and are not yet widely available. *Id.* at 214. However, many other ZE trucks are commercially available today, and many more are expected in the next few years. *Id.* at 104-05. As the prevalence of ZE trucks and ZE charging infrastructure develops, the cost of ZE trucks will likely decrease. *Id.* at 301. For this reason as well the goal of encouraging and incentivizing the transition to ZE trucks is feasible. Moreover, the proposed rule provides options that do not involve converting to ZE trucks and are feasible today.

Similarly, the proposed rule does not require any entity to use ZE trucks to carry goods outside the District. PR 2305 includes many options for warehouse owners and operators to accomplish rule compliance: completing actions from the WAIRE menu (which includes many options other than acquiring and using ZE trucks), implementing an approved Custom WAIRE Plan, paying a mitigation fee, or a combination of any of the above three options. If using a ZE truck to deliver goods to or from locations outside the District is impracticable, the operator may select another compliance method, or may use ZE trucks only for more local transport. The availability of ZE truck infrastructure outside of the District does not render the goals of PR 2305 infeasible.

Response to Comment 44-9

The comment contends that the District cannot make the findings required by HSC section 40727. Proposed section 40727 findings and substantial evidence in support are found in the Final Staff Report at page 80. As discussed above in Response to Comment 44-3, the District has ample authority to adopt PR 2305. *See also* Staff Rep. at 18-20, 80.

The Final Staff Report also explains why PR 2305 is necessary. As the comment notes, NO_x reductions in the South Coast Air Basin are necessary to meet federal air quality standards for ozone. PR 2305 is one of a suite of rules and tools the District plans to use to meet these federal ozone standards, and thus there is no requirement to show that PR 2305 alone will bring the District into compliance with federal ambient air quality standards. No single rule can possibly accomplish that goal. PR 2305 is part of a larger comprehensive strategy described in the 2016 Air Quality Management Plan that is designed to meet federal and state air quality standards. The 2016 AQMP was adopted by the South Coast AQMD Board, and approved by both CARB and the U.S. EPA.

The Final Staff Report also demonstrates that warehouses are an indirect source of NO_x emissions because they attract large volumes of diesel truck trips. *See* Staff Rep. at 13-14, 44.

While the scenario modeling provided in the Final Staff Report and EA indicates that, in some scenarios, the proposed rule would not reduce NO_x, these scenarios were developed and analyzed to determine the “bookends” of PR 2305’s impacts and benefits. It is not likely that those scenarios would occur, as they would require all warehouse operators in all years to comply with PR 2305 by purchasing or installing filtration systems. If these scenarios did occur, however, they would nonetheless have health and air quality benefits for sensitive, overburdened communities in the District. *See, e.g.*, Staff Rep. at 61-63 (describing scenarios); 25, 138-139, (filters reduce exposure to particulate matter which are linked to health hazards).

PR 2305 and PR 316 facilitate and supplement CARB’s Mobile Source Strategy. The proposed rule will achieve NO_x reductions before the CARB rules go into effect, as well as emission reductions beyond CARB requirements even after those rules go into effect. Please see Master Response 3 for an explanation of emission reductions from warehouse ISR. The WAIRE Menu includes options that go above and beyond current regulations in order to earn WAIRE Points. Warehouse operators may also decide to take early action ahead of the implementation schedule of EPA or CARB rules and regulation in order to earn WAIRE Points. PR 2305 is anticipated to result in significant reductions at the recommended stringency of 0.0025 WAIRE Points per Weighted Annual Truck Trip (“WATT”) phased-in over three years. Based on the analysis of 19 WAIRE Menu scenarios, PR 2305 could achieve NO_x reductions in the range of 1.5 – 3 tons per day beyond emission reductions resulting from CARB Rules (CARB’s Advanced Clean Trucks, Low NO_x Omnibus, and Heavy Duty I/M rules), which represents about a 10-15% reduction beyond baseline for both NO_x and PM. While CARB’s strategies are targeting dates in 2035 and 2045, PR 2305 could result in reductions as soon as 2022. As stated, the effect of CARB’s Advanced Clean Trucks rule on NO_x emissions was considered in developing PR 2305 and PR 316. CARB’s Advanced Clean Fleets rule cannot be considered in the emissions analysis because the rule has not yet been implemented.

PR 2305 is “clear” because it expressly states what is required of warehouse owners and operators and how compliance can be achieved. PR 2305 does not require operators to determine what is currently required by state and federal law. Warehouse operators and owners can understand their compliance obligation via the Warehouse Points Compliance Obligation (WPCO) equation provided in PR 2305(d)(1)(A). PR 2305 includes many options for warehouse owners and operators to accomplish rule compliance: completing actions from the WAIRE menu, implementing an approved Custom WAIRE Plan, paying a mitigation fee, or a combination of any of the above three options. In order to assist warehouse operators and owners subject to PR 2305 and PR 316, a supplemental guidance document is also available (WAIRE Implementation Guidelines). All WAIRE Menu options and the mitigation fee are actions that go beyond the requirements of EPA, CARB, and the District’s other regulations. The District will modify the WAIRE Menu if any items are no longer surplus. The District will also review all Custom WAIRE plans to ensure reductions are surplus, and will provide additional guidance if needed to assist regulated entities in understanding the compliance options going forward.

Response to Comment 45-5

See Master Response 2b for a discussion on truck engine manufacturing standards.

Response to Comment 45-6

South Coast AQMD Staff is recommending a stringency a 0.0025 WAIRE Points per WATT, which was a result of a thorough and extensive analysis of 19 WAIRE Menu compliance scenarios (see Final Staff Report, pp. 59-72). Additional supporting analysis was included in the Socioeconomic Impact Assessment, including a warehouse relocation study. There is no mathematical equation governing the entire process, nor is an overarching governing equation required. The totality of the impact of the proposed rule has been considered for the recommend stringency of 0.0025 WAIRE Points per WATT. The benefits of the proposed rule at the recommended stringency include, but are not limited to: significant emission reductions of about 1.5 to 3 tons per day of NO_x, the encouragement of many facilitating measures to enhance emission reductions from other programs, public health benefits for most compliance scenarios that are about three times higher than the costs, costs on industry that are not out of line with normal cost increases that the industry experiences routinely in rent hikes, a market signal for the goods movement industry to encourage adoption NZE and ZE technologies on a more widespread basis than the unregulated market would provide – and much faster than CARB would require with its regulations, satisfying the requirements of control measure MOB-03 in the 2016 AQMP, satisfying the commitment in AB 617 Community Emission Reduction Plans, and reducing emissions for local communities located closest to warehouses who have experienced disproportionate environmental burdens just by living where they do. Other stringencies have also been analyzed, such as 0.005 WAIRE Points per WATT and 0.0001 WAIRE Points per WATT, and the Board may use its own independent judgement to set the final stringency within the bounds of the analysis contained in the record before them.

Emission reductions have been calculated using a bounding analysis, as is common when evaluating menu-based points systems. See Response to Comments 43-2. PR 2305 is designed to have a multitude of compliance options (implementing any of the 32 WAIRE Menu actions, implementing an approved Custom WAIRE Plan, paying the optional mitigation fee, or a

combination of all or some of these options) so that warehouse owners and operators have the flexibility to decide what compliance options work best for their specific warehouses. Since there are so many options for compliance and thousands of warehouse operators, the most reasonable approach is to determine the potential bounds of what PR 2305 and PR 316 would impose.

Response to Comment 45-7

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 45-8

The warehouse industry has grown steadily in the South Coast Air Basin in the past two decades as stated in Chapter 3 of Final Staff Report (page 45) and has shown significant demand in the South Coast AQMD region even in the economic uncertainty due to the COVID-19 pandemic. Demand for goods continues to grow as the goods and logistics industry have continue to grow during the pandemic. The Ports have reported record activity, and the warehouse vacancy rates have consistently remained around 4% even as lease rates continue to increase. See Master Responses 4 and 5 for discussions on the warehousing industry and economic impacts.

With respect to any potential regressive impacts of PR 2305 mentioned in the comment, the potential economic impacts of PR 2305 and PR 316 have been analyzed in the Socioeconomic Impact Assessment. This analysis found that the monetized public health benefits of most compliance scenarios outweighed the potential costs by a ratio of about 3:1, including in 11 of the 13 scenarios with the lowest costs ($\leq \$0.23/\text{sf}$). As shown in the 2016 AQMP Socioeconomic Impact Assessment, the benefits of measures that reduce regional pollution (like PR 2305) are focused about 20-25% more in environmental justice communities.¹⁵⁷ Communities within 0.5 miles of a warehouse also have higher environmental burdens than communities farther away (see Figure 4 in the Final Staff Report). A recent study also found that while warehouses “are more likely to be located in neighborhoods with lower median household incomes and higher poverty levels”, yet at the same time “the majority of warehouses in Southern California are placed in the areas that online shopping is done the least.” PR 2305 is expected to reduce the pollution burden in these communities surrounding warehouses.

Further, the increase in operating costs for these cheapest compliance scenarios would be less half of the approximately \$0.50/sf/yr increase in rental prices that warehouse operators have had to absorb continually over the past decade (see Figure 12 in the Final Staff Report).

Response to Comment 45-9

Southern California is a major gateway for goods coming from Asia and with a significant amount of goods imported through the Port of Los Angeles and Long Beach. Demand for

¹⁵⁷ http://www.aqmd.gov/docs/default-source/clean-air-plans/socioeconomic-analysis/final/sociofinal_030817.pdf, (see Table 6-6)

goods continue to grow during the COVID-19 pandemic, the warehouse vacancy rates remain consistently around 4% even while lease rates continue to increase. The low vacancy rates reflect the high demand for warehouse space and the growth of the warehouse sector, this is strong indication that South Coast AQMD jurisdiction is still highly competitive for warehousing operations. See the Socioeconomic Impact Assessment and Master Responses for discussions on the warehousing industry and economic impacts. In addition, a study commissioned by South Coast AQMD found that the anticipated costs from PR 2305 will not result in any warehouses relocating to any neighboring markets.¹⁵⁸

Response to Comment 45-10

PR 2305 and PR 316 do not impose a tax, and the mitigation fee is only one of many options available to comply with PR 2305. See Master Response to Comments 1, 5, 6 and the Socioeconomic Impact Assessment (SIA) for a discussion on the potential costs of PR 2305, economic impacts, and impacts on jobs. Additionally, see the response to Comment 39-1 (Comment Letter 39, Response 1) for a discussion of why the proposed rules do not constitute a tax. Finally, a provision has been added into the most recent draft rule that will sunset the rule upon attainment of the federal and state 70 ppb ozone standards. See Master Response to Comments 10 for a discussion of the mitigation fee as a compliance option.

Response to Comment 45-11

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

¹⁵⁸ [http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf?sfvrsn=8](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf?sfvrsn=8)

Response to Comment Letter 46 – Watson Land Company – March 2, 2021

Response to Comment 46-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. See Master Responses 4 for a discussion on the warehousing industry growth during the COVID-19 pandemic.

Response to Comment 46-2

See Master Responses 4, 5, and Socioeconomic Impact Assessment (SIA) for a discussion on the potential costs of PR 2305 and economic impacts during the COVID-19 pandemic.

Response to Comment 46-3

South Coast AQMD Staff recognizes that PR 2305 will be a new kind of regulation for warehouse operators. PR 2305 includes many flexible options for warehouse owners and operators to accomplish rule compliance: an optional mitigation fee, completing WAIRE menu actions (there are 32 different actions on the WAIRE Menu), implementing an approved Custom WAIRE Plan, or any combination of these three options. South Coast AQMD Staff has included streamlined guidance via the WAIRE Program Implementation Guidelines within the Final Staff Report (see Appendix A) to help warehouse owners and operators understand how to comply with PR 2305 and PR 316. Training and outreach will also be provided if PR 2305 is approved. Please see Master Response 2a for an explanation of rule feasibility.

Response to Comment 46-4

See Master Response 7 for a discussion of South Coast AQMD legal authority.

Response to Comment 46-5

See Master Responses 1, 5, and the Socioeconomic Impact Assessment (SIA) for discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 46-6

PR 2305 and PR 316 do not impose a tax, and the mitigation fee is one of the flexible options available to comply with PR 2305 and is also not a tax. See Master Responses 7 for a discussion of South Coast AQMD legal authority. Additionally, see the response to Comment 39-1 (Comment Letter 39, Response 1) for a detailed explanation of why the proposed rules, including the mitigation fee option, do not constitute a tax.

Response to Comment 46-7

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM emissions toward meeting the state and federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse

operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency.

Response to Comment 46-8

See Master Response 2a through 2c for a discussion on feasibility.

Response to Comment 46-9

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 46-10

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 46-11

Again, thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter – 47 - LACI – 3/2/2021

Response to Comment 47-1

Thank you for your participation in the rule development process and support of a warehouse ISR.

Response to Comment 47-2

Staff understands the importance of prioritizing zero emission technology, when available it provides total emission reduction and advances the region toward the state's ZE goal. ZE yard trucks are the only options considered on the WAIRE Menu as ZE yard trucks are commercially available today and have been in commercial service at warehouses for several years. The main purpose of PR 2305 is regional and local reduction of NO_x and PM to assist in the goal of meeting the state and federal clean air standards for 2023 and 2031, where the implementation of NZE technology would provide at least a 90% reduction in NO_x toward that goal as the state shifts to 100% ZE technology. NZE yard trucks, utilizing renewable natural gas, will be allowed as a Custom WAIRE Plan, though with less points than ZE yard trucks.

Response to Comment 47-3

Acquisition and usage of a ZE charging and fueling infrastructure is included in the WAIRE Menu, with the installation broken down to three milestones. With the installation of ZE infrastructure being a new type project, it has been subject to delays of more than one year to complete installation. Both industry and utility stakeholders provided feedback that a long lead time may be needed to complete a ZE charging infrastructure projects. WAIRE Points may be earned for three milestones that are achieved during a project which are equipment acquisition and purchase, beginning construction, and construction finalization and energization is incorporated into the WAIRE Menu. Most WAIRE Points are earned upon final energization of the project. PR 2305 is a facilitative measure and though the installation of infrastructure does not directly result in emission reductions, it does facilitate reductions from other related rules and regulations and promote usage of ZE trucks and equipment. WAIRE Points are earned for the number of EVSEs purchased so maximizing the size of the ZE charging station does increase the number of EVSE and considers shared construction activity. In the event a warehouse operator wishes to install higher level equipment such as a 500 kW EVSE and need more specialized construction activity, the warehouse operator may propose a Custom WAIRE Plan, which would be able to earn WAIRE Points upon approval.

Response to Comment 47-4

The recommended final stringency is 0.0025 WAIRE Points per WATT, to be phased in over three-years until full stringency is reached. Stringencies were analyzed using 19 WAIRE Menu based scenarios to show emission reductions and costs, considered limits based on the quantity of the available technology and modeled fleet turnover, the IEc Relocation Study, and the Davies Port Study. The 0.0025 WAIRE Points per WATT resulted in significant emission reductions with enough NZE and ZE trucks and equipment available to be implemented and resulting in no warehouse relocations. The significant emission reductions would assist in getting NO_x emission reductions toward the ozone attainment goals and address the disproportionate burden of air pollution in the communities neighboring warehouses. South Coast AQMD Staff developed calculations for the WPCO and the WAIRE Menu that are

designed to be equitable and promote the implementation of cleaner technologies to help address the disproportionate impacts of air pollution faced by disadvantaged communities.

Response to Comment 47-5

The mitigation fee is an option that warehouse operators can use to comply with their WPCO, but may be a higher cost option if no other actions are taken, as shown in Table 20 of the Final Staff Report. The mitigation fee of \$1,000 per WAIRE Point was analyzed to be within a similar range of cost as the other WAIRE Menu options and is not meant as a way to allow for a “pay-to-pollute” compliance option. There are cheaper options for the warehouse operators to meet their WPCO, the current cost of the mitigation fee may not be the most cost-effective option for warehouse operators. The mitigation fee fund would be tracked to ensure the funds are used to incentivize cleaner technologies in the communities surrounding the warehouses that paid the mitigation fees.

Response to Comment 47-6

South Coast AQMD Staff understand the need for transparency in providing data relevant to enforcement and compliance. Each year staff will be reporting on the effectiveness of the WAIRE Program to the South Coast AQMD Mobile Source Committee to report on the status of the WAIRE Program and seek direction on any adjustments that may be required. A public version of the annual report on the WAIRE Program will be made available for public review. Custom WAIRE Plan submissions would also be released for public review prior to their approval. Finally, staff intends to put information on program compliance on the South Coast AQMD website in a public portal that will be built if PR 2305 is approved.

Response to Comment 47-7

Thank you for your comments and support of PR 2305. We look forward to working with you in the future.

Response to Comment Letter 48 – LAWA – March 2, 2021

Response to Comment 48-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. Staff appreciates the work our two agencies have accomplished together, including with the recent MOU. However, more work is needed to both reduce regional air pollutants like NO_x and PM 2.5, and local pollutants like DPM. We note that in the most recent draft Multiple Air Toxics Exposure Study that the area centered on LAX, including many of the warehouses covered by PR 2305, has the highest air toxics cancer risk in the entire South Coast AQMD, based on 2018 data.¹⁵⁹

Response to Comment 48-2

South Coast AQMD Staff do not intend to change the existing methodology for calculating Weighted Annual Truck Trips (WATTs). See Response to Comments 35-8 and 35-9. In addition, that there are trucks that make multiple stops at warehouses at LAX, there is opportunity for reducing the cost of compliance by working with those trucking companies to transition to NZE or ZE trucks. If one truck is converted to NZE or ZE technology, it could earn WAIRE Points for every warehouse it visits on a single route. This result could make it easier to comply with the rule compared to other warehouses that do not experience this type of activity. This approach is not required however, and other options may be selected by each independent warehouse operator.

Response to Comment 48-3

PR 2305 includes the option for warehouse owners and operators to propose a Custom WAIRE Plan to comply with PR 2305 (see PR 2305, Section (d)(4)). A Custom WAIRE Plan contains actions not included in the existing WAIRE Menu, which warehouse owners and operators can propose to meet their WPCO. In order to achieve WAIRE Points, warehouse owners and operators must show how a proposed Custom WAIRE Plan will achieve quantifiable, verifiable, and real NO_x and DPM emission reductions, and meet all the requirements as outlined in PR 2305 Section (d)(4). Thus, a Custom WAIRE Plan provides opportunities to pursue flexible solutions to comply with PR 2305. WAIRE Points may only be earned from approved Custom WAIRE Plans.

Specifically in regards to the Landside Access Modernization Program (LAMP): LAMP or other projects at LAX may be able to earn WAIRE Points as part of a Custom WAIRE Plan if it meets the criteria for Custom WAIRE Plans in PR 2305 and the WAIRE Implementation Guidelines. However, clause (d)(4)(A)(v) requires “Any Custom WAIRE Plan that relies on VMT reduction must demonstrate that these reductions are surplus to what is included in the most recently approved Regional Transportation Plan (RTP) and Air Quality Management Plan (AQMP).” The LAMP project appears to have been included already in the 2020 and the 2016 RTPs, therefore it is not clear how LAX would propose earning any additional WAIRE Points.

Response to Comment 48-4

¹⁵⁹ <http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-v>

The proposed rules do not prohibit the use of incentive funding; however, some incentive funding programs may not be able to be used in conjunction with earning WAIRE Points because of the nature of the incentive funding program. In practice, for many state incentive programs this means that NZE/ZE truck acquisitions with incentive funding by warehouse operators or owners cannot be used to comply with PR 2305, thus no WAIRE Points can be earned from these acquisitions. However, because PR 2305 requires use of those trucks at specific locations to reduce local emissions, the use of incentivized trucks is not prohibited by incentive programs with a program like PR 2305. Warehouse operators will therefore not be required to determine if a NZE or ZE truck that visits their warehouse is incentivized, and will not be required to determine if any usage is surplus. FAA grant administrators should be consulted to evaluate how the VALE program and the Zero Emission Vehicle grants could work within the context of PR 2305, including the various flexibilities it provides for banking and transferring WAIRE Points, the separation of earning WAIRE Points for acquisition and usage, and the ability to earn WAIRE Points through a Custom WAIRE Plan.¹⁶⁰ While incentive programs are a critical strategy to reduce emissions, LAX has apparently not been able to use them in the context of warehouses at their airport, therefore there is no apparent conflict between PR 2305 and LAX's pursuit of FAA funding.

Response to Comment 48-5

Please see Master Response 7 for the South Coast AQMD's legal authority. The comment contends that PR 2305 is preempted by the Airline Deregulation Act ("ADA"). Courts apply the same preemption analysis under the ADA that they apply under the Federal Aviation Administration Authorization Act ("FAAAA"). *Ward v. United Airlines, Inc.*, 986 F.3d 1234, 1243 n.2 (9th Cir. 2021). The District has responded to other comments contending that PR 2305 is preempted by the FAAAA, and those responses apply fully here. See Responses to Comments 44-4, 106-1, 106-2.

Response to Comment 48-6

In the context of PR 2305, section (d)(1), "may be used" means floor area that has nothing inherent in its design or function that could prohibit it being used for warehousing activities, even if it is not being used for warehousing activities at the moment. This is meant to prevent circumvention of PR 2305 as temporary physical limitations or self-imposed administrative control of warehousing space can easily be removed at any time by the warehouse operator to adjust to the demands of additional or seasonal changes. The warehousing industry is dynamic and could adjust the warehouse square footage to accommodate increased demand or seasonal changes for goods storage or movement needs. For example, the operator of a warehouse in South Coast AQMD's jurisdiction that has 120,000 square feet of floor area will be required to earn WAIRE Points under PR 2305, unless there is something inherent in the design or function of at least 21,000 square feet of floor area that prohibits it from being used for warehousing activities (such as manufacturing equipment that is built into the building), which would reduce

¹⁶⁰ Staff found a VALE grant for ground power from five years ago in 2016, but the electric bus project mentioned by the commenter is not listed as one of the grants provided by FAA's VALE, ZEV, or Airport Improvement programs. <https://www.faa.gov/airports/environmental/vale/media/VALE-grant-summary.pdf>, https://www.faa.gov/airports/environmental/zero_emissions_vehicles/media/Summary-ZEV-Airport-Projects-Contacts-2015-2020.pdf, https://www.faa.gov/airports/aip/grant_histories/lookup/

the floor area for warehousing activities to 99,000 square feet, which is less than the 100,000 square-foot threshold.

Additional clarification has been added to (d)(1) since this comment was made that also addresses the comment. It now states: “Only warehouse operators in buildings with greater than or equal to 100,000 square feet of floor area that may be used for warehousing activities and who operate at least 50,000 square feet of the warehouse for warehousing activities are required to earn WAIRE Points.”

Response to Comment 48-7

South Coast AQMD Staff appreciates your support of the South Coast AQMD’s air quality goals, and welcomes your feedback on cargo operations and PR 2305 and PR 316’s development.

Response to Comment 48-8

Again, thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter 49 - Earthjustice – 3/2/2021

Response to Comment 49-1

Thank you for your participation in the rule development process.

Response to Comment 49-2

South Coast AQMD staff's recommended stringency is 0.0025 WAIRE Points per WATT phased in over three-years. The recommended stringency was determined considering the analysis of 19 WAIRE Menu based scenarios that looked at emission reductions and costs, the potential for limited availability of WARIE Menu options at higher stringencies, the warehouse relocation study commissioned by South Coast AQMD, and the ports' study on the Clean Truck Rate program. The stringency factor of 0.0025 WAIRE Points per WATT is expected to result in significant emission reductions and no warehouse relocations. The emission reductions from PR 2305 would help address the disproportionate burden of air pollution in the communities neighboring warehouses and reduce emissions. See also Response to Comment 40-42.

Response to Comment 49-3

South Coast AQMD Staff understands the importance of prioritizing ZE technology. Currently, the WAIRE Menu includes both NZE and ZE on-road trucks because Class 8 on-road ZE trucks are not yet well established and are expected to cost significantly more than NZE trucks in the near term, for marginally better benefit. By allowing NZE technology in part of the WAIRE Menu, NZE can provide at least a 90% reduction in NO_x emissions and 100% reduction in DPM when compared to conventional diesel fueled trucks. The reduction of diesel fueled trucks can produce emission reductions in the near term which can improve the public health of the communities surrounding the warehouses, as Class 8 on-road ZE trucks and ZE charging and fueling infrastructure are developed and become widespread and commercially available.

ZE technology implementation can indeed lead to creation of new jobs in some industries as stated by the commenter and discussed in the Socioeconomic Impact Assessment. The WAIRE Mitigation Program will also include requirements that mitigation funding spent on ZE charging infrastructure use a skilled and trained workforce to ensure that the equipment is installed properly and can be reliably used.

Response to Comment 49-4

The mitigation fee of \$1,000 per WAIRE Point was analyzed to be within a similar range of cost as the other WAIRE Menu options and is not intended to be a "pay-to-pollute" compliance option. Because there are cheaper options for the warehouse operators to meet their WPCO, the current cost of the mitigation fee may not be the most cost-effective option for warehouse operators. Each warehouse operator will make decisions on which WAIRE Menu options to pursue, based on their specific situation and circumstances. The mitigation fee fund would be tracked to ensure the funds are used to incentivize cleaner technologies in the communities surrounding the warehouses that paid the mitigation fees.

Response to Comment 49-5

South Coast AQMD Staff understand the need for transparency in providing data relevant to enforcement and compliance. Each year staff will be reporting on the effectiveness of the WAIRE Program to the South Coast AQMD Mobile Source Committee to report on the status of the WAIRE Program and seek direction on any adjustments that may be required. A public version of the annual report on the WAIRE Program will be made available for public review. Custom WAIRE Plan submissions would also be released for public review prior to their approval. Finally, staff intends to put information on program compliance on the South Coast AQMD website in a public portal that will be built if PR 2305 is approved.

Some of the requested data in the comment will not be reported by warehouse operators, including the trucking companies services each warehouse, the fuel type and truck class of every truck visiting a warehouse, and the truck routes to and from each facility. These parameters are not needed to determine an operator's WPCO. However some of this information may be reported for some of the WAIRE Menu compliance options, or as part of a Custom WAIRE Plan.

Response to Comment 49-6

South Coast AQMD Staff understands the impact of air pollution on communities near warehouses is an important consideration. At this time, PR 2305 is expected to go before the South Coast AQMD Governing Board's for its consideration on May 7, 2021.

Response to Comment 49-7

Thank you for your comments and support of PR 2305. We look forward to working with you in the future.

Response to Comment Letter 50 - Bizfed – 3/2/2021

Response to Comment 50-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for a discussion on the growth of warehousing industry during the COVID-19 pandemic.

Response to Comment 50-2

PR 2305 is a part of the targeted strategy to reduce region and local NO_x and PM emissions to meet the state and federal ozone standards for 2023 and 2031 and improve public health. Failure to meet federal ozone standards in a timely manner could result in EPA imposing economic sanctions on the region.

We note also that the warehouse industry is thriving during the COVID-19 pandemic. The goods movement industry is growing in Southern California because of the record cargo volumes enjoyed by the busiest port complex in the nation, a developed transportation system, and a large employee pool.

The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Response 4 for a discussion on the warehousing industry's growth during the COVID-19 pandemic.

Response to Comment 50-3

The potential cost stated by the commenter is inaccurate, as the potential cost ranges are significantly lower. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 50-4

See Master Responses 2a through 2c for discussions on feasibility.

Response to Comment 50-5

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 50-6

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 50-7

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on jobs and economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 50-8

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 50-9

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 50-10

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 51 – CCAir – March 2, 2021

Response to Comment 51-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. PR 2305 is designed to reduce regional and local NO_x and PM reductions to assist in attainment of the federal and state air quality standards and reduce disproportionate impacts on the communities surrounding warehouses.

Response to Comment 51-2

South Coast AQMD Staff is recommending a stringency a 0.0025 WAIRE Points per WATT. See Response to Comment 40-42. The South Coast AQMD Governing Board may consider the adoption of a higher stringency at the May 7, 2021 hearing, if they choose.

Response to Comment 51-3

Impacts of air pollution on communities surrounding warehouses are considered in the structure of the WAIRE Points themselves. WAIRE Points for each WAIRE Menu action were determined by calculating the NO_x emission reductions (which affects regional air pollution) as well as Diesel PM emission reductions (which affects regional and local air pollution), and the cost. Further, all warehouse operators must take actions themselves that reduce emissions or facilitate emission and/or exposure reductions in the communities near their warehouses. PR 2305 is meant to reduce pollution burdens in communities near warehouses; those living within 0.5 miles of a PR 2305 warehouse rank in the 85th percentile according to CalEnviroScreen, whereas the average community in South Coast AQMD is ranked in the 61st percentile (see Figure 4 of the Final Staff Report for a map; also see pp. 16-17). Because of the high overlap between the locations of warehouses and communities with pollution burdens, the most practical approach to reduce these cumulative impacts is to ensure that all warehouse operators take actions to benefit their local communities.

Response to Comment 51-4

Neither the transferability of points in PR 2305, nor the mitigation fee, can be used as a loophole for compliance. WAIRE Points may only be transferred or banked to a future year if there is overcompliance and extra WAIRE Points were earned. In order to ensure that any limited transferring of WAIRE Points that may occur under PR 2305 does not disproportionately affect local communities, any WAIRE Points transferred from a different location are discounted by the number of WAIRE Points associated with local benefits from diesel PM reductions (PR 2305, section (d)(6)(A)), and see Table 3 of PR 2305 for specific point discounts per WAIRE Menu action), since localized emission reductions from PR 2305 should benefit the communities where they were created. The intent of PR 2305's limited transfer provision was to allow warehouse operators that operate multiple warehouses to be able to implement larger scale projects at one of their warehouses at one time rather than little projects at each site, ultimately improving the flexibility and efficacy of PR 2305.

The mitigation fee is an option warehouse operators can use that provides extra flexibility in PR 2305. The mitigation fee of \$1,000 per WAIRE Point was analyzed to be within a similar range of cost as the other WAIRE Menu options and is not meant to allow for a “pay-to-pollute” compliance option. Over the 10-year period analyzed, there are less expensive options

for the warehouse operators to meet their WPCO (Final Staff Report, pp. 63-72 and Table 20), and warehouse operators are expected to gravitate towards the least expensive option of compliance for their operations. The mitigation fees would be collected into the WAIRE Mitigation Program, from which funds will provide incentives toward projects that reduce emissions or that facilitate emission reductions, such as the purchase of NZE and ZE trucks and ZE charging and fueling infrastructure (these actions are the same as those included in the WAIRE Menu). The mitigation fee funds would be tracked to ensure the funds are used in the communities surrounding the warehouses that paid the mitigation fees. Projects funded by the WAIRE Mitigation Program will be approved annually or more often by the South Coast AQMD Governing Board and will follow the policies described in the Board Resolution that accompanies PR 2305 as well as subsequent requirements set out by the Board (Final Staff Report, p. 107).

Response to Comment 51-5

Any mitigation fees paid for the proposed rules would be collected into the WAIRE Mitigation Program, from which funds will provide incentives to projects that reduce emissions or that facilitate emission reductions from warehouses, such as the purchase of NZE and ZE trucks and ZE charging and fueling infrastructure. Additional WAIRE Mitigation Program requirements will be developed in future Board actions, including during program solicitations and project awards.

Response to Comment 51-6

The scenario analysis included in the Final Staff Report determines there will be about 1.5 to 3 tons per day of NOx emission reductions resulting from implementation of PR 2305 and PR 316 beyond those gained from CARB regulations. Further, if PR 2305 is approved, it can ensure that the emission reductions projected to occur in South Coast AQMD from statewide rules actually occur in our region instead of in other regions. PR 2305 is complementary to existing CARB regulations and is meant to motivate early compliance of the CARB regulations, in order to get emission reductions sooner than CARB's 2037 attainment goals, and to achieve additional reductions beyond what CARB rules would do. See Master Response 9 for a discussion on overlap with CARB regulations, and Master Response 4 for an explanation of emission reductions from warehouse ISR. CARB's existing regulations have been considered in the Final Staff Report of PR 2305 and PR 316; PR 2305's expected emission reductions (Final Staff Report pp. 61-63) and comparative similarity to other existing regulations (Final Staff Report pp. 80-85, and Appendix D) has been analyzed.

Response to Comment 51-7

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter 52 – CBPA – March 2, 2021

Response to Comment 52-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 52-2

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 3, and 8 for discussions on costs, feasibility, emission reductions, and concerns about PR 2305 being duplicative. Additionally, see the WAIRE Implementation Guidelines (Appendix A of the Final Staff Report) for a warehouse operator's guide to complying with PR 2305.

Response to Comment 52-3

See Master Response 8 for a discussion of recent and upcoming CARB regulations, and how PR 2305 is not duplicative with their efforts.

Response to Comment 52-4

See the Socioeconomic Impact Assessment and Master Responses 1 and 5 for discussions on costs and economic impacts. See Master Response 3 and 8 for discussions of air quality benefits from PR 2305 and how PR 2305 is not duplicative with CARB's efforts.

Response to Comment 52-5

Thank you for your interest in the warehouse ISR and for bringing your comments to our attention.

Response to Comment Letter 53 - Disneyland Resort – 2/22/2021

Response to Comment 53-1

The definition of electric charger provided in PR 2305 was revised and states that the electric charging station for vehicles can operate at 208 Volts or greater but does not limit the usage to heavy-duty vehicles. Electric chargers installed to charge employee personal vehicles can earn WAIRE Points but with the 208 Volts or greater definition the installed electric chargers must be a minimum Level 2 charger.

Response to Comment 53-2

Electric forklifts are not included in the WAIRE Menu therefore the electric forklifts, the electric forklift chargers, and any usage related to the electric forklifts cannot earn WAIRE Points.

Response to Comment Letter 54 -NDRC – 03/03/2021

Response to Comment 54-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 54-2

South Coast AQMD staff appreciates the support in reducing emissions.

Response to Comment 54-3

PR 2305 would be the first air quality regulation to address indirect source emissions associated with the warehousing industry in the South Coast AQMD jurisdiction. The warehousing industry has been present in the region for decades and has been steadily growing along with air pollution associated with warehouse operations. As proposed, PR 2305 would result in significant reductions of 1.5-3.0 tpd of NO_x reductions which is approximately 10%-15% of the baseline NO_x emissions associated with warehouses. A similar percentage reduction is expected for PM 2.5. See Response to Comment 40-42 and the Final Staff Report pages 58-59.

Response to Comment 54-4

PR 2305 would contribute to the shift to cleaner technology to replace conventional diesel engines. PR 2305 is designed to reduce regional and local NO_x and PM emissions to help attain the federal and state ozone standards. Both NZE and ZE technology is available to provide immediate emission reductions toward the 2023 and 2031 goals. The implementation of PR 2305 provides WAIRE Points incentives to transition to ZE technology which provide air quality benefits and can create high quality jobs in the emerging ZE technology field. See Master Response 6 and the Socioeconomic Impact Assessment for additional discussion on jobs.

Response to Comment 54-5

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter 55 - Maersk – 3/2/2021

Response to Comment 55-1

Thank you for your participation in the rule development process.

Response to Comment 55-2

Staff appreciates the time and effort take to provide your comments on the warehouse ISR. It is not clear from the comment which letter is also incorporated into this comment. Staff believes the letter in question is Comment Letter 57, and responses have been provided to that letter.

Response to Comment 55-3

See Master Response to Comment 7 for discussion on legal authority and Master Response to Comment 8 for a discussion of CARB rules relative to PR 2305.

Response to Comment 55-4

See Master Responses 3 and 8 for discussions on air quality benefit and concerns about regulatory overlap.

Response to Comment 55-5

See Master Responses 1 and 2 for discussions on the costs and feasibility. The metrics, management, and reporting included in PR 2305 are necessary to ensure that it is enforceable. There are no CARB rules that currently overlap with PR 2305 and place requirements on warehouse operators. PR 2305 reporting has also been structured to take advantage of common industry practice in data collection that already occurs (e.g., tracking basic truck data for security purposes), and updates have been made to PR 2305 (d)(1)(B) and further described in the WAIRE Implementation Guidelines to minimize administrative burden on warehouse operators.

Response to Comment 55-6

See Master Responses 1 and 2 for discussions on the costs and feasibility of PR 2305. In addition, PR 2305 has been designed to provide flexibility so that warehouse operators can identify the most cost-effective approach for their operations, rather than prescribe a specific approach that could result in the uneven costs described in the comment. The WAIRE Menu has also been designed specifically to remove complexity, by removing the need for every warehouse operator to conduct extensive calculations to determine how to comply with the rule, and allowing warehouse operators to pick and choose options as they see fit, and knowing instantly how much their choice contributes to their compliance obligation.

Response to Comment 55-7

The concerns raised in this comment have been thoroughly addressed in the Final Staff Report and Socioeconomic Impact Assessment. See also Master Response to Comments 7 for discussion of legal authority, 8 for a discussion of CARB regulations in relation to PR 2305, and 3 for a discussion of emission reductions. Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter 56 – MFLS – March 3, 2021

Response to Comment 56-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 56-2

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, and 8 for discussions on the costs, feasibility, and concerns about duplicative effort.

Response to Comment 56-3

See Master Response 4, 5 and the Socioeconomic Impact Assessment for discussions on the goods movement industry and economic impacts.

Response to Comment 56-4

See Master Response 6 for a discussion on jobs.

Response to Comment 56-5

See Master Response 9 for a discussion on the need for more actions to clean California's goods supply chain.

Response to Comment 56-6

See Master Responses 7 and 8 for discussions on legal authority and concerns about duplicative effort.

Response to Comment 56-7

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 3, 7, and 8 for discussions on costs, feasibility, air quality benefit, legal authority, and concerns on duplicative effort.

Response to Comment 56-8

See Master Responses 3 and 10 for a discussions on air quality benefits and concerns regarding the mitigation fee.

Response to Comment 56-9

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 7, and 8 for discussions on cost, air quality benefit, legal authority, and concerns about duplicative effort.

Response to Comment Letter 57 – CTA Group – March 3, 2021

Response to Comment 57-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 57-2

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 3, 8, and 10 for discussions on the costs, feasibility, air quality benefit, concerns about duplicative effort, and concerns about the mitigation fee.

Response to Comment 57-3

See Master Responses 4, 5 and the Socioeconomic Impact Assessment for discussions on the goods movement industry and economic impacts.

Response to Comment 57-4

See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 57-5

See Master Response 9 for a discussion on the need for more actions to clean California's goods supply chain.

Response to Comment 57-6

See Master Response 8 for a discussion of CARB regulation in relation to PR 2305.

Response to Comment 57-7

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 3, 7, and 8 for discussions on costs, feasibility, air quality benefit, legal authority, and concerns on duplicative effort.

Response to Comment 57-8

See the Socioeconomic Impact Assessment and Master Responses 1, 3, and 8 for discussions on cost, air quality benefit, and concerns about duplicative effort.

Response to Comment 57-9

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 7, and 8 for discussions on cost, air quality benefit, legal authority, and concerns about duplicative effort.

Response to Comment 57-10

Thank you for your interest in the warehouse ISR and for your comments.

Response to Comment Letter 58 - CRA – 3/1/2021

Response to Comment 58-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. See the Socioeconomic Impact Assessment and Master Responses 1, 4, and 6 for discussions on costs, economic impact, and jobs.

Response to Comment 58-2

See Master Response 3, 8, and 9 for discussions on air quality benefit and the need for more actions to clean California's goods supply chain.

Response to Comment 58-3

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, and 2c for discussions on costs and feasibility.

Response to Comment 58-4

Since the submission of the Comment Letter, PR 2305 rule language has changed the compliance period six months to start January 1, 2022 for the first phase of warehouses that are at least 250,000 square feet. The commenter also incorrectly states that zero and near zero emission fleets will not be available until the 2025 to 2030 period. First, absent additional regulations there is no anticipation for widely available adoption of NZE or ZE trucks until the 2030s or later. However PR 2305 will provide incentives for greater use of NZE and ZE vehicles, in the near term. Second, NZE trucks are commercially available today with South Coast AQMD providing funding for more than 1,200 trucks in the past few years, and ZE trucks are becoming available commercially this year, and into next year, with smaller ZE trucks expected to be more readily available first.¹⁶¹ While these trucks are more expensive than conventional diesel technology, truck manufacturers are willing and able to make them if there is market demand. The warehousing industry has a critical role in shaping that market demand. See the Socioeconomic Impact Assessment and Master Responses 1 and 2 for additional discussions on cost and technology availability.

Response to Comment 58-5

Since the submission of the Comment Letter, PR 2305 rule language has changed the compliance period six months to start January 1, 2022 for the first phase of warehouses that are at least 250,000 square feet. See the WAIRE Implementation Guidelines in Appendix A of the Final Staff Report for more details on potential methods to record truck trip counts. These methods are designed to allow use of current industry practice to record truck trip data at warehouses (e.g., data already collected for security purposes).

Response to Comment 58-6

See Master Responses 4, 5, and 6 for discussions on economic impacts and jobs.

Response to Comment 58-7

¹⁶¹ <https://globaldrivetozero.org/tools/zero-emission-technology-inventory/>

Thank you for your interest in the warehouse ISR and your comments.

Response to Comment Letter 59 – Disneyland Resort – 3/2/2021

*An email on 3/4/2021, the commenter requested the comments submitted on 3/2/2021 be disregarded. The comments are maintained in the record but will not receive a response as requested by the commenter. No further action is required.

Response to Comment Letter 60 - Riverside 350 – 3/4/2021

Response to Comment 60-1

South Coast AQMD staff agrees that improving air quality is imperative for public health especially during the COVID-19 pandemic. PR 2305 seeks to get much needed regional NOx reductions toward the goal of attaining the federal ozone standard and local DPM reductions to improve public health in local communities living near warehouses.

Response to Comment 60-2

The warehouse ISR is a new regulatory approach for an industry that has not previously been regulated by South Coast AQMD. Even during the COVID-19 pandemic the goods movement industry is growing because of the record cargo volumes enjoyed by the busiest port complex in the nation, a developed transportation system, and a large employee pool. PR 2305 is expected to reduce NOx emissions by ~1.5-3.0 tons per day which is ~10-15% of the baseline emissions. The estimated significant emission reductions are beyond the reductions that current CARB regulations are expected to gain, while PR 2305 will help also facilitate early reductions from CARB regulations.

Response to Comment 60-3

PR 2305 includes both ZE and NZE trucks, which allows warehouse operators the flexibility to implement actions that work within their operations. PR 2305 also includes ZE charging and fueling infrastructure, which will be a critical component to accelerating the market for ZE trucks. As stated by the commenter, the construction of this infrastructure can provide good quality jobs. See additional discussion in the Socioeconomic Impact Assessment.

Response to Comment 60-4

Thank you for your comments and participation in the development process for the warehouse ISR.

Response to Comment Letter 61 - Disneyland Resort – 3/4/2021

Response to Comment 61-1

South Coast AQMD Staff did receive the commenters emails dated 2/22/2021 and 3/2/2021. As requested on the email dated 3/4/2021, previous emails sent on 3/2/2021 will be disregarded but will remain part of the record. Below are responses to the updated comments submitted on 3/4/2021.

Response to Comment 61-2

CARB did not establish the Optional Low NO_x Standards for heavy-duty engines until 2013, with the lowest standard equaling 0.02 g/bhp-hr. Staff is not aware of any trucks manufactured before this date that would meet the Optional Low NO_x Standard. The best resource to verify if your own trucks meet the Optional Low NO_x Standard is by finding the CARB Executive Order for the engine in question and verify the it meets the 0.02 g/hp-hr emission standard.¹⁶² In order to take credit for an NZE truck trip from a 3rd party it would be the warehouse operator's responsibility to determine whether the truck meets that standard. Additional information is provided in the WAIRE Implementation Guidelines.

Response to Comment 61-3

South Coast AQMD does not endorse any particular product or manufacturer. The Final Staff Report and the WAIRE Implementation Guidelines provide more detail on the various methods to collect truck trip data or identify NZE or ZE truck trips. Existing security cameras currently operating at your facility may work, if someone were able to go through the footage to identify the types and number of trucks that enter to deliver or pick up goods. Depending on the quality of the video someone may also be able to identify the truck by the license plate to later verify whether the truck is NZE or ZE with the truck fleet operator or similar method.

Response to Comment 61-4

The most recent draft of PR 2305 includes a low activity exemption. Facilities with a calculated WPCO <10 would not be required to earn WAIRE Points and may only have to provide limited reporting.

Response to Comment 61-5

The VMT is only reported in the Initial Site Information Report (ISIR) to gather information and is not used in the Annual WAIRE Report. The VMT that must be reported in the ISIR is only for trucks owned or leased by the warehouse operator for that warehouse.

Response to Comment 61-6

The definition of a truck trip involves entering or exiting warehouse site to deliver or pick up goods for later distribution to other locations. Based on the comment, it appears that the truck activity described is not related to this and could just be for overnight parking of a truck that is unrelated to the warehouse. In this case, the truck activity would not be considered a truck trip

¹⁶² <https://ww3.arb.ca.gov/msprog/onroad/cert/cert.php>

for PR 2305. A truck that leaves empty and returns with goods for the warehouse would be included in any truck trip calculations (and vice versa).

Response to Comment 61-7

A warehouse owner can transfer WAIRE Points to the warehouse operator that are earned from the purchase and installation of solar panels during the compliance period. Installations that occur prior to adoption of PR 2305 would not earn WAIRE Points. WAIRE Points for usage of pre-existing solar panels would earn WAIRE Points, and there are no requirements for who retains ownership or control of the panels.

Response to Comment 61-8

The first report due on September 1, 2021 is the Warehouse Operations Notification (WON) which is the responsibility of the warehouse owner. In that report the warehouse owner will state the tenants of the building (as named in the lease). There is no requirement on the warehouse owner to determine the tenant's status to another business or corporate entity.

The parent company information of a warehouse operator also does not need to be reported except potentially if exemptions are claimed by the operator in PR 2305 (e)(2)(A)(ii) or (g)(1).

Response to Comment Letter 62 - Los Angeles Area Chamber of Commerce – 3/4/2021

Response to Comment 62-1

Thank you for your participation in the rule development process and bringing your comments to our attention. See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 4, and 5 for discussions on the cost, feasibility, economic impacts, and current economic state.

Response to Comment 62-2

See Master Response 4 for a discussion on the growth of the warehousing industry during the COVID-19 pandemic.

Response to Comment 62-3

See Master Response 9 for a discussion on the need for more actions to clean California's goods supply chain.

Response to Comment 62-4

See Master Response to Comments 2.

Response to Comment 62-5

Thank you for your comments and interest in PR 3205.

Response to Comment Letter 63 – WECA – March 4, 2021

Response to Comment 63-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. See Master Response to Comments 4.

Response to Comment 63-2

Since the submission of the comment letter, a revised version of the PR 2305 was released on April 7, 2021 which updated the compliance dates. The first report required to be submitted by the warehouse owners is now due September 1, 2021. The compliance periods were delayed six months, starting on January 1, 2022 though only the first phase of warehouses ($\geq 250,000$ square feet) would be required to earn WAIRE Points for the first compliance period. See Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts.

Response to Comment 63-3

See the Socioeconomic Impact Assessment and Master Response 1 and 4 for discussions on the costs and economic impacts.

Response to Comment 63-4

See Master Responses 2a, 2b, and 2c for discussions on feasibility, warehouse operator control of trucks, and truck engine emission standards.

Response to Comment 63-5

See Master Response 2d for a discussion on technology availability.

Response to Comment 63-6

See the Socioeconomic Impact Assessment and Master Responses 1, 4, and 5 for discussions on costs, economic impact, and uncertainty in the economy.

Response to Comment 63-7

See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 63-8

See Master Response 7 for legal authority.

Response to Comment 63-9

Thank you for your interest in the warehouse ISR and for your comments. The comments are part of the record and will be available for South Coast AQMD Board Member review.

Response to Comment Letter 64 - Viewsonic – 3/4/2021

Response to Comment 64-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. South Coast AQMD Staff agree that the warehousing industry is growing to adapt to the needs of customers even during the COVID-19 pandemic. As the warehousing industry grows so does the disproportionate burden of air pollution on the communities surrounding the warehouses.

Since the submission of the comment letter, a revised version of the PR 2305 was released on April 7, 2021 which updated the compliance dates. The first report required to be submitted by the warehouse owners is now due September 1, 2021. The compliance periods were delayed six months, starting on January 1, 2022 though only the first phase of warehouses ($\geq 250,000$ square feet) would be required to earn WAIRE Points for the first compliance period. See Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts.

Response to Comment 64-2

See the Socioeconomic Impact Assessment and Master Response 1 and 4 for discussions on the costs and economic impacts.

Response to Comment 64-3

See Master Responses 2a, 2b, and 2c for discussions on feasibility, warehouse operator control of trucks, and truck engine emission standards.

Response to Comment 64-4

See Master Response 2d for a discussion on technology availability.

Response to Comment 64-5

See Master Response 4 for a discussion on the warehousing industry role in goods movement.

Response to Comment 64-6

See the Socioeconomic Impact Assessment and Master Responses 5 and 6 for discussions on economic uncertainty and jobs.

Response to Comment 64-7

See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 64-8

See Master Response 7 for a discussion on legal authority.

Response to Comment 64-9

Thank you for your interest in the warehouse ISR and for bringing your comments to our attention.

Response to Comment Letter 65 - Earthjustice – 3/5/2021

Response to Comment 65-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR. During the set hearing held on March 5, 2021, a motion was made and approved to postpone the public hearing to allow more time to study PR 2305, which now has an approved hearing date of May 7, 2021.

Response to Comment 65-2

South Coast AQMD staff agree that the warehousing industry has continued to grow even during the COVID-19 pandemic which increases the healthcare costs for the disproportionately burdened communities surrounding the warehouses. See the Socioeconomic Impact Assessment and Master Response 4 for discussions on the economic analysis of the potential healthcare benefits and the growth of the warehousing industry.

Response to Comment 65-3

South Coast AQMD Staff agree that PR 2305 would result in significant regional and local emission reductions toward attaining air quality standards. PR 2305 would fulfill part of the 2016 AQMP strategy to reduce emissions in the goods movement industry. Adoption of PR 2305 would facilitate the transition to cleaner transportation which could create high quality jobs for a skilled and trained workforce in the ZE technology sector. See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 65-4

Thank you for your interest in the warehouse ISR and your comments.

Response to Comment Letter 66 - OCBC – 3/3/2021

Response to Comment 66-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 66-2

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 3, 8, and 10 for discussions on the costs, feasibility, air quality benefit, concerns about duplicative effort, and concerns about the mitigation fee.

Response to Comment 66-3

See Master Responses 4, 5 and the Socioeconomic Impact Assessment for discussions on the goods movement industry and economic impacts.

Response to Comment 66-4

See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 66-5

See Master Response 9 for a discussion on the need for more actions to clean California's goods supply chain.

Response to Comment 66-6

See Master Response 7 for a discussion on legal authority.

Response to Comment 66-7

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 3, 7, and 8 for discussions on costs, feasibility, air quality benefit, legal authority, and concerns on duplicative effort.

Response to Comment 66-8

See the Socioeconomic Impact Assessment and Master Responses 1, 3, and 8 for discussions on cost, air quality benefit, and concerns about duplicative effort.

Response to Comment 66-9

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 7, and 8 for discussions on cost, air quality benefit, legal authority, and concerns about duplicative effort.

Response to Comment 66-10

Thank you for your interest in the warehouse ISR and for your comments.

Response to Comment Letter 67 - Multicultural Business Alliance – 3/6/2021

Response to Comment 67-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. South Coast AQMD Staff agree that the warehousing industry is growing to adapt to the needs of customers even during the COVID-19 pandemic. As the warehousing industry grows so does the disproportionate burden of air pollution on the communities surrounding the warehouses.

Response to Comment 67-2

Since the submission of the comment letter, a revised version of the PR 2305 was released on April 7, 2021 which updated the compliance dates. The first report required to be submitted by the warehouse owners is now due September 1, 2021. The compliance periods were delayed six months, starting on January 1, 2022 though only the first phase of warehouses ($\geq 250,000$ square feet) would be required to earn WAIRE Points for the first compliance period. See Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts.

See the Socioeconomic Impact Assessment and Master Response 1 and 4 for discussions on the costs and economic impacts.

Response to Comment 67-4

See Master Responses 2a, 2b, and 2c for discussions on feasibility, warehouse operator control of trucks, and truck engine emission standards.

Response to Comment 67-5

See Master Response 2d for a discussion on technology availability.

Response to Comment 67-6

See Master Response 4 for a discussion on the warehousing industry role in goods movement.

Response to Comment 67-7

See the Socioeconomic Impact Assessment and Master Responses 5 and 6 for discussions on economic uncertainty and jobs.

Response to Comment 67-8

See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 67-9

See Master Response 7 for a discussion on legal authority.

Response to Comment 67-10

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter 68 - TTU – 3/8/2021

Response to Comment 68-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 68-2

See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 8, and 10 for discussions on the costs, feasibility, concerns about duplicative effort, and the mitigation fee.

Response to Comment 68-3

See Master Response 4, 5 and the Socioeconomic Impact Assessment for discussions on the goods movement industry and economic impacts.

Response to Comment 68-4

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on jobs.

Response to Comment 68-5

See Master Response 9 for a discussion on the need for more actions to clean California's goods supply chain.

Response to Comment 68-6

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 7 and 8 for discussions on costs, air quality benefit, legal authority and concerns about duplicative effort.

Response to Comment 68-7

See Socioeconomic Impact Assessment and Master Responses 1, 3, 8, and 10 for discussions on costs, air quality benefit, concerns on duplicative efforts, and concerns on the mitigation fee. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment Letter 69 - General Motors – 03/12/2021

Response to Comment 69-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 69-2

South Coast AQMD staff appreciates General Motor's strategy to sell only electric vehicle in the light duty portfolio by 2035 and achieving carbon neutrality by 2040. These actions are important in assisting South Coast AQMD with its efforts toward meeting air quality standards and California's goal of all ZE vehicles by 2045.

Response to Comment 69-3

South Coast AQMD Staff agrees that PR 2305 will play an important role in facilitating and encourage the transition to ZE technologies. PR 2305 will provide additional motivation in the installation and use of ZE infrastructures to support the increased demand for ZE trucks in support California's ZE transportation goals.

Response to Comment 69-4

South Coast AQMD staff appreciates GMs support, willingness to coordinate with its partners, and statements toward the recommended approach of PR 2305. Thank you for your interest in the warehouse ISR and your comments.

Response to Comment Letter 70 – OrangeEV – March 16, 2021

Response to Comment 70-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 70-2

South Coast AQMD Staff agrees that the inclusion of ZE technology in PR 2305's WAIRE Menu is important for meeting the South Coast Air Basin's ozone attainment goals for 2023, 2031, and 2037 as well as California's goals of all ZE by 2045. Currently, the WAIRE Menu includes both NZE and ZE on-road trucks because Class 8 on-road ZE trucks are in demonstration service but are not commercially available today. By allowing NZE technology in part of the WAIRE Menu, NZE can provide at least a 90% reduction in NOx emissions when compared to conventional diesel fueled trucks, and 100% DPM reduction. The reduction of diesel fueled trucks can produce emission reductions in the near term which can improve the public health of the communities surrounding the warehouses, as Class 8 on-road ZE trucks, ZE charging and fueling infrastructure continue to develop and become widespread. NZE yard trucks fueled by renewable fuels have also been added as a compliance option within a Custom WAIRE Plan in order to increase the options that warehouse operators have to comply with the rule.

Response to Comment 70-3

South Coast AQMD Staff agrees that PR 2305 can play an important role in addressing air pollution emissions from warehouses impacting environmental justice communities. PR 2305 has considered the impacts of warehouse operations on local communities, including the AB617 communities. South Coast AQMD Staff has been engaged with the AB617 Community Steering Committees, and has continued to update those committees on the progress of the warehouse ISR. In addition, staff held a community workshop to better explain an overview of the PR 2305 and how it could benefit the local communities.

Response to Comment 70-4

South Coast AQMD Staff recognizes that OrangeEV's ZE yard trucks have been commercially available and in commercial service for several years. The WAIRE Menu only includes ZE yard trucks, however, acquisition and/or usage of NZE yard trucks using renewable fuels may earn WAIRE Points when submitted as a Custom WAIRE Plan. NZE technology provides at least a 90% reduction in NOx emissions and 100% reduction in DPM which can provide immediate emission reductions toward the 2023 and 2031 ozone attainment goals.

Response to Comment 70-5

Thank you for your interest in the warehouse ISR development process and your comments.

Response to Comment Letter 71 – RDS – March 12, 2021

Response to Comment 71-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. South Coast AQMD Staff appreciate RDS' feedback on a successful transition to ZE cargo handling equipment including the ZE yard trucks (also called spotters).

Response to Comment 71-2

South Coast AQMD Staff appreciates RDS' initiative converting diesel yard spotters with new electric units as it assists in reducing emissions toward the attainment of the 2023 and 2031 ozone attainment standards.

Response to Comment 71-3

South Coast AQMD Staff appreciates RDS' efforts transitioning to zero emission yard spotters that have resulted in reducing emissions, increasing driver safety, minimizing noise, and reducing in-use vibrations, and are purchasing zero emission yard spotters for the RDS facility in Bloomington. The incorporation of cleaner technology assist in South Coast AQMD's goal for emission reductions and helps in the transition away from high emitting diesel engines.

Response to Comment 71-4

Thank you for your interest in the warehouse ISR and for providing valuable feedback on RDS' transition to ZE technology.

Response to Comment Letter 72 – Exemplis – 03/15/2021

Response to Comment 72-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. South Coast AQMD Staff hope the material emailed to Exemplis was useful in learning more about PR 2305. See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment Letter 73 – Lee & Associates Commercial Real Estate Services– March 3, 2021

Response to Comment 73-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for a discussion on the warehousing industry during the COVID-19 pandemic.

Response to Comment 73-2

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM emission reductions to help meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See also Master Response 4.

Response to Comment 73-3

The potential costs stated by the commenter are inaccurate as potential cost ranges are significantly lower. The warehousing industry has in fact experienced significant growth during the COVID-19 pandemic. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 73-4

See Master Response 2a through 2c for a discussion on feasibility.

Response to Comment 73-5

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 73-6

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 73-7

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 73-8

See Master Response 7 and Response to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 73-9

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 74 – KKK Vineyard – March 3, 2021

Response to Comment 74-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for a discussion on the warehousing industry during the COVID-19 pandemic.

Response to Comment 74-2

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM reductions toward meeting the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021. This is an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See also Master Response 4.

Response to Comment 74-3

The potential costs stated by the commenter are inaccurate as potential cost ranges are significantly lower. The commenter did not mention that the growth of the warehousing industry during the COVID-19 pandemic. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 74-4

See Master Response 2a through 2c for a discussion on feasibility.

Response to Comment 74-5

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 74-6

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 74-7

Response to Comment 74-9

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 75 - Howard Industrial Partners – 3/16/2021

Response to Comment 75-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 3, and 7 for discussions on costs, feasibility, air quality benefits, and legal authority.

Response to Comment 75-2

See the Socioeconomic Impact Assessment and Master Responses 4 and 6 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and jobs.

Response to Comment 75-3

The warehousing industry has grown in the last decades, but so has the disproportionate impacts of air pollution on the disadvantaged communities surrounding the warehouses. See the Socioeconomic Impact Assessment and Master Responses 2a, 4, and 5 for discussions on feasibility and the warehousing industry impacts on the economy.

Response to Comment 75-4

See Master Responses 8 and 9 for discussions on concerns about duplicative regulations and actions needed to clean up the goods supply chain.

Response to Comment 75-5

Thank you for your interest in the warehouse ISR and your comments.

Response to Comment Letter 76 – Bryan Bradford – March 17, 2021

Response to Comment 76-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 76-2

South Coast AQMD Staff appreciate your comments and sharing a resident's perspective on the warehousing industry. During the development of PR 2305 and PR 316 the costs, jobs, and potential for warehouse relocation were all considered. See the Socioeconomic Impact Assessment and Master Responses 1 and 6 for discussions on the costs, health benefit, and jobs.

Response to Comment 76-3

Thank you for your comments and support of the warehouse ISR.

Response to Comment Letter 77 - Rockefeller Group – 3/17/2021

Response to Comment 77-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for a discussion on the warehousing industry during the COVID-19 pandemic.

Response to Comment 77-2

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM reductions toward meeting the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Response 4 for a discussion on the warehousing industry's growth during the COVID-19 pandemic.

Response to Comment 77-3

The potential cost stated by the commenter are inaccurate, as the potential cost ranges are significantly lower. The commenter did not mention the growth of the warehousing industry during the COVID-19 pandemic. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 77-4

Response to Comment 77-9

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 77-10

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 78 - Pacific Industries – 3/19/2021

Response to Comment 78-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 offers a flexible program that allows warehouse operators to choose to comply with 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee and is not a tax. See Master Response 4 and Response to Comment Letter 39 for discussions on the growth of warehousing industry during the COVID-19 pandemic and the reasons PR 2305 is not a tax.

Response to Comment 78-2

PR 2305 is a part of the targeted strategy to reduce regional and local NOx and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Response 4 for a discussion on the warehousing industry's growth during the COVID-19 pandemic.

Response to Comment 78-3

See Master Responses 3 and 7 for discussions on the air quality benefits from reducing emissions from warehouse operations and legal authority.

Response to Comment 78-4

The commenter is incorrect in the statements provided, PR 2305 does not impose a tax and the stated costs are inaccurate. See the Socioeconomic Impact Assessment and Master Responses 1 and 6 for discussions on the costs and jobs and Response to Comment Letter 39 for an explanation of why Rule 2305 is not a tax.

Response to Comment 78-5

See Master Responses 2a, 2b, 2c, and 2d for discussions on feasibility, truck engine standards, warehouse operators that own or operate fleets, and technology availability.

Response to Comment 78-6

See Master Response 4 for a discussion on the growth of warehousing industry which increases the disproportionate burden of air pollution on the disadvantaged communities surrounding the warehouses.

Response to Comment 78-7

See Master Responses 3 and 5 for discussions on the air quality benefit of PR 2305 and the economic uncertainty during the COVID-19 pandemic.

Response to Comment 78-8

See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 78-9

See Master Response 7 for legal authority.

Response to Comment 78-10

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 79 – Warland – March 19, 2021

Response to Comment 79-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 79-2

The comment that South Coast AQMD does not have the legal authority to adopt PR 2305 is incorrect. See Master Response to Comments 7 and Response to Comments 44-2. The South Coast AQMD is indeed governed by Health and Safety Code 40400, but not exclusively. The comment ignores the many other statutes that grant authority to South Coast AQMD. Nothing in Section 40440(b)(3) indicates that it is intended to impose a limitation on the South Coast AQMD's indirect source authority.

Response to Comment 79-3

PR 2305 and PR 316 do not impose a tax, and the mitigation fee is not a tax. See Master Response 7 and Response to Comment Letter 39 for discussions on legal authority and the reasons PR 2305 is not a tax.

Response to Comment 79-4

See the Socioeconomic Impact Assessment and Master Response 1 for a discussion on costs.

Response to Comment 79-5

See the Socioeconomic Impact Assessment (SIA) and Master Response 6 for a discussion on jobs and economic impacts. The SIA provides a comprehensive analysis of potential economic impacts of PR 2305, and includes a study of the potential for warehouse relocation in response to PR 2305. The study found that warehouses would not relocate out of the South Coast AQMD region with the costs that are expected from PR 2305.

Response to Comment 79-6

The commenter is incorrect as the PR 2305 offers nearly three dozen flexible options for compliance along with a Custom WAIRE Plan option, an optional mitigation fee, and a combination thereof. Additionally, all of the WAIRE Menu options with the exception of ZE Class 8 on-road trucks are commercially available and have been in commercial service for several years, with ZE Class 8 on-road trucks expected in late 2021 or 2022. See Master Responses 2a and 2d for discussions on feasibility and technology availability. The comment that near-zero emission trucks with a gross vehicle weight rating of greater than 33,001 pounds are not currently commercially available is incorrect. These natural gas-fueled trucks have been available commercially for several years, and the engine manufacturers and truck dealers have stated that there are no limitations on how many of these can be sold today relative to diesel trucks. South Coast AQMD has also funded more than 1,200 of these trucks in the past several years.

The comment states that details about charging infrastructure have not been provided in the Final Staff Report. With about 2,902 warehouse that are expected to earn WAIRE Points, it is not possible to determine how or whether charging infrastructure would be installed at every

individual site. Warehouse operators would need to determine many factors before moving forward with any charging station project, including the size of the charging station that is appropriate for their operations, where on their site is most appropriate, what the requirements are from the local utility and building department, how many plugs are needed, etc. Utility programs are available to assist warehouse operators and owners in developing these site-specific plans.¹⁶³ No warehouse operator is required to install a charging station however, and they may choose another option that makes sense for their operations.

Response to Comment 79-7

PR 2305 is designed to have a multitude of compliance options (implementing any combination of the 32 WAIRE Menu actions, implementing an approved Custom WAIRE Plan, paying the optional mitigation fee, or a combination of all or some of these options) so that warehouse owners and operators have the flexibility to decide what compliance options work best for their specific warehouses. Since there are so many options for compliance and thousands of warehouse operators, the most reasonable approach is to determine the potential bounds of what PR 2305 and PR 316 would impose. Warehouse operators are expected to gravitate towards lower cost options, however if they determine that a higher cost option is the path they choose to pursue (e.g., due to corporate sustainability goals), they are allowed to do so. See also Response to Comment 43-2.

South Coast AQMD Staff used a bounding analysis approach. Cost and emission reductions from rule compliance (the impact of the rule) are based on an analysis of 19 scenarios of rule compliance, designed to show a range of potential compliance outcomes. The scenarios were developed to show potential impacts from scenarios of WAIRE Menu actions including the use of the mitigation fee option. The bounding analysis approach assumed all 2,902 warehouses use one single scenario approach from 2022 through 2031 which present unlikely extreme cases to see the full extent of potential emission and cost impacts. In reality, a hybrid of all scenarios (or other compliance approaches encompassed within the range of scenarios analyzed) is expected to occur. By analyzing the most extreme possible compliance outcomes, the bounding analysis shows the most impact any one compliance option could create; actual rule compliance for each compliance option will be within the impact shown in the bounding analysis (Final Staff Report, pp. 59-61).

Response to Comment 79-8

There are no requirements and no ability for warehouse owners or operators to obtain any credits, or to obtain SIP credit under PR 2305. There is a discussion of potential approaches that South Coast AQMD may take to determine what level of emission reductions can be credited towards the SIP in Appendix D of the Final Staff Report. See also Response to Comment 40-48. Another type of credit discussed in the Final Staff Report are Low Carbon Fuel Standard credits, which is a CARB program that can reduce the cost of electricity for transportation fuels.¹⁶⁴ Warehouse operators who install ZE charging or fueling infrastructure

¹⁶³ Example: <https://crt.sce.com/overview>

¹⁶⁴ Information about CARB's program is available here: <https://ww2.arb.ca.gov/our-work/programs/low-carbon-fuel-standard>

or who use those stations may be able to earn credits and generate revenue from that program. PR 2305 does not limit any activity with respect to the LCFS program.

Response to Comment 79-9

South Coast AQMD Staff has included the WAIRE Program Implementation Guidelines within the Appendix A of the Final Staff Report (pp. 87-110) to help warehouse owners and operators understand how to comply with PR 2305 and PR 316. The metrics for earning WAIRE Points are also clearly outlined in the WAIRE Menu (Table 3 of PR 2305). Warehouse operators may choose from the flexible compliance options of 32 actions and investments offered in the WAIRE Menu, propose a Custom WAIRE Plan, or the optional mitigation fee, however, it is not required that warehouse owners or operators pay the optional mitigation fee for rule compliance. See Master Responses 2 and 10 for discussions on feasibility and the mitigation fee.

Response to Comment 79-10

See the Socioeconomic Impact Assessment and Master Responses 2, 5, 7 and 10 for discussions on feasibility, economic impacts, legal authority, and the mitigation fee. Thank you for your interest in the warehouse ISR and comments.

Response to Comment Letter 80-GRID – 3/18/2021

Response to Comment 80-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 80-2

The comment correctly states that installation and usage of solar panel systems at warehouses can earn WAIRE Points and that the use of solar panels reduces the reliance on fossil fuel powerplants (including natural gas fueled powerplants in South Coast AQMD's jurisdiction), which would reduce emissions.

Response to Comment 80-3

South Coast AQMD staff appreciates the workforce support and training provided by the commenter.

Response to Comment 80-4

Thank you for your comments and interest in the warehouse ISR.

Response to Comment Letter 81 – PLG – March 23, 2021

Response to Comment 81-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. We also appreciate the opportunity provided for continued discussion after this letter was submitted.

Response to Comment 81-2

See the Socioeconomic Impact Assessment and Master Responses 2a, 2c, and 6 for discussions on feasibility for warehouse operators that do not own or operate truck fleets and jobs. Many warehouses do contract with truck fleets, and others like yourselves may also own and operate trucks. Warehouse operators that do not have the ability to contract with truck fleets have other compliance options available to them.

Response to Comment 81-3

PR 2305 offers flexibility in a warehouse operator being able to choose from a combination of 32 WAIRE Menu options, a Custom WAIRE Plan, an optional mitigation fee which is not a tax, or a combination of all. See the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax. As an example, during subsequent conversation with the commenter there were other potential options identified in the WAIRE Menu that would work for their specific operation that could be used for compliance without any need for paying the optional mitigation fee, such as yard trucks, charging stations, or acquiring NZE trucks themselves in their own fleet.

Response to Comment 81-4

As discussed above in Response to Comment 81-3, the proposed rules do not impose a tax. For an understanding of emissions from warehouses, South Coast AQMD Staff has included an estimated baseline emissions inventory of NO_x and diesel PM in 2019, 2023, and 2031 for the 2,902 warehouses expected to be required to earn WAIRE Points under PR 2305 (Final Staff Report, pp. 47-52). The ~45 tons per day of NO_x in 2019 from warehouses in are almost as large as all stationary sources in South Coast AQMD (which are about 48 tons per day).¹⁶⁵ The South Coast AQMD's jurisdiction is currently classified as being in extreme nonattainment status for the federal NAAQS ozone standards, and serious nonattainment for the federal fine Particulate Matter (PM 2.5) standards (Final Staff Report, p. 7). Additional actions are needed beyond current conditions to reach attainment status. See Figure 1 and Figure 2 of the Final Staff Report for a summary of baseline emission conditions and control strategies for reaching attainment. See Master Response 9 for a discussion on the actions needed to clean up California's goods supply chain.

Response to Comment 81-5

While the maximum cost that warehouse operators would be expected to incur is about \$0.83/sq. ft./yr, or approximately \$670 million per year, 13 out of 19 scenarios analyzed had costs of \$0.23/sf/yr or less. This is expected to result in <1% of an operator's total operating

¹⁶⁵ <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-iii.pdf>

cost, and would be less than the normal increases that the warehouse industry faces every year just from increasing rents. See the Socioeconomic Impact Assessment and Master Response 1, 4, and 5 for discussions on the costs, the growth of the warehousing industry, and economic impacts during the COVID-19 pandemic.

Response to Comment 81-6

See the Socioeconomic Impact Assessment and Master Response 6 for a discussion on jobs.

Response to Comment 81-7

See the Socioeconomic Impact Assessment and Master Responses 4 and 6 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and jobs. As stated in previous responses, PR 2305 offers flexibility by offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which is therefore not a tax as described in the responses to Comment Letter 39.

Response to Comment 81-8

See Master Responses 2a and 2d for discussions on feasibility for warehouse operators that do not control fleets and technology availability. In addition, there is no penalty for warehouse operators who have already installed solar or EV charging improvements. PR 2305 is structured so that warehouse operators can earn WAIRE Points for the use of that previously installed equipment.

Response to Comment 81-9

Thank you for your comments and interest in the warehouse ISR.

Response to Comment Letter –82-Dart – 3/24/2021

Response to Comment 82-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention

Response to Comment 82-2

See Master Response 3, 7 and 8 for discussions on air quality benefit, legal authority, and concerns on duplicative effort.

Response to Comment 82-3

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, and 7 for discussions on costs, air quality benefit, the growth of warehousing industry, and legal authority. Additionally, see responses to Comment Letter 39 for discussions on why PR 2305 does not constitute a tax. In addition, a sunset date has been added to PR 2305 after this comment was provided. The options to comply with PR 2305 are not arbitrary, as each compliance option addresses emissions associated with warehouses. The flexible approach built into PR 2305 (including a menu with 32 options, a custom plan approach, and a mitigation fee) addresses the concerns raised by industry stakeholders during the rulemaking process. PR 2305 does not impose any taxes (see Response to Comment Letter 39), nor does it regulate the trucking industry as PR 2305 is applicable to warehouse operators. Potential economic impacts of PR 2305 are described in the Socioeconomic Impact Assessment, including the monetized public health benefits that are estimated to be about three times higher than the compliance costs for the rule for most scenarios analyzed.

Response to Comment 82-4

Thank you for your comments and interest in the warehouse ISR. The comment letter and response will be available for review by South Coast AQMD Board Members.

Response to Comment Letter –83_ Operon Group – 3/17/2021

Response to Comment 83-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for a discussion on the growth of warehousing industry during the COVID-19 pandemic.

Response to Comment 83-2

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Response 4 for a discussion on the warehousing industry's growth during the COVID-19 pandemic.

Response to Comment 83-3

The potential costs stated by the commenter are inaccurate, as the potential cost ranges are significantly lower. The commenter did not mention the growth of the warehousing industry during the COVID-19 pandemic. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 83-4

See Master Responses 2a through 2c for discussions on feasibility.

Response to Comment 83-5

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 83-6

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 83-7

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on jobs and economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 83-8

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 83-9

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 83-10

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 84 – Tech Data – March 29, 2021

Response to Comment 84-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for a discussion on the growth of warehousing industry during the COVID-19 pandemic.

Response to Comment 84-2

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Response to Comment Letter 85 - BOMA – 3/8/2021

Response to Comment 85-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 85-2

See Master Response 3 and 4 for discussions on air quality benefits and the growth of warehousing industry during the COVID-19 pandemic.

Response to Comment 85-3

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Response 4 for a discussion on the warehousing industry's growth during the COVID-19 pandemic.

Response to Comment 85-4

The potential costs stated by the commenter are inaccurate, as the potential cost ranges are significantly lower. The commenter did not mention the growth of the warehousing industry during the COVID-19 pandemic. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 85-5

See Master Responses 2a through 2c for discussions on feasibility.

Response to Comment 85-6

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 85-7

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 85-8

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on jobs and economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 85-9

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on jobs and economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 85-10

The opinion expressed by the commenter about increasing costs tied to increasing numbers of installations is contrary to how the market has behaved in the past, and is expected to continue to behave in the future. As an example, there have been many technology advancements in recent years in solar panels that have made them lighter, more efficient, and more flexible which allows for them to be installed in more applications that have led to a decrease in overall installation costs. According to a report released by the National Renewable Energy Laboratory, the reduction in installation cost in solar panels and improvements in operation, system design and technology have resulted in significant cost reduction in the sector, all while solar installations have increased.¹⁶⁶ Regardless, the potential economic impacts of PR 2305 and PR 316 have been evaluated in the Socioeconomic Impact Assessment and in the Final Staff Report.

The WAIRE Menu offer different options of compliance to offer flexibility to warehouse operators that best suits their business needs. To comply with PR 2305, warehouse operators can choose to implement up to 32 different WAIRE menu actions, a Custom WAIRE Plan, pay the optional mitigation fee, or a combination of the three. Currently, only about 214 of the potential 3,320 warehouses subject to PR 2305 have existing solar panels installed. See Master Response 2a and 2c for discussions on other flexibility options of PR 2305.

Response to Comment 85-11

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 85-12

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

¹⁶⁶ <https://www.nrel.gov/docs/fy19osti/72399.pdf>

Response to Comment Letter 86 - Cypress – 4/2/2021

Response to Comment 86-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. The public hearing was postponed and will now take place on May 7, 2021.

Response to Comment 86-2

South Coast AQMD Staff understand the City of Cypress' concern over impacts to the warehousing industry. South Coast AQMD continues to have the worst ozone in the country, and we must meet federal ozone attainment standards by 2023 and 2031 or the region could be subject to substantial sanctions. Additionally, this poor air quality causes serious health issues, especially in the communities surrounding warehouses that are heavily impacted by the disproportionate burden of air pollution due to warehouse operations. PR 2305 offers a flexible menu-based points system that offers 32 WAIRE Menu options utilizing cleaner technology, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment (SIA) and Master Responses 1, 2a, 2c, 3, 5, and 10 for discussions on costs, feasibility, air quality benefits, economic impacts, and the mitigation fee. The analysis in the SIA found that the public health benefits from PR 2305 are about three times higher than the compliance costs for most scenarios modeled.

Response to Comment 86-3

The potential economic impacts of PR 2305 have been evaluated in the Socioeconomic Impact Assessment. In addition, South Coast AQMD commissioned a study to evaluate if warehouses would relocate with PR 2305, and had the study go through third party peer review. The study determined that no warehouses would relocate with the anticipated compliance costs from PR 2305 and PR 316.

Response to Comment 86-4

Thank you for your interest in the warehouse ISR and your comments.

Response to Comment Letter 87 – XO Vision – April 8, 2021

Response to Comment 87-1

We believe that the commenter is incorrect, PR 2305 is not a tax, and is certainly not a property tax. PR 2305 offers flexibility by offering warehouse operators 32 options on the WAIRE Menu, the ability to implement a Custom WAIRE Plan specific to their operations, or pay an optional mitigation fee in lieu of completing the other actions. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 87-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 87-3

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 87-4

In the most recent revision to PR 2305 released on April 7, 2021 a sunset provision was added to the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion).

Response to Comment 87-5

See Master Response 3 for a discussion on air quality benefits and the strategy to meet air quality standards. The Final Staff Report provides details on the methodology used to develop the WAIRE Menu based on costs and emission reductions. Appendix A of the Final Staff Report includes the WAIRE Program Implementation Guidelines which provides guidance for warehouse operators to comply with PR 2305.

Response to Comment 87-6

See Master Response 3 for a discussion on the air quality benefits and the strategies to meet attainment of state and federal air quality standards.

Response to Comment 87-7

As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment and Master Responses 1 and 10 for discussions on costs and the mitigation fee. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 87-8

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 88 – Zippyshell – April 9, 2021

Response to Comment 88-1

We believe that the commenter is incorrect, PR 2305 is not a tax. PR 2305 offers flexibility by offering warehouse operators 32 options on the WAIRE Menu, the ability to implement a Custom WAIRE Plan specific to their operations, or pay an optional mitigation fee in lieu of completing the other actions. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 88-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 88-3

In the most recent revision to PR 2305 released on April 7, 2021 a sunset provision was added to the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 88-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 89 - Bob Khalsa - 4/7/2021

Response to Comment 89-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 89-2

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM toward meeting the federal ozone standards for 2023 and 2031 and improve public health. See Master Response 3 and 4 for a discussion on the NO_x emission reduction strategy, air quality benefits, and the growth of the warehousing industry during the COVID-19 pandemic.

Response to Comment 89-3

See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 89-4

See Master Responses 2a, 2c, and 2d for discussions on feasibility and technology availability.

Response to Comment 89-5

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 89-6

See Master Response 6, and the Socioeconomic Impact Assessment for a discussion on jobs.

Response to Comment 89-7

PR 2305 is not a tax. See responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 89-8

See Master Responses 1,3 and the Socioeconomic Impact Assessment for discussions on the NO_x strategy, air quality benefits, and costs. The monetized public health benefits of the rule are expected to be about three times the compliance costs of the rule for most scenarios that were analyzed.

Response to Comment Letter 90 – Silver Spur – April 9, 2021

Response to Comment 90-1

We believe that the commenter is incorrect, PR 2305 is not a tax. PR 2305 offers flexibility by offering warehouse operators 32 options on the WAIRE Menu, the ability to implement a Custom WAIRE Plan specific to their operations, or pay an optional mitigation fee in lieu of completing the other actions. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 90-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts and jobs.

Response to Comment 90-3

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 90-4

In the most recent revision to PR 2305 released on April 7, 2021 a sunset provision was added to the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion).

Response to Comment 90-5

See Master Response 3 for a discussion on air quality benefits and the strategy to meet air quality standards. The Final Staff Report provides details on the methodology used to develop the WAIRE Menu based on costs and emission reductions. Appendix A of the Final Staff Report is the WAIRE Program Implementation Guidelines which provides guidance for warehouse operators to comply with PR 2305. The options to comply with PR 2305 are not arbitrary, as each compliance option addresses emissions associated with warehouses. Flexibility has been added to PR 2305 to address the concerns raised by industry stakeholders during the rulemaking process, however there are no credit provisions within the rule.

Response to Comment 90-6

See Master Response 3 for a discussion on the air quality benefits and the strategies to meet attainment of state and federal air quality standards.

Response to Comment 90-7

As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment and Master Responses 1 and 10 for discussions on costs and the mitigation fee.

Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 90-8

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 91 - Three Way Logistics - 4/9/2021

Response to Comment 91-1

We believe that the commenter is incorrect, PR 2305 is not a tax. PR 2305 offers flexibility by offering warehouse operators 32 options on the WAIRE Menu, the ability to implement a Custom WAIRE Plan specific to their operations, or pay an optional mitigation fee in lieu of completing the other actions. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 91-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 91-3

In the most recent revision to PR 2305 released on April 7, 2021 a sunset provision was added to the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 91-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 92 – SVF Flow Controls – April 9, 2021

Response to Comment 92-1

We believe that the commenter is incorrect, PR 2305 is not a tax. PR 2305 offers flexibility by offering warehouse operators 32 options on the WAIRE Menu, the ability to implement a Custom WAIRE Plan specific to their operations, or pay an optional mitigation fee in lieu of completing the other actions. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 92-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 92-3

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 92-4

In the most recent revision to PR 2305 released on April 7, 2021 a sunset provision was added to the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion).

Response to Comment 92-5

See Master Response 3 for a discussion on air quality benefits and the strategy to meet air quality standards. The Final Staff Report provides details on the methodology used to develop the WAIRE Menu based on costs and emission reductions. Appendix A of the Final Staff Report is the WAIRE Program Implementation Guidelines which provides guidance for warehouse operators to comply with PR 2305. The options to comply with PR 2305 are not arbitrary, as each compliance option addresses emissions associated with warehouses. Flexibility has been added to PR 2305 to address the concerns raised by industry stakeholders during the rulemaking process, however there are no credit provisions within the rule.

Response to Comment 92-6

See Master Response 3 for a discussion on the air quality benefits and the strategies to meet attainment of state and federal air quality standards.

Response to Comment 92-7

As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment and Master Responses 1 and 10 for discussions on costs and the mitigation fee.

Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 92-8

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter –93_WestRock - 4/14/2021

Response to Comment 93-1

Thank you for your participation in the warehouse ISR development process, and bringing your comments to our attention. See Master Responses 1, 4, and the Socioeconomic Impact Assessment for discussions on costs and the growth of the warehousing industry in the last several years. Based on the information in this comment and in information available online and in our records, it is not clear if the commenter is mistaken about the cost of the rule, or if the commenter's warehouses have much higher truck trip rates than average. If the commenter's warehouses had average truck trip rates, the highest cost they would potentially face if they only pay the mitigation fee would be about \$715,000 spread across all three warehouses. Because of the phase in of PR 2305, they would pay less in earlier years, for an average of about \$625,000 over ten years. This very conservative scenario assumes that the warehouse operator would never try to earn WAIRE Points from the trucks incentivized from the WAIRE Mitigation Program. Most of the compliance scenarios analyzed for PR 2305 would cost less than one third of the mitigation fee costs mentioned above.

Response to Comment 93-2

South Coast AQMD staff agrees that the warehouse industry is an essential part of the goods movement system especially during the response to the COVID-19 pandemic. The ongoing COVID-19 pandemic has increased the demand for goods movements in our basin resulting in record activity at the San Pedro Bay Ports and continued low vacancy rates of 4% for warehouses even as lease rates increase annually. The increasing warehouse activity also increases public health risks in disproportionately impacted communities surrounding warehouses. PR 2305 will help address these emission impacts and address the public health issues in the disadvantaged communities. See the Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on the growth of the warehousing industry during the COVID-19 pandemic, economic impacts, and jobs.

Response to Comment 93-3

See Master Responses 2a, 2c, and 3 for discussions on feasibility of complying with PR 2305 for warehouse operators that do not own or operate fleets, emission reduction strategy, and air quality benefits. In addition, the commenter may have additional flexibility as they apparently contract directly with several trucking companies. Other warehouse operators have been able to take advantage of these direct relationships to ensure that the trucking companies they hire use at least some lower emission trucks.

Response to Comment 93-4

Thank you for your comments and interest in the warehouse ISR.

Response to Comment Letter 94 – CHBC – April 15, 2021

Response to Comment 94-1

Thank you for your participation in the rule development process and your support of PR 2305. South Coast AQMD staff's recommended stringency is 0.0025 WAIRE Points per WATT phased in over three-years. The recommended stringency was determined considering the analysis of 19 WAIRE Menu based scenarios that looked at emission reductions and costs, the potential for limited availability of WAIRE Menu options at higher stringencies, the warehouse relocation study commissioned by South Coast AQMD, and the ports' study on the Clean Truck Rate program. The stringency factor of 0.0025 WAIRE Points per WATT is expected to result in significant emission reductions and no warehouse relocations. The emission reductions from PR 2305 would help address the disproportionate burden of air pollution in the communities neighboring warehouses and reduce their exposure to emissions. See also Response to Comment 40-42.

Response to Comment 94-2

South Coast AQMD staff understands the health impact of air pollution on communities near warehouses is an important consideration. PR 2305 is designed to reduce regional and local emissions of NO_x and PM associated with warehouses in order to assist in meeting state and federal air quality standards and improve public health especially in the local communities surrounding warehouses.

Response to Comment 94-3

South Coast AQMD staff agrees that the implementation of PR 2305 will result in the creation of new jobs to support transportation electrification, such as in the installation of ZE charging infrastructure. Please refer to Master Response 6 for a discussion of warehousing employment as related to PR 2305 and PR 316, and the Socioeconomic Impact Assessment that further analyzes the economic impacts.

Response to Comment 94-4

It is true that the installation of air filter systems or the replacement of air filters will not result in any emission reductions (Final Staff Report, pp. 61-63). However, this measure is an important community benefit that can reduce exposure to particulate matter, including toxic diesel particulate matter, which can improve public health outcomes. Because this action does not reduce emissions, it does not receive the same number of WAIRE Points as other actions, which results in this item being more expensive than most other WAIRE Menu items (Table 20 of the Final Staff Report). While this action is not anticipated to be widely used, it may make sense to some operators in particular circumstances with schools, daycares, or other similar land uses nearby. There are an estimated 1,039 daycares and public and private schools located within about 0.5 miles of the 2,902 warehouses that are expected to earn WAIRE Points. By keeping filters in the WAIRE Menu, it provides additional flexibility to warehouse operators, and provides a public health benefit to people affected by pollution associated with warehouses.Response to Comment 94-5

PR 2305 is intended to be submitted to U.S. EPA for inclusion into the SIP. The concern about SIP credit does not consider the full range of options normally available to fold emission

reductions into the SIP inventory. These options are discussed in Appendix D of the Final Staff Report. As an example, the indirect source rule adopted by San Joaquin Valley Air District was approved into the SIP by EPA, but the approval did not include any ‘SIP credit’ for emission reductions. However, the emission reductions achieved by their rule are included as part of normal updates to the mobile source emissions inventory in regular updates by CARB. This includes regular updates to the EMFAC model for on-road vehicles, and various updates to off-road inventories as necessary. This proven example is expected to be the primary process by which SIP creditable emissions reductions would be accounted for with PR 2305 as well. Other prospective SIP creditable emission reductions methods may be possible too with the WAIRE Mitigation Program once funds are received and the program has been established.

Staff will report back to the Mobile Source Committee of the Board every year with updates on the options that warehouses are taking to implement PR 2305, if approved. This reporting will include specifics on the kinds of options chosen to earn WAIRE Points, including filtration systems. In addition, staff anticipates returning to the Board every five years with a technology review of the WAIRE Program, and will make recommendations for updates to the WAIRE Menu at that time, which will include an evaluation of the state of technology and the actions that warehouse operators are implementing to earn WAIRE Points.

Response to Comment 94-6

See Response to Comment 94-4. Staff is planning to continue recommending the inclusion of filters in the WAIRE Menu. Other funding programs are uncertain, and may not cover the broader categories of land uses that PR 2305 allows (e.g., residences).

Response to Comment 94-7

The WAIRE Menu includes the installation of a hydrogen fueling station and the use of a hydrogen fueling station as options to earn WAIRE Points. Onsite hydrogen generation was not included in the WAIRE Menu as it is dependent on many site-specific equipment design variables. Though onsite hydrogen generation is not included in the WAIRE Menu, a warehouse operator can propose it as a Custom WAIRE Plan application if it meets all the requirements for a Custom WAIRE Plan listed in PR 2305 (see PR 2305, Section (d)(4)). Staff is open to working with the commenter or other stakeholders to develop a streamlined approach to include in the WAIRE Implementation Guidelines for some Custom WAIRE Plan approaches (such as hydrogen production) if it appears that a broadly applicable default approach can be developed.

Response to Comment 94-8

South Coast AQMD staff appreciates your acknowledgement.

Response to Comment 94-9

Thank you for your interest in the warehouse ISR development process and your comments.

Response to Comment Letter – 95_NAIOP - 4/14/2021

Response to Comment 95-1

Thank you for your participation in the warehouse ISR development process, South Coast AQMD Staff appreciates the time and effort taken to provide your comments on the warehouse ISR. Legal responses to the CTA/Holland & Knight and CalTax comment letters were posted on the South Coast AQMD website on 4/16/2021, one day after receiving this comment letter.

Response to Comment 95-2

The Response to Comments listed in Appendix E of the Final Staff Report provided Response to Comments 1-30, all subsequent comment letters have been posted on the South Coast AQMD website on a rolling basis as they are submitted and compiled by staff. Legal memos responding to letters from CalTax and CTA were posted on our website on April 16, 2021.

Response to Comment 95-3

South Coast AQMD Staff recognize the importance of providing detailed analysis of PR 2035 to the public and Governing Board, and has engaged in an extensive public process to ensure that information is shared, and opportunities for feedback have been provided.

Response to Comment 95-4

The Response to Comments for letters 31 and beyond are being made available for review with the release of this Board package. Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter 96 – EarthJustice – April 16, 2021

Response to Comment 96-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR. The commenter mentions that South Coast AQMD is required to adopt indirect source rules that address “high-level, localized concentrations of pollutants”, and PR 2305 is designed to achieve this, along with the primary goal of reducing regional pollutants to assist in meeting federal and state air quality standards. Trucks that travel to warehouses emit a variety of pollutants, including NO_x and Particulate Matter (PM). As part of AB 617 efforts, various monitoring campaigns have been conducted to determine how pollutants are spread throughout each AB 617 community, in particular by using mobile monitors (monitoring equipment in a vehicle that collects ambient air quality data while the vehicle is driving). The results from these studies have consistently found that pollutants like NO₂ (a component of NO_x), and black carbon and ultrafine particulates (both components of PM, and markers for Diesel PM) all are found at some of their highest levels near areas of higher truck activity (e.g., freeways), with lower levels found farther away from areas where trucks travel.¹⁶⁷ These findings are consistent with voluminous research that has found high levels of pollutants in the near roadway environment, especially roads carrying diesel trucks.¹⁶⁸

Response to Comment 96-2

The comment accurately states what the Socioeconomic Impact Assessment determined.

Response to Comment 96-3

The COVID-19 pandemic has resulted in negative impacts on public health while the reliance upon goods movement has resulting in increased activity for the goods movement industry. Please refer to Master Responses 4 and 5 for a discussion on impact of the COVID-19 pandemic on the volume of goods and the economy. Additionally, there is a Socioeconomic Impact Assessment for PR 2305 and PR 316 that further analyzes the economic impacts on the goods movement industry.

Response to Comment 96-4

South Coast AQMD Staff understands the importance of prioritizing ZE technology. Currently, the WAIRE Menu includes both NZE and ZE on-road trucks because Class 8 on-road ZE trucks are in demonstration service but are not yet commercially available. By allowing NZE technology in as part of the WAIRE Menu, NZE engines can provide at least a 90% reduction in NO_x emissions immediately when compared to conventional diesel fueled trucks. This reduction of diesel emissions in the near term can improve the public health of the communities

¹⁶⁷ <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/sbm-progress-reports/sbm-neighborhood-truck-traffic---coming-soon.pdf>, <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/wcwlb-progress-reports/wcwlb-truck-traffic-progress-report---august-2020.pdf>, <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/elabhw-progress-reports/elabhw-neighborhood-amp-freeway-truck-traffic---coming-soon.pdf>, <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/sbm-progress-reports/sbm-warehouses---coming-soon.pdf>

¹⁶⁸ <https://www.epa.gov/air-research/research-near-roadway-and-other-near-source-air-pollution>, [http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-\(february-2013\)/chapter-9-final-2012.pdf](http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-(february-2013)/chapter-9-final-2012.pdf)

surrounding warehouses, while at the same time Class 8 on-road ZE trucks and ZE charging and fueling infrastructure are developed and become more widespread and commercially available. Please refer to Master Response 2 for an explanation of rule feasibility, including regarding truck fleets, and specifically Master Response 2d for information on the commercial availability of NZE/ZE truck engines. See Appendix B of PR 2305 and PR 316's Final Staff Report, which contains information on the commercial availability of every technology in the WAIRE Menu.

South Coast AQMD staff's recommended stringency is 0.0025 WAIRE Points per WATT phased in over three-years. The recommended stringency was determined considering the analysis of 19 WAIRE Menu based scenarios that looked at emission reductions and costs, the potential for limited availability of WAIRE Menu options at higher stringencies, the warehouse relocation study commissioned by South Coast AQMD, and the ports' study on the Clean Truck Rate program. The stringency factor of 0.0025 WAIRE Points per WATT is expected to result in significant emission reductions and no warehouse relocations. The emission reductions from PR 2305 would help address the disproportionate burden of air pollution in the communities neighboring warehouses and reduce emissions. See also Response to Comment 40-42.

Response to Comment 96-5

Again, thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment Letter 97_Jacob Ruiz - 4/15/2021

Response to Comment 97-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR. PR 2305 will be considered by the South Coast AQMD Governing Boarding during a public hearing on May 7, 2021.

Response to Comment 97-2

Thank you for your perspective on the impacts of air pollution and unhealthy air.

Response to Comment Letter 98 – Shannon Labuschagne – April 16, 2021

Response to Comment 98-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 98-2

Thank you for your testimony on the impacts of air pollution and unhealthy air.

Response to Comment Letter 99 - Amy Vasquez - 4/15/2021

Response to Comment 99-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 99-2

Thank you for your testimony on the impacts of air pollution and your experience with warehouses.

Response to Comment Letter 100 - Mason - 4/7/2021

Response to Comment 100-1

The commenter is incorrect PR 2305 is not a tax nor does it lead to increased property taxes. PR 2305 offers flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which is not a tax. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 100-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 100-3

The most recent revision to PR 2305 released on April 7, 2021 includes a sunset provision in the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax. Also, the options to comply with PR 2305 are not arbitrary, as each compliance option addresses emissions associated with warehouses.

Response to Comment 100-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 101 – CARB - 4/21/2021

Response to Comment 101-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 101-2

South Coast AQMD staff agrees that the large population of conventional diesel trucks operating in the South Coast Air Basin (SCAB) are a major source of pollutants that leads to increased health impacts for the region and local communities. Immediate emission reductions are needed to improve the public health of the communities surrounding warehouses. Staff agrees that PR 2305 is a complementary piece to CARB's Mobile Source Strategy to address our region's air quality issues.

Response to Comment 101-3

As stated by the commenter, PR 2305 is part of a comprehensive set of strategies to reduce emissions in our region and specifically in the communities near warehouses.

Response to Comment 101-4

Staff agrees with the commenter that South Coast AQMD has clear authority to use its indirect source authority to regulate new and existing warehouses under state and federal law. See Master Response 7 for a discussion on South Coast AQMD's legal authority.

Response to Comment 101-5

As stated by the commenter, PR 2305 is designed to fulfill the control measure identified for warehouses in the U.S. EPA-approved 2016 AQMP (MOB-03).

Response to Comment 101-6

Staff agrees with the commenter that South Coast AQMD has clear authority to adopt PR 2305 and PR 316 under state law.

Response to Comment 101-7

Staff agrees with the commenter's statement that PR 2305 will encourage greater adoption of ZE trucks in South Coast AQMD. These ZE trucks will meet CARB's requirements for truck manufacturers under the Advanced Clean Trucks rule. Similarly, trucks that meet CARB's lowest Optional Low NO_x standards under its Low NO_x Omnibus rule will also be encouraged to have higher adoption rates in South Coast AQMD due to PR 2305.

PR 2305 includes the WAIRE Program which is a flexible menu-base point system that offers a menu of options which serve to not only reduce emissions but to facilitate the early implementation of related CARB regulations while accounting for potential overlaps in emissions. The net result will be that emission reductions will be achieved sooner than, and may be greater than, would have otherwise been expected due to the WAIRE Points functioning as an additional incentive to motivate early action. See Master Response 8 and the Final Staff Report for additional discussion on the potential emission reduction overlap between PR 2305 and CARB regulations. The analysis in the Final Staff Report demonstrates

that PR 2305 will not only ensure that the emission reductions from the statewide ACT and Low NOx Omnibus rules will occur in South Coast AQMD, but that emissions reductions will be greater than what those statewide rules could achieve on their own.

Response to Comment 101-8

Staff anticipates conducting a technology assessment for emission sources related to warehouses every five years, and reporting those results to our Board. Rapid advancements have occurred with on-road ZE technologies in the past several years and are anticipated to continue in the near future. Based on the assessment, staff may recommend updates to the WAIRE Menu to our Board.

Communities throughout the SCAB have been waiting and calling for the warehouse ISR for a long time as they need the immediate emission reductions coupled with the public health benefit. The warehousing industry has been growing for decades even during the COVID-19 pandemic. PR 2305 would start the transition of warehouse operations away from diesel trucks and deploy cleaner technology to bring relief to the communities. Unfortunately, ZE on-road Class 8 trucks are not yet commercially available and there is insufficient charging facilities so NZE technology was included in the program to provide the much needed 90% NOx reductions toward the ozone attainment goals and immediate benefit to public health. PR 2305 is very flexible as it allows warehouse operators to pick options that may fit their business model or allow for preparation for ZE operations in the future by allowing WAIRE Points for infrastructure installations. South Coast AQMD Staff developed the recommended stringency of 0.0025 WAIRE Points per WATT by considering the bounding analysis of 19 WAIRE Menu-based scenarios, the IEc Relocation Study, the Davies Cargo Diversion Study, and the supply of WAIRE Menu options. The current stringency results in significant emission reductions and transition of a previously unregulated industry. See also Response to Comment 40-42.

Response to Comment 101-9

While we share the goal to get to widespread deployment of ZE technologies, they are not expected to be widely available in all applications immediately. Until then, NZE technologies provide a cost-effective solution that provides a 90% reduction in NOx and a 100% reduction in Diesel PM. About 77% of natural gas used for transportation today are also renewable fuels, and can therefore provide a climate benefit.¹⁶⁹ Therefore these NZE options have been included in PR 2305 to maximize the opportunities for near-term emission reductions.

Response to Comment 101-10

South Coast AQMD staff's recommended stringency is 0.0025 WAIRE Points per WATT phased in over three-years. The recommended stringency was determined considering the analysis of 19 WAIRE Menu based scenarios that looked at emission reductions and costs, the potential for limited availability of WARIE Menu options at higher stringencies, the warehouse relocation study commissioned by South Coast AQMD, and the ports' study on the Clean Truck Rate program. The stringency factor of 0.0025 WAIRE Points per WATT is expected to result in significant emission reductions and no warehouse relocations. The emission reductions from PR 2305 would help address the disproportionate burden of air pollution in the

¹⁶⁹ , <https://efiling.energy.ca.gov/getdocument.aspx?tn=236905>, pg. 134.

communities neighboring warehouses and reduce emissions. For most scenarios analyzed, the monetized public health benefits outweigh the compliance costs by about 3:1. See also Response to Comment 40-42.

Response to Comment 101-11

While we share the goal to get to widespread deployment of ZE technologies, they are not expected to be widely available in all applications immediately. Until then, NZE technologies provide a cost-effective solution that provides a 90% reduction in NO_x and a 100% reduction in Diesel PM. About 77% of natural gas used for transportation today are also renewable fuels, and can therefore provide a climate benefit.¹⁷⁰ Therefore these NZE options have been included in PR 2305 to maximize the opportunities for near-term emission reductions. PR 2305 is designed to reduce regional and local emissions, and reduce exposures for communities most impacted by warehouse operations. PR 2305 achieves all of these goals and those stated in the Air Quality Need section of the Final Staff Report.

Response to Comment 101-12

South Coast AQMD Staff agree that lowering the threshold size would increase the potential cumulative emissions reductions benefit of PR 2305. Reducing the size threshold size would increase the population of warehouses, potentially substantially so with up to 52,000 industrial facilities of any size in South Coast AQMD, whereas PR 2305 focuses on the largest ~3,320, 2,902 of which are expected to earn WAIRE Points (see Appendix C of the Final Staff Report). In order to ensure that this program can be effectively administered and enforced, the scope of the regulation has been limited to those facilities expected to have the largest impact on air quality. During future reviews of the WAIRE Program implementation staff will review and report to the Board if potential rule amendments should be considered that broaden its applicability.

Response to Comment 101-13

Thank you for your comments in support of PR 2305.

¹⁷⁰ <https://efiling.energy.ca.gov/getdocument.aspx?tn=236905>, pg. 134.

Response to Comment Letter 102 – Paige Electric - 4/9/2021

Response to Comment 102-1

We disagree with the commenter's assertion that PR 2305 is a tax. PR 2305 is not a tax nor does it lead to increased property taxes. PR 2305 offers flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which is not a tax. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 102-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 102-3

The most recent revision to PR 2305 released on April 7, 2021 included a sunset provision in the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 is not a tax as it offers compliance flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 102-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 103 – Paige Electric - 4/9/2021

Response to Comment 103-1

We disagree with the commenter's assertion that PR 2305 is a tax. PR 2305 is not a tax nor does it lead to increased property taxes. PR 2305 offers flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an option mitigation fee which is not a tax. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 103-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 103-3

The most recent revision to PR 2305 released on April 7, 2021 included a sunset provision in the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 103-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 104 – Rexford Industrial - 4/9/2021

NOTE: Rexford Industrial is a real estate services corporation and not a warehouse operator.

Response to Comment 104-1

We disagree with the commenter's assertion that PR 2305 is a tax. PR 2305 is not a tax nor does it lead to increased property taxes. PR 2305 offers flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which is not a tax. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 104-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 104-3

The most recent revision to PR 2305 released on April 7, 2021 included a sunset provision in the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 104-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 105 - Southwest Carpenters – 4/21/2021

Response to Comment 105-1

The recent revision to the PR 2305 rule language revised the timeline and delayed the first report submission until September 1, 2021, and delayed the first compliance period for the first phase of warehouses six months to January 1, 2022 to December 31, 2022. See Master Responses 4, 5, 6, and the Socioeconomic Impact Report for discussions on the growth of the warehousing industry during the COVID-19 pandemic, economic impacts, and jobs.

Response to Comment 105-2

See Master Responses 4, 5, 6, and the Socioeconomic Impact Report for discussions on the growth of the warehousing industry during the COVID-19 pandemic, economic impacts, and jobs.

Response to Comment 105-3

A thorough analysis of the emission reduction benefits and cost were conducted on PR 2305 including a South Coast AQMD sponsored study on potential warehouse relocations due to regulation. At the proposed stringency the study showed that there would be no warehouse relocations. See Master Response 3 for a discussion on the NOx strategy and air quality benefits. The potential jobs impacts, including on the construction industry and others is included in the Socioeconomic Impact Assessment and Master Response 6. Thank you for your comments and interest in the warehouse indirect source rule.

Response to Comment Letter 106 - Scopelitis, Garvin, Light, Hanson & Feary

Response to Comment 106-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

The comment asserts that PR 2305 is preempted by the FAAAA because, the comment alleges, truck deliveries are a major portion of warehouse-related emissions, and the compliance options related to ZE and NZE “dictat[e]” that motor carriers use equipment other than what the market might favor. The comment asserts that the proposed rule would thus frustrate Congress’s deregulatory objectives under the FAAAA, and that, under *Rowe v. New Hampshire Motor Transport Ass’n*, 504 U.S. 364 (2008), this outcome is preempted.¹⁷¹

The comment provides an incomplete description of the standard for FAAAA preemption. The FAAAA preempts state and local laws “related to a price, route, or service of any motor carrier . . . with respect to the transportation of property.” 49 U.S.C. § 14501(c)(1). While the FAAAA may preempt state laws “having a connection with, or reference to” prices, routes, or services, *Rowe*, 504 U.S. at 370-71, state laws affecting prices, routes, or services “in only a ‘tenuous, remote, or peripheral . . . manner’ with no significant impact on Congress’s

¹⁷¹ The District has previously responded to comments alleging that PR 2305 is preempted by the FAAAA. See Response to Comment 44-4. Portions of that response are reiterated here.

deregulatory objectives” are not preempted. *Cal. Trucking Ass’n v. Su*, 903 F.3d 953, 960 (9th Cir. 2018) (quoting *Rowe*, 552 U.S. at 371).

Contrary to the comment’s conclusion, PR 2305 is materially different from the preempted law in *Rowe*. There, the Court held that a Maine statute that required retailers to use motor carriers providing “a special kind of recipient-verification service” was preempted because it would “require carriers to offer a system of services that the market does not now provide (and which the carriers would prefer not to offer),” and thus had a significant impact on Congress’s deregulatory objectives. *Rowe*, 552 U.S. at 368, 371-72. *Rowe* identified Congress’s objectives as promoting competition, “thereby stimulating ‘efficiency, innovation, and low prices,’ as well as ‘variety’ and ‘quality.’” *Id.* at 371 (quoting *Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 378 (1992)).

In contrast to the law preempted in *Rowe*, PR 2305 does not mandate or prohibit the provision of any particular service and would not frustrate Congress’s deregulatory objectives. The proposed rule does not *require* any particular action at all, but rather provides a menu of options for satisfying a warehouse operator’s WPCO, many of which are wholly unrelated to transportation (e.g., installing renewable energy systems on buildings, installing air filters for sensitive receptors, or adopting a custom plan). Although the proposed rule may encourage certain behaviors (e.g., using ZE or NZE vehicles or reducing annual truck trips), this does not bring it within the scope of FAAAA preemption. *See Dilts v. Penske Logistics, LLC*, 769 F.3d 637, 647 (9th Cir. 2014) (a law is not preempted “just because it shifts incentives and makes it more costly for motor carriers to choose some routes or services relative to others, leading the carriers to . . . make different business decisions”); *see also Bedoya v. Am. Eagle Express, Inc.*, 914 F.3d 812, 825 (3d Cir. 2019) (finding no preemption where a law, among other things, “does not mandate a particular course of action” and “offers carriers various options to comply.”). The flexibility offered by the proposed rule would allow regulated entities to select the most efficient and cost-effective mode of compliance, thereby encouraging innovation in keeping with the deregulatory intent behind the FAAAA. *See Rowe*, 552 U.S. at 371 (describing Congress’ goal as to promote competition, “thereby stimulating ‘efficiency, innovation, and low prices,’ as well as ‘variety’ and ‘quality.’”) (quoting *Morales*, 504 U.S. at 378).

Further, unlike the preempted law in *Rowe*, the proposed rule’s compliance options related to ZE or NZE vehicles concern *equipment* and not services (or routes or prices). Courts have drawn a distinction between regulation of outputs—i.e., transportation services—and regulation of inputs. *Bedoya*, 914 F.3d at 821 (explaining that “[t]he FAAAA’s focus on prices, routes, and service[s] shows that the statute is concerned with the industry’s production outputs,” and not “resource inputs,” including “labor, capital, and technology, which may be regulated by various laws.”); *S.C. Johnson & Son, Inc. v. Transp. Corp. of Am., Inc.*, 697 F.3d 544, 558 (7th Cir. 2012) (same). Regulations of *inputs* are generally not preempted. *Id.*

Even regulations that require carriers to adopt pollution-control technology fall in the category of regulation of resource inputs that are generally not preempted. For example, the Eastern District of California rejected an FAAAA preemption challenge to a CARB rule that required heavy-duty trucks to install filters and upgrade engines to reduce emissions. *Cal. Dump Truck Owners Ass’n v. Nichols*, No. 2:11-cv-00384, 2012 WL 273162 at *4-8 (E.D. Cal. Jan. 30, 2012) (concluding that plaintiff had failed to establish a likelihood of success on the merits). The court held that, even though the rule regulated the technology used in trucks, it did

not bind motor carriers to a particular route or service, and the effects of any technology-related cost increases on prices or services were too attenuated to trigger preemption. *Id.* at *7-8.

Here, as in *Nichols*, warehouse operators' compliance options related to ZE or NZE trucks concern equipment technology and do not bind covered entities to a particular route, price, or service. Moreover, the District's proposed rule is even more remotely related to motor carriers' prices, routes, and services than the rule in *Nichols* because the proposed rule does not *require* covered entities to adopt any particular compliance option. In short, like the rule in *Nichols*, the proposed rule concerns inputs (here, technologies, facilities, equipment, etc.) and lacks the (multiple) prohibited connections to prices, routes, and services that doomed the law in *Rowe*.

Response to Comment 106-2

The comment asserts that PR 2305 is preempted because it would, the comment alleges, oblige warehouse operators to require the use of equipment (ZE or NZE vehicles) that the market does not support, thereby requiring warehouse operators to do what the State itself cannot. As explained in Response to Comment 106-1, above, however, the proposed rule includes many compliance options and does not *require* operators to adopt any particular option. Further, regulations of equipment and technology—like the emissions filters required in *Nichols*—are permissible under and generally not preempted by the FAAAA.

The comment further asserts that the proposed rule is preempted because (1) the elevated cost of low emissions trucks will result in increased motor carrier prices, and (2) the need for motor carriers to consider charging infrastructure and battery range will impact routes and services. A state law is not preempted, however, merely because it may increase the cost of doing business and may factor into decisions regarding prices or routes. *See Dilts*, 769 F.3d at 643, 646 (stating that laws that operate “several steps removed from prices, routes, or services” are not preempted “even if they raise the overall cost of doing business or require a carrier to re-direct or reroute some equipment.”); *Ward v. United Airlines, Inc.*, 986 F.3d 1234, 1243 (9th Cir. 2021) (requiring a showing, for preemption under the identical standard in the Airline Deregulation Act, that the alleged “increased costs would have a ‘significant impact’ on . . . prices, routes, or services” (quoting *Rowe*, 552 U.S. at 375)).

For example, in *Dilts*, the Ninth Circuit rejected the argument that state-mandated meal and rest breaks impermissibly decreased services because drivers would take longer to drive the same distance. 769 F.3d at 648. While the court acknowledged that motor carriers “may have to hire additional drivers or reallocate resources in order to maintain a particular service level,” the law was not preempted because it did not dictate the services motor carriers had to provide. *Id.* The court also rejected the argument that meal breaks necessarily altered routes by requiring drivers to pull off the road. *Id.* at 649. The court stated that such “minor deviations” from routes were not the sort of route control Congress sought to preempt. *Id.* (“Indeed, Congress has made clear that even more onerous route restrictions, such as weight limits on particular roads, are not ‘related to’ routes and therefore are not preempted.”).

Here, as in *Dilts*, PR 2305 includes compliance options related to pollution-control equipment and technology that operate “several steps removed from prices, routes, or services,” and they are thus not preempted even though they may increase costs of doing business and

factor into decisions about routes, prices, and services. While regulated entities may *choose* to require or prefer low-emissions vehicles in their contracts with motor carriers, thereby potentially increasing the costs of business for motor carriers, the proposed rule does not require a motor carrier to provide or abandon any particular service or service level. Further, the need for motor carriers to consider charging infrastructure in planning their routes is analogous to the need to plan for meal and rest breaks. The proposed rule—which does not require adoption of low emissions vehicles—may lead motor carriers to reallocate resources or make “minor deviations” from routes, but it neither indirectly binds motor carriers to particular routes or makes specific routes necessary. *See id.* at 649. Indeed, motor carriers must already factor re-fueling locations into their routes and schedules. *See id.* (“Moreover, drivers already must incorporate into their schedule fuel breaks, pick ups, drop offs and, in some cases, time to install products or wait for their partner to complete an installation.”).

Response to Comment 106-3

The comment asserts that, despite the fact that the proposed rule is “being considered to further important public health and safety goals,” there is no public health exception to FAAAAA preemption. This assertion is superfluous; the proposed rule need not rely on any public health exception because it falls beyond the scope of FAAAAA preemption in the first instance.

Response to Comment Letter 107 - DCG – 4/28/2021

Response to Comment 107-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Response 4 and 5 and the Socioeconomic Impact Assessment for discussions on the warehousing industry's growth and economic impacts during the COVID-19 pandemic.

Response to Comment 107-2

The potential costs stated by the commenter are inaccurate, as the potential cost ranges are significantly lower. While the commenter describes challenges faced during the COVID-19 pandemic, the warehousing industry has actually experienced substantial growth during this time due to increased cargo volumes. See Master Responses 1, 5, and Socioeconomic Impact Assessment for discussions on the potential costs of PR 2305 and economic impacts.

Response to Comment 107-3

See Master Responses 2a through 2c for discussions on feasibility.

Response to Comment 107-4

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 107-5

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 107-6

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on jobs and economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 107-7

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 107-8

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority. As explained in the Responses to Comment Letter 44, PR 2305 does not regulate trucks or trucking companies, but rather is an indirect source regulation that applies to warehouses. A regulation may violate the commerce clause if it imposes burdens on interstate commerce that so outweigh the regulation's benefits that the regulation is unreasonable or irrational. *Pacific Merchant Shipping Ass'n. v. Goldstene*, 639 F. 3d 1154, 1177 (9th Cir. 2011). The comment fails to articulate facts to show that this is the case for PR 2305.

Response to Comment 107-9

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 108 – Pactiv Evergreen – 4/23/2021

Response to Comment 108-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 is applicable to all warehouses in the South Coast AQMD jurisdiction that are at least 100,000 square feet and will be required to comply using PR 2305's flexible compliance options, which can include a Custom Plan option. South Coast AQMD is available to meet with you and discuss options that may work for your facility. See Master Response 2a and 2c for a discussion on feasibility.

Response to Comment 108-2

PR 2305 is a part of the targeted strategy to reduce regional and local NOx and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Responses 3 and 4 for discussions on the strategy to reduce emissions from the warehousing industry and the growth of the warehousing industry.

Response to Comment 108-3

South Coast AQMD sponsored a study on potential warehouse relocation to areas just outside the South Coast AQMD jurisdiction due to regulations. The study found that at the stringency proposed no warehouses are expected to relocate given the amenities of the proximity to the ports, the transportation infrastructure, and the consumer market and labor force in the South Coast AQMD region. See the Socioeconomic Impact Assessment for a discussion on the economic impacts of PR 2305 on the warehousing industry.

Response to Comment 108-4

The potential costs stated by the commenter are inaccurate, as the potential cost ranges are significantly lower. While the commenter describes challenges faced during the COVID-19 pandemic, the warehousing industry has actually experienced substantial growth during this time due to increased cargo volumes. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 108-5

See Master Responses 2a through 2c for discussions on feasibility.

Response to Comment 108-6

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 108-7

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts during the COVID-19 pandemic.

Response to Comment 108-8

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on economic uncertainty related to goods movement and jobs during the COVID-19 pandemic.

Response to Comment 108-9

See Master Response 7 and Responses to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority. As explained in the Responses to Comment Letter 44, PR 3205 does not regulate trucks or trucking companies, but rather is an indirect source regulation that applies to warehouses. A regulation might violate the commerce clause if it imposes burdens on interstate commerce that so outweigh the regulation's benefits that the regulation is unreasonable or irrational. *Pacific Merchant Shipping Ass'n. v. Goldstene*, 639 F. 3d 1154, 1177 (9th Cir. 2011). The comment fails to articulate facts to show that this is the case for PR 2305.

Response to Comment 108-10

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 109 - United – 4/23/2021

Response to Comment 109-1

Thank you for your participation in the warehouse ISR development process, and for bringing your comments to our attention. Staff has not received a comment letter from Airlines 4 America.

Response to Comment 109-2

See Master Response 7 and Responses to Comment Letters 39, 40, 44, and 106 for discussions on the South Coast AQMD legal authority.

Response to Comment 109-3

The Legal Authority section of the Final Staff Report (p. 19-20) provides the appropriate response to the references made by the commenter. However, for further legal discussion on the South Coast AQMD legal authority see Master Response 7 and Responses to Comment Letters 39, 40, 44, and 106.

Response to Comment 109-4

The response to Comment Letter 106 provides the appropriate response to the commenter's concerns on preemption. However, for further legal discussion on the South Coast AQMD legal authority see Master Response 7 and Responses to Comment Letters 39, 40, and 44. The analysis for the Airline Deregulation Act is the same as for the FAAA which is discussed in Responses to Letter 106.. Ward v. United Airlines, Inc., 986 F. 3d. 1234, 1243 n. 2 (9th Cir. 2021). Also, it is unclear if the operations cited by the commenter for aircraft maintenance training and cabin cleaning provisioning fall under the definition of warehousing activity. If they do not, then it may be possible that PR 2305 does not apply to the commenter's warehouse, depending on the amount of space left that is dedicated to warehousing activity. See PR 2305 (d)(1), (d)(7), (e)(2), and (g)(1).

Response to Comment 109-5

The scenario analysis accounts for the potential overlap in emission reductions between PR 2305 and existing CARB regulations. See Master Responses 2a, 2b, 2c, 8 and 10 for discussions on feasibility, concerns on duplicative efforts, and concerns regarding the mitigation fee. The commenter's claim that they do not own or operate fleets traveling to their facility, therefore they would need to pay a mitigation fee is incorrect. First, the operator could work with their clients to see if they could arrange for NZE or ZE trucks to make the shipments to the commenter's warehouse, or they could choose another non-truck option on the WAIRE Menu, or a Custom WAIRE Plan. The comment that the mitigation fees will only go towards ZE fueling/charging infrastructure is incorrect. They will also provide incentives for NZE and ZE trucks. Both the fueling/charging infrastructure and trucks that are incentivized by the WAIRE Mitigation Program will increase the likelihood that these trucks will visit the commenter's warehouse, thus allowing them to earn WAIRE Points and reduce their emissions profile. There are many entities in the goods movement sector whose business models rely on mobile sources that emit pollutants like NO_x and PM including trucking companies, shippers, goods owners, warehouse operators, etc. All entities have a role to play to reduce emissions

and exposures, especially for the communities near their facilities. In the case of PR 2305, many feasible options are included so that warehouse operators can find the option that most suits their needs.

Response to Comment 109-6

The commenter is incorrect, PR 2305 will result in emission reductions toward attainment of the state and federal attainment standards. Whether these emission reductions are assigned to PR 2305, or to another part of the SIP inventory (e.g., incentive programs that are enhanced by PR 2305, future emissions inventories that are updated with cleaner truck fleets due to PR 2305, etc.) is not relevant for warehouse operators. In its approval of the SJVAPCD Indirect Source Rule into the SIP, EPA recognized the benefit of their rule and the emissions reduction potential, even if the emissions are not SIP creditable at the time of approval of the rule into the SIP. See Appendix D and Master Responses 3 and 7 for discussions on the potential SIP credit approach, air quality benefits from PR 2305, and legal authority.

Response to Comment 109-7

Thank you for your comments and interest in the warehouse ISR.

Response to Comment Letter 110 – Environmental Defense Fund – 4/22/2021

Response to Comment 110-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. South Coast AQMD Staff agree that the South Coast Air Basin (SCAB) has the worst air quality in the nation and getting worse due to the emissions from goods movement operations that heavily impact the health of the communities surrounding the warehouses. PR 2305 is needed to reduce emissions from the warehousing industry and improve the public health in the communities surrounding the warehouses.

Response to Comment 110-2

The commenter is referring to Figure 4 of the Final Staff Report (p. 17) which shows the CalEnviroScreen Percentile for communities within a half mile radius from a warehouse which shows the disproportionate burden of air pollution on the communities of color living in the disadvantaged areas surrounding warehouses. Warehouses attract diesel trucks and other emitting equipment to itself and impact the surrounding communities with NOx and DPM emissions. South Coast AQMD staff agree that there are disproportionate impacts of air pollution that negatively impacts these disadvantaged communities surrounding the warehouses which is only increasing due to the high cargo volumes at the ports, the COVID-19 pandemic, and the growth of e-commerce.

Response to Comment 110-3

PR 2305 is designed to offer a flexible menu of clean technology options that warehouse operators would need to implement to reduce emissions NOx and PM or exposure to meet their compliance obligation. Their compliance obligation is based on the number of trucks that visit their warehouse. Incorporating ZE and clean technology leads to immediate emission reductions, facilitates the implementation of other regulations, or provides support for the growth of ZE technology. By design the warehouse operators would use the flexibility of PR 2305 to implement the most cost-effective options available to them to comply with PR 2305. The inclusion of NZE and ZE truck acquisition and usage will increase use of the cleaner technologies and great support and demand to grow assist in growing the technology while earning the warehouse operator WAIRE Points.

Response to Comment 110-4

Thank you for providing the reports. South Coast AQMD Staff has been working with the California Public Utilities Commission, California Energy Commission, and truck makers to advance the development of ZE technology and infrastructure in preparing for California's ZE goals. Currently all of the NZE and ZE technology offered on the WAIRE Menu with the exception of ZE Class 8 on-road trucks are commercially available and in commercial service, with ZE Class 8 on-road trucks expected late 2021 or 2022. The ZETI tool¹⁷² provides additional information on ZE technology including availability. See the Socioeconomic Impact Assessment and Master Response 2d for more information on the cost analysis conducted on the implementation of ZE technology.

¹⁷² . <https://globaldrivetozero.org/tools/zero-emission-technology-inventory/>

Response to Comment 110-5

South Coast AQMD Staff agree that no one policy will result in transforming the market. PR 2305 is one piece of a larger puzzle of strategies to reduce emissions and assist in the transitioning the goods movement industry away from diesel engines. In addition to PR 2305's design to reduce NOx and PM emissions and improve public health, it also seeks to facilitate other regulations by providing WAIRE Points incentives to install ZE charging or fueling infrastructure and NZE/ZE acquisition and usage points to further the support and demand for new NZE and ZE technology. PR 2305 also has local benefit by providing immediate emission reductions to the disproportionately burdened communities surrounding warehouses by motivating warehouses to implement cleaner technology solutions when replacing their diesel equipment.

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 111 – Quidel - 4/8/2021

Response to Comment 111-1

The commenter is mistaken in that PR 2305 is neither a tax nor does it lead to increased property taxes. PR 2305 instead is a regulation that provides a high level of compliance flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which is not a tax. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 111-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 111-3

The most recent revision to PR 2305, released on April 7, 2021 includes a sunset provision in the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for further explanation as to why PR 2305 is not a tax. Also, the options to comply with PR 2305 are not arbitrary, as each compliance option addresses emissions associated with warehouses.

Response to Comment 111-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 112 – Sadaf - 4/16/2021

Response to Comment 112-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 112-2

The commenter is mistaken in that PR 2305 does not impact or add taxes, including property taxes. PR 2305 is instead a regulation that provides compliance flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which is not a tax. See response to Comment Letter 39. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, and economic impacts.

Response to Comment 112-3

South Coast AQMD conducted thorough analysis on the emission reductions and costs of PR 2305, which included a sponsored study on potential warehouse relocations in response to regulation. The study by Industrial Economics, Inc., showed that no warehouses would relocate at the proposed stringency. See the Socioeconomic Impact Assessment and Master Responses 1, 4, and 5 for discussions on costs, the growth of the warehousing industry, and economic impacts during the COVID-19 pandemic.

Response to Comment Letter 113 – Cummins Logistics - 4/20/2021

Response to Comment 113-1

The commenter is mistaken in that PR 2305 is neither a tax nor does it lead to increased property taxes. PR 2305 instead is a regulation that provides compliance flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See Response to Letter 39. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for further explanation why PR 2305 is not a tax.

Response to Comment 113-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 113-3

The most recent revision to PR 2305, released on April 7, 2021, included a sunset provision in the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses, PR 2305 is not a tax but a regulation, offering compliance flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for further explanation as to why PR 2305 is not a tax.

Response to Comment 113-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 114 – HD Supply - 4/19/2021

Response to Comment 114-1

The commenter is mistaken in that PR 2305 is neither a tax nor does it lead to increased property taxes. PR 2305 instead is a regulation that provides compliance flexibility in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which is not a tax. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for a further explanation as to why PR 2305 is not a tax.

Response to Comment 114-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 114-3

The most recent revision to PR 2305, released on April 7, 2021, includes a sunset provision in the rule language. PR 2305 will begin to sunset upon U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 is not a tax as it offers flexibility in 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Response to Comment 114-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 115 – Ryan Ole Hass - 4/7/2021

Response to Comment 115-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 is a part of the targeted strategy to reduce region and local NOx and PM reductions toward meeting the federal ozone standards for 2023 and 2031 and improve public health. See Master Response 3 and 4 for a discussion on the NOx emission reduction strategy, air quality benefits, and the growth of the warehousing industry during the COVID-19 pandemic.

Response to Comment 115-2

See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 115-3

See Master Responses 2a, 2c, and 2d for discussions on feasibility and technology availability.

Response to Comment 115-4

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 115-5

See Master Response 6, and the Socioeconomic Impact Assessment for a discussion on jobs.

Response to Comment 115-6

PR 2305 provides flexible compliance options as it offers 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See responses to Comment Letter 39 for a further explanation as to why PR 2305 is not a tax.

Response to Comment 115-7

See Master Responses 1, 3, and the Socioeconomic Impact Assessment for discussions on the NOx strategy, air quality benefits, and costs.

Response to Comment 115-8

Thank you for your comments and interest in the warehouse ISR.

Response to Comment Letter 116 – Gregg Pawlik - 4/21/2021

Response to Comment 116-1

PR 2305 is a part of the targeted strategy to reduce region and local NO_x and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. See Master Response 3 and 4 for a discussion on the NO_x emission reduction strategy, air quality benefits, and the growth of the warehousing industry during the COVID-19 pandemic.

Response to Comment 116-2

See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 116-3

See Master Responses 2a, 2c, and 2d for discussions on feasibility and technology availability.

Response to Comment 116-4

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 116-5 See Master Response 6, and the Socioeconomic Impact Assessment for a discussion on jobs.

Response to Comment 116-6

PR 2305 is flexible as it offers 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee which we do not believe is a tax. See responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 116-7

See Master Responses 1, 3, and the Socioeconomic Impact Assessment for discussions on the NO_x strategy, air quality benefits, and costs.

Response to Comment Letter 117 – Mike Kelso, Trimodal – April 7, 2021

Response to Comment 117-1

The PR 2305 cost analysis relies on CARB's ZE truck price forecast table in Table C-7 of their Advanced Clean Trucks Standardized Regulatory Impact Assessment (SRIA) for ZE Class 8 truck acquisition costs in calendar years 2024-2030.¹⁷³ ZE Class 8 truck acquisition costs for calendar years 2022 and 2023 are calculated by linearly interpolating with the calendar year 2024 price estimate and the 2018 calendar year estimate of \$474,930 quoted in the Appendix H: Draft Advanced Clean Trucks Total Cost of Ownership Discussion Document.¹⁷⁴ ZE truck prices vary considerably based on battery size and duty cycle. The ZE Class 8 price forecast in the SRIA is based on a 400 kWh battery with an estimated 140 mile daily range. Price quotes are expected to vary across truck makers, like with any product. The analysis contained in the Socioeconomic Impact Assessment is meant to be representative of costs faced broadly by warehouse operators under PR 2305.

Response to Comment 117-2

For a discussion of replacing diesel Class 8 trucks with ZE trucks, please see Response to Comment 43-35.

The PR 2305 Second Draft Socioeconomic Impact Assessment dated April 2021 assumes a 42,000 annual mileage for ZE Class 8 trucks compared with the 54,000 annual mileage assumed for Diesel Class 8 and NZE Class 8 trucks. The lower annual mileage for ZE Class 8 trucks results in higher estimates of per mile usage costs and per mile total cost of ownership for ZE Class 8 trucks (when compared to the ZE Class 8 trucks with a 54,000 annual range as was assumed in the PR 2305 Draft Socioeconomic Impact Assessment dated March 2021).

Response to Comment 117-3

This comment cites that some customers are looking at alternative ports due to rising rents (which have grown even more than stated by the commenter). The 30% cited by the commenter is not consistent with estimates calculated in the Socioeconomic Impact Assessment and Final Staff Report. That analysis found that for most scenarios the costs would increase by no more than \$0.23/sf/yr, with a worst case of \$0.83/sf/yr. Current rents are about \$10-\$11/sf/yr, and have risen about \$0.50/sf/yr. PR 2305 is expected to impose about 0.5% increase in overall operating costs. Although some customers may be pursuing alternative ports, warehousing overall is growing in South Coast AQMD more than in other regions and larger market forces routinely shift where customers decide to ship goods. Vacancies are very low, even with increasing rents and millions of square feet of new buildings being introduced every year. A study of warehouse relocations was conducted by a third party, and then peer reviewed by an independent reviewer. The analysis concluded warehouses would not relocate to other locations with compliance costs at the level imposed by PR 2305. Although global trade flows shift regularly, this shifting is due to larger macroeconomic forces beyond local regulations and local costs (see Final Staff Report, Chapter 3, Rule Stringency section).

¹⁷³ <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

¹⁷⁴ <https://ww3.arb.ca.gov/regact/2019/act2019/apph.pdf>

Response to Comment Letter 118 - Manuel A. Mancha, City of Moreno Valley Community Development Director – March 16, 2021

Response to Comment 118-1

South Coast AQMD staff recognizes the complexity of the scenario and cost modeling considered in the Draft Socioeconomic Impact Assessment for PR 2305. For more traditional proposed or proposed amended rules, the costs are more straightforward, as they cover mainly facilities known by South Coast AQMD staff, the actions expected to comply are more certain, and the costs of those actions are fairly easily estimated. Each of these factors is highly uncertain in PR 2305, e.g. which warehouse operators are affected, which actions each warehouse operator takes to comply, and how costly each compliance action turns out to be. Therefore, it is reasonable the scenario and cost estimation performed in the Draft Socioeconomic Impact Assessment is complicated.

One way South Coast AQMD staff attempted to make the analysis less complicated, was to present hypothetical compliance “scenarios.” South Coast AQMD staff has developed, modeled, and estimated the costs and health benefits of 19 different compliance scenarios. See Response to Comments 43-2 for additional discussion on the use of scenario modeling for menu-based points systems. For a summary of potential impacts, the commenter is referred to Tables 26 to 31, and 42 in the Socioeconomic Impact Assessment, and Table 20 of the Final Staff Report.

Response to Comment 118-2

South Coast AQMD staff has estimated administrative costs, including those for reporting requirements of PR 2305, and included them into the cost estimates presented in the Draft Socioeconomic Impact Assessment. Since the comment was submitted, PR 2305 was updated to provide more flexibility for warehouse operators to use methods already in place to track truck activity at their warehouses (e.g., for security purposes). In PR 2305 (d)(1)(B), operators are now only required to count trucks using a ‘verifiable and representative’ method, rather than the more stringent method that required a ‘contemporaneous record’ in PR 2305 when the commenter submitted this letter. Staff tried to ensure the administrative cost assumptions are conservative in both the time required to complete each task and the per-hour salary cost to facilities. Moreover, many of the administrative costs, such as camera installations and truck tracking, are already in place at many existing PR 2305 warehouse facilities.

Response to Comment Letter 119 – Cora Went - 4/16/2021

Response to Comment 97-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR. And thank you for your testimony on the impacts of air pollution.

Response to Comment Letter 120 – PWF, LAANE, OCCORD, and WWRC - 04/23/2021

Response to Comment 120-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 is designed to reduce NO_x and PM emissions to attain the federal ozone standards for 2023 and 2031 while facilitating implementation of other regulations, and improving public health in the communities surrounding warehouses. We also recognize that the warehouse industry has been growing for several years and even during the COVID-19 pandemic.

South Coast AQMD staff's recommended stringency for the rule is 0.0025 WAIRE Points per WATT phased in over three-years. The recommended stringency was determined considering the analysis of 19 WAIRE Menu based scenarios that looked at emission reductions and costs, the potential for limited availability of WAIRE Menu options at higher stringencies, the warehouse relocation study commissioned by South Coast AQMD, and the ports' study on the Clean Truck Rate program. The stringency factor of 0.0025 WAIRE Points per WATT is expected to result in significant emission reductions and no warehouse relocations. The proposed stringency can result in significant emission reductions of approximately 10-15% of the baseline for NO_x, and South Coast AQMD staff will routinely report back to the Board to evaluate the efficacy of the rule. The emission reductions from PR 2305 would help address the disproportionate burden of air pollution in the communities neighboring warehouses and reduce emissions. See also Response to Comment 40-42.

Response to Comment 120-2

Thank you for sharing your insights into the warehousing market in our region. Staff agrees that the industry is robust, and is expected to continue to grow if PR 2305 is approved. See Master Responses 4, 5, and the Socioeconomic Impact Assessment for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts on the warehousing industry.

Response to Comment 120-3

South Coast AQMD Staff evaluated the range of warehouse sizes and determined that the largest warehouses have greater emissions than smaller warehouses. If PR 2305 is approved, it will require that South Coast AQMD compliance staff verify compliance for about another 3,320 facilities. It is important to ensure that the program is properly administered before increasing its scope to include many thousands of new facilities. For example, there are a total of about 52,000 industrial properties of any size in South Coast AQMD. Staff will provide annual reports to the Mobile Source Committee of the Board and will recommend potential amendments to the rule if necessary, including considerations of changing the building size threshold.

Response to Comment 120-4

The staff recommended stringency of PR 2305 is 0.0025 WAIRE Points per WATT. See Response to Comment 120-1 for additional discussion of stringency.

Response to Comment 120-5

Thank you for your comment and your interest in the warehouse ISR.

Response to Comment Letter 121 – Lee & Associates – 4/27/2021

Response to Comment 121-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 is a part of the targeted strategy to reduce region and local NO_x and PM emissions to meet the state and federal air quality standards and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Responses 3 and 4 for discussions on the strategy of PR 2305 to reduce emissions and the warehousing industry's growth during the COVID-19 pandemic.

Response to Comment 121-2

The potential costs stated by the commenter are inaccurate, as the potential cost ranges are significantly lower. Further, while there have been economic impacts during the COVID-19 pandemic, the warehousing industry has continued to grow substantially during this time due to the increase in cargo volumes. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 121-3

See Master Responses 2a through 2c for discussions on feasibility.

Response to Comment 121-4

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 121-5

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 121-6

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on jobs and economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 121-7

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 121-8

See Master Response 7 and Responses to Comment Letters 39, 40, 44, and 106 for discussion of South Coast AQMD legal authority. As explained in the Responses to Comment Letter 44, PR 3205 does not regulate trucks or trucking companies, but rather is an indirect source regulation that applies to warehouses. A regulation might violate the commerce clause if it imposes burdens on interstate commerce that so outweigh the regulation's benefits that the regulation is unreasonable or irrational. *Pacific Merchant Shipping Ass'n. v. Goldstene*, 639 F. 3d 1154, 1177 (9th Cir. 2011). The comment fails to articulate facts to show that this is the case for PR 2305.

Response to Comment 121-9

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 122 – Logistics Property Co (10 letters) – 4/28/2021

NOTE: There are 10 identical letters from 10 different Logistics Property Co signatories (Vince Pergande, Robert Hefferman, Mark Glagola, Irma Sahagun, Grace Hidalgo, Cameron Pybus, Jeanne Sok, Maria Peralta, James G. Martell, and William Peltin)

Response to Comment 122-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 is a part of the targeted strategy to reduce region and local NOx and PM emissions to meet the federal ozone standards for 2023 and 2031 and improve public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency. See Master Responses 3 and 4 for discussions on the strategy of PR 2305 to reduce emissions and the warehousing industry's growth during the COVID-19 pandemic.

Response to Comment 122-2

The potential costs stated by the commenter are inaccurate, as the potential cost ranges are significantly lower. Further, while there have been economic impacts during the COVID-19 pandemic, the warehousing industry has continued to grow substantially during this time due to the increase in cargo volumes. See Master Responses 1, 5, and Socioeconomic Impact Assessment for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 122-3

See Master Responses 2a through 2c for discussions on feasibility.

Response to Comment 122-4

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 122-5

See the Socioeconomic Impact Assessment and Master Responses 4 for discussions on the warehousing industry and economic impacts.

Response to Comment 122-6

See Master Responses 4, 5, 6, and the Socioeconomic Impact Assessment for discussions on jobs and economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 122-7

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 122-8

See Master Response 7 and Responses to Comment Letters 39, 40, 44, and 106 for discussion of South Coast AQMD legal authority. As explained in the Responses to Comment Letter 44, PR 3205 does not regulate trucks or trucking companies, but rather is an indirect source regulation that applies to warehouses. A regulation might violate the commerce clause if it imposes burdens on interstate commerce that so outweigh the regulation's benefits that the regulation is unreasonable or irrational. *Pacific Merchant Shipping Ass'n. v. Goldstene*, 639 F. 3d 1154, 1177 (9th Cir. 2011). The comment fails to articulate facts to show that this is the case for PR 2305.

Response to Comment 122-9

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be available for review by South Coast AQMD Governing Board members.

Response to Comment Letter 123 – Great Buy Products - 4/9/2021

Response to Comment 123-1

The commenter's concern that PR 2305 will lead to increased property taxes is incorrect. PR 2305 is an air quality regulation that provides flexible compliance options by offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee to comply. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 123-2

See the Socioeconomic Impact Assessment and Master Responses 1, 3, 4, 5, and 6 for discussions on costs, air quality benefits, the growth of the warehousing industry, economic impacts, and jobs.

Response to Comment 123-3

The most recent revision to PR 2305, released on April 7, 2021, includes a sunset provision in the rule language. PR 2305 will begin to sunset upon the U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 National Ambient Air Quality Standard (NAAQS) for ozone (i.e., 70 parts per billion), and when the California Air Resources Board (CARB) has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion). As stated in previous responses PR 2305 does not increase taxes. Instead, PR 2305 is a flexible air quality regulation offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee. See the Socioeconomic Impact Assessment, Master Response 1, 3, 7, 10, and responses to Comment Letters 40, and 44 for discussions on costs, air quality strategy, the mitigation fee, and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax. Also, the options to comply with PR 2305 are not arbitrary, as each compliance option addresses emissions associated with warehouses.

Response to Comment 123-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

Response to Comment Letter 124 – Rexford Industrial - 4/9/2021

Response to Comment 124-1

The commenter is incorrect, PR 2305 will not result in the increase of property taxes. PR 2305 is instead an air quality regulation that provides flexibility by offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee to comply. See the Socioeconomic Impact Assessment and Master Responses 1, 5, and 7 for discussions on costs, economic impact and legal authority. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Response to Comment 124-2

See the Master Responses 3 and 8 for discussions on air quality benefits and concerns on duplicative regulatory effort. Staff appreciates that the commenter has used innovative leasing and business models to drive environmental initiatives. This same kind of innovative approach can be useful for warehouse operators to comply with PR 2305.

Response to Comment 124-3

PR 2305 is not a tax nor does it lead to increased property taxes. PR 2305 provides flexible compliance pathways in offering 32 WAIRE Menu options, a Custom WAIRE Plan, or an optional mitigation fee,. See the Socioeconomic Impact Assessment and Master Responses 1, 2a, 2c, and 5 for discussions on costs, feasibility, and economic impacts. Additionally, see the responses to Comment Letter 39 for discussions on why PR 2305 is not a tax.

Staff notes that the commenter's most recent financial report was published since the comment letter was submitted.¹⁷⁵ This report shows that even with PR 2305 in place that they project vacancy in their property portfolio to go down in the future, and same property income to increase. Another recent projection by the commenter's firm found that rents are projected to grow over the next five years by 41% in LA County.¹⁷⁶ These projections are consistent with the analysis in the Socioeconomic Impact Assessment that while there will be costs with PR 2305, the industry is expected to be able to absorb increasing costs as part of their normal business and that it will continue to grow. The potential monetized public health benefit of PR 2305 is expected to be about three times higher than the compliance costs for most scenarios that were analyzed in the Final Staff Report.

Response to Comment 124-4

See the Socioeconomic Impact Assessment and Master Responses 4 and 5 for discussions on the growth of the warehousing industry and economic impacts.

¹⁷⁶ https://s21.q4cdn.com/234859041/files/doc_presentations/2021/Final-2021-Rexford-Citi-Investor-Presentation.pdf

Response to Comment Letter 125 – Clean Energy - 04/27/2021

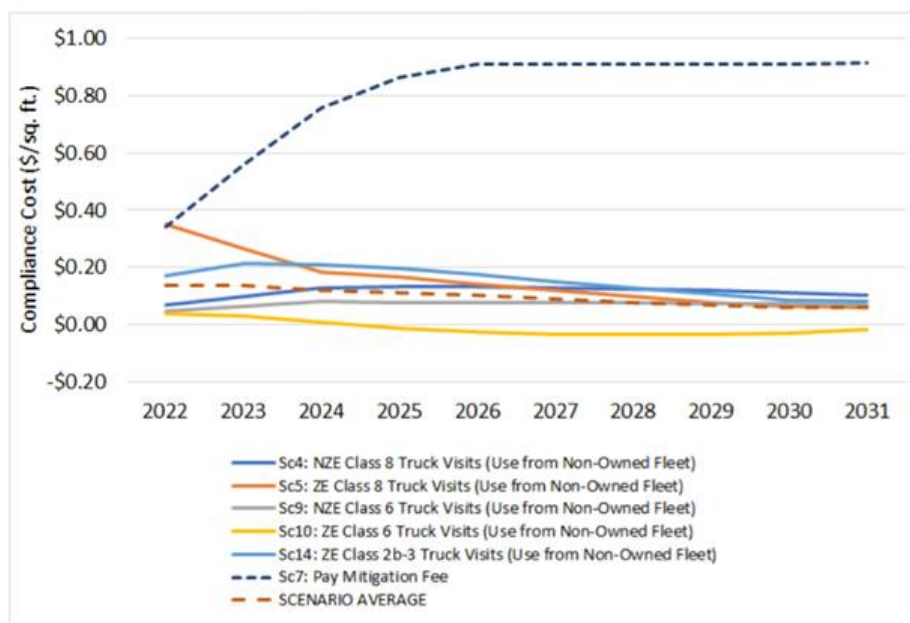

Response to Comment 125-1

The commenter did not state the entire purpose of PR 2305. The purpose, as stated in PR 2305 (a) is:

The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter.

PR 2305 is a unique rule compared to other more traditional stationary source rules. There are many air quality needs that PR 2305 is trying to address (see Air Quality Need section in Chapter 1 of the Final Staff Report), many complementary policies and regulations in development, albeit with longer timelines, and a large and diverse industry with differing needs. PR 2305 is therefore designed to be flexible, while meeting the region's air quality needs. An important consideration with any regulatory development is cost, and PR 2305 is no different. With the flexibility allowed in PR 2305, costs are a reasonable common metric for all compliance actions that can serve as a proxy for the level of effort of a warehouse operator. These costs have therefore been built into the very structure of the WAIRE Points system. The end result is a simplified menu of compliance options that facilitates smoother administration and implementation across all WAIRE Menu items. PR 2305 is expected to result in near term emission reductions, as early as 2022-2023. These near term reductions are expected to occur because warehouse operator's are expected to choose the most cost-effective approach to compliance. As shown in Figure 16 of the Final Staff Report (copied below), NZE class 8 truck visits (Sc. 4) are more cost effective than ZE class 8 truck visits (Sc. 5) until about 2027.

Figure 16: Potential Bounding Analysis Costs from Truck Visits from a Non-owned Fleet

Because of the structure of PR 2305 including costs together with emission reductions in the WAIRE Points system, this cheaper scenario result in greater NOx emission reductions for

NZE class 8 trucks. For example, Scenario 4 (NZE trucks) results in 2.5 tons per day while Scenario 5 (ZE trucks) results in only 2.3 tons per day in 2024 (Table 15 of the Final Staff Report). Warehouse operators are anticipated to gravitate towards the lower cost options of compliance that fits within their operational needs. In the early years, this is expected to be NZE trucks, and the WAIRE Points system encourages this outcome. This also appears to be the goal of the commenter.

Response to Comment 125-2

See Response to Comment 125-1. PR 2305 is designed to achieve emission reductions faster than CARB regulations, including achieving emission reductions in the 2022-2023 timeframe, and in the 2031 timeframe as shown in Table 15 of the Final Staff Report.

Response to Comment 125-3

There are other significant benefits of the current WAIRE Points system's structure in addition to those discussed in Response to Comment 125-1 and 2 above. PR 2305 is different than traditional rules in that it applies to indirect sources, who can have a critical and unique role to play in the transformation of the truck fleet. In particular, on the path to zero emissions trucks in the coming decade, charging and fueling infrastructure could present a significant obstacle. PR 2305 encourages its development at sites that make the most sense to warehouse operators. By including costs in the WAIRE Points system, the installation of the ZE infrastructure can earn WAIRE Points on its own, without needing to wait for it to be utilized. This is an important consideration as these ZE infrastructure projects can take 1-2 years to complete, or more. At the same time, the warehousing industry is dynamic, and short term leases of 3-5 years are common. With approximately 2,900 warehouses required to earn WAIRE Points, it is important that compliance occur over a short period, in this case annually, to ensure that PR 2305 applies equally to all warehouse operators given the significant expected turnover. If costs are taken out of the WAIRE Points system, then it is not clear how installing ZE charging/fueling infrastructure could earn any WAIRE Points until it was used. Given the potentially significant costs and effort associated with these kinds of projects, this effectively discourages the eventual transition to ZE trucks.

Finally, including costs in the WAIRE Points system allows the acquisition and usage of vehicles/equipment to earn WAIRE Points independently. Because of this approach, existing incentive programs should be able to work within the regulatory format of PR 2305. The dynamic of allowing incentives to work within a regulation is unique, but an important consideration given the substantially higher costs of the technologies included in the WAIRE Menu, whether NZE or ZE. By allowing operators to use apply for and use incentive funding, they will be able to reduce the cost of implementation and get more NZE and ZE trucks on the road faster. With increased demand for incentives, it is also possible that the level of incentive funding may be able to be lowered and spread among more award recipients, thus spreading the benefits of the incentives to a broader population.

By removing the cost component from the WAIRE Points system, it is not clear that incentives could still be used in the program and there would be less encouragement of the installation of ZE charging/fueling infrastructure. Both of these outcomes would make PR 2305 a less effective rule. Finally, as a procedural matter this kind of fundamental reshaping of the rule

would likely result in many months of delay to redo from scratch the analysis in the Final Staff Report, Socioeconomic Impact Assessment, and Environmental Assessment. This would also result in a delay of emission reductions.

Response to Comment 125-4

Thank you for your comments and interest in the warehouse ISR.

Response to Comment Letter 126 – Vogel Properties - 4/19/2021

NOTE: Should this Comment Letter have any CEQA concerns, the Final EA can be found in Attachment J.

Response to Comment 126-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. Most of the requirements of PR 2305 are the responsibility of the warehouse operator as they have day to day control of the operations that are the source of emissions. However, as the warehouse owner has unique knowledge about the tenants and leases the warehouse operator is required to submit a Warehouse Operations Notification (WON) which provides basic information on the size of the warehouse, information on the current and previous tenants, lease terms, and square footage leased. If adopted, the WON is due September 1, 2021 and each time there are new tenants or renovations to the warehouse that changes the rentable building area. As the warehousing industry is dynamic, only the warehouse owner would have the most accurate information South Coast AQMD compliance staff would need regarding their building. Very limited reporting is required of the warehouse owner unless they are also the operator, or they wish to exercise the provision of earning WAIRE Points on behalf of the warehouse operator. Regarding the commenters statement of a vacant warehouse, a WON would still be required to report the size of the warehouse and the last tenant.

Response to Comment 126-2

PR 2305 seeks to reduce regional and local NOx and PM emissions to meet attainment of the federal and state air quality standards for ozone and PM, using the authority granted to us. The goods movement sector is the source of more than half of the NOx emissions that cause ozone and trucks are the largest source, and the warehousing category is the largest facility-based sector contributing to those emissions.¹⁷⁷ See Master Response 4 and 7 for discussions on the growth of the warehousing industry and the South Coast AQMD legal authority.

Response to Comment 126-3

If a warehouse operator is concerned with the potential for grid impacts they may choose a different option in the WAIRE Menu, or implement a site-specific Custom Plan, or pay a mitigation fee. Local utility programs are also expanding to address the need for charging infrastructure for heavy duty vehicles.¹⁷⁸ While the local distribution grid at every site may have its own constraints, an analysis by the California Energy Commission determined that the load added to the grid from even wider adoption of truck electrification than PR 2305 would ever require is only about 1-2% higher than their ‘mid-case’ projection, and less than their ‘high-case’ projection. See pg. 78 of the Final Staff Report and Response to Comment 1.11 in the Final Environmental Assessment Appendix X for additional discussion.

Response to Comment 126-4

South Coast AQMD sponsored a study on the potential relocation of warehouses due to regulation. The study found that at the stringency proposed there are no warehouses expected to relocate. In fact, the warehousing industry continues to grow maintaining a low vacancy rate of 4% even as rates are increasing annually, due to the close proximity to the San Pedro Bay ports, developed transportation infrastructure, and a large workforce. See Master Response 4, 5, and the Socioeconomic Impact Assessment for discussions on the growth of the warehousing industry during the COVID-19 pandemic and economic impacts. Thank you for your comments and your interest in the warehouse ISR.

PREFACE

This document constitutes the Final Environmental Assessment (EA) for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305. An Initial Study (IS) was circulated for a 32-day public review and comment period from November 13, 2020 to December 15, 2020 and 12 comment letters were received during the comment period, one comment was received with regards to the California Environmental Quality Act (CEQA) at the CEQA Scoping Meeting, and one comment letter was received after the close of the 32-day comment period. The comments and responses relative to the IS were included in Appendix C of the Draft EA. A Draft EA was circulated for a 45-day public review and comment period from January 26, 2021 to March 12, 2021 and four comment letters were received during the comment period and three comment letters were received after the close of the comment period. The comments and responses relative to the Draft EA are included in Appendix E of this Final EA.

Analysis of Proposed Rule (PR) 2305, the associated mitigation fee program, and PR 316 (also referred to as the proposed project or the WAIRE Program) in the Draft EA indicated that while reducing NO_x emissions is an environmental benefit, significant and unavoidable adverse direct and/or indirect environmental impacts may occur for the following environmental topic areas: 1) aesthetics; 2) agriculture and forestry resources; 3) air quality and greenhouse gas emissions; 4) biological resources; 5) cultural resources; 6) energy; 7) geology and soils; 8) hazardous materials and solid and hazardous waste; 9) hydrology and water quality; 10) mineral resources; 11) noise; 12) transportation; and 13) utilities and service systems. Since significant adverse impacts were identified, an alternatives analysis and mitigation measures were included in the Final EA (CEQA Guidelines Sections 15126.4 and 15126.6).

In addition, subsequent to the release of the Draft EA for public review and comment, minor modifications were made to PR 2305 and PR 316. The minor modifications include: 1) the revision of various reporting and compliance dates; 2) rewording and renumbering of rule language; 3) the revision of provisions for clarity; 4) the addition of provisions to the exemptions; 5) the inclusion of a sunset date for the rule when federal and state ozone standards are met; and 6) near zero emission (NZE) yard trucks allowed as an option under Custom WAIRE Plans. To facilitate identification of the changes between the Draft EA and the Final EA, modifications to the document are included as underlined text and text removed from the document is indicated by ~~strikethrough text~~. To avoid confusion, minor formatting changes are not shown in underline or strikethrough mode.

Subsequent to the release of the Draft EA for public review and comment, modifications were made to PR 2305 and PR 316 and some of the revisions were made in response to verbal and written comments received during the rule development process. Staff has reviewed the modifications to PR 2305 and PR 316 and concluded that none of the revisions constitute significant new information, because: 1) no new significant environmental impacts would result from the project or from a new mitigation measure proposed to be implemented; 2) there is no substantial increase in the severity of an environmental impact; 3) no other feasible project alternative or mitigation measure was identified that would clearly lessen the environmental impacts of the project and was considerably different from others previously analyzed and, 4) the Draft EA did not deprive the public from meaningful review and comment. In addition, revisions to the proposed project in response to verbal or written comments during the rule development process would not create new, unavoidable significant effects. As a result, these revisions to the Draft EA merely clarify, amplify, or make insignificant modifications which do not require

recirculation of the Draft EA pursuant to CEQA Guidelines Sections 15073.5 and 15088.5. Therefore, the Draft EA has been revised to include the aforementioned modifications such that it is now the Final EA for PR 2305 and PR 316.

**SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT
GOVERNING BOARD**

CHAIRMAN: DR. WILLIAM A. BURKE
Speaker of the Assembly Appointee

VICE CHAIRMAN: BEN BENOIT
Mayor Pro Tem, Wildomar
Cities of Riverside County

MEMBERS:

LISA BARTLETT
Supervisor, Fifth District
County of Orange

JOE BUSCAINO
Council Member, 15th District
City of Los Angeles Representative

MICHAEL A. CACCIOTTI
Mayor Pro Tem, South Pasadena
Cities of Los Angeles County/Eastern Region

VANESSA DELGADO
Senate Rules Committee Appointee

GIDEON KRACOV
Governor's Appointee

SHEILA KUEHL
Supervisor, Third District

EXECUTIVE SUMMARY

This EA consists of the following chapters: Chapter 1 – Background; Chapter 2 – Proposed Project; Chapter 3 – Existing Setting, Chapter 4 – Environmental Impact Analysis and Mitigation Measures, Chapter 5 – Alternatives, Chapter 6 – Other CEQA Considerations, and various appendices. The following subsections briefly summarize the contents of each chapter.

SUMMARY OF CHAPTER 1 - BACKGROUND

Chapter 1 includes an introduction of the proposed project and a discussion of the legislative authority that allows the South Coast AQMD to amend and adopt air pollution control rules, identifies general CEQA requirements, and identifies the intended uses of this CEQA document.

SUMMARY OF CHAPTER 2 – PROPOSED PROJECT

The proposed project (also referred to as the WAIRE Program) consists of PR 2305 and the associated mitigation program, and PR 316. PR 316 is a fee rule to allow South Coast AQMD to recover administrative costs associated with implementation of PR 2305. Although PR 316 does not result in environmental changes or impacts and would qualify for a CEQA exemption on its own, the proposed project includes PR 316 for completeness. A copy of PR 2305 and PR 316 can be found in Appendix A1 and A2 of this EA.

Chapter 2 includes the objectives of the proposed project, a description of the various components of the WAIRE Program, the types of facilities subject to the proposed project, and the various compliance options for warehouses subject to the WAIRE Program.

SUMMARY OF CHAPTER 3 – EXISTING SETTING

Chapter 3 includes a description of the environmental topic areas that are potentially adversely affected by the proposed project. The analysis of the proposed project in the Initial Study indicated that additional potentially significant adverse air quality and greenhouse gas emissions, energy, and transportation impacts could occur. In addition, comments on the Initial Study requested that this EA discuss potential impacts from increased use and disposal of batteries and hydrogen fuel cells, and potential indirect impacts from construction of new manufacturing facilities, recycling facilities, and grid improvements. In response, the EA also covers the environmental topics of hazardous materials and solid and hazardous waste, and incorporates by reference the existing setting for other impact areas from the CARB Advanced Clean Trucks Regulation Final Environmental Analysis. Each of these impact areas is discussed briefly below.

Air Quality and Greenhouse Gas Emissions

Air quality within the South Coast AQMD's jurisdiction has shown substantial improvement over the last two decades. Nevertheless, some federal and state air quality standards are still exceeded frequently and by a wide margin. Chapter 3 provides a brief description of the existing air quality setting for each criteria pollutant, as well as the human health effects resulting from exposure to each criteria pollutant. In addition to developing and implementing plans to meet federal and state air quality standards, the South Coast AQMD also works towards controlling emissions of air contaminants and preventing endangerment to public health. As such, South Coast AQMD regulates other pollutants such as toxic air contaminants. Although greenhouse gas emissions are

regulated by the federal and state governments, South Coast AQMD has adopted a policy to consider greenhouse gas impacts in its rulemaking and revisions to the Air Quality Management Plan. Chapter 3 provides a brief description of the existing air quality setting for each criteria pollutant as well as the human health effects resulting from exposure to each criteria pollutant. A discussion of air toxics and greenhouse gases, including relevant laws, regulations, and plans, is also provided in Chapter 3.

Energy

Consumption of petroleum-based fuels plays a major factor in the amount of criteria pollutants and greenhouse gas emissions in the South Coast Air Basin. Alternative fuels and other energy sources play an important role in the strategies to reach attainment. Energy use and consumption ~~is~~ are regulated through various means by federal and state agencies. Several federal and state laws have been enacted to regulate fuel economy standards, mandate environmentally sound transportation planning, increase the use of renewable energy resources and alternative fuels, provide the nation with greater energy independence and security, and adequately plan for California's future energy needs. Relevant energy laws and regulations are summarized in Chapter 3.

Hazardous Materials and Solid and Hazardous Wastes

While conventional vehicles use lead acid batteries, zero emission vehicles most commonly use lithium-ion batteries and, to a lesser extent, nickel metal hydride and nickel cadmium batteries. Zero emission vehicles may also use fuel cells, the most common for hydrogen fueled vehicles being the polymer electrolyte membrane. When vehicle batteries and fuel cells are spent, they need to be disposed of or recycled. There is one facility within the South Coast AQMD jurisdiction capable of recycling conventional lead acid batteries while there are a few companies located throughout North America capable of recycling the other battery types. The various federal and state regulations and plans that govern the disposal of spent batteries and hydrogen fuel cells are summarized in Chapter 3.

Transportation

Regional transportation planning within the South Coast Air Basin is governed by the Southern California Association of Governments (SCAG). SCAG integrates transportation planning activities in the region through their Regional Transportation Plan/Sustainable Communities Strategy, which envisions transportation investments and integrates land use and transportation strategies to assist in achieving the federal ambient air quality standards, and state emission and greenhouse gas reduction targets. Additionally, several federal and state laws and regional and local plans have been enacted to regulate transportation planning, reduction of vehicle miles travelled, and compliance with regional transportation-related air quality standards. Chapter 3 provides a brief overview of the existing and relevant transportation laws, regulations, and plans.

Other Impact Areas

The existing setting for other impact areas, including aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, and utilities and service systems, are incorporated by reference from the CARB Advanced Clean Trucks Regulation Final Environmental Analysis. The potential future construction of new manufacturing and recycling facilities and improvement to the electrical grid are indirect impacts

of the proposed project, and because it would be speculative to analyze these impacts at this time, they are not evaluated at the same level of detail as the direct impacts.

SUMMARY OF CHAPTER 4 – ENVIRONMENTAL IMPACT ANALYSIS AND MITIGATION MEASURES

CEQA Guidelines¹ Section 15126(a) requires a CEQA document to identify and focus on the “significant environmental effects of the proposed project.” Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects. In addition, CEQA Guidelines Section 15126(b) requires a CEQA document to identify the significant environmental effects that cannot be avoided if the proposed project is implemented. CEQA Guidelines Section 15126(c) also requires a CEQA document to consider and discuss the significant irreversible environmental changes that would be involved if the proposed project is implemented. Further, CEQA Guidelines Section 15126(e) requires a CEQA document to consider and discuss mitigation measures proposed to minimize the significant effects. Finally, CEQA Guidelines Section 15130 requires a CEQA document to discuss whether the proposed project has cumulative impacts. Chapter 4 considers and discusses each of these requirements. A consideration and discussion of alternatives to the proposed project, as required by CEQA Guidelines Section 15126.6 ~~45430~~, is provided in Chapter 5 of the EA; a summary of the alternatives analysis is provided in the following section.

Potential Environmental Impacts Found to Be Significant

Air quality and greenhouse gas emissions, energy, hazardous materials and solid and hazardous waste, and transportation have been identified in this EA as having potentially significant adverse direct and indirect impacts if the proposed project is implemented. In addition, indirect impacts associated with the proposed project, including the construction of new manufacturing and recycling facilities and improvements to the electrical grid, are identified in this EA as having potentially significant adverse environmental effects in the following topic areas: aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hydrology and water quality, mineral resources (during operations), noise, and utilities and service systems (during operations).

Potential Environmental Impacts Found Not to Be Significant

This EA is a comprehensive environmental document that analyzes potential environmental impacts from implementing the proposed project. The EA includes an examination of the implementation of best management practices (in the form of WAIRE Menu actions or a Custom WAIRE Plan) and/or mitigation fees at existing or new warehouses subject to the WAIRE Program requirements throughout the entire South Coast AQMD jurisdiction. The Initial Study analyzed the proposed project’s impact in approximately 17 environmental topic areas and concluded that the proposed project would have potentially significant adverse direct and indirect impacts to three topic areas: air quality and greenhouse gas emissions, energy, and transportation. In response to the public comments received on the Initial Study, this EA includes one additional topic area: direct and indirect impacts to hazardous materials and solid and hazardous waste related to disposal of batteries and hydrogen fuel cells, construction waste, and accidental release of liquified natural gas during transportation. In addition, indirect impacts associated with the proposed project,

¹ The CEQA Guidelines, Cal. Code Regs., tit. 14 § 15000 et seq., are referred to herein as “Guidelines.”

including the construction of new manufacturing and recycling facilities and improvements to the electrical grid, are identified in this EA as having potentially significant adverse environmental effects in the following topic areas: aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hydrology and water quality, mineral resources (during operations), noise, and utilities and service systems (during operations). As such, only these topic areas have been evaluated in this EA, and no other environmental topic areas have been evaluated. Thus, the proposed project would have either no significant or less than significant direct and/or indirect adverse effects on the following environmental topic areas:

- air quality and greenhouse gas emissions (long-term air quality impacts and consistency of the proposed project with GHG reduction plans)
- energy (energy impacts during construction)
- hazardous materials and solid and hazardous waste (impacts from routine transport, use, or disposal of batteries)
- land use and planning
- mineral resources (during construction)
- population and housing
- public services
- utilities and service systems (during construction)
- recreation
- transportation (impacts from construction and employee commute trips)
- wildfire

SUMMARY OF CHAPTER 5 – ALTERNATIVES

CEQA Guidelines Section 15126(e) requires a CEQA document to consider and discuss alternatives to the proposed project. Five alternatives to the proposed project are summarized in Table 5-1: 1)-Alternative A – No Project; 2)-Alternative B – Decreased Emission Reductions; 3)-Alternative C – Increased Emission Reductions; 4)-Alternative D – All-Natural Gas Options Only; and 5)-Alternative E – All Electric Options Only. Pursuant to the requirements in CEQA Guidelines Section 15126.6(b) to mitigate or avoid the significant effects that a project may have on the environment, a comparison of the project’s potentially adverse impacts to each of the project alternatives is provided in Chapter 5. When comparing the environmental adverse impacts and evaluating the effectiveness of achieving the project objectives and providing long-term, permanent beneficial effects of the project alternatives particularly Alternative C which would be considered as the lowest toxic alternative and environmentally superior alternative to the proposed project, the proposed project balances achieving the project objectives and the potential adverse impacts.

SUMMARY OF CHAPTER 6 – OTHER CEQA CONSIDERATIONS

CEQA documents are also required to consider and discuss the potential for growth-inducing impacts (CEQA Guidelines Section 15126(d)) and to explain and make findings about the project’s relationship between short-term and long-term environmental goals (CEQA Guidelines Section

15065(a)(2)). Additional analysis confirms that the proposed project could result in significant irreversible environmental changes and the irretrievable commitment of resources. The proposed project would expedite the demand for near zero emission (NZE) and zero emission (ZE) trucks, which may result in an increased production of batteries and fuel cells. The demand for lithium and other mineral sources used in battery production could increase, resulting in a need for increased mineral extraction through mining activities. The proposed project was found to not foster economic or population growth or the construction of additional housing. Further, implementation of the proposed project is not expected to achieve short-term goals to the disadvantage of long-term environmental goals.

CHAPTER 1 BACKGROUND

1.1 INTRODUCTION

The California Legislature created the South Coast Air Quality Management District (South Coast AQMD) in 1977¹ as the agency responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (SCAB) and portions of the Salton Sea Air Basin (SSAB) and Mojave Desert Air Basin (MDAB). In 1977, amendments to the federal Clean Air Act (CAA) included requirements for submitting State Implementation Plans (SIPs) for nonattainment areas that fail to meet all federal ambient air quality standards (CAA Section 172), and similar requirements exist in state law (Health and Safety Code Section 40462). The federal CAA was amended in 1990 to specify attainment dates and SIP requirements for ozone, carbon monoxide (CO), nitrogen dioxide (NO₂), and particulate matter (PM) with an aerodynamic diameter of less than 10 microns (PM₁₀). The United States Environmental Protection Agency (U.S. EPA) is required to periodically update the national ambient air quality standards (NAAQS). In 1997, the U.S. EPA established the first federal standard for ozone averaged over 8 hours, at 0.08 ppm. The federal standard has since been lowered twice, in 2008 to 0.075 ppm and in 2015 to the current 0.070 ppm, based on additional evaluations of the health effects from ozone exposure. In 1997, the ~~United States Environmental Protection Agency~~ (U.S. EPA) also promulgated ambient air quality standards for PM with an aerodynamic diameter less than 2.5 microns (PM_{2.5}). In addition, the California Clean Air Act (CCAA), adopted in 1988, requires the South Coast AQMD to achieve and maintain state ambient air quality standards for ozone, CO, sulfur dioxide (SO₂), and NO₂ by the earliest practicable date.² The CCAA also includes a standard for fine particulate matter, or PM_{2.5}. Notably, for ozone, the current 8-Hour CAAQS and the 2015 8-hour NAAQS are at an equivalent level, and for PM_{2.5}, the current annual CAAQS and the 2012 annual NAAQS are also at an equivalent level.³ As a result, the South Coast AQMD relies on the same measures to meet both federal and state ozone and PM_{2.5} standards. The CCAA also requires a three-year plan review, and, if necessary, an update to the SIP. The CCAA requires air districts to achieve and maintain state standards by the earliest practicable date, and for extreme non-attainment areas, to include all feasible measures pursuant to Health and Safety Code Sections 40913, 40914, and 40920.5. While not defined in this part of the Health and Safety Code, “feasible” is defined in the California Environmental Quality Act (CEQA) Guidelines⁴ Section 15364 as a measure “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.”

¹ The Lewis-Presley Air Quality Management Act, 1976 Cal. Stats., Ch. 324 (codified at Health and Safety Code Section 40400–40540).

² Health and Safety Code Section 40910.

³ There are minor differences in the averaging time for federal and state standards.
<https://ww2.arb.ca.gov/sites/default/files/2020-07/aaqs2.pdf>

⁴ The CEQA Guidelines are codified at Title 14 California Code of Regulations Section 15000 *et seq.*

1.1.1 Air Quality Management Plan

By statute, the South Coast AQMD is required to adopt an air quality management plan (AQMP) demonstrating compliance with all federal and state ambient air quality standards for the areas under the jurisdiction of the South Coast AQMD.⁵ Furthermore, the South Coast AQMD must adopt rules and regulations that carry out the AQMP.⁶ The AQMP is a regional blueprint for how the South Coast AQMD will achieve air quality standards and healthful air, and the 2016 AQMP⁷ contains multiple goals promoting reductions of criteria air pollutants, greenhouse gases (GHGs), and toxic air contaminants (TACs). In particular, the 2016 AQMP states that both oxides of nitrogen (NOx) and volatile organic compound (VOC) emissions need to be addressed, with the emphasis that NOx emission reductions are more effective to reduce the formation of ozone and PM2.5. Ozone is a criteria pollutant shown to adversely affect human health and is formed when VOCs react with NOx in the atmosphere. NOx is a precursor to the formation of ozone, and NOx emission reductions are necessary to attain the ozone standard. NOx emission reductions also contribute to attainment of PM2.5 standards. The 2016 AQMP determined that the “NOx strategy will assist in meeting the annual PM2.5 standard as “expeditiously as practicable” and earlier than the attainment year of 2025.”⁸

To meet air pollution reduction goals, the 2016 AQMP contains a variety of control measures, including Facility-Based Mobile Source Measures (FBMSMs), also known as indirect source measures or rules. An indirect source rule (ISR) is distinct from a traditional air pollution control regulation that focuses on stationary equipment in that an ISR focuses on reducing emissions from the vehicles and other sources of emissions associated with a facility rather than just emissions from a facility itself. The primary goal of the FBMSMs is to reduce NOx emissions as one of many local, state, and federal strategies to meet ozone and PM2.5 NAAQS. NOx is locally and regionally important due to its involvement in the photochemical formation of ozone. Mobile sources associated with goods movement make up about 52% of all NOx emissions in the SCAB.

The FBMSMs described in the 2016 AQMP are concentrated on the four sectors of the goods movement industry: commercial marine ports, rail yards, warehouse distribution centers, and commercial airports. Of these FBMSMs, Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, is committed to exploring how to achieve emission reductions from the warehouse sector.

The South Coast AQMD Governing Board approved the 2016 AQMP in March of 2017 and forwarded that approval to the California Air Resources Board (CARB). Later that month, CARB approved the 2016 AQMP into the SIP, and the 2016 AQMP was ultimately approved by U.S. EPA on October 1, 2019.

A Final Program Environmental Impact Report (EIR) was prepared for the 2016 AQMP and certified in March of 2017. The ~~March 2017~~ 2016 AQMP Final Program EIR⁹ analyzed the

⁵ Health and Safety Code Section 40460(a).

⁸ South Coast Air Quality Management District. 2017, March. Final 2016 Air Quality Management Plan. Page 4-52. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

⁹ South Coast Air Quality Management District. 2017, March. Final Program EIR for the 2016 AQMP. <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfeir.pdf>

environmental impacts from implementation of all the control measures and strategies identified in the 2016 AQMP, including Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers.

Initially, the South Coast AQMD Governing Board authorized a one-year public process to identify if MOB-03 could be achieved through voluntary or regulatory measures, and then ultimately determined in May of 2018 that staff should pursue a regulatory approach.

Consistent with this direction, South Coast AQMD staff has developed Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and the mitigation fee program to implement Control Measure MOB-03, and PR 316 – Fees for Rule 2305, which establishes fees to recover administrative costs associated with compliance activities of PR 2305. The proposed project (also referred to as the WAIRE Program) consists of both PR 2305 and PR 316. PR 2305 is an indirect source rule that South Coast AQMD can adopt under the authority of Health and Safety Code Sections 39002, 39650 through 39669, 40000, 40001, 40440, 40441, 40522.5, 40701, 40702, 40716, 40717, 40725 through 40728, 40910, 40920.5, 41508, 41511, and 41700. The emission reductions from PR 2305 will contribute to meeting commitments for reducing NO_x and PM_{2.5} in the SIP.

Aside from regional air quality benefits, PR 2305 will also have localized air quality benefits. PR 2305 will reduce diesel particulate matter (DPM) from diesel-fueled vehicles such as on-road trucks, off-road yard trucks, and transportation refrigeration units. DPM, which is a component of PM_{2.5}, is a toxic air contaminant and a designated carcinogen by the state of California. DPM emission reductions from PR 2305 will contribute to reduced exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse.

If adopted, PR 2305 would be applicable to any existing or new warehouse located in South Coast AQMD's jurisdiction with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building that may be used for warehousing activities by one or more warehouse operators. At the time of this analysis, approximately 3,320 facilities located throughout South Coast AQMD's jurisdiction would be subject to PR 2305. An estimated 418 of these facilities are expected to only be subject to reporting requirements, and the remaining 2,902 warehouses would be required to comply with additional air quality improvement measures. Warehouse owners or operators of these 2,902 warehouses would be subject to an annual WAIRE Points Compliance Obligation (WPCO). WAIRE Points can be earned by selecting from the following implementation measures in the WAIRE Menu: 1) acquiring and/or using near-zero emissions (NZE) and zero-emission (ZE) trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or transport refrigeration units (TRUs); 4) installing and/or using onsite solar panels; and 5) installing MERV 16 or greater filters or filter systems in residences, schools, daycares, hospitals, or community centers. In addition, warehouse operators may apply to earn WAIRE Points through a Custom WAIRE Plan specific to their operations that satisfies prescribed performance metrics. Custom WAIRE Plans could include measures like NZE yard trucks using renewable fuels and installing offsite fueling/charging infrastructure or implementing new onsite practices to reduce air quality impacts from electricity consumption (such as installing and operating battery storage, or energy management systems to shift when electricity is used).

WAIRE Points may be earned only for “surplus” actions that go beyond existing federal and state regulations that warehouse owners or operators earning WAIRE Points must comply with. In lieu

of satisfying the WPCO via implementation measures, warehouse owners or operators may choose the option to pay a mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve the emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The environmental impacts associated with the mitigation program are similar to implementation of measures to earn WAIRE Points from the WAIRE Menu. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option.

In addition, South Coast AQMD staff has developed PR 316 – Fees for Rule 2305 to establish fees to recover South Coast AQMD administrative costs associated with ensuring compliance, such as submittal and review of various notifications and reports; Custom WAIRE Plan application evaluation; implementing an incentive program using fees from warehouse operators that choose to pay a mitigation fee; as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records. Although PR 316 is statutorily exempt from CEQA, the analysis in this EA considers PR 2305 and PR 316 a “project” as defined by CEQA. Of the requirements in the proposed project, only the components that pertain to PR 2305 could involve physical or operational modifications to warehouses that are subject to the WAIRE Program, and these physical or operational modifications could potentially have an effect on the physical environment.

Implementation of the proposed project is expected to result in NO_x and PM, including DPM, emission reductions and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed. Estimated emission benefits from the proposed project, including any that are creditable towards the SIP, are included in this EA.

1.2 CALIFORNIA ENVIRONMENTAL QUALITY ACT

The California Environmental Quality Act (CEQA) requires that all potentially significant, adverse environmental impacts of proposed projects be evaluated and that methods to reduce or avoid identified significant adverse environmental impacts of these projects be implemented, if feasible. The purpose of the CEQA process is to inform the South Coast AQMD Governing Board, public agencies, and interested parties of potential adverse environmental impacts that could result from implementing the proposed project and to identify feasible mitigation measures or alternatives when an impact is significant.

Public Resources Code Section 21080.5 allows public agencies with regulatory programs to prepare a plan or other written documents in lieu of a negative declaration or environmental impact report once the secretary of the resources agency has certified the regulatory program. The South Coast AQMD's regulatory program was certified by the secretary of resources agency on March 1, 1989 (CEQA Guidelines Section 15251(l)). In addition, the South Coast AQMD adopted Rule 110 – Rule Adoption Procedures to Assure Protection and Enhancement of the Environment, which implements the South Coast AQMD's certified regulatory program. Under the certified regulatory program, the South Coast AQMD typically prepares an Environmental Assessment (EA) to evaluate the environmental impacts for rule projects proposed for adoption or amendment.

The proposed adoption of PR 2305 and PR 316 is a discretionary action subject to South Coast AQMD Governing Board consideration, ~~which~~ that has the potential for resulting in direct or

indirect changes to the environment, and, therefore, is considered a “project” as defined by CEQA (CEQA Guidelines Section 15378). While PR 316 would individually qualify for a statutory exemption under CEQA Guidelines Section 15273 – Rates, Tolls, Fares, and Charges, it is being included as part of the project description for clarity and to give a complete description of the proposed project.

The lead agency is the “public agency that has the principal responsibility for carrying out or approving a project that may have a significant effect upon the environment” (Public Resources Code Section 21067). Since the South Coast AQMD Governing Board has the primary responsibility for approving and carrying out the entire project as a whole, the South Coast AQMD is the most appropriate public agency to act as lead agency for the proposed project (CEQA Guidelines Section 15051(b)).

Implementation of the WAIRE Program is expected to result in NO_x and PM, including DPM, emission reductions and will assist in meeting state and federal air quality standards for ozone and PM_{2.5}. By reducing emissions of DPM, the WAIRE Program is also expected to reduce emissions of toxic air contaminants. While reducing NO_x and PM emissions will result in an environmental benefit, activities that warehouse owners or operators may undertake to comply with the WAIRE Program may also cause potentially significant direct and indirect adverse environmental impacts, including to air quality and greenhouse gas emissions, energy, hazardous materials and solid and hazardous waste, and transportation (traffic). In addition, because the WAIRE Program would incentivize the purchase and use of zero emission vehicles, some comments received on the Initial Study noted that the proposed project could lead to the construction of new manufacturing and battery recycling facilities and improvements to the electrical grid. While it is too speculative to analyze the particular impacts of such development projects, ~~the California Air Resources Board (CARB)~~ provided a general analysis of these potential development projects and the environmental impacts in its Final Environmental Analysis (EA) for the Advanced Clean Trucks (ACT) Regulation. The ACT Regulation is part of the mobile source emission reduction activities at the state level to accelerate a large-scale transition of zero emission vehicles by establishing a new requirement that manufacturers selling new medium- and heavy-duty trucks in California would be required to sell zero-emission trucks at an increasing percentage by 2035. In the Final EA, CARB found that actions taken in response to the ACT Regulation could result in potential indirect physical changes to the environment from potential increases in development projects related to manufacturing, recycling, mining, and grid improvements. This EA acknowledges the potentially significant impacts of such development projects by incorporating CARB’s analysis of these indirect impacts from its Final EA for the ACT Regulation.¹⁰ As discussed below, this EA also tiers off of the ~~2017~~ Final Program EIR for the 2016 AQMP, which ~~also~~ analyzed similar potential indirect impacts of a warehouse indirect source rule.

PR 316 is an administrative rule that is not expected to require any physical modifications that would cause any direct or indirect adverse environmental impacts.

¹⁰ California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Advanced Clean Trucks Regulation. <https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf>.

1.2.1 CEQA Process

1.2.1.1 Notice of Preparation and Initial Study

Notice of Preparation of a Draft Environmental Assessment, Initial Study, and Opportunity for Public Comment for the Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investment to Reduce Emissions (WAIRE) Program, and Proposed Rule 316 – Fees for Regulation XXIII November 2020 (SCH No. 2020110225): In accordance with CEQA, the South Coast AQMD, as Lead Agency, prepared a Notice of Preparation (NOP) of the Draft EA and an Initial Study (IS) to analyze the project level environmental impacts from the proposed project pursuant to its certified regulatory program (Public Resources Code Section 21080.5; CEQA Guidelines Section 15251(l); and South Coast AQMD Rule 110). The NOP/IS included a project description and analysis of potential adverse environmental impacts that could be generated from the proposed project. The NOP/IS served two purposes: 1) to solicit information on the scope of the environmental analysis for the proposed project, and 2) to notify public agencies and the public that the South Coast AQMD will prepare a Draft EA to further assess potential adverse environmental impacts that may result from implementing the proposed project. The EA is a substitute CEQA document (CEQA Guidelines Section 15252), prepared in lieu of an Environmental Impact Report for a project with potentially significant adverse impacts, pursuant to the South Coast AQMD's Certified Regulatory Program. The EA is also a public disclosure document intended to: 1) provide the lead agency, responsible agencies, decision makers and the general public with information on the environmental impacts of the proposed project; and 2) be used as a tool by decision makers to facilitate decision making on the proposed project. The Initial Study concluded that the proposed project could have potentially significant adverse impacts to the environmental topic areas of air quality and greenhouse gas emissions, energy, and transportation (traffic), and those are analyzed further in this EA. The NOP/IS was released for a 320-day public review and comment period from November 13, 2020, to December 15, 2020. During the public comment period, South Coast AQMD received comments related to the environmental impacts associated with the increased disposal of batteries and hydrogen fuel cells and the potential indirect impacts associated with incentivizing the transition to NZE and ZE vehicles (e.g., the construction of new manufacturing facilities, increased lithium mining). Although the Initial Study concluded that the proposed project is expected to result in less than significant impacts on hazardous materials and solid and hazardous waste, the EA analyzes the environmental issues associated with increased disposal of batteries and hydrogen fuel cells and the potential impacts on the battery recycling infrastructure, construction waste, and the accidental release of liquified natural gas during routine transport, use, or disposal. Additionally, the Initial Study also concluded that the proposed project is expected to result in less than significant impacts on aesthetics, agriculture~~al~~ and forestry resources, biological resources, cultural and tribal resources, geology and soils, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, and utilities and service systems; however, this EA analyzes the indirect environmental impacts to these areas to the extent that they may be impacted by potential future construction of new manufacturing and recycling facilities, and improvement to the electrical grid. All CEQA comments received on the NOP/IS during the public comment period and the responses, if necessary, are included in Appendix C.

1.2.1.2 CEQA Scoping Meeting

A virtual CEQA scoping meeting was held on Wednesday, December 2, 2020, at 1:30 PM to inform the public that the proposed project may have statewide, regional, or areawide significance

and to solicit public comment in regard to the type and extent of the environmental analyses to be undertaken in accordance with Public Resources Code Section 21083.9(a)(2) as well as to solicit feedback on the NOP/IS. Approximately 80 people participated in the CEQA scoping meeting. South Coast AQMD staff presented an overview of the proposed rules and the environmental analysis in the IS. Stakeholders provided comments on limited WAIRE Point transfers, WAIRE Point composition, inclusion of pre-existing WAIRE Menu actions, implementation schedule, and the environmental impacts from diesel truck replacements or transfers outside of the South Coast AQMD's jurisdiction. All CEQA comments received on the NOP/IS during the CEQA Scoping Meeting and the responses, if necessary, are included in Appendix C.

1.2.1.3 Environmental Assessment

The Draft EA ~~is being~~ was released and circulated for a 45-day public review and comment period from January 26, 2021, to March 23, 2021. Written comments received during the public review and comment period on the scope of the environmental analysis presented in the Draft EA ~~will be~~ are addressed in the Final EA in Appendix E, Letters Received on the Draft EA and Responses to Comments.

Subsequent to the release of the Draft EA for public review and comment, modifications were made to PR 2305 and PR 316 and some of the revisions were made in response to verbal and written comments received during the rule development process. Staff has reviewed the modifications to PR 2305 and PR 316 and concluded that none of the revisions constitute significant new information, because: 1) no new significant environmental impacts would result from the project or from a new mitigation measure proposed to be implemented; 2) there is no substantial increase in the severity of an environmental impact; 3) no other feasible project alternative or mitigation measures was identified that would clearly lessen the environmental impacts of the project and was considerably different from others previously analyzed and, 4) the Draft EA did not deprive the public from meaningful review and comment. In addition, revisions to the proposed project in response to verbal or written comments during the rule development process would not create new, unavoidable significant effects. As a result, these revisions to the Draft EA merely clarify, amplify, or make insignificant modifications which do not require recirculation of the Draft EA pursuant to CEQA Guidelines Sections 15073.5 and 15088.5. Therefore, the Draft EA has been revised to include the aforementioned modifications such that it is now the Final EA for PR 2305 and PR 316.

Prior to making a decision on the adoption of the proposed project, the South Coast AQMD Governing Board must review and certify the Final EA, including responses to comments received on the Draft EA, as providing adequate information on the potential adverse environmental impacts that may occur as a result of adopting the proposed project.

1.2.2 Other CEQA Documents

Final Program Environmental Impact Report (EIR) for the 2016 Air Quality Management Plan (AQMP), March 2017 (SCH No. 2016071006): The 2016 AQMP identified control measures and strategies to bring the region into attainment with the revoked 1997 8-hour NAAQS (standard) (80 ppb) for ozone by 2024; the 2008 8-hour ozone standard (75 ppb) by 2032; the 2012 annual PM_{2.5} standard (12 µg/m³) by 2025; the 2006 24-hour PM_{2.5} standard (35 µg/m³) by 2019; and the revoked 1979 1-hour ozone standard (120 ppb) by 2023. The 2016 AQMP consists of three components: 1) the South Coast AQMD's Stationary, Area, and Mobile Source Control Measures; 2) State and Federal Control Measures provided by the California Air Resources Board;

and 3) Regional Transportation Strategy and Control Measures provided by the Southern California Association of Governments. The 2016 AQMP includes emission inventories and control measures for stationary, area, and mobile sources, including the facility-based mobile source measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, the most current air quality setting, updated growth projections, new modeling techniques, demonstrations of compliance with state and federal Clean Air Act requirements, and an implementation schedule for adoption of the proposed control strategy. A Final Program EIR was prepared for the project which analyzed each of the proposed control measures, including MOB-03, and identified potential adverse impacts that may result from implementing the project for the following environmental topic areas: 1) aesthetics; 2) air quality and GHGs; 3) energy; 4) hazards and hazardous materials; 5) hydrology and water quality; 6) noise; 7) solid and hazardous waste; and 8) transportation and traffic. The analysis concluded that significant and unavoidable adverse environmental impacts from the 2016 AQMP are expected to occur after implementing mitigation measures for the following environmental topic areas: 1) aesthetics from increased glare and from the construction and operation of catenary lines and use of bonnet technology for ships; 2) construction air quality and GHGs; 3) energy (due to increased electricity demand); 4) hazards and hazardous materials due to: (a) increased flammability of solvents; (b) storage, accidental release, and transportation of ammonia; (c) storage and transportation of liquefied natural gas (LNG); and (d) proximity to schools; 5) hydrology (water demand); 6) construction noise and vibration; 7) solid construction waste and operational waste from vehicle and equipment scrapping; and 8) transportation and traffic during construction and during operation on roadways with catenary lines and at the harbors. Since significant adverse environmental impacts were identified, an alternatives analysis was required by CEQA and prepared. The ~~March 2017~~ 2016 AQMP Final Program EIR concluded that the project would have significant and unavoidable adverse environmental impacts even after mitigation measures were identified and applied. As such, mitigation measures were made a condition of the approval of the project and a Mitigation Monitoring and Reporting Plan was adopted. Findings were made and a Statement of Overriding Considerations was prepared and adopted. The South Coast AQMD Governing Board certified the Final Program EIR and approved the project on March 3, 2017. This document can be obtained by visiting the following website-at: <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd/projects/2016/2016aqmpfpeir.pdf>.

The 2016 AQMP can be obtained by visiting the following website: <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>.

The proposed project is consistent with, and implements, the 2016 AQMP, in particular MOB-03 – Emission Reductions at Warehouse Distribution Centers.

Final Environmental Analysis (EA) for the Advanced Clean Trucks (ACT) Regulation, June 2020 (SCH No. 2018052041): The ACT Regulation established a new requirement that manufacturers selling new medium- and heavy-duty trucks in California would be required to sell zero-emission trucks at an increasing percentage by 2035. Additionally, the ACT Regulation established reporting requirements for large employers and fleet owners. A Final EA was prepared for the project which programmatically analyzed a reasonably foreseeable compliance response scenario and identified potential adverse indirect impacts that may result from implementing the project for the following environmental topic areas: 1) aesthetics; 2) agriculture and forestry resources; 3) air quality; 4) biological resources; 5) cultural resources; 6) geology and soils; 7) hazards and hazardous materials; 8) hydrology and water quality; 9) mineral resources; 10) noise;

11) transportation/traffic; and 12) utilities and service systems. The analysis concluded that significant and unavoidable adverse indirect environmental impacts from the ACT Regulation are expected to occur from the potential increase in manufacturing, recycling, mining, and grid improvements after implementing mitigation measures for the following environmental topic areas: 1) aesthetics; 2) agriculture and forestry resources; 3) construction air quality; 4) biological resources; 5) cultural resources; 6) geology and soils; 7) hazards and hazardous materials; 8) hydrology and water quality; 9) mineral resources; 10) noise; 11) transportation/traffic; and 12) utilities and service systems. The Final EA concluded that the project would have significant and unavoidable adverse indirect environmental impacts even after mitigation measures were identified and applied.¹¹

1.3 INTENDED USES OF THIS DOCUMENT

In general, a CEQA document is an informational document that informs a public agency's decision-makers and the public generally of potentially significant adverse environmental effects of a project, identifies possible ways to avoid or minimize the significant effects, and describes reasonable alternatives to the project (CEQA Guidelines Section 15121). A public agency's decision-makers must consider the information in a CEQA document prior to making a decision on the project. Accordingly, this EA is intended to: a) provide the South Coast AQMD Governing Board and the public with information on the environmental effects of the proposed project; and b) be used as a tool by the South Coast AQMD Governing Board to facilitate decision-making on the proposed project.

Additionally, CEQA Guidelines Section 15124(d)(1) requires a public agency to identify the following specific types of intended uses of a CEQA document:

1. A list of the agencies that are expected to use the EA in their decision-making.
2. A list of permits and other approvals required to implement the project.~~;~~~~and~~
3. A list of related environmental review and consultation requirements required by federal, state, or local laws, regulations, or policies.

To the extent that local public agencies, such as cities, county planning commissions, et cetera, are responsible for making land use and planning decisions related to projects that must comply with the requirements of the proposed project, they could possibly rely on this EA during their decision-making process. Similarly, other public agencies approving projects subject to PR 2305 and PR 316 may choose to rely on this EA.

There are no South Coast AQMD permits required to implement the proposed project. Instead, regulated warehouse owners or operators will be required to submit reports and/or compliance plans. However, certain measures selected by warehouse owners or operators to comply with the proposed project, such as installing charging infrastructure, may require local government permits and approvals by other public agencies, such as public utilities. It is not possible to predict which measures will be selected by warehouses subject to the proposed project or what type of approvals

¹¹ California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Advanced Clean Trucks Regulation. <https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf>.

may be required by those agencies. Therefore, it is speculative to list local permits and other actions and approvals that will be required to implement the proposed project.

In addition to the South Coast AQMD's Governing Board, which will consider the EA for the proposed project in their decision-making, ~~the California Air Resources Board (CARB)~~, a state agency, and the U.S. EPA, a federal agency, will be reviewing PR 2305 and PR 316 and all supporting documents as part of the process for considering the inclusion of PR 2305 into the SIP. Moreover, PR 2305 and PR 316 are not subject to any other related environmental review or consultation requirements.

1.3.1 Tiering and Incorporation by Reference

1.3.1.1 Tiering

This EA tiers off of the ~~2017~~ Final Program EIR for the 2016 AQMP¹² (SCH No. 2016071006) (also referred to as “2016 AQMP Final Program EIR”), pursuant to Public Resources Code Section 21094 and Guidelines Section 15152 (g). The 2016 AQMP Final Program EIR analyzed a number of air pollution control measures to be implemented by South Coast AQMD, including Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, which required the assessment and identification of potential actions to reduce emissions associated with mobile sources operating in and out of warehouse distribution centers.

CEQA encourages tiering whenever feasible (Public Resources Code Section 21093). “Tiering” or “tier” means the coverage of general matters and environmental effects in an environmental impact report prepared for a policy, plan, program or ordinance followed by narrower or site-specific environmental impact reports which incorporate by reference the discussion in any prior environmental impact report and which concentrate on the environmental effects which (a) are capable of being mitigated, or (b) were not analyzed as significant effects on the environment in the prior environmental impact report (Public Resources Code, Section 21094(a), Section 21068.5).

The 2016 AQMP Final Program EIR concluded that implementation of the AQMP, including Control Measure MOB-03, would have significant and unavoidable impacts in the following areas 1) aesthetics from increased glare from solar panels and from the construction and operation of catenary lines and use of bonnet technology for ships; 2) construction air quality and GHGs; 3) energy (due to increased electricity demand); 4) hazards and hazardous materials due to: (a) increased flammability of solvents; (b) storage, accidental release, and transportation of ammonia; (c) storage and transportation of liquefied natural gas (LNG); and (d) proximity to schools; 5) hydrology (water demand); 6) construction noise and vibration; 7) solid construction waste and operational waste from vehicle and equipment scrapping; and 8) transportation and traffic during construction and during operation on roadways with catenary lines and at the harbors. It also concluded that implementation of the AQMP would have significant and unavoidable cumulative impacts. The proposed project is consistent with the AQMP, as it implements Control Measure MOB-03.

In analyzing the potential impacts of Control Measure MOB-03 in particular, the 2016 AQMP Final Program EIR generally noted that this measure could have impacts associated with

¹² South Coast Air Quality Management District. 2017, March. Final Program EIR for the 2016 AQMP. <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfeir.pdf>

incentivizing increased acquisition and use of zero-emission vehicles, including impacts associated with constructing infrastructure to provide support for these vehicles, increased use of electricity and alternative fuels, and increased vehicle scrapping. See, e.g., 2016 AQMP Final Program EIR at 4.1-17. Impacts associated with other measures in the AQMP included potential installation of solar panels and cool roof technology. See, e.g., 2016 AQMP Final Program EIR at 4.5-5 (discussing potential noise impacts from installation). The 2016 AQMP Final Program EIR did not specifically analyze potential impacts associated with the construction of new manufacturing plants or recycling facilities.

Pursuant to CEQA, as long as a program EIR has adequately addressed a potentially significant impact, the later EIR need not provide further analysis. See CEQA Guidelines Section 15152(f); CEQA Section 21093 (“tiering is appropriate when it helps a public agency . . . exclude duplicative analysis of environmental effects examined in previous environmental impact reports”). An impact has been adequately addressed if it has been examined at a sufficient level of detail in the prior environmental impact report to enable the lead agency and public to consider whether those effects can be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the later project. See CEQA Guidelines Section 15152(f); ~~2-Practice Under CEQA, Section 10.10~~. The 2016 AQMP Final Program EIR adequately addressed the following potentially significant impacts, which, according to the 2016 AQMP Final Program EIR, could result from Control Measure MOB-03. This EA also incorporates the cited 2016 AQMP Final Program EIR analysis by reference. See CEQA Guidelines Section 15150.

1. **Energy:** “The 2016 AQMP could result in a substantial increase in electricity use (greater than one percent of the existing electricity use in the Basin), and the increased electricity demand is considered significant.” 2016 AQMP Final Program EIR 4.10-4.

The 2016 AQMP Final Program EIR stated that “the electricity consumption impacts [associated with increased penetration of ZE vehicles] are significant because the potential 2024 electricity usage increase would exceed baseline electricity consumption by 7.8 to 12.7 percent.” Given that it is uncertain how much impact the proposed project will have with respect to increasing penetration of ZE vehicles, the 2016 AQMP Final Program EIR’s analysis of this potential impact was adequate. Nonetheless, this EA provides additional analysis of this potential impact in the Energy discussion, ~~below~~, to provide a conservative estimate of impacts under the proposed rule.

2. **Hazards:** “Hazard impacts associated with a tank rupture and the transportation of LNG were determined to be significant, and would remain significant after mitigation.” 2016 AQMP Final Program EIR 4.10-4.

Because Control Measure MOB-03 would incentivize the acquisition and use of natural gas vehicles, thereby increasing the demand for LNG fuel, the 2016 AQMP Final Program EIR concluded that MOB-03 could contribute to this potentially significant impact. Given that it is uncertain how much impact the proposed project will have with respect to increasing use of natural gas vehicles, the 2016 AQMP Final Program EIR’s analysis of this potential impact was adequate. The EA incorporates this analysis by reference in the Hazards discussion, ~~below~~.

3. **Noise:** “Noise and vibration impacts would be temporary in nature and related solely to construction activities, but are considered significant, even after mitigation.” 2016 AQMP Final Program EIR 4.10-4.

The 2016 AQMP Final Program EIR stated: “Potential noise impacts associated with the 2016 AQMP relate primarily to construction activities which could include the construction related to the: 1) installation of air pollution control equipment, (e.g., enclosures and filtration systems); 2) replacement of existing equipment; 3) installation of roadway infrastructure (wayside power and catenary lines or other similar technologies); 4) installation of battery charging or fueling infrastructure; and, 5) installation of solar panels, cool roof technology, and water heaters.” Given that it is uncertain how much of this type of construction will result from implementing the proposed project, the 2016 AQMP Final Program EIR’s analysis of this potential impact was adequate. The EA incorporates this analysis by reference in the Noise discussion, below.

4. **Solid and Hazardous Waste:** “The extent and timing of construction needed to implement the 2016 AQMP is not known at this time, but the potential to exceed landfill capacities from construction waste was found to be significant. Additionally, the high volume of vehicle and equipment to retire in a short timeframe and uncertainty of their outcome would result in potential significant solid and hazardous waste impacts.” 2016 AQMP Final Program EIR 4.10-5.

Pursuant to the 2016 AQMP Final Program EIR, Control Measure MOB-03 could contribute to this significant impact by incentivizing the use of ZE vehicles (which would require construction of infrastructure) and retirement of older vehicles (which could produce scrapping waste). Given that it is uncertain how much of this type of construction and scrapping will result from implementing the proposed project, the 2016 AQMP Final Program EIR’s analysis of this potential impact was adequate. The EA incorporates this analysis by reference in the Hazard and Hazardous Waste discussion, below.

5. **Aesthetics:** “During construction, the equipment staging and laydown areas would be in close proximity to the location of the control measures and could create a temporary, but significant aesthetic impact due to the degradation of the existing visual character of the site. The installation of catenary lines and use of bonnet technology on ocean going vessels at the ports may substantially degrade the existing visual character or quality of a site and its surroundings and this impact is considered significant.” 2016 AQMP Final Program EIR 4.10-5.
“The installation of solar panels and use of cool roof technology would create a significant source of glare.” 2016 AQMP Final Program EIR 4.10-5.

To the extent the proposed project could result in increased catenary lines, infrastructure construction projects, or installation of solar panels, this analysis of potential aesthetic impacts is sufficiently detailed. The EA incorporates this analysis by reference in the Aesthetic discussion, below.

1.3.1.2 Incorporation by Reference

CEQA also allows lead agencies to incorporate by reference environmental impact analysis prepared in prior EIRs (CEQA Guidelines Section 15150). Comments received during the public review and comment period requested that this EA consider the potential impacts of the

construction of new manufacturing and battery recycling facilities from the increased disposal of batteries and hydrogen fuel cells, and improvements to the electrical grid that could result if warehouse operators choose to comply with the WAIRE Program by purchasing or using zero emission vehicles. These potential indirect impacts of the rule were comprehensively analyzed by ~~the California Air Resources Board~~ CARB in its Final Environmental Analysis for the ACT Regulation (SCH No. 2018052041).¹³ As a result, this EA incorporates by reference the analysis in that document, as described in Chapters 3 and 4.

1.4 AREAS OF CONTROVERSY

CEQA Guidelines Section 15123(b)(2) requires a public agency to identify the areas of controversy in the CEQA document, including issues raised by agencies and the public. Over the course of developing the proposed project, the predominant concerns expressed by representatives of public agencies, industry, and environmental groups, either in public meetings or in written comments, regarding the proposed project are summarized in Table 1-1.

**Table 1-1
Areas of Controversy**

	Area of Controversy	Topics Raised by the Public	South Coast AQMD Staff Evaluation
1.	Inclusion of NZE instead of only ZE technology; availability of Class 8 ZE trucks	The proposed rule will allow the use of equipment that is not ZE, which will continue to cause adverse air quality impacts in communities.	<ul style="list-style-type: none"> • It would not be technologically feasible to require only ZE technology at this time. • ZE demonstration projects such as projects with Volvo and Daimler are being conducted and ongoing. • Potential range limitations due to battery and charging infrastructure are being considered. • Despite these limitations, trucks can be routed to accommodate range limitations. • NZE trucks result in at least 90 percent NOx emissions reductions. • NZE Class 8 trucks are commercially available today and are expected to be significantly cheaper than Class 8 ZE trucks until costs come down for ZE technologies and fuels. • <u>NZE yard trucks that use renewable fuels are allowed for Custom WAIRE Plans.</u>

¹³ California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Advanced Clean Trucks Regulation. <https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf>.

**Table 1-1
Areas of Controversy**

	Area of Controversy	Topics Raised by the Public	South Coast AQMD Staff Evaluation
2.	Compliance Options (e.g., transferring of WAIRE Points or mitigation fee)	Compliance options could allow for the rule to be used as a credit program or allow for a “pay-to-pollute” structure. Additionally, localized impacts may not be adequately addressed when using mitigation fees. Community should be involved in decision of where to use funds.	<ul style="list-style-type: none"> • Compliance options provide flexibility. • Transfer of WAIRE Points are limited to points that are in excess of the WPCO; WAIRE Points transferred to a different warehouse will be discounted. • WAIRE Point transferring provides an incentive for operators of multiple warehouses to build ZE infrastructure at a larger scale early since overcompliance at one site can be used for another site. More and earlier actions to implement ZE and NZE technologies would occur with the transfer options than without. • Fees collected will create new source of funds to reduce pollution in the communities impacted by vehicles and other emissions sources associated with warehouses. • Use of mitigation fees will be prioritized in areas near the warehouses using this compliance option. • PR 2305 proposes to regulate an industry previously not regulated for their emissions. Even if every warehouse owner or operator paid the optional mitigation fees, that would not encourage increased emissions, but would allow for a new source of funds available to reduce emissions from warehouses.
3.	Effect on incentives	Use of incentives (e.g., Carl Moyer) may be discouraged since trucks purchased with incentive funding will not count towards WAIRE Points.	<ul style="list-style-type: none"> • Any limitations on the use of incentive funds with regulations like PR 2305 are tied to the funding programs themselves, not PR 2305. PR 2305 does not place limits on the use of incentive funds. • PR 2305 is designed to work together with voluntary incentive programs as much as possible. While most trucks purchased through incentive funding programs won’t earn WAIRE Points, visits from those trucks are still able to earn WAIRE Points. • Non-state incentives such as Southern California Edison’s Charge Ready Transport can be used and still earn WAIRE Points. • Incentive programs will lower the cost of compliance with PR 2305, and the design

**Table 1-1
Areas of Controversy**

	Area of Controversy	Topics Raised by the Public	South Coast AQMD Staff Evaluation
			of PR 2305 is expected to ultimately increase interest in incentive programs rather than discourage interest.
4.	Existing and future regulations	Existing and future state and federal regulations already regulate truck emissions, and PR 2305 would not provide any additional emissions benefits.	<ul style="list-style-type: none"> • The proposed stringency of ISR is expected to result in early and additional implementation of actions beyond state requirements. Even if the PR 2305 did not result in additional emission reductions beyond state and federal regulations, it would still ensure that statewide or nationwide measures result in emissions benefits in South Coast AQMD, and in communities near warehouses. • Analysis takes into account potential interaction of PR 2305 and future state regulations by reducing or discounting PR 2305's emission reductions after considering CARB's recently adopted ACT Regulation, Heavy-Duty Engine and Vehicle Omnibus Low NOx Regulation, and Senate Bill 210 (2019) which requires CARB to develop a Heavy-Duty Inspection and Maintenance program. • Additional regulations have been proposed, such as CARB's Advanced Clean Fleets regulation and <u>U.S.</u> EPA's Cleaner Trucks Initiative, but those rules are in early stages of development and it is too speculative to determine exactly how they will affect emissions at PR 2305 warehouses. What is known about those regulatory efforts is that they are not expected to provide substantial emission reductions until the late 2020s at the earliest, whereas PR 2305 is designed to provide emission reductions as early as 2021. • CARB's Draft Mobile Source Strategy (2020) analyzed all existing and proposed CARB and <u>U.S.</u> EPA mobile source regulations and found that additional NOx reductions are still needed to meet federal air quality standards in South Coast AQMD in 2023 and 2031. PR 2305 is one measure that can provide additional reductions. • <u>PR 2305 will sunset upon final action by the U.S. EPA finding that all air basins within South Coast AQMD have attained</u>

**Table 1-1
Areas of Controversy**

	Area of Controversy	Topics Raised by the Public	South Coast AQMD Staff Evaluation
			<u>the 2015 NAAQS for ozone of 70 parts per billion and when CARB has determined that South Coast AQMD has met the state ozone standard of 70 parts per billion.</u>
5.	Availability of charging infrastructure to support ZE trucks.	Increased use of ZE trucks will require significant upgrades to the electric grid to provide sufficient charging infrastructure.	<ul style="list-style-type: none"> • There are many state policies pushing the rapid adoption of ZE vehicles (e.g., governor’s executive order N-79-20). PR 2305 promotes installation of infrastructure to facilitate this transition by including installation of charging infrastructure as a WAIRE compliance option and by providing funding for charging infrastructure through the mitigation program. • Other state and regional entities are working on programs to develop charging infrastructure (e.g., Public Utilities Commission, Energy Commission, utilities). One of the WAIRE Menu actions available for compliance with PR 2305 is the installation of EV charging infrastructure which bolsters the overall availability of EV charging infrastructure.
6.	Points for pre-existing WAIRE Menu items such as pre-existing solar or TRU Plugs	Compliance option should consider pre-existing infrastructure (e.g., solar, TRU plugs).	<ul style="list-style-type: none"> • Pre-existing infrastructure can still earn WAIRE Points for operation. • PR 2305 also allows for Phase 2 or 3 warehouse owner or operators to earn WAIRE Points earlier than PR 2305 requires, and then bank those for use in later years. In order to not discourage early action, the three-year banking clock for these WAIRE Points would not start until the Phase 2 or 3 warehouse owner or operator is required to earn Points under PR 2305.
7.	Warehouse relocation	Warehouses might relocate outside of South Coast AQMD’s jurisdiction to avoid complying with PR 2305.	<ul style="list-style-type: none"> • South Coast AQMD commissioned a study to evaluate the potential for warehouses to relocate to nearby regions in response to PR 2305. The study found that no warehouses would relocate at the proposed stringency level. Nonetheless, this Draft EA conservatively evaluates up to three warehouses relocating to a nearby region in Chapter 4. • The potential for warehouse relocation is discussed in more detail in the Staff Report and the Socioeconomic Analysis.

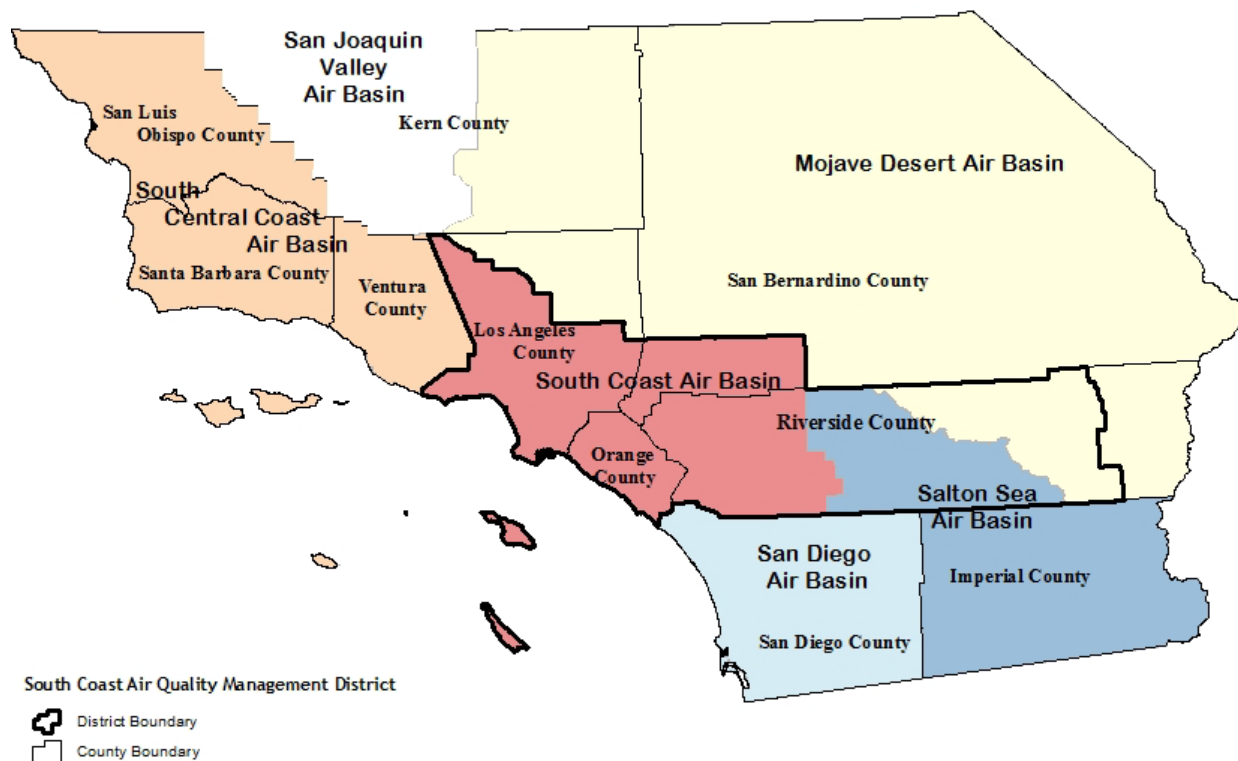

Physical changes that may be caused by PR 2305 have been evaluated in Chapter 4 of this EA. PR 316 provides a mechanism for the collection of administrative fees to be paid by warehouse facility or land owners, or operators subject to Rule 2305 to recover reasonable South Coast AQMD costs for compliance activities. No physical changes resulting from PR 316 have been identified. To date, no other controversial issues relevant to the CEQA analysis were raised in response to the NOP/IS for the proposed project.

CHAPTER 2 PROPOSED PROJECT

2.1 PROJECT LOCATION

The South Coast AQMD has jurisdiction over an area of approximately 10,743 square miles, consisting of the four-county South Coast Air Basin (SCAB); and the Riverside County portion of the Salton Sea Air Basin (SSAB); and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin (MDAB). SCAB is a subarea of South Coast AQMD's jurisdiction, bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto mountains to the north and east. SCAB includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. The Riverside County portion of the SSAB is bounded by the San Jacinto Mountains in the west and spans eastward up to the Palo Verde Valley. A federal nonattainment area (known as the Coachella Valley Planning Area) is a subregion of Riverside County and the SSAB that is bounded by the San Jacinto Mountains to the west and the eastern boundary of the Coachella Valley to the east (see Figure 2-1).

**Figure 2-1
Southern California Air Basins and South Coast AQMD's Jurisdiction**

2.2 PROJECT BACKGROUND

In response to historical and ongoing exceedances of state and federal ambient air quality standards for PM₁₀, PM_{2.5}, and ozone, South Coast AQMD has adopted a series of AQMPs with the most recent 2016 AQMP¹ adopted in March 2017. The 2016 AQMP evaluated new implementation strategies and control measures to achieve emission reductions to demonstrate how the region will meet federal air quality standards for ozone and PM_{2.5}. The 2016 AQMP states NO_x, VOC, and PM_{2.5} emissions need to be addressed, emphasizing NO_x emission reductions are ultimately most important to meet federal standards for ozone and PM_{2.5}. DPM is a component of PM_{2.5}.

The 2016 AQMP includes potential regulatory control options to achieve multiple air quality goals. The primary goal of the 2016 AQMP is to reduce NO_x emissions as one of many local, state, and federal strategies to meet the 1997 and 2008 8-hour ozone National Ambient Air Quality Standards (NAAQS). If these standards are met, then all other federal ozone and PM standards within South Coast AQMD should be achieved. In order to meet these air quality standards, total NO_x emissions in the SCAB must be reduced by approximately 45 percent below ‘baseline’ 2023 levels, and 55 percent below ‘baseline’ 2031 levels (see Figure 2-2). ‘Baseline’ levels in this context refer to future emission levels that are expected with all adopted regulations in place at the time that the 2016 AQMP was approved by the South Coast AQMD Governing Board. Any new regulations adopted after the 2016 AQMP would reduce emissions below this ‘baseline.’²

¹ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>.

² Note that the term ‘baseline’ as used in this section refers to the emissions data presented in the 2016 AQMP. A traditional CEQA baseline is used in the environmental impact analysis of this EA (i.e., the environment as it existed when the NOP was issued).

NOx Emission Reductions Needed to Achieve Federal 8-Hour Ozone NAAQS
Baseline NOx Inventory

Source: South Coast AQMD, 2016 Air Quality Management Plan, Potential Strategies for Facility-Based Mobile Source Measures, May 4, 2018, Figure 1-1, page 1-1, <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2018/2018-may4-032.pdf>

To meet air pollution reduction goals, the 2016 AQMP contains Facility-Based Mobile Source Measures (FBMSMs) to reduce NOx and PM2.5 emissions associated with the goods movement industry as one of many local, state, and federal strategies to meet the 8-hour ozone NAAQS.³ The FBMSMs were focused on four sectors of the goods movement industry: commercial marine ports, rail yards and intermodal facilities, warehouse distribution centers, and commercial airports.

2.2.1 Warehouse Distribution Centers

The 2016 AQMP included Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers which required the assessment and identification of potential actions to reduce emissions associated with warehouse distribution centers.⁴ Distribution centers and/or warehouses are facilities that serve as a distribution point for the transfer of goods and have a variety of emission sources. In particular, depending on the size and type, a warehouse distribution center may attract hundreds of diesel trucks each day which deliver, load, and/or unload goods, often

³ NOx is locally and regionally important due to its involvement in the photochemical formation of ozone and PM2.5.

⁴ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

operating seven days a week. Further, if the warehouse distribution center needs to transport perishable goods which require refrigeration, the trucks are equipped with diesel-fueled Transport Refrigeration Units (TRUs). In addition, diesel-fueled cargo handling equipment (CHE) such as yard tractors are utilized to move goods throughout the warehouse and onto or off of the trucks. Lastly, warehouse employees' commute trips via gasoline or diesel-fueled passenger vehicles also contribute to the overall emissions. Thus, emissions from trucks with or without TRUs, CHEs, and warehouse employees all contribute to the overall emissions profile associated with warehouse distribution centers. Additional emissions sources include power plant emissions associated with providing electricity to warehouses, natural gas usage for heating and water heating onsite, and potentially onsite stationary sources like diesel backup engines, vehicle fueling stations, or manufacturing equipment.

Over the past decade, the capacity and quantity of warehouse distribution centers have been increasing rapidly throughout the region (Figure 2-3), and future growth of this sector is projected to continue, with the greatest growth occurring in the Inland Empire (e.g., an additional ~15 million square feet per year added to the regional building stock).⁵ As shown in Table 2-1 below, the majority of NO_x emissions currently and in the future are from heavy-duty diesel trucks.

2.2.2 Working Group Meetings

In order to evaluate potential emission reduction strategies for the FBMSMs, including Control Measure MOB-03, South Coast AQMD staff convened FBMSM Working Groups with stakeholders to explore voluntary, collaborative approaches in addition to potential regulatory approaches to reduce emissions from facilities following adoption of the 2016 AQMP. A total of 17 working group meetings for all FBMSMs were held in the first year following the adoption of the 2016 AQMP in March 2017, with three meetings held on June 1, 2017, October 4, 2017, and January 17, 2018, which specifically focused on warehouses.

After considering the recommendations by South Coast AQMD staff on potential voluntary and regulatory strategies developed from the FBMSM Working Group Meetings, the South Coast AQMD Governing Board, at the May 4, 2018, Public Hearing, directed staff to initiate the development of an ISR for warehouses and distribution centers. The Warehouse ISR Working Group was formed to discuss warehouse air quality related issues and to provide feedback on a potential ISR approach, and 12 meetings were held on the following dates: August 1, 2018, August 23, 2018, October 24, 2018, March 22, 2019, August 23, 2019, September 19, 2019, November 13, 2019, December 10, 2019, March 3, 2020, October 9, 2020, October 30, 2020, and December 17, 2020. Additional working group meetings continue to be held as part of the rule development process. Presentations for the FBMSM and the Warehouse ISR Working Group meetings are available on the South Coast AQMD's website at: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/fbmsm-mtngs>.

2.2.3 Warehouse ISR

Recognizing the importance of reducing criteria pollutant emissions from facilities that attract mobile emission sources, federal law allows states to adopt indirect source regulations. California law explicitly provides ISR authority to local air districts (Health and Safety Code Sections 40716, 40440). An indirect source is defined in the Federal Clean Air Act as “a facility, building, structure,

installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution” (42 United States Code (USC) Section 7410(a)(5)(C)).

As such, the following potential options for reducing emissions from the warehouse source category were discussed in the Warehouse ISR Working Group:

- **Facility Caps:** Allow emissions at each warehouse distribution center to be capped so each warehouse distribution center would have the flexibility to individually determine how to reduce emissions.
- **Local Government Measures:** Local governments may decide to tailor emission reduction strategies to address local needs (e.g., through their land use authority).
- **Clean Fleets Crediting/Banking Program:** Allow clean fleets to generate credits that would be managed through a bank while requiring ISR facilities to regularly purchase and apply the credits to offset emissions from individual warehouse distribution centers.
- **Voluntary Fleet Certification Program:** Allow fleet owners to certify their fleets are cleaner than what would otherwise be required by CARB regulations while requiring facilities to use a prescribed amount of certified fleets.
- **Best Management Practices (BMPs):** Allow facilities to choose from an assortment of BMPs such as utilizing ZE or NZE equipment on site, and/or installing ZE/NZE fueling and charging infrastructure, or solar energy storage.
- **Mitigation Fees:** Allow facilities to pay mitigation fees if other options are not chosen and apply collected funds to subsidize the purchase and use of ZE/NZE equipment or the installation of fueling/charging infrastructure.

Of these options, only the Best Management Practices (now the WAIRE Menu and Custom WAIRE Plan option) and the Mitigation Fee options have been carried forward to PR 2305. These options were found to be the least administratively burdensome for facilities and South Coast AQMD compliance staff, and ensured that emission reductions would be focused in the communities near warehouses. PR 2305 and PR 316 are described in the Project Description section below.

2.3 NEED FOR THE PROJECT

There are six key reasons why PR 2305 and PR 316 are needed. First and foremost, as discussed above, the South Coast AQMD region continues to experience ozone and fine particulate matter levels that exceed federal air quality standards. This poor air quality is among the worst, if not the worst, in the nation.⁶ Attaining the air quality standards yields monetized health benefits that are estimated to be about 173 billion dollars.⁷ NO_x is the primary pollutant that needs to be reduced to meet federal air quality standards, and mobile sources associated with goods movement make up about 52 percent of all NO_x emissions in the SCAB.⁸ Trucks are the largest source of NO_x

⁷ South Coast Air Quality Management District. 2017, March. Final Socio Economic Report. 2016 Final Air Quality Management Plan. http://www.aqmd.gov/docs/default-source/clean-air-plans/socioeconomic-analysis/final/sociofinal_030817.pdf

⁸ Southern California Association of Governments. 2020, September 3. Connect SoCal Technical Report: Transportation System Goods Movement. https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf?1606001690

emissions in the air basin and also for the emissions associated with warehouses. Any diesel PM reductions brought about by PR 2305 and PR 316 will also help meet federal air quality standards for fine PM. PR 2305 and PR 316 would contribute to reducing emissions from the goods movement sector by requiring warehouse operators to take actions to reduce emissions directly through their own actions, or through taking actions to facilitate emissions reductions.

Second, existing regulations are not sufficient to meet either the 2023 or 2031 federal ozone attainment standard dates. Even newly proposed regulations from CARB and U.S. EPA (as shown in CARB's Draft Mobile Source Strategy [MSS]) will not reduce NOx emission enough to be able to meet these air quality standards on their own, and additional actions are needed. The Draft MSS evaluates emissions from all mobile source sectors (which make up at least 80 percent of NOx emissions in South Coast AQMD) and identifies potential targets for future measures in order to meet the various state goals for air pollution and climate impacts.⁹ A summary of the emission reductions CARB is targeting in 2031 from all vehicle sectors is shown in Figure 2-4. There are three key conclusions that can be drawn from the Draft MSS analysis:

1. Significant emissions reductions are required from all mobile source sectors in order to meet 2031 ozone standards.
2. The draft MSS analysis does not evaluate the 2023 ozone standard, and its proposed strategy will not meet this standard.
3. Some mobile source sectors with significant emissions and targeted emission reductions (e.g., ocean going vessels, locomotives, aircraft) may require regulations from either the federal government or from international bodies. Emission reductions from these sectors are therefore likely more difficult to achieve than emission reductions from sources that operate solely within the state. If shortfalls occur from these sectors, more emissions reductions from other sectors (e.g., heavy duty on-road vehicles, cargo handling equipment, ~~locomotives, aircraft, ocean going vessels,~~ light duty on-road vehicles, etc.) may be required.

No single regulation could achieve federal air quality standards on its own, including PR 2305 and PR 316. However, these proposed rules are designed to contribute their own additional emissions reductions and enhance emission reductions from other programs, and are part of the collective of actions needed to meet air quality standards.

⁹ Draft MSS available here: <https://ww2.arb.ca.gov/resources/documents/2020-mobile-source-strategy>

Source: CARB Draft 2020 Mobile Source Strategy, <https://ww2.arb.ca.gov/resources/documents/2020-mobile-source-strategy>

A third reason for the project is that the 2016 AQMP estimated that at least one billion dollars per year in incentive funding to clean up vehicle and engine fleets would be needed—absent any further regulations—to meet the 2023 and 2031 federal ozone attainment standard dates. Although incentive funding has increased, reaching between 100 to 200 million dollars per year over the past few years,¹⁰ it has not reached a level sufficient to turn over enough cleaner vehicles to meet air quality standards. Many incentive programs are oversubscribed, with demand far exceeding funding availability.¹¹ However, some programs are undersubscribed.¹² PR 2305 and PR 316 are designed to work with existing and future incentive programs. The requirements in PR 2305 and PR 316 are expected to increase industry's interest in incentive programs in order to reduce the cost of compliance. This can help ensure that all incentive funds are spent and can potentially spread incentives to a broader segment of industry if more recipients sign up for funding. Finally, much of the incentive funding that South Coast AQMD distributes is allocated annually as part of the state legislature's budgetary process. A regulatory requirement may increase the request for funding from the legislature by many stakeholders, which has the potential to further increase the amount of funding available and reduce the cost of compliance to industry.

¹² South Coast Air Quality Management District. 2020, December 4. Governing Board Meeting. <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2020/2020-dec4-005.pdf>

A fourth need for PR 2305 and PR 316 includes providing support for statewide policies and objectives to increase the number of ZE vehicles. There are many actions occurring across state government to increase the use of ZE vehicles to satisfy many goals, including meeting federal and state air quality standards, reducing localized air quality impacts, reducing greenhouse gas emissions, etc.¹³ The South Coast AQMD is uniquely positioned to contribute to this effort with its indirect source authority. PR 2305 and PR 316 provide a mechanism to require warehouse operators to encourage ZE vehicle use at their facilities as one of many options of compliance.

A fifth air quality need is to ensure that state actions to require cleaner vehicles actually occur in the South Coast AQMD. The recent ACT and Low NO_x Omnibus regulations assume a certain amount of new truck sales every year, and also assume that the activity of those newer, cleaner trucks will occur consistent with past behavior as demonstrated in the EMFAC model. However, the nature of those two regulations ensures that lower emissions occur only *if* trucks are sold, but it does not require any certain number of trucks to be sold, or to operate within the South Coast AQMD. Similarly, the upcoming TRU regulation is expected to have requirements for newly manufactured trailer TRUs to meet lower PM standards, yet will not mandate that fleets purchase them.¹⁴ PR 2305 and PR 316 would place requirements on warehouse operators in South Coast AQMD that will encourage them to ensure that the potential benefits from these regulations occur here.

Finally, in addition to the regional pollution that exceeds federal air quality standards from emission sources associated with warehouses, there are important localized health effects from air pollution. Communities have repeatedly expressed concern about these impacts, including through the AB 617 process. In particular, diesel fueled vehicles and equipment like on-road trucks, off-road yard trucks, and TRUs emit diesel PM, a pollutant designated a carcinogen by the state of California.¹⁵ Diesel PM contains many pollutants (e.g., benzene, acetaldehyde, etc.) which are also recognized federally as hazardous air pollutants.¹⁶ Further, the state Office of Environmental Health Hazard Assessment (OEHHA) has developed a tool to evaluate the environmental burden on communities throughout the state called CalEnviroScreen.¹⁷ As seen in Figure 2-5 below, an analysis of communities in South Coast AQMD shows that those living within 0.5 miles of a PR 2305 warehouse rank in the 80th percentile according to CalEnviroScreen, whereas the average community in South Coast AQMD has a much lower burden, ranking in the 61st percentile. PR 2305 and PR 316 can reduce this local pollution burden on environmental justice communities by requiring warehouse operators to take actions to reduce emissions from trucks and other emission sources associated with their facility, ~~as well as~~ and can take actions to facilitate and enhance emission reductions from other programs (e.g., incentive programs, CARB regulations, etc.). Some of these disadvantaged communities with local pollution issues were selected to be part of the AB 617 Program, and all three Year 1 communities requested that the warehouse ISR be developed due to concerns about carcinogenic diesel PM.

¹⁶ United States Environmental Protection Agency. 2021 (Accessed). Initial List of Hazardous Air Pollutants with Modifications <https://www.epa.gov/haps/initial-list-hazardous-air-pollutants-modifications>

¹⁷ This tool ranks communities based on their pollution burden (e.g., air pollution levels), as well as community characteristics that can make them more susceptible to impacts from pollution (e.g., socioeconomic status). Communities are given a percentile score (out of 100%) to show how they compare with the rest of the state—higher scores mean they experience higher burden. (<https://oehha.ca.gov/calenviroscreen>).

Figure 2-5
Environmental Burden on Communities Near PR 2305 Warehouses as Demonstrated by CalEnviroScreen

2.4 PROJECT OBJECTIVES

The main objectives of the proposed project are to: 1) reduce NO_x and PM emissions, including DPM emissions, and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional reduction of emissions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617; and 4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse.

2.5 PROJECT DESCRIPTION

The proposed project is comprised of PR 2305 and the associated mitigation program and PR 316. The purpose of PR 2305 is to facilitate reductions of NO_x and PM emissions, including DPM emissions, associated with warehouses and the mobile sources attracted to warehouses subject to PR 2305 in order to assist in meeting state and federal air quality standards for ozone and PM_{2.5}. Implementation of the proposed project is expected to result in NO_x and PM, including DPM, emission reductions and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed.

The purpose of PR 316 is to establish a mechanism for the collection of administrative fees to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with review of various notifications, Custom WAIRE Plan evaluation, reports, and mitigation fees as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records.

2.5.1 Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program

The section provides a detailed summary of the key elements contained in PR 2305. ~~A draft of~~ PR 2305 can be found in Appendix A1. PR 2305 is designed to apply to any new or existing warehouse located within South Coast AQMD's jurisdiction with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building. PR 2305 also applies to manufacturing or other facilities that have ancillary warehouses with equal to or greater than 100,000 square feet of indoor floor space in a single building.

Implementation of PR 2305 would initially affect about 3,320 warehouses. Some of these facilities have more than one tenant, so there are potentially a total of about 4,000 warehouse operators that may be subject to the rule. As new facilities are built, they would also become subject to the rule. It is expected that about 418 of these existing facilities would only be subject to reporting requirements in PR 2305. Figure 2-6 shows the approximate location of these existing facilities within South Coast AQMD's jurisdiction.

The WAIRE Program under PR 2305 is being developed so operators of warehouses subject to PR 2305 can implement changes to reduce emissions from mobile sources associated with their operations. Under this program, warehouse operators must report the number of truck trips for applicable warehouses over the prior 12-month compliance period. These truck trips in turn are converted into each operator's WAIRE Points Compliance Obligation (WPCO) for that compliance period. The WPCO can be satisfied by earning WAIRE Points. These WAIRE Points, in turn, are earned by completing actions and investments from the WAIRE Menu, completing actions from an approved Custom WAIRE Plan, or paying the optional mitigation fee. Warehouse operators (or warehouse facility or land owners acting on behalf of their operators) must satisfy a WPCO every year.

2.5.1.1 Calculating WPCO

A warehouse's WPCO is calculated by multiplying the number of weighted annual truck trips (WATTs) by a Stringency factor and an Annual Variable, as shown in the following equation.

$$WPCO = WATTs \times Stringency \times (Annual\ Variable)$$

Where:

- WPCO is the number of WAIRE Points a warehouse operator must earn in a year.
- WATTs are the number of Weighted Annual Truck Trips.
- Stringency factor is a dimensionless multiplier that determines how many Points an operator needs to earn.
- The Annual Variable is a dimensionless multiplier which controls how the stringency will phase in through time.

A warehouse operator with a WPCO that is less than 10 in any compliance period is exempt from the requirement to earn WAIRE Points for that compliance period. The warehouse operator shall document their WPCO and exemption in an Annual WAIRE Report.

WATTs include the number of all actual truck trips from Class 2b to Class 8 vehicles that occurred at a warehouse (i.e., the number of trips to and from the warehouse) while the warehouse operator was responsible for operations during the previous 12-month compliance period. If a warehouse is occupied by more than one warehouse operator, the WATTs are only the truck trips attributed to that operator. Warehouse operators would be required to count and report all of the trucks entering their facility's truck entrance to determine the WATTs in every compliance year.

WATTs are calculated according to the following equation:

$$WATTs = [Class\ 2b\ to\ 7\ truck\ trips] + [2.5 \times Class\ 8\ truck\ trips]$$

In the rare event of a force majeure event such that the warehouse operator does not have truck trip information (e.g., records destroyed in a fire), then the WATTs(alt) are determined using default average truck trip rates.

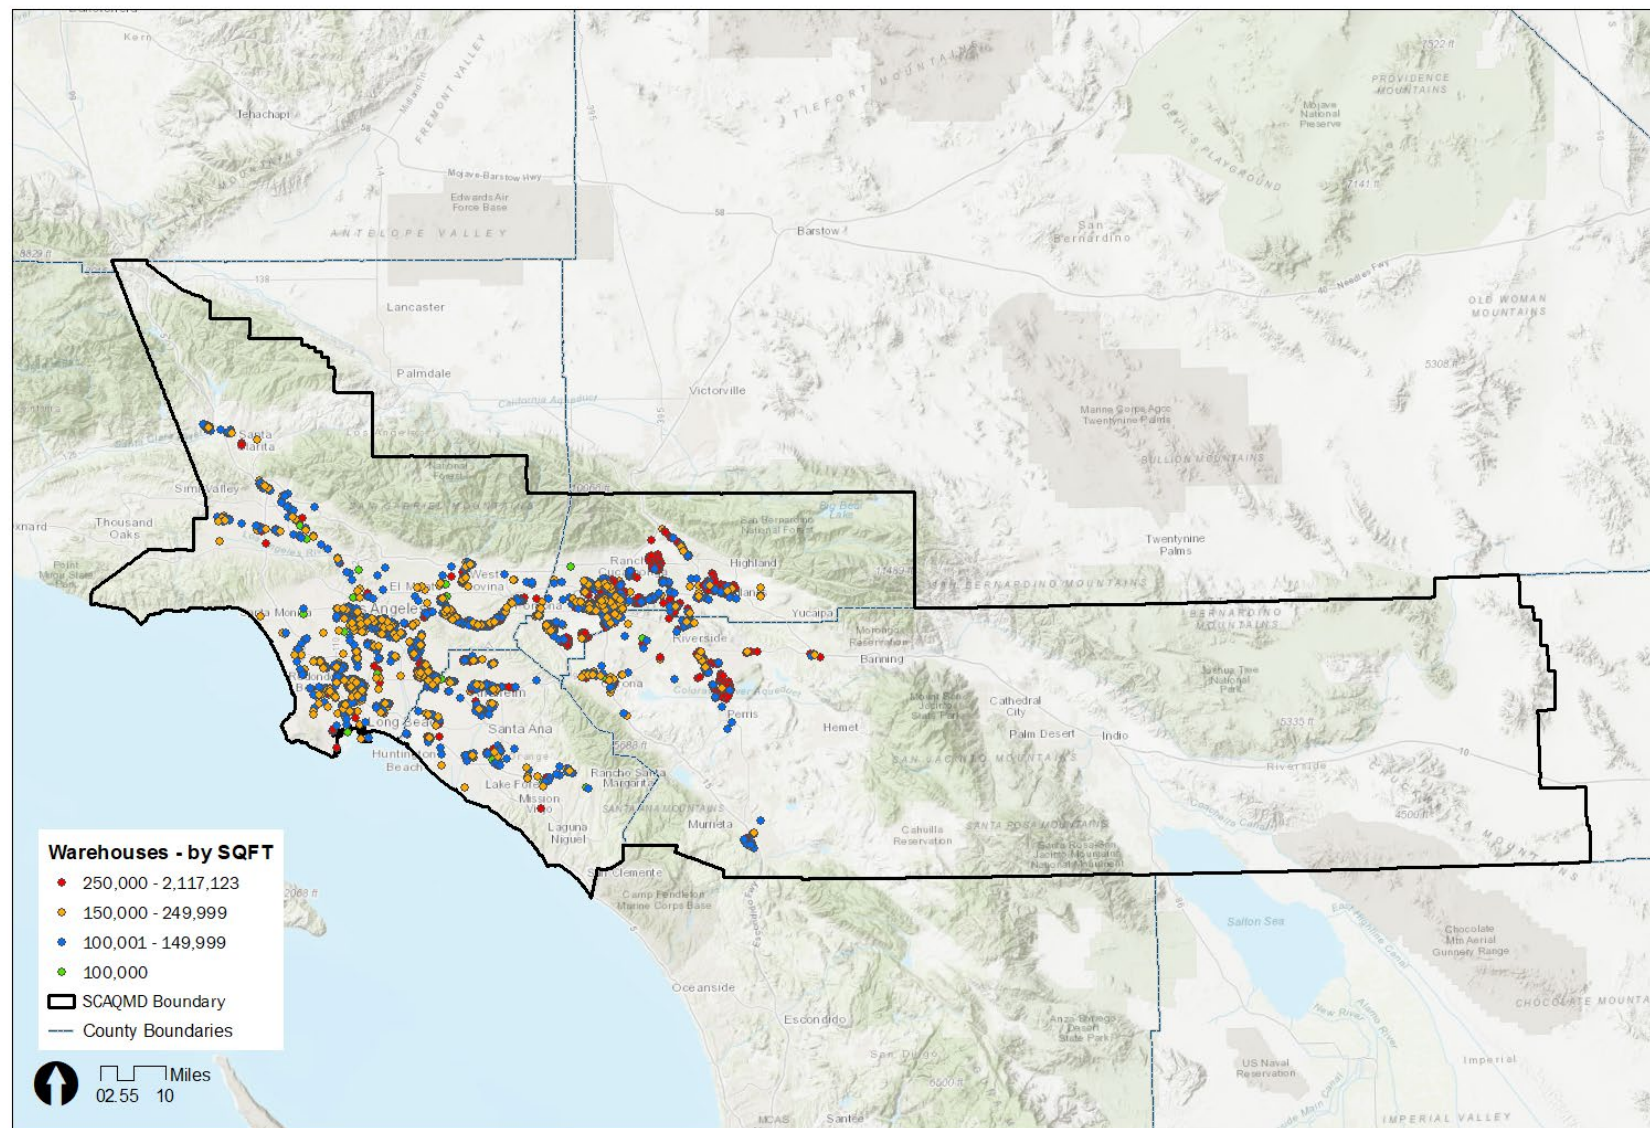

$$WATTs(alt) = Days\ per\ Year \times Warehouse\ Size \times WTTR^{18}$$

To determine how many WAIRE Points a warehouse operator needs to earn per WATT, a Stringency factor was developed. The factor was developed in consideration of balancing the following elements: emission reduction needs to meet attainment deadlines, emission reductions that can be achieved beyond what other regulations will require, the significance of emissions from the warehouse industry on local communities, and the economic impacts of PR 2305 on the warehousing industry. Balancing these elements, South Coast AQMD staff is proposing to set the Stringency factor at 0.0025 WAIRE Points per WATT.

The Annual Variable was developed to provide a phase-in of the proposed project's stringency and is tied to PR 2305's Phases (see Table 2 in Appendix A1). The Annual Variable increases each year, beginning at an Annual Variable of 0.33 in the facility's initial compliance period year. Full stringency would be achieved in a facility's third compliance period year with an Annual Variable of 1.0. However, the Annual Variable is established relative to the proposed project's adoption and will not 'reset' for new facilities. For example, this means that a new Phase 3 warehouse facility built in 2025 submitting their first Annual WAIRE Plan after ~~July~~ January 1, 2026, would be subject to an Annual Variable of 1.0, or full stringency. The steady increase in the Annual Variable attached to the warehouse Phases schedule allows for a gradual increase in WPCO in the initial years following the adoption of PR 2305.

¹⁸ WATTs(alt) = Weighted Annual Truck Trips alternate calculation and WTTR = Weighted Truck Trip Rate

Figure 2-6
Warehouses $\geq 100,000$ Square Feet in the South Coast AQMD Jurisdiction

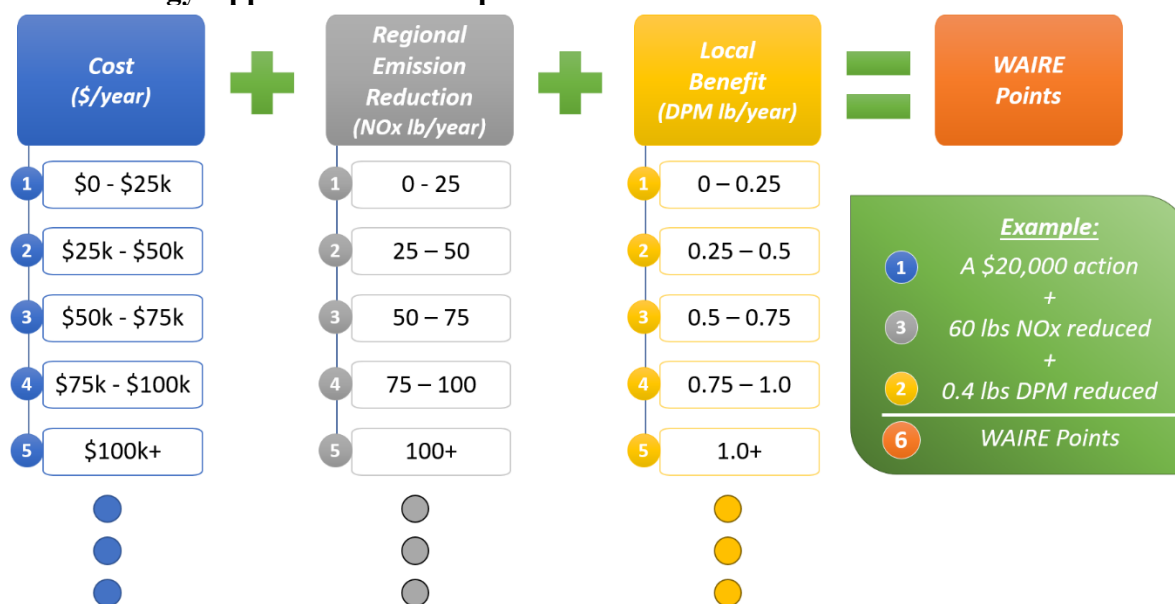

2.5.1.2 Earning WAIRE Points

WAIRE Points can be earned by completing actions and investments from the following menu of implementation measures: 1) acquiring and/or using NZE and ZE trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or TRUs; 4) installing and/or using onsite energy systems (e.g., solar panels); and 5) implementing community benefits (e.g., air filters for sensitive receptors). In addition, warehouse operators may apply to earn WAIRE Points through a Custom WAIRE Plan specific to their operations that satisfy strict criteria.

Most warehouse operators are expected to earn WAIRE Points using the WAIRE Menu in Table 3 of PR 2305 (see Appendix A1). This table equates the number of WAIRE Points earned to a set level of implementation of every action. For example, 365 visits by a Class 8 ZE truck in one year would earn 51 WAIRE Points. The exact methodology to determine the number of WAIRE Points for each action in the WAIRE Menu is described in the WAIRE Menu Technical Report (Appendix B of the ~~Preliminary~~ Second Draft Staff Report¹⁹). This method generally considers for each action: the annualized cost of installing and/or operating vehicles/infrastructure; the amount of regional NOx emissions reductions; and the local DPM emissions reduction benefit, which are generally weighted equally using the equation in Figure 2-7 below. Warehouse operators will not use this equation. Rather, they will only need to use the WAIRE Menu to determine how many WAIRE Points they have earned for this compliance option.

Figure 2-7
Methodology Approach to Develop WAIRE Points for Each WAIRE Menu Action

¹⁹ South Coast Air Quality Management District. 2021, April January. ~~Preliminary~~ Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305. <http://www.aqmd.gov/does/default-source/planning/fbmsm-does/preliminary-draft-staff-report.pdf> <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/warehs-distr-wkng-grp>

WAIRE Points may be earned only for actions that go beyond existing state and federal regulations. If adopted, PR 2305 will interact with other existing and upcoming regulations and incentive programs in varying ways. For example, some incentive programs like Carl Moyer prohibit using funds to comply with a regulation. A warehouse operator that owns a fleet may not use Carl Moyer funds to purchase a truck and also earn WAIRE Points for that truck purchase. However, visits to a warehouse from a truck that was funded through the Carl Moyer program can still earn WAIRE Points because Carl Moyer does not require localized emission reductions near warehouses, and because the Carl Moyer program applies to truck owners and not warehouse operators. Separately, if CARB adopts a regulation that applies to warehouse operators (e.g., installing ZE charging infrastructure), ~~they operators~~ will not be able to use those actions to comply with PR 2305. However, if they implement actions beyond CARB requirements, or earlier than required by CARB, then they would be able to earn WAIRE Points for those actions.

In lieu of satisfying the WPCO via the WAIRE Menu, a warehouse operator may choose two other options or may choose a combination thereof. The first is to prepare and then implement a Custom WAIRE Plan tailored to the operator's site that will achieve an equal number of WAIRE Points as would be obtained by implementing actions from the WAIRE Menu.²⁰ The types of projects that might fit within this approach that have been suggested by industry stakeholders include modifying a building's energy use throughout the day to draw more energy from renewable power sources (such as solar) rather than natural gas fueled power plants, operating NZE yard trucks using renewable fuels, or installing ZE charging infrastructure for onroad trucks at an offsite location, perhaps in cooperation with other nearby warehouse operators.

The Custom WAIRE Plan application shall follow the WAIRE Implementation Guidelines and the following criteria:

- Custom WAIRE Plan applications must demonstrate how the proposed action will earn WAIRE Points based on the incremental cost of the action, the NOx emission reductions from the action, and the DPM emission reductions from the action, relative to baseline conditions if the warehouse operator had not completed the action in that compliance year.
- Any WAIRE Points for emission reductions must be quantifiable, verifiable, and real as determined by the Executive Officer and consistent with the WAIRE Implementation Guidelines.
- Custom WAIRE Plan applications must include the following elements:
 - A description of how the proposed actions will achieve quantifiable, verifiable, and real NOx and DPM emission reductions as quickly as feasible, but no later than three years after plan approval; and
 - A quantification of expected NOx and/or DPM emission reductions from the proposed project within the South Coast AQMD and within three miles of the warehouse; and
 - A description of the method to be used to verify that the proposed project will achieve NOx and/or DPM emission reductions; and

²⁰ The Custom WAIRE Plan option uses a similar method as the basis for the WAIRE Menu to determine the number of WAIRE Points earned for any particular action. PR 2305 (d)(4) describes the criteria for Custom WAIRE Plans, and the WAIRE Implementation Guide (Chapter 2 of the ~~Preliminary Second Draft Staff Report~~) and provides additional guidance for Custom WAIRE Plan applicants. Actions within a Custom WAIRE Plan can not be anything that is already listed in the WAIRE Menu.

- A schedule of key milestones showing the increments of progress to complete the proposed project; and
- A description of the location and a map of where the proposed project will occur; and
- Any expected permits or approvals required by other private parties, or South Coast AQMD, or other federal, state, or local government agencies to implement the proposed plan.

Any proposed plan that relies on vehicle miles travelled (VMT) reduction must demonstrate that these reductions are surplus to what is included in the most recent approved Regional Transportation Plan (RTP) and AQMP.

The second option is that warehouse operators may elect to pay an optional mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option. Therefore, the environmental impacts associated with the mitigation program are similar to implementation of measures to earn WAIRE Points and are analyzed in this EA.

2.5.1.3 Transferring WAIRE Points

WAIRE Points accumulated by a warehouse owner or operator in a given compliance year can be transferred in one of three limited ways. First, an operator may transfer excess WAIRE Points from one of its warehouses to another of its warehouses. WAIRE Points transferred under this scenario are subject to a reduction via a locational discount to encourage emission reductions within the immediate vicinity of warehouses. The locational discount is intended to account for the reduced health benefits within the immediate vicinity of a warehouse that utilizes WAIRE Points earned at another warehouse. The net effect of applying a locational discount would result in the warehouse needing to secure more WAIRE Points via transfer than if it had otherwise self-generated WAIRE Points onsite.

Second, operators may bank WAIRE Points earned in excess of their WPCO for up to three years for use at the warehouse where the points were earned provided that the actions from the WAIRE Menu used to earn those points are not otherwise required by U.S. EPA, CARB, or South Coast AQMD regulatory requirements in place at the time they are used. For example, while points may be earned prior to the adoption of a pending regulatory requirement, once the regulatory requirement is in effect, the points may not be used for future years. Furthermore, owners or operators transferring WAIRE Points to a different compliance year shall demonstrate that any onsite improvements or equipment installations that were used to earn the WAIRE Points being transferred are still operational at that warehouse facility in the year that WAIRE Points are used. WAIRE Points that are banked from one year to another are not allowed to be transferred to a different site. Similarly, WAIRE Points transferred to another site are not allowed to be banked to a later year.

Third, a warehouse owner may earn points and transfer the points to an operator of the same warehouse, and vice-versa, subject to the three-year WAIRE Points banking limitation. Transfers of WAIRE Points are allowed within an individual warehouse (e.g., from owner to operator) or

between warehouses controlled by the same operator. Transfers between different operators at different warehouses are prohibited.

2.5.1.4 Reporting, Notification, and Recordkeeping Requirements

There are three types of reports required by PR 2305. The first is a Warehouse Operations Notification. Warehouse owners will be required to provide a Warehouse Operations Notification to the South Coast AQMD when any of the following conditions occur:

- ~~Within 60 calendar days after adoption of PR 2305~~ On September 1, 2021;
- Within 14 calendar days after a new warehouse operator has the ability to use at least 50,000 square feet of a warehouse that has greater than or equal to 100,000 square feet used for warehousing activities;
- Within 30 calendar days after a renovated warehouse has received a certificate of occupancy from the local land use agency such that the total warehouse space that may be used for warehousing activities has increased or decreased; or
- Within three calendar days of a request from the Executive Officer.

This Notification will need to contain basic information about the site, such as building size and how much of the building is used for warehousing activities, and the name and contact information of any tenant leasing the property and the length of the lease term. Many of the 3,320 initially identified facilities may not ultimately be required to earn WAIRE Points based on data provided in these Warehouse Operations Notifications. For example, a building that is 100,000 square feet in size that has only 80,000 square feet used for warehousing and 20,000 square feet used for offices would not be subject to the parts of PR 2305 that require operators to earn WAIRE Points. Other reasons that operators may not be required to earn WAIRE Points could include that the facility is not currently used for warehousing activity at all (e.g., it is used only for manufacturing or is used as a church), warehouse operators with a WPCO less than 10, or that no operator uses more than 50,000 square feet for warehousing activity in a building with multiple tenants.

The second type of report is a one-time Initial Site Information Report that warehouse operators must submit no later than ~~January 15~~ July 1 of the year that they must submit their first Annual WAIRE Report (the third type of report). This Initial Site Information Report will include more detailed information pertaining to warehouse characteristics, truck trip data, fleet data if they own a fleet, and the anticipated implementation approach to satisfy the WPCO for the next compliance period.

Finally, warehouse operators required to satisfy a WPCO must submit an Annual WAIRE Report that includes truck trip data (used to determine their site-specific WPCO) that is verifiable and representative of their operations, details on actions that were implemented to earn WAIRE Points, and how many WAIRE Points were earned for the prior compliance period.

2.5.1.5 Timing of WAIRE Program

Implementation of PR 2305 will be annually phased in according to warehouse size. As summarized in Table 2-2, the first compliance period is applicable to warehouses with the largest footprint of floor space (e.g., at least 250,000 square feet), with the Initial Site Information Report due by ~~January 15~~ July 1, 2022, and the Annual WAIRE Report due by ~~August 2, 2022~~ January 31, 2023.

Table 2-2
PR 2305 First Annual WAIRE Report Dates

Warehouse Size (square feet)	First Annual WAIRE Report Date
Greater than or equal to (\geq) 250,000 square feet	August 2, 2022 January 31, 2023
\geq to 150,000 square feet <250,000 square feet	August 1, 2023 January 31, 2024
\geq to 100,000 square feet <150,000 square feet	July 31, 2024 January 31, 2025

2.5.1.6 Sunset Date for Rule

PR 2305 will sunset upon final action by the U.S. EPA finding that all air basins within South Coast AQMD have attained the 2015 NAAQS for ozone of 70 parts per billion and when CARB has determined that South Coast AQMD has met the state ozone standard of 70 parts per billion. The sunset date for the WPCO will be 45 days after the end of the compliance period during which the latter of U.S. EPA or CARB makes the relevant finding. All reporting requirements associated with this final compliance period will remain in effect, but no reporting will be required for future compliance periods.

2.5.2 Proposed Rule 316 – Fees for Regulation XXIII

The proposed project also includes Proposed Rule 316 – Fees for Regulation XXIII. These administrative fees will be paid by facilities subject to PR 2305 every year to cover the costs associated with submittal and review of various notifications, reports, and mitigation fees as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records. Specific administrative fees are proposed for submitting an Annual WAIRE Report, Initial Site Information Report, Warehouse Operations Notification, Custom WAIRE Plan Evaluation, and/or Mitigation Fee. PR 316 also includes a fee schedule to address late fees and provides for a fee exemption for warehouses with less than 100,000 square feet of floor area within a single building used for warehousing activities for that year. A draft of PR 316 can be found in Appendix A2.

PR 316 would individually qualify for a statutory exemption under CEQA Guidelines Section 15273 – Rates, Tolls, Fares, and Charges. However, it is being included as part of the project description for clarity.

2.6 TECHNOLOGY OVERVIEW

The following provides a brief description of the various near-zero (NZE) and zero emission (ZE) technologies included as WAIRE Menu actions that may be implemented by affected warehouse operators to comply with PR 2305. Because this technology is emerging, and because the proposed project would incentivize the purchase and use of these technologies, additional manufacturing and other facilities may be necessary to produce and fuel these vehicles.

2.6.1 Zero Emission and Near Zero Emission Trucks

~~Zero Emission (ZE) and Near Zero Emission (NZE) trucks are categorized by the definition of a ZE and NZE vehicle and the truck class. In the context of the proposed project, the definition of a ZE truck is the same as CARB’s Advanced Clean Trucks Regulation definition. CARB’s definition~~

for a ZE truck is one “with a drivetrain that produces zero exhaust emission of any criteria pollutant (or precursor pollutant) or greenhouse gas under any possible operational modes or conditions.” An ~~Near Zero Emission~~ (NZE) truck is one in which the engine meets CARB’s lowest Optional Low NOx standard applicable at the time of manufacture (currently 0.02 g/hp-hr NOx, 90 percent lower than the 2010 standard set by U.S. EPA).

In addition to drivetrain technology, trucks are commonly classified based on their Gross Vehicle Weight Rating (GVWR). Table 2-3 below presents truck classifications.

**Table 2-3
Truck Classes**

Truck Class	GVWR (lbs)
Class 2b	8,501 – 10,000
Class 3	10,001 – 14,000
Class 4	14,001 – 16,000
Class 5	16,001 – 19,500
Class 6	19,501 – 26,000
Class 7	26,001 – 33,000
Class 8	33,001 and over

The ZE truck market is beginning to grow rapidly with many models entering the commercial market today and many major manufacturers announcing plans for future commercialization of battery-electric and hydrogen fuel cell electric trucks. Some notable manufacturer announcements include: Daimler Class 8 eCascadia, Navistar battery-electric Class 8, Volvo battery-electric VNR Class 8, Tesla’s long range battery-electric tractor, BYD’s battery-electric Class 6 and 8, and Nikola’s and Kenworth’s (in conjunction with Toyota) hydrogen fuel cell tractors, with additional battery-electric trucks expected from newer manufacturers like Lion Rivian, Sea Electric, Chanje, Xos, Workhorse, GreenPower, etc. NZE engines are currently available in two sizes—11.9 liter and 8.9 liter. Major truck manufacturers offer these engines in different truck classes, including for Class 8 regional haul and/or drayage truck operations.

Trucks that visit warehouses may be owned by the warehouse operator or by a motor carrier not affiliated with that warehouse. Arrangements for a truck visit to a warehouse to deliver or pick up goods is typically made by the owner of the goods or someone acting on their behalf. As such, each individual truck visiting a warehouse can have a unique operating profile that may not be shared by any other truck visiting that site. One truck may travel 30 miles on the inbound trip and only 2 miles on the outbound trip. Another truck may be loaded with goods from multiple warehouses or stores, and determining what portion of a trip to attribute to each warehouse would be impractical.

2.6.2 Zero Emission Yard Trucks

Yard trucks are defined as ~~a~~-mobile utility vehicles that operates as either ~~an~~ on- or off-road vehicles, used to carry cargo containers with or without a chassis (also commonly called yard tractors, terminal trucks, hostlers, yard jockeys, or yard goats).

Yard trucks move trailers and containers around warehouse facilities. Most yard trucks at warehouse facilities are diesel fueled and emit NO_x, DPM, and other pollutants. Duty cycles for yard trucks vary depending on use, with heavier use at railyards and port facilities and lighter use typically at warehouses and manufacturing plants, as defined by hours of use and diesel consumption rates. CARB has limited population data for about 1,100 off-road yard tractors operating statewide through its DOORS reporting program for off-road vehicles, but it is unclear how many of these operate at warehouses in South Coast AQMD. In addition, many yard tractors can be on-road vehicles, which are not required to be reported through the DOORS system. For example, about two-thirds of the roughly 1,600 yard tractors at the ports of Los Angeles and Long Beach are on-road vehicles. Operation of yard trucks can be tracked by hours of use, with hourly usage varying from less than 1,000 hours per year up to 6,000 hours per year.

Many battery-electric yard tractor demonstration projects have taken place in the past several years, including in the South Coast AQMD. Following these efforts, multiple manufacturers have begun offering battery-electric ZE yard trucks for sale commercially, including OrangeEV, Kalmar Ottawa, and BYD.

2.6.3 Electric Charging Infrastructure

An electric charger is defined as an electric charging station for vehicles. Each unique plug that can charge an individual vehicle at any time, regardless of whether other electric chargers or plugs are operating, is considered one electric charger. This equipment is also referred to as Electric Vehicle Supply Equipment (EVSE).

ZE battery electric trucks require specialized charging infrastructure. Installing this infrastructure can require facility electrical upgrades, dedication of space for electrical equipment and vehicle parking, permitting with local authorities, and plans to optimize charger usage. The charging stations themselves range in size and are typically rated based on the amount of kilowatts (kW) that can be dispensed. Higher powered charging stations (greater than or equal to 350 kW) are just now entering the market and may require more construction than lower powered charging stations on the market today. On the usage side, the cost of the electricity can vary depending on the time of day when trucks are charged, the kW charging level, and the level of demand charges. Utilities are introducing new rate structures for the use of these stations to address this new market need. Trucks that would use charging infrastructure at a warehouse are likely to travel to destinations unrelated to the warehouse itself, and providing this infrastructure can facilitate greater usage of ZE trucks.

Several different manufacturers sell EVSE at a variety of power levels (~~e.g., Level 2, Level 3, etc.~~), including with optional power management software that govern how trucks are charged. At the current early stage of commercialization and demonstration of electric trucks, the higher power chargers used for heavy duty vehicle charging have yet not followed a common standard, and proprietary charging systems are commonly tailored to each vehicle. This is expected to change in the near future with the development of a common High Power Charging for Commercial Vehicles standard by the CharIN organization. In addition, local utilities and land use agencies are

developing programs specifically focused on charging infrastructure upgrades. Notable examples include the Charge Ready Transport program from Southern California Edison (SCE), the Commercial EV Charging Station Rebate Program from the Los Angeles Department of Water and Power (LADWP),²¹ and permit streamlining efforts from many local permitting agencies.²² SCE and LADWP collectively provide power to greater than 80 percent of warehouses that may be included in PR 2305, as shown in Figure 2-8.

Figure 2-8
Percentage of Warehouses Greater Than 100,000 Square Feet in Each Utility

While charging infrastructure on its own does not reduce emissions, this equipment does facilitate emissions reductions by providing additional locations for electric vehicles to obtain power and making it possible for their increased use.

2.6.4 Hydrogen Fueling Infrastructure

Hydrogen refueling stations (HRS) are used to supply fuel to vehicles with hydrogen fuel cell drivetrains. An HRS is composed of storage and dispensing units and can sometimes include a production unit if the hydrogen is produced onsite. If the hydrogen is produced onsite or delivered to the station at an intermediary pressure or in liquid state, intermediary storage is also needed, along with a compression system. As hydrogen fuel cell vehicles (FCVs) penetrate the market through pilot programs and commercialization, a robust HRS network will be needed for increased deployment of FCVs.

2.6.5 Solar Panels

Solar panels refers to a type of solar energy technology that uses photovoltaic cells to generate electricity through absorption and conversion of sunlight into electricity or heat. Solar panels create renewable energy which reduces dependence on existing fossil-fuel power plants. While solar panels on their own do not reduce emissions, as vehicles are increasingly electrified, solar energy production has a direct criteria pollutant emission reduction impact over time and assists in meeting federal ozone standards.

²² Governor's Office of Business and Economic Development. 2021 (Accessed). Plug-in Electric Vehicle Charging Station Readiness. Plug-in Electric Vehicle Charging Station Readiness (ca.gov)

2.6.6 MERV 16 or Greater Filters or Filter Systems

Unlike the other WAIRE Menu items, the installation of high efficiency air filters or filter systems does not result in emission reductions from the generating source. Instead, these measures would reduce exposure to PM in the locations where these filters or filter systems are installed and utilized. It is important to note that the filters and filter systems have their limitations, such as the increased cost associated with filter replacements, increased energy consumption to operate the system, filter effectiveness is limited to when the system is operating and the sensitive receptors are indoors with the windows closed, and the inability to filter out any toxic gases. Past studies have shown that high-efficiency air filtration systems are effective in reducing PM concentrations, including DPM.²³

2.7 SUMMARY OF AFFECTED FACILITIES

The proposed project applies to qualifying-sized warehouses located within South Coast AQMD's jurisdiction. As the information contained within existing databases may not be sufficient to determine if the property is currently used for warehousing or if warehousing activities are conducted in areas above PR 2305 thresholds, and because the warehousing industry is dynamic, the number of regulated entities is expected to change year to year as more warehouses are constructed or as operations change at existing warehouses. Table 2-4 provides a summary of the warehouses anticipated to be affected by the proposed project.

Table 2-4
Existing Warehouses and Industrial Properties Expected to Be Subject to PR 2305

County	Total Number of Industrial Properties Anticipated to Be Subject to PR 2305	Total Number of Warehouses Likely Required to Earn WAIRE Points	Total Number of Warehouses and Industrial Properties Likely Only Subject to PR 2305 Reporting Requirements
Los Angeles	1,635	1,392	243
Orange	398	325	73
Riverside	406	365	41
San Bernardino	881	820	61
Total	3,320	2,902	418

The total number of warehouses expected to be affected by PR 2305 at the time of rule adoption is around 3,320. Any new warehouse would also be required to comply with the rule. The total

²³ South Coast AQMD Pilot Study of High Performance Air Filtration for Classroom Applications, available online at: <https://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf>

number of warehouses likely required to earn WAIRE Points is 2,902,²⁴ and the number of warehouses and industrial properties likely only subject to reporting requirements is 418²⁵.

Warehouses may be categorized many ways. A study commissioned by South Coast AQMD described the main categories of affected warehouses as 1) general purpose warehouses (port or non-port related); 2) transload facilities; 3) cross-dock transload facilities; 4) truck terminals for less-than-truckload trucks; 5) general purpose distribution centers; 6) manufacturing and distribution facilities; 7) retail fulfillment centers; and 8) cold storage facilities. An overview of the warehouses affected by PR 2305 described by category is included below.^{26,27}

General Purpose Warehouse (GPW) is a facility used to store goods. The majority of general purpose warehouses are operated by Logistics Service Providers or Third-party Logistics Providers (LSP or 3PL). The primary function of a GPW is to store goods that usually have not been sold yet. Value-added services like barcode application and scanning, ticketing and labeling, and carton packing are also provided at these facilities. Goods typically stay at a GPW several weeks to several months.

- **Port-Related General Purpose Warehouses** are in commercial and industrial clusters. Port-related import products include international manufactured or processed goods, such as textiles and apparel, footwear, electronics, and home and office supplies.
- **Non-Port-Related General Purpose Warehouses** are dispersed throughout the South Coast AQMD jurisdiction and typically include storage of domestic products, which may be domestically manufactured, harvested, or processed goods, such as chemicals, minerals, pharmaceuticals, agricultural products, and other food products.

Transload Facility is a special purpose port-related facility that typically handles imported products. Transloading refers to the transfer of contents from marine containers (40 feet) into domestic rail or truck containers or trailers (53 feet) near a US gateway port for onward movement to an inland destination. Cargo is transferred based on the destination, specified by the beneficial cargo owner (BCO). Transloading typically reduces the per-unit cost of inland transportation for importers. The turnaround time for these facilities is usually up to one week.

Cross-Dock Transload Facility is a transload facility that handles cargo for export, import, or domestic cargo. The difference between a transload and a cross-dock facility is purely operational, with both structured very similarly. They are pure distribution facilities, with no storage. At a Cross-Dock Transload Facility, the time from receipt to shipment is less than 24 hours. Goods generally leave these facilities in full truckloads.

Truck Terminals for Less-Than-Truckload Trucks (LTL) are facilities used to transfer domestic and imported cargo in small order quantities. They are operated by a motor carrier to transfer the less-than-truckload shipments from one truck to another. Sorting and segregation of

²⁴ About 919 are in Phase 1, about 931 are in Phase 2, and about 1,052 are in Phase 3.

²⁵ About 37 in Phase 1, about 57 in Phase 2, and about 324 in Phase 3.

[http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf)

²⁷ Southern California Association of Governments. 2018, March 30. Industrial Warehousing in the SCAG Region, Full Report, (2018), Southern California Council of Governments. https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf

inbound cargo takes place to make one outbound LTL truck, with cargo typically stored up to one week. The outbound LTL trucks contain orders meant for multiple customers within a limited geographical area, while full truckloads are filled with cargo designated for a single customer.

General Purpose Distribution Centers (DCs) are warehouses operated by beneficial cargo owners (BCOs), or outsourced to LSPs, to manage storage and distribution of inventory for their customers. Distribution centers store product for retailers and wholesalers to be redistributed to another location or directly to the consumer. DCs are positioned strategically to maximize the range of customers they are able to serve and keep delivery costs low. Turnaround time varies depending on cargo type and demand but is generally shorter than in a GPW, on the order of weeks. The flow of product is very large, and each order may contain hundreds or thousands of items.

Retail Fulfillment Centers are special-purpose DCs that have become much more common in the supply chains of large retailers. Typically, DCs replenish store stock and ship to retailer stores, while retail fulfillment centers process individual consumer orders placed through catalogs and the Internet, replenish store inventory from the stock on hand, and serve local retail customers.

Manufacturing and Distribution Facilities are facilities that consist of onsite manufacturing, warehousing, and distribution. At least 50 percent of the floor area is dedicated to manufacturing. The smallest part of the facility is dedicated for office space, no more than 10 percent, and the remaining floor area is used for warehouses and distribution facilities.²⁸ Separate warehouses are dedicated for incoming raw materials and for finished goods. The raw materials or products are stored in the warehouses from two weeks to 90 days.

Cold Storage Facilities are functionally identical to regular distribution centers, except that all products must be either refrigerated or frozen, and the turnaround time is very short to ensure freshness. Trucks serving these facilities are often equipped with a transportation refrigeration unit (TRU), and there are commonly more truck trips at these facilities than at equivalently sized non-cold storage facilities. This type of distribution center uses the same strategy as regular distribution centers, and overall reduces the number of LTL trucks driving from a vendor to a retail store.

Additional warehouse subcategories that are specialized cases of the categories above are detailed below.

Parcel Hubs are a unique hybrid of a transload facility and a distribution center. Starting with either a mail carrier or a company's retail store, small packages are sent to a regional parcel hub and sorted by destination. The parcels are consolidated onto a pallet and shipped to another parcel hub near the package's destination. The pallets may pass through a dedicated transloading facility near an airport or be shipped directly via a class 8 truck.

E-commerce Fulfillment Centers are specialized DCs that support online orders. The facilities process a large number of individual consumer orders placed through the Internet. Orders are generally small, one to three items, and are filled and shipped within hours. These centers are typically located in proximity to highways in order to accommodate the large number of delivery vehicles accessing the facility.

²⁸ Yap, Johansson and Circ, Rene. 2003. Guide to Classifying Industrial Property, Second Edition. Urban Land Institute.

**Table 2-5
Warehousing Facilities²⁹**

Warehouse Category	Description of Facility	Building Location
General Purpose Warehouse	The typical area is 25,000 to 50,000 <u>square feet</u> (sq. ft.), with low-ceiling height, and varying width.	Not Specific
Transloading Facility	The typical area is 25,000 to 50,000 sq. ft., with low-ceilings, and a narrow rectangular shape with multiple doors on the long side. One side is meant for inbound containers and the opposite is meant for outbound containers.	Depends on Proximity to Ports
Crossdock Transload Facility	The typical area is 25,000 to 50,000 sq. ft., with low-ceilings, and a narrow rectangular shape with multiple doors on the long side. One side is meant for inbound containers and the opposite is meant for outbound containers.	Depends on Proximity to Ports
Parcel Hub	The typical area can be up to 500,000 sq. ft.	Depends on Proximity to Market
Truck Terminal for Less-Than-Truckload Trucks	The typical area is anywhere from 25,000 sq. ft. to 150,000 sq. ft., with low-ceilings. It's usually narrow and long with multiple doors to quickly and efficiently process cargo.	Not Specific
General Purpose Distribution Center	The building size can vary greatly depending on the distributor, ranging from 50,000 sq. ft. to 500,000 sq. ft. and are generally very tall.	Depends on Proximity to Market
Manufacturing and Distribution	The size can range from 200,000 sq. ft. to 1,000,000 sq. ft. or more depending if light or heavy manufacturing.	Not Specific
Retail Fulfillment Center	The area ranges from 500,000 sq. ft. to 1,000,000 sq. ft., with very high ceilings to accommodate the automated pick and pack technology.	Depends on Land Availability
E-commerce Fulfillment Center	Square footage varies.	Depends on Proximity to Market
Cold Storage Facility	The building size depend on demand and turn over time.	Depends on Proximity to Market

CHAPTER 3 EXISTING SETTING

3.0 INTRODUCTION

In order to determine the significance of the impacts associated with a proposed project, it is necessary to evaluate the project's impacts against the backdrop of the environment as it exists at the time the environmental analysis is commenced. The CEQA Guidelines define 'environment' as "the physical conditions that exist within the area which will be affected by a proposed project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance" (CEQA Guidelines Section 15360; see also Public Resources Code Section §21060.5). Furthermore, a CEQA document must include a description of the physical environment in the vicinity of the project, as it exists at the time the environmental analysis is commenced, from both a local and regional perspective (CEQA Guidelines Section 15125). Therefore, the 'environment' or 'existing setting' against which a project's impacts are compared consists of the immediate, contemporaneous physical conditions at and around the project site.

The following sections summarize the existing setting for the proposed project and the existing rules that will be affected by the proposed project as well as the regional existing setting for air quality and greenhouse gas emissions, energy, hazardous materials and solid and hazardous waste,¹ and transportation (traffic). In addition, these documents incorporate by reference the existing setting for Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Noise, Population and Housing, Public Services, Recreation, and Utilities and Service Systems, as described in CARB's Final Environmental Analysis for the Advanced Clean Trucks Regulation. These impact areas are only affected by potential indirect impacts of the project, i.e., potential development of new manufacturing and recycling facilities to produce and fuel zero emissions vehicles incentivized by the proposed project as well as infrastructure improvements to support the transition to NZE and ZE vehicles. These indirect impacts were analyzed in CARB's Final Environmental Analysis for the Advanced Clean Trucks Regulation.

¹ During the public comment period on the NOP/IS, South Coast AQMD received comments related to the environmental impacts associated with the increased disposal of batteries. Therefore, the environmental impacts related to the increased disposal of batteries have been included and analyzed in the topic area of hazardous materials and solid and hazardous waste in this EA and a discussion of the environmental setting is provided in this chapter.

3.1 AIR QUALITY AND GREENHOUSE GAS EMISSIONS

Ambient air quality standards have been adopted at the state and federal levels for criteria air pollutants. In addition, both the state and federal government regulate the release of toxic air contaminants and GHG emissions. Projects within South Coast AQMD's jurisdiction are subject to the rules and regulations imposed by the South Coast AQMD as regulations adopted by CARB and U.S. EPA. Federal, state, regional, and local laws, regulations, plans, or guidelines that are potentially applicable to the proposed project are summarized in this section.

3.1.1 Air Quality Management Planning

The California Legislature created the South Coast AQMD in 1977¹ as the agency responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (SCAB) and the Riverside County portion of the Salton Sea Air Basin (SSAB) and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin (MDAB).

In 1977, amendments to the federal Clean Air Act (CAA) included requirements for submitting State Implementation Plans (SIPs) for nonattainment areas that failed to meet all federal ambient air quality standards (CAA Section 172), and similar requirements exist in state law (Health and Safety Code Section 40462). The federal CAA was amended in 1990 to specify attainment dates and SIP requirements for ozone, carbon monoxide (CO), nitrogen dioxide (NO₂), and particulate matter (PM) with an aerodynamic diameter of less than 10 microns (PM₁₀). In 1997, the U.S. EPA promulgated ambient air quality standards for particulate matter with an aerodynamic diameter less than 2.5 microns (PM_{2.5} or fine particulate matter). U.S. EPA is required to periodically update the national ambient air quality standards (AAQS or standards).

In addition, the California Clean Air Act (CCAA), adopted in 1988, requires the South Coast AQMD to achieve and maintain the State ambient air quality standards for ozone, CO, sulfur dioxide (SO₂), and NO₂ by the earliest practicable date (Health and Safety Code Section 40910). In addition, the CCAA includes a standard for fine particulate matter, or PM_{2.5}. Notably, for ozone, the current 8-hour CAAQS and the 2015 8-hour NAAQS are at an equivalent level and for PM_{2.5}, the current annual CAAQS and the 2012 annual NAAQS are also at an equivalent level. As a result, the South Coast AQMD relies on the same measures to meet both federal and state ozone and PM_{2.5} standards. The CCAA also requires a three-year plan review, and, if necessary, an update to the SIP. The CCAA requires air districts to achieve and maintain state standards by the earliest practicable date, and for extreme non-attainment areas, to include all feasible measures pursuant to Health and Safety Code Sections 40913, 40914, and 40920.5. While not defined in this part of the Health and Safety Code, the term 'feasible' is defined in the CEQA Guidelines² Section 15364 as a measure "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors."

¹ The Lewis-Prezley Air Quality Management Act, 1976 Cal. Stats., Ch. 324 (codified at Health and Safety Code Section 40400-40540).

² The CEQA Guidelines are codified at Title 14 California Code of Regulations Section 15000 *et seq.*

3.1.1.1 South Coast AQMD Air Quality Management Plan

By statute, the South Coast AQMD is required to adopt an air quality management plan (AQMP) demonstrating compliance with all federal and state ambient air quality standards for the areas under the jurisdiction of the South Coast AQMD.³ Furthermore, the South Coast AQMD must adopt rules and regulations that carry out the AQMP.⁴ The AQMP is a regional blueprint for how the South Coast AQMD will achieve air quality standards and healthful air, and the 2016 AQMP⁵ contains multiple goals promoting reductions of criteria air pollutants, GHG, and TACs. In particular, the 2016 AQMP states that oxides of nitrogen (NOx), volatile organic compound (VOC), and PM_{2.5} emissions need to be reduced to meet key ozone air quality standards in 2023 and 2031, with emphasis that NOx emission reductions are more effective to reduce the formation of ozone and PM_{2.5}. Ozone (O₃) is a criteria pollutant shown to adversely affect human health and is formed when VOCs react with NOx in the atmosphere. NOx is a precursor to the formation of ozone and PM_{2.5}. The 2016 AQMP specifically recognized that the “NOx strategy will assist in meeting the annual PM 2.5 standard as ‘expeditiously as practicable’ earlier than the attainment year of 2025.”⁶ The South Coast AQMD has also initiated development of the 2022 AQMP that will focus on meeting the 70 ppb NAAQS for ozone by 2037.

To meet air pollution reduction goals, the 2016 AQMP contains a variety of control measures, which include Facility-Based Mobile Source Measures (FBMSMs), also known as indirect source measures or rules. An indirect source rule (ISR) is distinct from a traditional air pollution control regulation that focuses on stationary equipment in that ISR focuses on reducing emissions from the vehicles and other emissions sources associated with a facility rather than just emissions from a facility itself.⁵ The primary goal of the FBMSMs is to reduce NOx emissions as one of many local, state, and federal strategies to meet the 8-hour ozone federal standard, but they can also assist in reducing other criteria pollutants like PM_{2.5}. NOx is locally and regionally important due to its involvement in the photochemical formation of ozone, nitrogen dioxide (NO₂), and PM_{2.5}. Mobile sources associated with goods movement make up about 52 percent of all NOx emissions in the SCAB.⁷

⁶ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp> (page 4-52)

⁷ SCAG 2020 Regional Transportation Plan. Accessed Oct. 7, 2020. https://www.connectsocial.org/Documents/Adopted/fConnectSoCal_Goods-Movement.pdf#page=4

The FBMSMs are concentrated on the four sectors of the goods movement industry: commercial marine ports, rail yards, warehouse distribution centers, and commercial airports. Of these FBMSMs, Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, is committed to achieve emission reductions from the warehouse sector. The South Coast AQMD Governing Board approved the 2016 Air Quality Management Plan (2016 AQMP) in March of 2017 and forwarded that approval to CARB. Later that month, CARB approved the 2016 AQMP into the SIP, and the 2016 AQMP was ultimately approved by U.S. EPA on October 1, 2019. The 2016 AQMP included MOB-03, a facility-based mobile source control measure to reduce emissions from warehouse distribution centers. Initially, the South Coast AQMD Governing Board authorized a one-year public process to identify if MOB-03 could be achieved through voluntary or regulatory measures, and then ultimately determined in May of 2018 that staff should pursue a regulatory approach.

3.1.2 Air Quality Regulations and Plans

3.1.2.1 Federal and State

It is the responsibility of South Coast AQMD to ensure that state and federal ambient air quality standards (AAQS or standards) are achieved and maintained in its geographical jurisdiction.

3.1.2.1.1 Air Pollutants of Concern

Health-based air quality standards have been established by California and the federal government for the following criteria air pollutants: ozone (O₃), carbon monoxide (CO), nitrogen dioxide (NO₂), particulate matter (PM, which includes PM₁₀ and PM_{2.5}), sulfur dioxide (SO₂), and lead (Pb). These standards were established to protect sensitive receptors with a margin of safety from adverse health impacts due to exposure to air pollution. The California standards are sometimes more stringent than the federal standards and in the case of PM₁₀ and SO₂, far more stringent. However, for ozone, the current 8-hour CAAQS and the 2015 8-hour NAAQS are at an equivalent level, and for PM_{2.5}, the current annual CAAQS and the 2012 annual NAAQS are also at an equivalent level. As a result, the South Coast AQMD relies on the same measures to meet both federal and state ozone and PM_{2.5} standards. California has also established standards for sulfates, visibility reducing particles, hydrogen sulfide, and vinyl chloride. The state and federal standards for each of these pollutants and their effects on health are summarized in Table 3.1-1.

South Coast AQMD monitors levels of various criteria pollutants at 38 monitoring stations. The 2019 air quality data (the latest data available) from South Coast AQMD's monitoring stations are presented in Tables 3.1-2 through 3.1-8 for the individual criteria air pollutants monitored by South Coast AQMD.

**Table 3.1-1
State and Federal Ambient Air Quality Standards**

Pollutant	Averaging Time	State Standard ^a	Federal Primary Standard ^b	Most Relevant Effects
Ozone (O3)	1-hour	0.09 ppm (180 µg/m³)	0.12 ppm	(a) Short-term exposures: 1) Pulmonary function decrements and localized lung edema in humans and animals; and 2) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (b) Long-term exposures: Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (c) Vegetation damage; and (d) Property damage.
	8-hour	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)	
Suspended Particulate Matter (PM10)	24-hour	50 µg/m³	150 µg/m³	(a) Excess deaths from short-term exposures and exacerbation of symptoms in sensitive patients with respiratory disease; and (b) Excess seasonal declines in pulmonary function, especially in children.
	Annual Arithmetic Mean	20 µg/m³	No Federal Standard	
Suspended Particulate Matter (PM2.5)	24-hour	No State Standard	35 µg/m³	(a) Increased hospital admissions and emergency room visits for heart and lung disease; (b) Increased respiratory symptoms and disease; and (c) Decreased lung functions and premature death.
	Annual Arithmetic Mean	12 µg/m³	12 µg/m³	
Carbon Monoxide (CO)	1-Hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	(a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) Impairment of central nervous system functions; and (d) Possible increased risk to fetuses.
	8-Hour	9 ppm (10 mg/m³)	9 ppm (10 mg/m³)	

^a The California ambient air quality standards for O3, CO, SO2 (1-hour and 24-hour), NO2, PM10, and PM2.5 are values not to be exceeded. All other California standards shown are values not to be equaled or exceeded.

^b The national ambient air quality standards, other than O3 and those based on annual averages are not to be exceeded more than once a year. The O3 standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above the standards is equal to or less than one.

Carbon Monoxide

CO is a primary pollutant, meaning that it is directly emitted into the air, not formed in the atmosphere by chemical reaction of precursors, as is the case with ozone and other secondary pollutants. Ambient concentrations of CO exhibit large spatial and temporal variations due to variations in the rate at which CO is emitted and in the meteorological conditions that govern transport and dilution. Unlike ozone, CO tends to reach high concentrations in the fall and winter months. The highest concentrations frequently occur on weekdays at times consistent with rush hour traffic and late night during the coolest, most stable portion of the day.

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise and electrocardiograph changes indicative of worsening oxygen supply to the heart. Inhaled CO has no direct toxic effect on the lungs but exerts its effect on tissues by interfering with oxygen transport by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses, and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes. Reductions in birth weight and impaired neurobehavioral development have been observed in animals chronically exposed to CO resulting in COHb levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels. These include preterm births and heart abnormalities.^{8, 9, 10}

As summarized in Table 3.1-2, CO concentrations were measured at 24 locations in the SCAB and neighboring SSAB in 2019 but did not exceed the state or federal standards in 2019. All areas within the South Coast AQMD's jurisdiction are in attainment for both the federal and state 1-hour and 8-hour CO standards.

On August 12, 2011, U.S. EPA added a monitoring requirement for near-road CO monitors in urban areas with populations of one million or more, utilizing stations that would be implemented to meet the 2010 NO₂ near-road monitoring requirements. The two new CO monitors are at the I-5 near-road site, located in Orange County near Anaheim, and the I-10 near-road site, located near Etiwanda Avenue in San Bernardino County near Ontario, Rancho Cucamonga, and Fontana.

Ozone

Ozone (O₃), a colorless gas with a sharp odor, is a highly reactive form of oxygen. High ozone concentrations exist naturally in the stratosphere. Some mixing of stratospheric ozone downward through the troposphere to the Earth's surface does occur; however, the extent of ozone transport is limited. At the Earth's surface in sites remote from urban areas, ozone concentrations are normally very low (e.g., from 0.03 ppm to 0.05 ppm).

Ozone is highly reactive with organic materials, causing damage to living cells, and ambient ozone concentrations in the Basin are frequently sufficient to cause health effects. Ozone enters the human body primarily through the respiratory tract and causes respiratory irritation and discomfort, makes breathing more difficult during exercise, and reduces the respiratory system's ability to remove inhaled particles and fight infection. Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible subgroups for ozone effects. Short-term exposures (lasting for a few hours) to ozone at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. In recent years, a correlation between elevated ambient ozone levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and live in high ozone communities. Elevated ozone levels are also associated with increased school absences. Ozone exposure under exercising conditions is known to increase the severity of the above mentioned observed responses. Animal studies suggest that exposures to a combination of pollutants which include ozone may be more toxic than exposure to ozone alone. Although lung volume and resistance changes observed after a single exposure

diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.^{11,12,13}

As summarized in Table 3.1-3, ozone concentrations were measured at 28 locations in the SCAB and the Coachella Valley portion of the SSAB in 2019. All areas within South Coast AQMD's jurisdiction are in nonattainment of both the federal and state 1-hour and 8-hour ozone standards. Maximum ozone concentrations for all areas monitored were below the stage 1 episode level (0.20 ppm) and below the health advisory level (0.15 ppm). Most areas within South Coast AQMD's jurisdiction continue to exceed the state and federal ozone standards. Ozone is formed when heat and sunlight cause chemical reactions between NO_x and VOCs. Ozone formation is dependent upon a variety of complex factors, including the presence of sunlight and precursor pollutants, natural topography, nearby structures that cause building downwash, atmospheric stability, and wind patterns. The 2016 AQMP measures to reduce ozone include stationary and mobile source NO_x reduction strategies, supplemented by limited, strategic VOC emission reductions.

Nitrogen Dioxide

NO2 is a reddish-brown gas with a bleach-like odor. Nitric oxide (NO) is a colorless gas, formed from nitrogen (N2) and oxygen (O2) in air under conditions of high temperature and pressure which are generally present during combustion of fuels; NO reacts rapidly with the oxygen in air to form NO2. NO2 is responsible for the brownish tinge of polluted air. The two gases, NO and NO2, are referred to collectively as NOx. In the presence of sunlight, NO2 reacts to form nitric oxide and an oxygen atom. The oxygen atom can react further to form ozone, via a complex series

of chemical reactions involving hydrocarbons. Nitrogen dioxide may also react to form nitric acid (HNO₃) which reacts further to form nitrates, components of PM_{2.5} and PM₁₀.

Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposures to NO₂ at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO₂ in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma and/or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these subgroups. More recent studies have found associations between NO₂ exposures and cardiopulmonary mortality, decreased lung function, respiratory symptoms, and emergency room asthma visits. In animals, exposure to levels of NO₂ considerably higher than ambient concentrations result in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of ozone and NO₂.^{14, 15, 16}

As summarized in Table 3.1-4, NO₂ concentrations were measured at 26 locations in 2019. The South Coast Air Basin is in attainment for NO₂. No area of the SCAB or SSAB exceeded the federal or state standards for NO₂ in 2019. The higher relative concentrations in the Los Angeles area are indicative of the concentrated emission sources, especially heavy-duty vehicles. NO_x emission reductions continue to be necessary because it is a precursor to both ozone and PM (PM_{2.5} and PM₁₀) concentrations.¹⁷ As noted above, all areas within South Coast AQMD's jurisdiction are in nonattainment of both the federal and state 1-hour and 8-hour ozone standards. Furthermore, as noted and further discussed below, areas within South Coast AQMD's jurisdiction are in nonattainment under the various state and/or federal PM₁₀ and PM_{2.5} standards.

With the revised NO₂ federal standard in 2010, near-road NO₂ measurements were required to be phased in for larger cities. The four near-road monitoring stations are: 1) I-5 near-road, located in Orange County near Anaheim; 2) I-710 near-road, located at Long Beach Blvd. in Los Angeles County near Compton and Long Beach; 3) State Route 60 (CA-60) near-road, located west of Vineyard Avenue near the San Bernardino/Riverside County border near Ontario, Mira Loma, and Upland; and 4) I-10 near-road, located near Etiwanda Avenue in San Bernardino County near Ontario, Rancho Cucamonga, and Fontana.

The state 1-hour and annual standards are 0.18 ppm (180 ppb) and 0.030 ppm (30 ppb). ^b District Maximum is the maximum value calculated at any station in the South Coast AQMD jurisdiction. ^c Concentrations are the maximum value observed at any station in the SCAB. Number of daily exceedances are the total number of days that the indicated concentration is exceeded at any station in the SCAB.					

Sulfur Dioxide

SO₂ is a colorless gas with a sharp odor. It reacts in the air to form sulfuric acid (H₂SO₄), which contributes to acid precipitation, and sulfates, which are components of PM₁₀ and PM_{2.5}. Most of the SO₂ emitted into the atmosphere is produced by burning sulfur-containing fuels.

Exposure of a few minutes to low levels of SO₂ can result in airway constriction in some asthmatics. All asthmatics are sensitive to the effects of SO₂. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, is observed after acute higher exposure to SO₂. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO₂. Animal studies suggest that despite SO₂ being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO₂ levels. In these studies, efforts to separate the effects of SO₂ from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.^{18, 19, 20}

Historical measurements showed concentrations to be well below standards and monitoring was previously discontinued at those stations. As summarized in Table 3.1-5, SO₂ concentrations were measured at five locations in 2019. All areas within South Coast AQMD's jurisdiction are in attainment for the state and federal 1-hour SO₂ standards. No exceedances of federal or state standards for sulfur dioxide occurred in 2019 at any of the five monitoring locations. Although

Particulate Matter (PM₁₀ and PM_{2.5})

Of great concern to public health are the particles small enough to be inhaled into the deepest parts of the lung. Respirable particles (particulate matter less than about 10 micrometers in diameter [PM₁₀]) can accumulate in the respiratory system and aggravate health problems such as asthma, bronchitis, and other lung diseases. Children, the elderly, exercising adults, and those suffering from asthma are especially vulnerable to adverse health effects of particulate matter.

A consistent correlation between elevated ambient fine particulate matter (PM_{2.5}) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks, and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. Studies have reported an association between long-term exposure to air pollution dominated by PM_{2.5} and increased mortality, reduction in lifespan, and an increased mortality from lung cancer. Daily fluctuations in PM_{2.5} concentrations have also been related to hospital admissions for acute respiratory conditions, to school and kindergarten absences, to a decrease in respiratory function in normal children, and to increased medication use in children and adults with asthma. Studies have also shown lung function growth in children is reduced with long-term exposure to particulate matter. In addition to children, the elderly, and people with preexisting respiratory and/or cardiovascular disease appear to be more susceptible to the effects of PM₁₀ and PM_{2.5}.^{21, 22, 23}

As summarized in Table 3.1-6, PM₁₀ concentrations were measured at 22 locations in 2019. The SCAB has remained in attainment of the federal 24-hour PM₁₀ standard since 2006, and it was not exceeded in 2019. South Coast AQMD's jurisdiction also covers parts of the MDAB and SSAB, which are both in nonattainment of the federal 24-hour PM₁₀ standard. All areas within South Coast AQMD's jurisdiction are in nonattainment of the state 24-hour PM₁₀ standard, which

was exceeded at several of the monitoring stations in 2019. The federal annual PM10 standard has been revoked. All areas within South Coast AQMD's jurisdiction are in nonattainment of the state annual PM10 standard, which was exceeded at most stations in each county in the SCAB and in the Coachella Valley in 2019.

As summarized in Table 3.1-7, PM2.5 concentrations were measured at 19 locations throughout the South Coast Air Basin in 2019. The Coachella Valley is in attainment of both the federal annual and 24-hour PM2.5 standards. All areas within the South Coast Air Basin are in nonattainment of the federal 24-hour and annual PM2.5 standards. All areas within South Coast AQMD's jurisdiction are in nonattainment of the state annual PM2.5 standard. In 2019, the monitored PM2.5 concentrations exceeded the federal 24-hour and annual PM2.5 standards and the state annual PM2.5 standard.

^{##} Four near-road sites measuring one or more of the pollutants PM2.5, CO, and/or NO2 are operating near the following freeways: I-54, I-10, CA-60, and I-710 + High PM10 ($\geq 155 \mu\text{g}/\text{m}^3$) data recorded in Coachella Valley (due to high winds) and the Basin (due to Independence Day fireworks) are excluded in accordance with the U.S. EPA Exceptional Event Rule.						

On December 14, 2012, a requirement was added to monitor near the most heavily trafficked roadways in large urban areas. Particle pollution is expected to be higher along these roadways as a result of direct emissions from cars and heavy-duty diesel trucks and buses. South Coast AQMD installed the two required PM2.5 monitors at locations selected based upon the heavy-duty diesel traffic, which are: 1) I-710 Near Road Monitoring Station, located at Long Beach Blvd. in Los Angeles County near Compton and Long Beach; and 2) ~~CA State Route 60 (CA-60) Near Road~~

Monitoring Station, located west of Vineyard Avenue near the San Bernardino/Riverside County border near Ontario, Mira Loma, and Upland.²⁴

Lead

Under the federal CAA, lead is classified as a ‘criteria pollutant.’ Lead has observed adverse health effects at ambient concentrations. Lead is also deemed a carcinogenic toxic air contaminant (TAC) by the Office of Environmental Health Hazard Assessment (OEHHA). Lead in the atmosphere is present as a mixture of a number of lead compounds. Leaded gasoline and lead smelters have been the main sources of lead emitted into the air. Due to the phasing out of leaded gasoline, there was a dramatic reduction in atmospheric lead in the South Coast Air Basin over the past three decades. In fact, there were no violations of the lead standards at South Coast AQMD’s regular air monitoring stations from 1982 to 2007 as a result of removal of lead from gasoline.

Fetuses, infants, and children are more sensitive than others to the adverse effects of lead exposure. Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure. Lead poisoning can cause anemia, lethargy, seizures, and death. It appears that there are no direct effects of lead on the respiratory system. Lead can be stored in the bone from early-age environmental exposure, and elevated blood lead levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland), and osteoporosis (breakdown of bone tissue). Fetuses and breast-fed babies can be exposed to higher levels of lead because of previous environmental lead exposure of their mothers.^{25, 26, 27}

As summarized in Table 3.1-8, South Coast AQMD monitored lead concentrations at seven monitoring stations in 2019. The SCAB is currently in nonattainment for lead. The MDAB and SSAB are both in attainment for lead. The South Coast AQMD has petitioned U.S. EPA for a redesignation to attainment for the federal lead standard for the Los Angeles County nonattainment area. Stringent South Coast AQMD rules governing lead-producing sources will help to ensure that there are no future violations of the federal standard. At the time of this report, South Coast AQMD has not yet received a response from U.S. EPA regarding the petition. The current lead concentrations in Los Angeles County are below the federal lead standard. Further, the state standards for lead were not exceeded in any areas under the jurisdiction of the South Coast AQMD in 2019.

Sulfates

Sulfates are chemical compounds which contain the sulfate ion and are part of the mixture of solid materials which make up PM₁₀. Most of the sulfates in the atmosphere are produced by oxidation of SO₂. Oxidation of sulfur dioxide yields sulfur trioxide (SO₃), which reacts with water to form sulfuric acid, which then contributes to acid deposition. The reaction of sulfuric acid with basic substances such as ammonia yields sulfates, a component of PM₁₀ and PM_{2.5}.

Most of the health effects associated with fine particles and SO₂ at ambient levels are also associated with sulfates. Thus, both mortality and morbidity effects have been observed with an increase in ambient sulfate concentrations. However, efforts to separate the effects of sulfates from the effects of other pollutants have generally not been successful.^{28, 29, 30}

As summarized in Table 3.1-8, South Coast AQMD monitored sulfate at seven monitoring stations in 2019. The state 24-hour sulfate standard (25 µg/m³) was not exceeded in the South Coast Air Basin, which is in attainment for sulfate. The MDAB and SSAB are also in attainment for sulfate. There are no federal sulfate standards.

Vinyl Chloride

Vinyl chloride is a colorless, flammable gas at ambient temperature and pressure. It is also highly toxic and is classified by the American Conference of Governmental Industrial Hygienists (ACGIH) as A1 (confirmed carcinogen in humans) and by the International Agency for Research on Cancer (IARC) as 1 (known to be a human carcinogen).³¹ At room temperature, vinyl chloride is a gas with a sickly-sweet odor that is easily condensed. However, it is stored as a liquid. Due to the hazardous nature of vinyl chloride to human health there are no end products that use vinyl chloride in its monomer form. Vinyl chloride is a chemical intermediate, not a final product. It is an important industrial chemical chiefly used to produce polymer polyvinyl chloride (PVC). The process involves vinyl chloride liquid fed to polymerization reactors where it is converted from a monomer to a polymer PVC. The final product of the polymerization process is PVC in either a flake or pellet form. Billions of pounds of PVC are sold on the global market each year. From its flake or pellet form, PVC is sold to companies that heat and mold the PVC into end products such as PVC pipe and bottles.

In the past, vinyl chloride emissions have been associated primarily with sources such as landfills. Risks from exposure to vinyl chloride are considered to be localized impacts rather than regional impacts. Because landfills in the South Coast AQMD are subject to Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills, which contain stringent requirements for landfill gas collection and control, potential vinyl chloride emissions are expected to be below the level of detection. Therefore, South Coast AQMD does not monitor for vinyl chloride at its monitoring stations.

Volatile Organic Compounds

It should be noted that there are no state or federal standards for VOCs because they are not classified as criteria pollutants. VOCs are regulated, however, because VOCs are a precursor to the formation of ozone in the atmosphere. VOCs are also transformed into organic aerosols in the atmosphere, contributing to higher PM10 and lower visibility levels.

Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations of VOCs because of interference with oxygen uptake. In general, ambient VOC concentrations in the atmosphere are suspected to cause coughing, sneezing, headaches, weakness, laryngitis, and bronchitis, even at low concentrations. Some hydrocarbon components classified as VOC emissions are thought or known to be hazardous. Benzene, for example, one hydrocarbon component of VOC emissions, is known to be a human carcinogen.

Non-criteria Pollutants

Although South Coast AQMD's primary mandate is attaining the state and federal standards for criteria pollutants within their jurisdiction, South Coast AQMD also has a general responsibility pursuant to Health and Safety Code Section 41700 to control emissions of air contaminants and prevent endangerment to public health. Additionally, state law requires South Coast AQMD to implement airborne toxic control measures (ATCM) adopted by CARB and to implement the Air Toxics 'Hot Spots' Act. As a result, South Coast AQMD has regulated pollutants other than criteria pollutants such as TACs, greenhouse gases (GHGs), and stratospheric ozone-depleting compounds. South Coast AQMD has developed a number of rules to control non-criteria pollutants from both new and existing sources. These rules originated through state directives, CAA requirements, or the South Coast AQMD rulemaking process. In addition to promulgating non-criteria pollutant rules, South Coast AQMD has been evaluating control measures in the 2016 AQMP as well as existing rules to determine whether or not they would affect, either positively or negatively, emissions of non-criteria pollutants. For example, rules in which VOC components of coating materials are replaced by a non-photochemically reactive chlorinated substance would reduce the impacts resulting from ozone formation, but could increase emissions of toxic compounds or other substances that may have adverse impacts on human health.

Carcinogenic Health Risks from TACs: One of the primary health risks of concern due to exposure to TACs is the risk of contracting cancer. The carcinogenic potential of TACs is a particular public health concern because it is currently believed by many scientists that there is no 'safe' level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of causing cancer. It is currently estimated that about one in four deaths in the United States is attributable to cancer. The proportion of cancer deaths attributable to air pollution has not been estimated using epidemiological methods.

Non-cancer Health Risks from TACs: Unlike carcinogens, for most non-carcinogens it is believed that there is a threshold level of exposure to the compound below which it will not pose a health risk. CalEPA's OEHHA develops Reference Exposure Levels (RELs) for TACs which are health-conservative estimates of the levels of exposure at or below which health effects are not expected. The non-cancer health risk due to exposure to a TAC is assessed by comparing the estimated level of exposure to the REL. The comparison is expressed as the ratio of the estimated exposure level to the REL, called the hazard index (HI).

Multiple Air Toxics Exposure Study (MATES): In 1986, South Coast AQMD conducted the first MATES report to determine the risks associated with major airborne carcinogens in the SCAB. The most current version (MATES IV) includes a monitoring program, an updated emissions inventory of TACs, and a modeling effort to characterize risk across the SCAB. The study focuses on the carcinogenic risk from exposure to air toxics but does not estimate mortality or other health effects from particulate exposures. An additional focus of MATES IV is the inclusion of measurements of ultrafine particle concentrations. MATES IV incorporates the updated health risk assessment methodology from OEHHA. Compared to previous studies of air toxics in the SCAB, this study found decreasing air toxics exposure, with the estimated Basin-wide, population-weighted risk down by about 57 percent from the analysis done for the MATES III time period. The ambient air toxics data from the ten fixed monitoring locations also demonstrated a similar reduction in air toxic levels and risks. On average, diesel particulates contributes about 68 percent of the total air toxics risk. This is a lower portion of the overall risk compared to the MATES III estimates of about 84 percent.

3.1.2.1.2 Regulatory Requirements Affecting Mobile Sources Associated with Warehouses

There are many existing and upcoming air quality regulations at the state and federal level that focus on emissions from the mobile sources associated with warehouses. These can broadly be placed into three categories. First are regulations that aim to reduce emissions at the tailpipe of a vehicle, commonly called engine standards. These regulations typically focus on requirements for new vehicles. Second are regulations that aim to replace older vehicles with newer vehicles with cleaner technologies, often called fleet rules. Third are regulations that focus on air quality impacts from facilities. These regulations look at the activities associated with a facility and aim to reduce air quality impacts beyond what is already required by engine standards or fleet rules. Key examples of these three types of regulations that address air quality impacts from warehouses are presented in Figures 3.1-1a and 3.1-1b as follows.

Figure 3.1-1a

3.1.2.2 Other State and South Coast AQMD Requirements

Executive Order (EO) N-79-20. On September 23, 2020, Governor Newsom signed an executive order directing state agencies to pursue aggressive goals towards zero emissions technologies. Key directives include:

- CARB shall develop and propose car and truck regulations with increasing zero emissions percentages such that by 2035 all in state sales are zero emissions.
- CARB shall also pursue regulations to achieve a 100 percent zero emissions medium duty and heavy duty fleet by 2045, with drayage fleets achieving this goal by 2035.
- CARB shall develop, in coordination with state agencies, U.S. EPA, and local air districts, strategies to achieve 100 percent zero emissions operations for off-road vehicles by 2035.³²

Senate Bill 44. The California Legislature passed Senate Bill (SB) 44, acknowledging the ongoing need to evaluate opportunities for mobile source emissions reductions and requiring CARB to update the 2016 Mobile Source Strategy by January 1, 2021, and every five years thereafter. Specifically, SB 44 requires CARB to update the 2016 Mobile Source Strategy to include a comprehensive strategy for the deployment of medium- and heavy-duty vehicles for the purpose of meeting air quality standards and reducing GHG emissions. It also directs CARB to set reasonable and achievable goals for reducing emissions by 2030 and 2050 from medium- and heavy-duty vehicles that are consistent with the State's overall goals and maximizes the reduction of criteria air pollutants.

AB 617 Community Air Protection Program: In 2017, Governor Edmund Brown signed Assembly Bill (AB) 617 to develop a new community-focused program to reduce local air pollution in environmental justice communities more effectively. The AB 617 program includes community air monitoring and community emissions reduction programs. In addition, the legislature appropriated funding to support early actions to address localized air pollution through targeted incentive funding to deploy cleaner technologies in these communities, and grants to support community participation in the AB 617 process. AB 617 includes new requirements for accelerated retrofit of air pollution controls on industrial sources, increased penalty fees, and greater transparency and availability of air quality and emissions data, which will help advance air pollution control efforts throughout the State.

In December 2018, CARB designated three AB 617 communities in the South Coast AQMD—including Wilmington, Carson, West Long Beach; San Bernardino, Muscoy; and East Los Angeles, Boyle Heights, West Commerce. A Community Steering Committee (CSC) was established for each community to gather input and develop Community Emission Reduction Plans (CERPs) and Community Air Monitoring Plans (CAMPs). The CSCs are comprised made up of residents, community organizations, local agencies, and businesses. Each CERP includes actions, strategies, and goals focused on emission and exposure reductions for air quality priorities identified by the CSCs. In September 2019, the South Coast AQMD Governing Board adopted the CERPs. Due to concerns expressed by the CSCs about local air quality impacts in their communities from trucks going to warehouses, all three 1st Year CERPs include as an action item

³² California, Office of Governor Gavin Newsom. 2020, September 23. Executive Order N-79-20. <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-text.pdf>

that South Coast AQMD should continue developing an indirect source rule for warehouses (i.e., WAIRE Program).

In December 2019, CARB designated two new AB 617 communities in the South Coast AQMD—including Eastern Coachella Valley and Southeast Los Angeles. A CSC was established for each new community to gather input and develop CERPs and CAMPs. In December 2020, the South Coast AQMD Governing Board adopted the CERPs for the Eastern Coachella Valley and Southeast Los Angeles communities. Due to concerns expressed by the Southeast Los Angeles CSC about the goods movement out of the Ports of Los Angeles and Long Beach and the corresponding emissions from heavy-duty diesel trucks, the CERP for Southeast Los Angeles includes an action item that South Coast AQMD should continue development of the Warehouse Indirect Source Rule (i.e., the WAIRE Program).

In addition to the other five communities, in October 2020, the South Coast AQMD Board voted to designate a sixth AB 617 community in the South Los Angeles area.

Environmental Justice (EJ): Environmental justice has long been a focus of South Coast AQMD. In 1990, South Coast AQMD formed an Ethnic Community Advisory Group that was restructured as the Environmental Justice Advisory Group (EJAG) in 2008. EJAG’s mission is to advise and assist South Coast AQMD in protecting and improving public health in South Coast AQMD’s most impacted communities through the reduction and prevention of air pollution.

In 1997, the South Coast AQMD Governing Board adopted four guiding principles and ten initiatives to ensure environmental equity.³³ Also in 1997, the South Coast AQMD Governing Board expanded the initiatives to include the “Children’s Air Quality Agenda,” focusing on the disproportionate impacts of poor air quality on children. Some key initiatives that have been implemented were the Multiple Air Toxics Exposure Studies (MATES, MATES II, MATES III, and MATES IV); the Clean Fleet Rules; Cumulative Impact Reduction Strategies (CIRS); funding for lower emitting technologies under the Carl Moyer Program; the *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*; a guidance document on *Air Quality Issues in School Site Selection*; and the 2000 Air Toxics Control Plan and its 2004 Addendum. Key initiatives focusing on communities and residents include the Clean Air Congress, the Clean School Bus Program, Asthma and Air Quality Consortium, Brain and Lung Tumor and Air Pollution Foundation, air quality presentations to schools and community and civic groups, and Town Hall meetings. Technological and scientific projects and programs have been a large part of South Coast AQMD’s EJ program since its inception. Over time, the EJ program’s focus on public education, outreach, and opportunities for public participation have greatly increased. Public education materials and other resources for the public are available on South Coast AQMD’s website (www.aqmd.gov).

Clean Communities Plan: On November 5, 2010, the South Coast AQMD Governing Board approved the 2010 Clean Communities Plan (CCP). The CCP was an update to the 2000 Air Toxics Control Plan (ATCP) and the 2004 Addendum to the ATCP. The objective of the 2010 CCP was to reduce exposure to air toxics and air-related nuisances throughout the South Coast AQMD, with emphasis on cumulative impacts. The elements of the 2010 CCP are community exposure reduction, community participation, communication and outreach, agency coordination, monitoring and compliance, source-specific programs, and nuisances. The centerpiece of the 2010

³³ South Coast AQMD. Environmental Justice History. <http://www.aqmd.gov/nav/about/initiatives/environmental-justice/history>

CCP is a pilot study through which South Coast AQMD staff worked with community stakeholders to identify and develop community-specific solutions to air quality issues in two communities: 1) the city of San Bernardino; and 2) Boyle Heights and surrounding areas.

Control Measures in the AQMP. The 2016 AQMP consists of three components: 1) the South Coast AQMD's Stationary, Area, and Mobile Source Control Measures (MOB); 2) State and Federal Control Measures imposed by CARB through the SIP; and 3) Regional Transportation Strategy and Control Measures prepared by the Southern California Association of Governments. The 2016 AQMP includes emission inventories and control measures for stationary, area, and mobile sources; an air quality setting; updated growth projections; new modeling techniques; demonstrations of compliance with state and federal CAA requirements; and an implementation schedule for adoption of the proposed control strategies. MOB control measures applicable to the proposed project include:

- **MOB-03 – Emission Reductions at Warehouse Distribution Centers:** The goal of this facility-based mobile source control measure is to examine potential actions to reduce emissions associated with the operation of warehouse distribution centers. This measure aims to mitigate emissions from all pollutants. The proposed project is a direct outcome of MOB-03.
- **MOB-07 – Accelerated Penetration of Partial Zero-Emission and Zero-Emission Light-Heavy- and Medium-Heavy-Duty Vehicles:** The goal of this on-road mobile source control measure is to accelerate the introduction of hybrid or zero-emission technology for light-heavy-duty and medium-heavy-duty vehicles. This would be accomplished through continuing incentive programs like the Hybrid truck and bus Voucher Incentive Program (HVIP), and through seeking legislative authority to allow South Coast AQMD to update its fleet rules for public fleets.
- **MOB-08 – Accelerated Retirement of Older On-Road Heavy-Duty Vehicles:** The goal of this mobile source control measure is to achieve additional emission reductions from heavy-heavy-duty on-road vehicles by retiring older diesel vehicles and replacing them with NZE and ZE vehicles, either through incentive programs or through additional regulations. This measure would be accomplished through incentive programs, through seeking legislative authority to allow South Coast AQMD to update ~~is its~~ its fleet rules for public fleets, and also pursuing potential regulations for privately owned fleets.
- **Further Deployment of Cleaner Technologies:** This measure, included in the State SIP Strategy and the 2016 AQMP, encompasses more NO_x emission reductions than all other measures combined. The measure applies to both on-road and off-road sources and primarily relies on new regulations and significant new sources of incentive funding that were not defined at the time of the AQMP. Emission reductions from PR 2305 would apply towards the commitment in this control measure.

3.1.3 Greenhouse Gas Emissions

Greenhouse gases (GHGs) trap heat in the atmosphere, which in turn heats the surface of the Earth. Some GHGs occur naturally and are emitted to the atmosphere through natural processes, while others are created and emitted solely through human activities. The latter, anthropogenic sources of GHGs, is the focus of impacts under CEQA. Traditionally, GHGs and other global warming pollutants are perceived as solely global in their impacts, and that increasing emissions anywhere in the world contributes to climate change anywhere in the world. A study conducted on the health

impacts of CO₂ ‘domes’ that form over urban areas showed that they cause increases in local temperatures and local criteria pollutants, which have adverse health effects.³⁴

3.1.3.1 *Climate Change*

Global climate change is a change in the average weather of the ~~e~~Earth, which can be measured by wind patterns, storms, precipitation, and temperature. Historical records have shown that temperature changes have occurred in the past, such as during previous ice ages. Data indicate that the current temperature record differs from previous climate changes in rate and magnitude.

Gases that trap heat in the atmosphere are often called greenhouse gases (GHGs), comparable to a greenhouse, which captures and traps radiant energy. GHGs are emitted by natural processes and human activities. The accumulation of greenhouse gases in the atmosphere regulates the earth’s temperature. Global warming is the observed increase in average temperature of the ~~e~~Earth’s surface and atmosphere. The primary cause of global warming is an increase of GHGs in the atmosphere. The six major GHGs are carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), sulfur hexafluoride (SF₆), hydrofluorocarbons (HFCs), and perfluorocarbon (PFCs). The GHGs absorb longwave radiant energy emitted by the Earth, which warms the atmosphere. The GHGs also emit longwave radiation both upward to space and back down toward the surface of the Earth. The downward part of this longwave radiation emitted by the atmosphere is known as the ‘greenhouse effect.’ Emissions from human activities such as fossil fuel combustion for electricity production and vehicles have elevated the concentration of these gases in the atmosphere.

- **Carbon Dioxide (CO₂)** is an odorless, colorless greenhouse gas. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic (human caused) sources of CO₂ include burning coal, oil, gasoline, natural gas, and wood.
- **Methane (CH₄)** is a flammable gas and is the main component of natural gas.
- **Nitrous Oxide (N₂O)**, also known as laughing gas, is a colorless greenhouse gas. Some industrial processes such as fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions also contribute to the atmospheric load of N₂O.
- **Hydrofluorocarbons (HFCs)** are synthetic man-made chemicals that are used as a substitute for chlorofluorocarbons (whose production was stopped as required by the Montreal Protocol) for automobile air conditioners and refrigerants. The two main sources of perfluorocarbon (PFCs) are primary aluminum production and semiconductor manufacture. Sulfur hexafluoride (SF₆) is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF₆ is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

Scientific consensus, as reflected in recent reports issued by the United Nations Intergovernmental Panel on Climate Change, is that the majority of the observed warming over the last 50 years can be attributable to increased concentration of GHGs in the atmosphere due to human activities. Human activities are directly altering the chemical composition of the atmosphere through the

³⁴ Jacobsen, Mark Z. “Enhancement of Local Air Pollution by Urban CO₂ Domes,” Environmental Science and Technology, as describe in Stanford University press release on March 16, 2010 available at: <http://news.stanford.edu/news/2010/march/urban-carbon-domes-031610.html>

buildup of climate change pollutants.³⁵ In the past, gradual changes in temperature changed the distribution of species, availability of water, etc. However, human activities are accelerating this process so that environmental impacts associated with climate change no longer occur in a geologic time frame but in a human's lifetime.³⁶ Industrial activities, particularly increased consumption of fossil fuels (gasoline, diesel, ~~wood~~, coal, etc.), have heavily contributed to the increase in atmospheric levels of GHGs. The United Nations Intergovernmental Panel on Climate Change constructed several emission trajectories of greenhouse gases needed to stabilize global temperatures and climate change impacts. It concluded that a stabilization of greenhouse gases at 400 to 450 ppm carbon dioxide-equivalent (CO₂eq) concentration is required to keep global mean warming below two degrees Celsius, which has been identified as necessary to avoid dangerous impacts from climate change.³⁷

3.1.3.1.1 *Effects of Climate Change*

The potential health effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme events, air quality impacts, and sea level rise. There may be direct temperature effects through increases in average temperature, leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress and heat-related problems (e.g., heat rash and heat stroke). In addition, climate-sensitive diseases may increase, such as those spread by mosquitoes and other ~~disease-carrying~~ insects. Those diseases include malaria, dengue fever, yellow fever, and encephalitis. Extreme events such as flooding, hurricanes, and wildfires can displace people and agriculture, which would have negative consequences. Drought in some areas may increase, which would decrease water and food availability. Global warming may also contribute to air quality problems from increased frequency of smog and particulate air pollution.³⁸

The impacts of climate change will also affect projects in various ways. Effects of climate change are rising sea levels and changes in snowpack.³⁹ The extent of climate change impacts at specific locations remains unclear.

3.1.3.1.2 *California's GHG Sources and Relative Contribution*

In 2020, the statewide GHG emissions inventory was updated for 2000 to 2018 emissions using the global warming potentials (GWP) in the International Panel on Climate Change's (IPCC) Fourth Assessment Report (AR4).^{40, 41} Based on these GWPs, California produced 425.3 million metric tons (MMT) CO₂eq GHG emissions in 2018. California's transportation sector was the single largest generator of GHG emissions, producing 39.9 percent of the state's total emissions.

³⁷ Intergovernmental Panel on Climate Change (IPCC). 2014. *Fifth Assessment Report: Climate Change 2014*. New York: Cambridge University Press.

³⁸ Center for Disease Control. 2016. Climate Change Decreases the Quality of the Air We Breathe. https://www.cdc.gov/climateandhealth/pubs/AIR-QUALITY-Final_508.pdf

³⁹ Office of Environmental Health Hazards Assessment, 2018. Indicators of Climate Change in California. <https://oehha.ca.gov/media/downloads/climate-change/report/2018caindicatorsreportmay2018.pdf>, accessed April 3, 2019.

⁴⁰ Methodology for determining the statewide GHG inventory is not the same as the methodology used to determine statewide GHG emissions under Assembly Bill 32 (2006).

⁴¹ Global warming potential is the metric used to describe how much heat a molecule of a GHG absorbs relative to a molecule of carbon dioxide (CO₂) over a given period of time (20, 100, and 500 years). CO₂ has a GWP of 1.

Industrial sector emissions made up 21.0 percent, and electric power generation made up 14.8 percent of the state's emissions inventory. Other major sectors of GHG emissions include commercial and residential (9.7 percent), agriculture and forestry (7.7 percent), high GWP gases (4.8 percent), and recycling and waste (2.1 percent).⁴²

Since the peak level in 2004, California statewide GHG emissions dropped below the 2020 GHG limit of 431 MMTCO₂eq in 2016 and have remained below the 2020 GHG limit since then. In 2018, emissions from routine GHG emitting activities statewide were 6 MMTCO₂eq lower than the 2020 GHG limit. Per capita GHG emissions in California have dropped from a 2001 peak of 14.0 MTCO₂eq per person to 10.7 MTCO₂eq per person in 2018, a 24 percent decrease. Transportation emissions decreased in 2018 compared to the previous year, which is the first year over year decrease since 2013. Since 2008, California's electricity sector has followed an overall downward trend in emissions. In 2018, solar power generation has continued its rapid growth since 2013. Emissions from high-GWP gases increased 2.3 percent in 2018 (2000-to 2018 average year-over-year increase is 6.8 percent), continuing the increasing trend as they replace ozone depleting substances (ODS) being phased out under the 1987 Montreal Protocol. Overall trends in the inventory also demonstrate that the carbon intensity of California's economy (the amount of carbon pollution per million dollars of gross domestic product (GDP)) is declining, representing a 43 percent decline since the 2001 peak, while the state's GDP has grown 59 percent during this period.⁴³

3.1.3.1.3 South Coast Air Basin GHG Emissions

Table 3.1-9 presents the GHG emission inventory by fuel type in calendar year 2012 for the SCAB. These GHG emissions are reported in MTCO₂eq. Gasoline generates 53 percent of the GHG emissions from fuel combustion. Natural gas generates 31 percent of the GHG emissions from fuel combustion. The remaining 20 percent of the total SCAB GHG emissions from fuel combustion are from diesel, jet fuel, LPG, and fuel oil.⁴⁴

3.1.3.2 Federal Regulations and Plans

Greenhouse Gas Endangerment Findings: On December 7, 2009, the U.S. EPA Administrator signed two distinct findings regarding greenhouse gases pursuant to the Clean Air Act 202 (a). The Endangerment Finding stated that CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆, taken in combination, endanger both the public health and the public welfare of current and future generations. The *Cause or Contribute Finding* stated that the combined emissions from motor vehicles and motor vehicle engines contribute to the greenhouse gas air pollution that endangers public health and welfare. These findings were a prerequisite for implementing GHG standards for vehicles. The U.S. EPA and the National Highway Traffic Safety Administration (NHTSA) finalized emission standards for light-duty vehicles in May 2010 and for heavy-duty vehicles in August of 2011. Subsequently, the U.S. EPA rolled back the light duty GHG standards, a decision which is currently under litigation.

Renewable Fuel Standard: The Renewable Fuel Standard (RFS) program was established under the Energy Policy Act (EPAct) of 2005, and required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under the Energy Independence and Security Act (EISA) of 2007, the RFS program was expanded to include diesel, required that the volume of renewable fuel blended into transportation fuel be increased from nine billion gallons in 2008 to 36 billion gallons by 2022, established new categories of renewable fuel, and required U.S. EPA to apply life-cycle GHG performance threshold standards so that each category of renewable fuel emits fewer greenhouse gases than the petroleum fuel it replaces.

GHG Tailoring Rule: On May 13, 2010, U.S. EPA finalized the GHG Tailoring Rule to phase in the applicability of the Prevention of Significant Deterioration (PSD) and Title V operating permit programs for GHGs. The GHG Tailoring Rule applies to the largest GHG emitters, while excluding smaller sources (restaurants, commercial facilities, and small farms). The first phase (from January 2, 2011, to June 30, 2011) addressed the largest sources. Title V GHG requirements were triggered only when affected facility owners/operators were applying, renewing, or revising their permits for non-GHG pollutants. The PSD GHG requirements were applicable only if sources were undergoing permitting actions for other non-GHG pollutants and the permitted action would increase GHG emission by 75,000 MTCO₂eq per year or more.

The second phase (from July 1, 2011, to June 30, 2013) included sources that emit or have the potential to emit 100,000 MTCO₂eq per year or more. Newly constructed sources that are not major sources for non-GHG pollutants would not be subject to PSD GHG requirements unless it emits 100,000 MTCO₂eq per year or more. Modifications to a major source would not be subject to PSD GHG requirements unless it generates a net increase of 75,000 MTCO₂eq per year or more. Sources not subject to Title V would not be subject to Title V GHG requirements unless 100,000 MTCO₂eq per year or more would be emitted.

The third phase of the GHG Tailoring Rule, finalized on July 12, 2012, determined not to lower the current PSD and Title V applicability thresholds for GHG-emitting sources established in the GHG Tailoring Rule for phases 1 and 2. The GHG Tailoring Rule also promulgated regulatory revisions for better implementation of the federal program for establishing plantwide applicability limitations (PALs) for GHG emissions, which will improve the administration of the GHG PSD permitting programs. In 2014, the U.S. Supreme Court held that U.S. EPA was limited to phase 1.

GHG Reporting Program: U.S. EPA issued the Mandatory Reporting of Greenhouse Gases Rule (40 CFR Part 98) under the 2008 Consolidated Appropriations Act. The Mandatory Reporting of Greenhouse Gases Rule requires reporting of GHG data from large sources and suppliers under the Greenhouse Gas Reporting Program. Suppliers of certain products that would result in GHG emissions if released, combusted, or oxidized; direct emitting source categories; and facilities that inject CO₂ underground for geologic sequestration or any purpose other than geologic sequestration are included. Facilities that emit 25,000 MTCO₂eq or more per year are required to submit annual reports to U.S. EPA.

Ozone-Depleting Substances. Under the CAA Title VI, the U.S. EPA is assigned responsibility for implementing programs that protect the stratospheric ozone layer. 40 CFR Part 82 contains U.S. EPA's regulations specific to protecting the ozone layer. These U.S. EPA regulations phase out the production and import of ozone-depleting substances (ODSs) consistent with the Montreal

Protocol.⁴⁵ ODSs are typically used as refrigerants or as foam-blowing agents. ODS are regulated as Class I or Class II controlled substances. Class I substances have a higher ozone-depleting potential and have been completely phased out in the United States, except for exemptions allowed under the Montreal Protocol. Class II substances are HCFCs, which are transitional substitutes for many Class I substances and are being phased out.

3.1.3.3 State Regulations and Plans

3.1.3.3.1 Statewide GHG Reduction Targets

Executive Order S-3-05: In June 2005, Governor Schwarzenegger signed Executive Order S-3-05, which established emission reduction targets that would aim to reduce GHG emissions to 2000 levels by 2010, then to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050.

AB 32 – Global Warming Solutions Act: On September 27, 2006, AB 32, the California Global Warming Solutions Act of 2006, was signed by Governor Schwarzenegger. AB 32 expanded on Executive Order S-3-05. The California legislature stated that “global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California.” AB 32 represented the first enforceable statewide program in the U.S. to cap all GHG emissions from major industries that includes penalties for non-compliance. While acknowledging that national and international actions will be necessary to fully address the issue of global warming, AB 32 laid out a program to inventory and reduce GHG emissions in California and from power generation facilities located outside the state that serve California residents and businesses.

Consistent with the requirement to develop an emission reduction plan, CARB prepared a Scoping Plan indicating how GHG emission reductions will be achieved through regulations, market mechanisms, and other actions. The 2008 Scoping Plan called for reducing GHG emissions to 1990 levels by 2020. This means cutting approximately 30 percent from business-as-usual (BAU) emission levels projected for 2020, or about 15 percent from 2005 to 2008 levels.⁴⁶ However, as of January 1, 2020, SB 32 became the guiding GHG regulation.

SB 32 and AB 197: In September 2016, Governor Brown signed Senate Bill 32 and Assembly Bill 197, making the Executive Order goal for year 2030 into a statewide, mandated legislative target. AB 197 established a joint legislative committee on climate change policies and requires the CARB to prioritize direct emissions reductions rather than the market-based cap-and-trade program for large stationary, mobile, and other sources. CARB prepared a 2017 Climate Change Scoping Plan Update, which outlines potential regulations and programs, including strategies consistent with AB 197 requirements, to achieve the 2030 target. The 2017 Scoping Plan establishes a new emissions limit of 260 MMTCO₂eq for the year 2030, which corresponds to a 40 percent decrease in 1990 levels by 2030.⁴⁷

⁴⁵ The Montreal Protocol on Substances that Deplete the Ozone Layer (Montreal Protocol) is an international treaty designed to phase out halogenated hydrocarbons such as chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons (HCFCs), which are considered ODSs. The Montreal Protocol was first signed on September 16, 1987 and has been revised seven times. The U.S. ratified the original Montreal Protocol and each of its revisions.

⁴⁶ California Air Resources Board. 2008, December. Climate Change Scoping Plan, A Framework for Change.

⁴⁷ California Air Resources Board, 2017, California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target, https://www.arb.ca.gov/cc/scopingplan/2030sp_pp_final.pdf, accessed on March 18, 2019.

California’s climate strategy will require contributions from all sectors of the economy, including enhanced focus on zero- and near-zero-emission (ZE/NZE) vehicle technologies; continued investment in renewables such as solar roofs, wind, and other types of distributed generation; greater use of low carbon fuels; integrated land conservation and development strategies; coordinated efforts to reduce emissions of short-lived climate pollutants (methane, black carbon, and fluorinated gases); and an increased focus on integrated land use planning to support livable, transit-connected communities and conserve agricultural and other lands. Requirements for GHG reductions at stationary sources complement local air pollution control efforts by the local air districts to tighten criteria air pollutants and TACs emissions limits on a broad spectrum of industrial sources. Major elements of the 2017 Scoping Plan framework include:

- Implementing and/or increasing the stringency of the standards for the various strategies covered under the Mobile Source Strategy, which includes increasing ZE buses and trucks.
- Low Carbon Fuel Standard (LCFS), with an increased stringency (18 percent by 2030).
- Implementation of SB 350, which expands the Renewables Portfolio Standard (RPS) to 50 percent RPS and doubles energy efficiency savings by 2030.
- California Sustainable Freight Action Plan, which improves freight system efficiency and utilizes near-zero emissions technology and deployment of ZE trucks.
- Implementing the proposed Short-Lived Climate Pollutant Strategy, which focuses on reducing methane and hydrofluorocarbon emissions by 40 percent and anthropogenic black carbon emissions by 50 percent by year 2030.
- Post-2020 Cap-and-Trade Program that includes declining caps.
- Continued implementation of SB 375, which sets regional targets for GHG emission reductions from passenger vehicles through changed land use patterns and improved transportation.
- Development of a Natural and Working Lands Action Plan to secure California’s land base as a net carbon sink.⁴⁸

In addition to the statewide strategies listed above, the 2017 Climate Change Scoping Plan ~~also~~ identified local governments as essential partners in achieving the state’s long-term GHG reduction goals and recommended local actions to reduce GHG emissions—for example, statewide targets of no more than 6 MTCO₂eq or less per capita by 2030 and 2 MTCO₂eq or less per capita by 2050. CARB recommends that local governments evaluate and adopt robust and quantitative locally appropriate goals that align with the statewide per capita targets and sustainable development objectives and develop plans to achieve the local goals. The statewide per capita goals were developed by applying the percent reductions necessary to reach the 2030 and 2050 climate goals (i.e., 40 percent and 80 percent, respectively) to the state’s 1990 emissions limit established under AB 32. For CEQA projects, CARB states that lead agencies have discretion to develop evidenced-based numeric thresholds (mass emissions, per capita, or per service population) consistent with the Scoping Plan and the state’s long-term GHG goals. To the degree a project relies on GHG mitigation measures, CARB recommends that lead agencies prioritize onsite design features that reduce emissions, especially from vehicle miles traveled (VMT), and

⁴⁸ California Air Resources Board, 2017, California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target, https://www.arb.ca.gov/cc/scopingplan/2030sp_pp_final.pdf, accessed on March 18, 2019.

direct investments in GHG reductions within the project’s region that contribute potential air quality, health, and economic co-benefits. Where further project design or regional investments are infeasible or not proven to be effective, CARB recommends mitigating potential GHG impacts through purchasing and retiring carbon credits.⁴⁹

The Scoping Plan scenario is set against what is called the ~~business-as-usual~~ (BAU) yardstick—that is, what would the GHG emissions look like if the State did nothing at all beyond the existing policies that are required and already in place to achieve the 2020 limit. It includes the existing renewables requirements, advanced clean cars, the Low Carbon Fuel Standard (LCFS), and the SB 375 program for more vibrant communities, among others. However, it does not include a range of new policies or measures that have been developed or put into statute over the past two years. The known commitments are expected to result in emissions that are 60 MMTCO₂eq above the target in 2030. If the estimated GHG reductions from the known commitments are not realized due to delays in implementation or technology deployment, the post-2020 Cap-and-Trade Program would deliver the additional GHG reductions in the sectors it covers to ensure the 2030 target is achieved.⁵⁰

3.1.3.3.2 Mobile Sources

AB 1493 Vehicular Emissions: Prior to the U.S. EPA and NHTSA joint rulemaking, Governor Schwarzenegger signed Assembly Bill AB 1493 (2002). AB 1493 requires that CARB develop and adopt, by January 1, 2005, regulations that achieve “the maximum feasible reduction of greenhouse gases emitted by passenger vehicles and light-duty trucks and other vehicles determined by CARB to be vehicles whose primary use is noncommercial personal transportation in the state.” CARB originally approved regulations to reduce GHGs from passenger vehicles in September 2004, with the regulations to take effect in 2009 (see amendments to California Code of Regulations [CCR] Title 13 §§Sections 1900 and 1961 (~~13 CCR 1900, 1961~~), and the adoption of CCR Title 13 §Section 1961.1 (~~13 CCR 1961.1~~)). California’s first request to the U.S. EPA to implement GHG standards for passenger vehicles was made in December 2005 and subsequently denied by the U.S. EPA in March 2008. The U.S. EPA then granted California the authority to implement GHG emission reduction standards for new passenger cars, pickup trucks, and sport utility vehicles on June 30, 2009. On April 1, 2010, CARB filed amended regulations for passenger vehicles as part of California’s commitment toward the national program to reduce new passenger vehicle GHGs from 2012 through 2016. The amendments will prepare California to harmonize its rules with the federal Light-Duty Vehicle GHG Standards and CAFE Standards.

Low Carbon Fuel Standard (LCFS): In 2008 Scoping Plan, CARB identified the LCFS as one of the nine discrete early action GHG reduction measures. The LCFS is designed to decrease the carbon intensity of California’s transportation fuel pool and provide an increasing range of low-carbon and renewable alternatives, which reduce petroleum dependency and achieve air quality benefits. CARB approved the LCFS regulation in 2009 and began implementation on January 1, 2011, and has been amended several times since adoption. In 2018, CARB approved amendments to the regulation, which included strengthening and smoothing the carbon intensity benchmarks

⁴⁹ California Air Resources Board, 2017, California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target, https://www.arb.ca.gov/cc/scopingplan/2030sp_pp_final.pdf, accessed on March 18, 2019.

⁵⁰ California Public Utilities Commission. 2020. Greenhouse Gas Cap-and-Trade Program. <https://www.cpuc.ca.gov/general.aspx?id=5932>, accessed on December 8, 2020.

through 2030, in line with California’s 2030 GHG emission reduction target enacted through SB 32, adding new crediting opportunities to promote zero emission vehicle adoption, alternative jet fuel, carbon capture and sequestration, and advanced technologies to achieve deep decarbonization in the transportation sector. The LCFS is designed to encourage the use of cleaner low-carbon transportation fuels in California and encourage the production of those fuels, and therefore reduce GHG emissions and decrease petroleum dependence in the transportation sector. The LCFS standards are expressed in terms of the ‘carbon intensity’ of gasoline and diesel fuel and their respective substitutes. The program is based on the principle that each fuel has ‘life cycle’ greenhouse gas emissions that include CO₂, CH₄, N₂O, and other GHG contributors. This life-cycle assessment examines the GHG emissions associated with the production, transportation, and use of a given fuel. The life-cycle assessment includes direct emissions associated with producing, transporting, and using the fuels as well as significant indirect effects on GHG emissions, such as changes in land use for some biofuels. The carbon intensity scores assessed for each fuel are compared to a declining carbon intensity benchmark for each year. Low carbon fuels below the benchmark generate credits, while fuels above the carbon intensity benchmark generate deficits. Providers of transportation fuels must demonstrate that the mix of fuels they supply for use in California meets the LCFS carbon intensity standards, or benchmarks, for each annual compliance period. A deficit generator meets its compliance obligation by ensuring that the amount of credits it earns or otherwise acquires from another party is equal to, or greater than, the deficits it has incurred.

EO S-1-07: Governor Schwarzenegger signed Executive Order S-1-07 in 2007 which established the transportation sector as the main source of GHG emissions in California. Executive Order S-1-07 proclaims that the transportation sector accounts for over 40 percent of statewide GHG emissions. Executive Order S-1-07 also establishes a goal to reduce the carbon intensity of transportation fuels sold in California by a minimum of 10 percent by 2020. In particular, Executive Order S-1-07 established the LCFS and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission (CEC), CARB, the University of California, and other agencies to develop and propose protocols for measuring the ‘life-cycle carbon intensity’ of transportation fuels. The analysis supporting development of the protocols was included in the State Alternative Fuels Plan adopted by CEC on December 24, 2007 and was submitted to CARB for consideration as an ‘early action’ item under AB 32. CARB adopted the LCFS on April 23, 2009.

EO B-16-2012: On March 23, 2012, the State announced that CARB, the ~~California Energy Commission~~ (CEC), the Public Utilities Commission, and other relevant agencies worked with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to accommodate ZE vehicles in major metropolitan areas, including infrastructure to support them (e.g., electric vehicle charging stations). The executive order also directed the number of ZE vehicles in California’s state vehicle fleet to increase through the normal course of fleet replacement so that at least 10 percent of fleet purchases of light-duty vehicles are ZE by 2015 and at least 25 percent by 2020. The executive order also establishes a target for the transportation sector of reducing GHG emissions 80 percent below 1990 levels.

EO N-79-20: On September 23, 2020 Governor Newsom signed Executive Order N-79-20 which identifies a goal that 100 percent of in-state sales of new passenger cars and trucks will be zero emission by 2035. Additionally, ~~this Executive Order identified fleet goals for trucks of~~ are that

100 percent of drayage trucks be zero emissions by 2035 and 100 percent of medium- and heavy-duty vehicles in the state be zero emission by 2045, for all operations where feasible. Additionally, the Executive Order identifies a goal for the state to transition to 100 percent zero-emission off-road vehicles and equipment by 2035 where feasible.

Senate Bill 44. The California Legislature passed-Senate Bill (SB) 44, acknowledging the ongoing need to evaluate opportunities for mobile source emissions reductions and requires CARB to update the 2016 Mobile Source Strategy by January 1, 2021, and every five years thereafter. Specifically, SB 44 requires CARB to update the 2016 Mobile Source Strategy to include a comprehensive strategy for the deployment of medium- and heavy-duty vehicles for the purpose of meeting air quality standards and reducing GHG emissions. It also directs CARB to set reasonable and achievable goals for reducing emissions by 2030 and 2050 from medium- and heavy-duty vehicles that are consistent with the state’s overall goals and maximizes the reduction of criteria air pollutants.

SB 375: SB 375, signed into law in September 2008, aligns regional transportation planning efforts, regional GHG reduction targets, and land use and housing allocation. As part of the alignment, SB 375 requires Metropolitan Planning Organizations (MPOs) to adopt a Sustainable Communities Strategy (SCS) or Alternative Planning Strategy (APS) which prescribes land use allocation in that MPO’s Regional Transportation Plan (RTP). CARB, in consultation with MPOs, is required to provide each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035. These reduction targets will be updated every eight years but can be updated every four years if advancements in emissions technologies affect the reduction strategies to achieve the targets. CARB is also charged with reviewing each MPO’s SCS or APS for consistency with its assigned GHG emission reduction targets. If MPOs do not meet the GHG reduction targets, transportation projects located in the MPO boundaries would not be eligible for funding programmed after January 1, 2012.

CARB appointed the Regional Targets Advisory Committee (RTAC), as required under SB 375, on January 23, 2009. The RTAC’s charge was to advise CARB on the factors to be considered and methodologies to be used for establishing regional targets. The RTAC provided its recommendation to CARB on September 29, 2009. CARB was required to adopt final targets by September 30, 2010.⁵¹

CARB is required to update the targets for the MPOs every eight years. CARB adopted revised SB 375 targets for the MPOs in March 2018.^{52, 53} The updated targets become effective on October 1, 2018. The targets consider the need to further reduce VMT, as identified in the 2017 Scoping Plan Update (for SB 32), while balancing the need for additional and more flexible revenue sources to incentivize positive planning and action toward sustainable communities. Like the 2010 targets, the updated SB 375 targets are in units of percent per capita reduction in GHG emissions from automobiles and light trucks relative to 2005; this excludes reductions anticipated from implementation of state technology and fuels strategies and any potential future state strategies,

⁵¹ California Air Resources Board 2010, August. Staff Report Proposed Regional Greenhouse Gas Emission Reduction Targets for Automobiles and Light Trucks Pursuant to Senate Bill 375.

⁵² California Air Resources Board, 2018, SB 375 Regional Greenhouse Gas Emissions Reduction Targets https://ww2.arb.ca.gov/sites/default/files/2020-06/SB375_Final_Targets_2018.pdf, accessed on December 8, 2020.

⁵³ California Air Resources Board, 2018, Updated Final Staff Report: Proposed Update to the SB 375 Greenhouse Gas Emissions Reduction Targets.

such as statewide road user pricing. The proposed targets call for greater per-capita GHG emission reductions from SB 375 than are currently in place, which for 2035 translate into proposed targets that either match or exceed the emission reduction levels in the MPOs' currently adopted SCS to achieve the SB 375 targets. For the next round of SCS updates, CARB's updated targets for the SCAG region are an 8 percent per capita GHG reduction in 2020 from 2005 levels (unchanged from the 2010 target) and a 19 percent per capita GHG reduction in 2035 from 2005 levels (compared to the 2010 target of 13 percent).⁵⁴ CARB adopted the updated targets and methodology on March 22, 2018. All SCSs adopted after October 1, 2018, are subject to these new targets.

SCAG's Regional Transportation Plan / Sustainable Communities Strategy: SB 375 requires each MPO to prepare a sustainable communities strategy in its regional transportation plan. SCAG released the draft 2020-2045 RTP/SCS (Connect SoCal) on November 7, 2019. On September 3, 2020, SCAG's Regional Council unanimously voted to approve and fully adopt the Connect SoCal Plan.⁵⁵ In general, the SCS outlines a development pattern for the region that, when integrated with the transportation network and other transportation measures and policies, would reduce vehicle miles traveled from automobiles and light duty trucks and thereby reduce GHG emissions from these sources.

Connect SoCal focuses on the continued efforts of the previous RTP/SCSs to integrate transportation and land uses strategies in development of the SCAG region through horizon year 2045. Connect SoCal forecasts that the SCAG region will meet its GHG per capita reduction targets of 8 percent by 2020 and 19 percent by 2035. Additionally, Connect SoCal also forecasts that implementation of the plan will reduce VMT per capita in year 2045 by 4.1 percent compared to baseline conditions for that year. Connect SoCal includes a 'Core Vision' that centers on maintaining and better managing the transportation network for moving people and goods while expanding mobility choices by locating housing, jobs, and transit closer together and increasing investments in transit and complete streets.

3.1.3.3.3 Adaptation

EO S-13-08: Governor Schwarzenegger signed Executive Order S-13-08 on November 14, 2008, which directed California to develop methods for adapting to climate change through preparation of a statewide plan. Executive Order S-13-08 directed OPR, in cooperation with the Natural Resources Agency, to provide land use planning guidance related to sea level rise and other climate change impacts by May 30, 2009. Executive Order S-13-08 also directed the Natural Resources Agency to develop a state Climate Adaptation Strategy by June 30, 2009, and to convene an independent panel to complete the first California Sea Level Rise Assessment Report. The assessment report was required to be completed by December 1, 2010, and required to meet the following four criteria:

1. Project the relative sea level rise specific to California by taking into account issues such as coastal erosion rates, tidal impacts, El Niño and La Niña events, storm surge, and land subsidence rates.
2. Identify the range of uncertainty in selected sea level rise projections.

⁵⁴ California Air Resources Board. 2018, February. Proposed Update to the SB 375 Greenhouse Gas Emission Reduction Targets. https://www.arb.ca.gov/cc/sb375/sb375_target_update_final_staff_report_feb2018.pdf.

⁵⁵ Southern California Association of Governments (SCAG). 2020, September. Adopted Final Connect SoCal. <https://scag.ca.gov/read-plan-adopted-final-plan>, accessed December 8, 2020.

3. Synthesize existing information on projected sea level rise impacts to state infrastructure (e.g., roads, public facilities, beaches), natural areas, and coastal and marine ecosystems.
4. Discuss future research needs relating to sea level rise in California.

3.1.3.3.4 *Energy*

SB 1078, SB 107, and Executive Order S-14-08: SB 1078 (Chapter 516, Statutes of 2002) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017. SB 107 (Chapter 464, Statutes of 2006) changed the target date to 2010. In November 2008, Governor Schwarzenegger signed Executive Order S-14-08, which expands the state’s Renewable Portfolio Standard to 33 percent renewable power by 2020.

SB X-1-2: SB X1-2 was signed by Governor Brown in April 2011. SB X1-2 created a new Renewables Portfolio Standard (RPS), which pre-empted CARB’s 33 percent Renewable Electricity Standard. The new RPS applies to all electricity retailers in the state, including publicly owned utilities (POUs), investor-owned utilities, electricity service providers, and community choice aggregators. These entities must adopt the new RPS goals of 20 percent of retail sales from renewables by the end of 2013, 25 percent by the end of 2016, and the 33 percent requirement by the end of 2020.

SB 1368: SB 1368 is the companion bill of AB 32 and was signed by Governor Schwarzenegger in September 2006. SB 1368 required the CPUC to establish a GHG emission performance standard for baseload generation from investor-owned utilities (IOUs) by February 1, 2007. The CEC was also required to establish a similar standard for local, publicly owned utilities by June 30, 2007. These standards cannot exceed the greenhouse gas emission rate from a baseload combined-cycle, natural-gas-fired plant. The legislation further required that all electricity provided to California, including imported electricity, must be generated from plants that meet the standards set by the ~~Public Utilities Commission (CPUC)~~ and CEC.

Senate Bill 350: Senate Bill 350 (~~de Leon~~) was signed into law September 2015 and establishes tiered increases to the RPS—40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. SB 350 also set a new goal to double the energy-efficiency savings in electricity and natural gas through energy efficiency and conservation measures.

Senate Bill 100: On September 10, 2018, Governor Brown signed SB 100. Under SB 100, the RPS for public-owned facilities and retail sellers consist of 44 percent renewable energy by 2024, 52 percent by 2027, and 60 percent by 2030. Additionally, SB 100 also established a new RPS requirement of 50 percent by 2026. Furthermore, the bill establishes an overall state policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all state agencies by December 31, 2045. Under the bill, the state cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

Executive Order B-55-18: Executive Order B-55-18, signed September 10, 2018, sets a goal “to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter.” Executive Order B-55-18 directs CARB to work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the

carbon neutrality goal. The goal of carbon neutrality by 2045 is in addition to other statewide goals, meaning not only should emissions be reduced to 80 percent below 1990 levels by 2050, but that, by no later than 2045, the remaining emissions be offset by equivalent net removals of CO₂eq from the atmosphere, including through sequestration in forests, soils, and other natural landscapes.

Assembly Bill 2127: This bill requires the California Energy Commission (CEC), working with CARB and the California Public Utilities Commission (CPUC), to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 five million zero-emission vehicles on California roads by 2030 and of reducing emissions of greenhouse gases to 40 percent below 1990 levels by 2030. The bill requires the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure.⁵⁶

California Building Code – Building Energy Efficiency Standards: Energy conservation standards for new residential and non-residential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the CEC) in June 1977 (~~Title 24 CCR Part 6, of the California Code of Regulations [CCR]~~). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. The 2019 Building Energy Efficiency Standards were adopted on May 9, 2018, and went into effect on January 1, 2020. The 2019 standards move toward cutting energy use in new homes by more than 50 percent and will require installation of solar photovoltaic systems for single-family homes and multifamily buildings of three stories and less. The 2019 standards focus on four key areas: 1) smart residential photovoltaic systems; 2) updated thermal envelope standards (preventing heat transfer from the interior to exterior and vice versa); 3) residential and nonresidential ventilation requirements; 4) and nonresidential lighting requirements.⁵⁷

California Building Code – CALGreen: On July 17, 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (24 CCR, Part 11, known as 'CALGreen') was adopted as part of the California Building Standards Code. CALGreen established planning and design standards for sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and internal air contaminants.⁵⁸ The mandatory provisions of the California Green Building Code Standards became effective January 1, 2011, and were last updated in 2019. The 2019 CALGreen standards became effective January 1, 2020. Section 5.408 of CALGreen also requires that at least 65 percent of the nonhazardous construction and demolition waste from nonresidential construction operations be recycled and/or salvaged for reuse.

⁵⁶ California Legislative Information, September 14, 2018, AB-2127 Electric Vehicle Charging Infrastructure: Assessment, https://leginfo.ca.gov/faces/billTextClient.xhtml?bill_id=201720180AB2127, accessed December 17, 2020.

⁵⁷ California Energy Commission (CEC). 2018. News Release: Energy Commission Adopts Standards Requiring Solar Systems for New Homes, First in Nation. http://www.energy.ca.gov/releases/2018_releases/2018-05-09_building_standards_adopted_nr.html. Accessed December 8, 2020.

⁵⁸ The green building standards became mandatory in the 2010 edition of the code.

3.1.3.3.5 *Short-Lived Climate Pollutants*

SB 1383: On September 19, 2016, the governor signed SB 1383 to supplement the GHG reduction strategies in the Scoping Plan to consider short-lived climate pollutants, including black carbon and methane. Black carbon is the light-absorbing component of fine particulate matter produced during incomplete combustion of fuels. SB 1383 required CARB, no later than January 1, 2018, to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants to achieve a reduction in methane by 40 percent, hydrofluorocarbon gases by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030, as specified. On March 14, 2017, CARB adopted the “Final Proposed Short-Lived Climate Pollutant Reduction Strategy,” which identifies the state’s approach to reducing anthropogenic and biogenic sources of short-lived climate pollutants. Anthropogenic sources of black carbon include on- and off-road transportation, residential wood burning, fuel combustion (charbroiling), and industrial processes. According to CARB, ambient levels of black carbon in California are 90 percent lower than in the early 1960s despite the tripling of diesel fuel use. In-use on-road rules are expected to reduce black carbon emissions from on-road sources by 80 percent between 2000 and 2020.

3.1.3.3.6 *Ozone Depleting Substances (ODSs)*

Refrigerant Management Program: As part implementing AB 32, CARB also adopted a Refrigerant Management Program in 2009. The Refrigerant Management Program is designed to reduce GHG emissions from stationary sources through refrigerant leak detection and monitoring, leak repair, system retirement and retrofitting, reporting and recordkeeping, and proper refrigerant cylinder use, sale, and disposal.

HFC Emission Reduction Measures for Mobile Air Conditioning – Regulation for Small Containers of Automotive Refrigerant: The Regulation for Small Containers of Automotive Refrigerant applies to the sale, use, and disposal of small containers of automotive refrigerant with a GWP greater than 150. Emission reductions are achieved through implementation of four requirements: 1) use of a self-sealing valve on the container, 2) improved labeling instructions, 3) a deposit and recycling program for small containers, and 4) an education program that emphasizes best practices for vehicle recharging. This regulation went into effect on January 1, 2010, with a one-year sell-through period for containers manufactured before January 1, 2010. The target recycle rate is initially set at 90 percent, and rose to 95 percent beginning January 1, 2012.

3.1.3.4 *South Coast AQMD Regulations and Policies*

The South Coast AQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the South Coast AQMD to consider global impacts in rulemaking and in drafting revisions to the AQMP. In March 1992, the South Coast AQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include support of the adoption of a California GHG emission reduction goal.

Basin GHG Policy and Inventory: The South Coast AQMD has established a policy, adopted by the South Coast AQMD Governing Board at its September 5, 2008 meeting, to actively seek opportunities to reduce emissions of criteria, toxic, and climate change pollutants. The policy includes the intent to assist businesses and local governments implementing climate change measures, decrease the agency’s carbon footprint, and provide climate change information to the public.

3.1.3.4.1 South Coast AQMD's Ozone Depleting Substances (ODS) Policies and Rules

Policy on Global Warming and Stratospheric Ozone Depletion. The South Coast AQMD adopted a “Policy on Global Warming and Stratospheric Ozone Depletion” on April 6, 1990. The policy targeted a transition away from CFCs as an industrial refrigerant and propellant in aerosol cans. In March 1992, the South Coast AQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives for ODSs:

- Phase out the use and corresponding emissions of CFCs, methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995.
- Phase out the large quantity use and corresponding emissions of HCFCs by the year 2000.
- Develop recycling regulations for HCFCs.
- Develop an emissions inventory and control strategy for methyl bromide.

3.2 ENERGY

This section describes the existing conditions related to energy within the South Coast AQMD's jurisdiction, including the regulatory framework for energy. Several federal and state laws have been enacted to regulate fuel economy standards, mandate environmentally sound transportation planning, increase the use of renewable energy resources and alternative fuels, provide the nation with greater energy independence and security, and adequately plan for California's future energy needs. The most relevant energy laws and regulations are summarized later in this section.

3.2.1 Existing Energy Providers

According to the Draft WAIRE Menu Technical Report,¹ warehouses over 100,000 square feet in South Coast AQMD's jurisdiction are primarily serviced by Southern California Edison (SCE) (75 percent of service area) and the Los Angeles Department of Water and Power (LADWP) (8 percent of service area).²

- **SCE** – SCE's service area spans much of southern California—from Orange and Riverside counties in the south to Santa Barbara County in the west to Mono County in the north.³ The total electricity consumption in SCE's service area in gigawatt-hours (GWh) was 105,162 GWh in 2019.⁴ The total mid-electricity consumption in SCE's service area is forecast to increase by approximately 10,000 GWh between 2018 and 2030.⁵
- **LADWP** – The LADWP service area spans much of the urban areas of Los Angeles County with a total electricity consumption of 23,402 GWh in 2019.⁶ Based on LADWP's 2017 Power Strategic Long-Term Resource Plan, LADWP forecasts that its total retail sales in the 2021–2022 fiscal year will be 22,613 GWh of electricity.⁷

According to the CEC, transportation accounts for nearly 37 percent of California's total energy consumption in 2014.⁸ In 2019, California consumed 15.4 billion gallons of gasoline and 3.7

¹ Draft WAIRE Menu Technical Report, Version 3/3/2020, available on South Coast AQMD's website at http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/waire-menu-technical-report_draft_3-3-20.pdf?sfvrsn=6

² Other electricity service providers include, the City of Industry (6 percent of service area), City of Vernon (3 percent), City of Anaheim (2 percent), and Moreno Valley (1 percent).

⁷ Los Angeles Department of Water and Power, December 2017, 2017 Power Strategic Long-Term Resource Plan, https://www.ladwp.com/ladwp/faces/wcnav_externalId/a-p-doc?_adf.ctrl-state=ktddnyxka_4&_afLoop=353019973497746, accessed December 17, 2020.

⁸ California Energy Commission. 2017, January. 2016 Appliance Efficiency Regulations. <https://ww2.energy.ca.gov/2017publications/CEC-400-2017-002/CEC-400-2017-002.pdf>.

billion gallons of diesel fuel.^{9,10} Petroleum-based fuels currently account for 90 percent of California's transportation energy sources.¹¹ However, the State is now working on developing flexible strategies to reduce petroleum use. Over the last decade, California has implemented several policies, rules, and regulations to improve vehicle efficiency, increase the development and use of alternative fuels, reduce air pollutants and GHGs from the transportation sector, and reduce VMT. Accordingly, gasoline consumption in California has declined. The CEC predicts that the demand for gasoline will continue to decline over the next 10 years, and there will be an increase in the use of alternative fuels.¹² Per CEC fuel sales data, on-road transportation sources for Los Angeles County, Orange County, Riverside County, and San Bernardino County consumed a combined 6.9 billion gallons of gasoline and 1.3 billion gallons of diesel fuel in 2019.^{13,14}

3.2.2 Energy Regulations and Plans

3.2.2.1 Federal Regulations and Plans

Federal Energy Policy and Conservation Act: The Energy Policy and Conservation Act (EPCA) of 1975 was established in response to the 1973 oil crisis. The Act created the Strategic Petroleum Reserve, established vehicle fuel economy standards, and prohibited the export of U.S. crude oil (with a few limited exceptions). EPCA created Corporate Average Fuel Economy (CAFE) standards for passenger cars starting in model year 1978. CAFE Standards are updated periodically to account for changes in vehicle technologies, driver behavior, and/or driving conditions.

Energy Independence and Security Act of 2007: The Energy Independence and Security Act of 2007 (Public Law 110-140) seeks to provide the nation with greater energy independence and security by increasing the production of clean renewable fuels; improving vehicle fuel economy; and increasing the efficiency of products, buildings, and vehicles. It also seeks to improve the energy performance of the federal government. The Act sets increased CAFE Standards; the Renewable Fuel Standard; appliance energy efficiency standards; building energy efficiency standards; and accelerated research and development tasks on renewable energy sources (e.g., solar energy, geothermal energy, and marine and hydrokinetic renewable energy technologies), carbon capture, and sequestration.¹⁵

Update to Corporate Average Fuel Economy Standards (2021 to 2026): The federal government issued new CAFE standards in 2012 for model years 2017 to 2025, which required a fleet average of 54.5 miles per gallon in 2025. On March 30, 2020, the U.S. EPA finalized an updated CAFE and GHG emissions standards for passenger cars and light trucks and established new standards covering model years 2021 through 2026, known as The Safer Affordable Fuel

⁹ California Energy Commission. 2020, September 22. 2019 California Annual Retail Fuel Outlet Report Results (CEC-A15). <https://www.energy.ca.gov/sites/default/files/2020-10/2010-2019%20CEC-A15%20Results%20and%20Analysis.xlsx>.

¹⁴ Diesel is adjusted to account for retail (47.2 percent) and non-retail (52.8 percent) diesel sales.

¹⁵ United States Environmental Protection Agency. 2019, May 6, Summary of the Energy Independence and Security Act Public Law 110-140 (2007). <https://www.epa.gov/laws-regulations/summary-energy-independence-and-security-act>

Efficient (SAFE) Vehicles Final Rule for Model Years 2021-2026. Under SAFE, the fuel economy standards would have increased 1.5 percent per year compared to the 5 percent per year under the CAFE standards established in 2012. Overall, SAFE would have required a fleet average of 40.4 MPG for model year 2026 vehicles.¹⁶ However, a consortium of automakers and the state of California have agreed on a voluntary framework to reduce emissions that can serve as an alternative path forward for clean vehicle standards nationwide. Automakers that agreed to the framework include Ford, Honda, BMW of North America, Volkswagen Group of America, GM, and Nissan. The framework supports continued annual reductions of vehicle GHG emissions through the 2026 model year, encourages innovation to accelerate the transition to electric vehicles, and provides industry the certainty needed to make investments and create jobs. This commitment means that the auto companies party to the voluntary agreement will only sell cars in the United States that meet these standards.¹⁷ President Biden has signed an Executive Order directing the U.S. EPA to revise the SAFE Vehicles Rule Parts One and Two with Part One by April 2021 and Part Two by July 2021, respectively .

Phases 1 and 2 Heavy-Duty Vehicle GHG Standards: Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by the U.S. EPA-United States Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA). The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type.¹⁸ The U.S. EPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline, depending on the compliance year and vehicle type.¹⁹

3.2.2.2 State Regulations and Plans

Renewables Portfolio Standard: The California Renewables Portfolio Standard (RPS) was established in 2002 under SB 1078 and was amended in 2006, 2011 and 2018. The RPS program requires investor-owned utilities (IOU), electric service providers (ESP), and community choice aggregators (CCA) to increase the use of eligible renewable energy resources to 33 percent of total procurement by 2020. The California Public Utilities Commission (CPUC) is required to provide quarterly progress reports on progress toward RPS goals. This has accelerated the development of renewable energy projects throughout the state.

All electricity retail sellers had an interim target between compliance periods to serve at least 27 percent of their load with RPS-eligible resources by December 31, 2017. In general, retail sellers either met or exceeded the interim 27 percent target and are on track to achieve their compliance requirements. California's three large IOUs collectively served 36 percent of their 2017 retail

¹⁷ California Air Resources Board. 2019, July 25, California and major automakers reach groundbreaking framework agreement on clean emission standards, <https://ww2.arb.ca.gov/news/california-and-major-automakers-reach-groundbreaking-framework-agreement-clean-emission>

¹⁸ United States Environmental Protection Agency. 2011, August. Fact Sheet: EPA and NHTSA Adopt First-Ever Program to Reduce Greenhouse Gas Emissions and Improve Fuel Efficiency of Medium- and Heavy-Duty Vehicles. <https://nepis.epa.gov/Exe/ZyPDF.cgi/P100BOT1.PDF?Dockey=P100BOT1.PDF>.

¹⁹ Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2, Vol. 81 Federal Register, No. 206 (October 25, 2016).

electricity sales with renewable power. The small and multi-jurisdictional utilities (SMJUs) and ESPs served roughly 27 percent of retail sales with renewables, and CCAs collectively served 50 percent of retail sales with renewable power.²⁰ Senate Bill 350 (SB 350) was signed into law September 2015, establishing tiered increases to the RPS—40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. SB 350 also set a new goal to double the energy-efficiency savings in electricity and natural gas through energy efficiency and conservation measures. Senate Bill 100 (SB 100), passed in 2018, replaces the RPS requirements of SB 350. Under SB 100, the RPS for publicly owned facilities and retail sellers consist of 44 percent renewable energy by 2024, 52 percent by 2027, and 60 percent by 2030, and establishes an overall State policy that puts California on the path to 100 percent fossil-fuel-free electricity by the year 2045.

State Alternative Fuel Plan: Assembly Bill 1007 requires the CEC to prepare a plan to increase the use of alternative fuels in California. The State Alternative Fuels Plan was prepared by the ~~California Energy Commission (CEC)~~ with the ~~California Air Resources Board (CARB)~~ and in consultation with other federal, state, and local agencies to reduce petroleum consumption, increase use of alternative fuels (e.g., ethanol, natural gas, liquefied petroleum gas, electricity, and hydrogen), reduce GHG emissions, and increase in-state production of biofuels. The State Alternative Fuels Plan recommends a strategy that combines private capital investment, financial incentives, and advanced technology that will increase the use of alternative fuels, result in significant improvements in the energy efficiency of vehicles, and reduce trips and vehicle miles traveled (VMT) through changes in travel habits and land management policies. The Alternative Fuels and Vehicle Technologies Funding Program legislation (Assembly Bill 118, Statutes of 2007) proactively implements this plan.²¹

Assembly Bill 2127: This bill ~~would~~ requires the CEC, working with CARB and the CPUC, to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 million zero-emission vehicles on California roads by 2030 and of reducing emissions of greenhouse gases to 40% below 1990 levels by 2030. The bill would require the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure.²²

Executive Order (EO) N-79-20: On September 23, 2020, Governor Newsom signed an executive order directing state agencies to pursue aggressive goals towards zero emissions technologies. Key directives include:

- CARB shall develop and propose car and truck regulations with increasing zero emissions percentages such that by 2035 all in-state sales are zero emissions.
- CARB shall also pursue regulations to achieve a 100 percent zero emissions medium-duty and heavy-duty fleet by 2045.

- CARB shall develop, in coordination with state agencies, U.S. EPA, and local air districts, strategies to achieve 100 percent zero emissions operations for off-road vehicles by 2035.²³

Warren-Alquist Act: Established in 1974, the Warren-Alquist Act created the CEC in response to the energy crisis of the early 1970s and the state’s unsustainable growing demand for energy resources. The CEC’s core responsibilities include advancing state energy policy, encouraging energy efficiency, certifying thermal power plants, investing in energy innovation, developing renewable energy, transforming transportation, and preparing for energy emergencies. The Warren-Alquist Act is updated every year to address current energy needs and issues, with its latest edition in January 2020.

California Energy Action Plan: On May 8, 2003, the CEC and CPUC approved the California Energy Action Plan. The plan establishes shared goals and proposes specific actions to ensure that adequate, reliable, and reasonably priced electrical power and natural gas supplies are achieved and provided through policies, strategies, and actions that are cost-effective and environmentally sound for California’s consumers and taxpayers. On August 25, 2005, the Energy Action Plan II was approved which identifies further actions necessary to meet California’s future energy needs. Subsequently, in 2008, the Energy Action Plan update was published, which examines the state’s ongoing actions in the context of global climate change.

Assembly Bill 1493: California vehicle GHG emission standards were enacted under Assembly Bill 1493 (Pavley I). Pavley I was a clean-car standard that reduced GHG emissions from new passenger vehicles (light-duty auto to medium-duty vehicles) from 2009 through 2016, including a 30 percent reduction of GHG emissions in 2016. California implements the Pavley I standards through a waiver granted to California by the US EPA.

Low Carbon Fuel Standard: (LCFS) established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products, starting with 0.25 percent in 2011 and culminating in a 10 percent total reduction in 2020.²⁴ Petroleum importers, refiners, and wholesalers can either develop their own low carbon fuel products, or buy LCFS credits from other companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.²⁵

Senate Bill 1505: (Health and Safety Code Sections 43868 and 43869) requires, on a statewide basis, at least 33.3 percent of hydrogen produced for or dispensed by fueling stations that receive state funds be from renewable resources once production of hydrogen in the state reaches 3,500 metric tons per year.

Senate Bill 1389: (Public Resources Code Sections 25300–25323; SB 1389) requires the development of an integrated plan for electricity, natural gas, and transportation fuels. The CEC must adopt and transmit to the governor and legislature an Integrated Energy Policy Report (IEPR) every two years. Investor owned utilities (IOUs) forecast improvements to the electric grid to accommodate the future energy demand as part of the California Energy Commission’s (CEC)

²³ California, Office of Governor Gavin Newsom. 2020, September 23. Executive Order N-79-20. <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-text.pdf>

²⁴ California Air Resources Board, 2016, February 2 (reviewed), Low Carbon Fuel Standard Program Background. <https://ww3.arb.ca.gov/fuels/lcfs/lcfs-background.htm>.

²⁵ California Air Resources Board, 2016, February 2 (reviewed), Low Carbon Fuel Standard Program Background. <https://ww3.arb.ca.gov/fuels/lcfs/lcfs-background.htm>.

biennial IEPR. As identified in the 2019 IEPR, California is aggressively pursuing the deployment of ZE vehicles through regulations administered by CARB (e.g., the Advanced Clean Cars rulemaking and the Innovative Clean Transit Regulation) and incentives (such as the Clean Vehicle Rebate Project and the Low Carbon Transportation Program). The report contains an integrated assessment of major energy trends and issues facing California's electricity, natural gas, and transportation fuel sectors. The report provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the state's economy; and protect public health and safety.²⁶

3.2.2.2.1 *California Air Resources Board*

Advanced Clean Car Program: Closely associated with the Pavley regulations, the Advanced Clean Cars emissions-control program was approved by CARB in 2012.²⁷ The program combines the control of smog, soot, and GHGs with requirements for greater numbers of zero-emission vehicles for model years 2015–2025.²⁸ The components of the Advanced Clean Cars program include the Low-Emission Vehicle (LEV) regulations that reduce criteria pollutants and GHG emissions from light- and medium-duty vehicles, and the ~~Zero-Emission (ZE)~~ vehicle regulation, which requires manufacturers to produce an increasing number of pure ZE vehicles (meaning battery electric and fuel cell electric vehicles), with provisions to also produce plug-in hybrid electric vehicles (PHEV) in the 2018 through 2025 model years.²⁹

Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling: Title 13, California Code of Regulations, Division 3, Chapter 10, Section 2435, was adopted to reduce public exposure to diesel particulate matter and other air contaminants by limiting the idling of diesel-fueled commercial motor vehicles. This section applies to diesel-fueled commercial motor vehicles with gross vehicular weight ratings of greater than 10,000 pounds that are or must be licensed for operation on highways. Reducing idling of diesel-fueled commercial motor vehicles reduces the amount of petroleum-based fuel used by the vehicle.

Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen and other Criteria Pollutants, from In-Use Heavy-Duty Diesel-Fueled Vehicles: Title 13, California Code of Regulations, Division 3, Chapter 1, Section 2025, was adopted to reduce diesel particulate matter (DPM), nitrogen oxides (NOx), and other criteria pollutants from in-use diesel-fueled vehicles. This regulation is phased, with full implementation by 2023. The regulation aims to reduce emissions by requiring the installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models. The newer emission-controlled models would use petroleum-based fuel in a more efficient manner.

3.3 HAZARDOUS MATERIALS AND SOLID AND HAZARDOUS WASTE

By incentivizing the transition from gasoline- and diesel-fueled vehicles to NZE and ZE vehicles, the proposed project would decrease the use of lead acid batteries used in conventional vehicles but would increase the use of nickel metal hydride (NiMH), nickel cadmium (NiCad), and lithium ion (Li-ion) batteries and fuel cells during the operational phase. The increase in NiMH, NiCad, and Li-ion batteries and in fuel cells is due to WAIRE menu implementation actions related to acquiring and/or using ZE trucks, ZE yard trucks, and solar panel systems. These batteries and fuel cells would need to be disposed of or recycled and could therefore have impacts associated with hazardous waste. The spent batteries and fuel cells could exceed the capacity of local recycling infrastructure or have hazardous waste impacts associated with disposal of the batteries and fuel cells. This section summarizes the most relevant laws and regulations associated with these impacts.

3.3.1 Disposal of Hazardous Spent Batteries and Fuel Cells

Gasoline- and diesel-fueled vehicles commonly run on lead-acid batteries found in conventional automobiles and trucks. Lead-acid batteries are considered hazardous waste and are disposed of and processed by the lead recycling industry. These batteries are not sent to municipal landfills. The most common battery types available for zero emission (ZE) vehicles are Li-ion batteries. ZE vehicles use NiMH and NiCad batteries to a lesser extent. The most common type of fuel cell for hydrogen-fueled vehicles is the polymer electrolyte membrane (PEM) fuel cell. Lead-acid based batteries and Li-ion batteries are most used for the type of solar panel applications associated with the proposed project.

Quemetco recycles lead-acid batteries and is located in South Coast AQMD's jurisdiction. Quemetco processes about 600 tons of spent batteries per day and is seeking to increase its allowed capacity to 750 tons/day.¹ The Notice of Preparation and Initial Study for the Quemetco Capacity Upgrade Project was released by South Coast AQMD on August 30, 2018.² Quemetco had already assessed the need for a throughput increase prior to that time. Therefore, the planned upgrade is not in anticipation of any increased lead battery recycling needs resulting from the proposed project.

There are a few companies serving the North American market with the established technology and capacity to process NiMH, NiCad, and Li-ion batteries. Umicore, Glencore, Retrie Technologies (previously known as Toxco), and Battery Solutions recycle both NiMH and Li-ion batteries. While Inmetco only recycles NiMH batteries, and LiCycle recycles Li-ion batteries. Retrie Technologies also recycles NiCad batteries.

Umicore is a significant player in Europe in terms of capacity. It is the only company with European operations that accepts deliveries of electric vehicle (EV) batteries for recycling from

¹ Batteries International, September 27, 2018, Quemetco Plans to Increase Lead Battery Recycling by 25%, <https://www.batteriesinternational.com/2018/09/27/quemetco-plans-to-increase-lead-battery-recycling-by-25/#:~:text=The%20Quemetco%20Capacity%20Upgrade%20Project,from%2020%20hours%20a%20day>, accessed January 5, 2021.

² South Coast Air Quality Management Board, August 30, 2018, The Notice of Preparation of a Draft Environmental Impact Report for the Quemetco Capacity Upgrade Project, http://www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2018/2018-quemetco-nop_is-august-30_2018.pdf, accessed January 23, 2021.

North America. Umicore is a global mining and metallurgy company working on EV battery recycling as well as recycling of other large quantities of metal waste. As a mining company, it sees EV batteries as a critical source of cobalt and is recycling EV batteries in its industrial-scale pilot plant in Europe, which has a rated capacity of approximately 7,000 tons/year. Sudbury Integrated Nickel Operations (INO), a subsidiary company of global mining company Glencore, operates a large nickel and copper smelter in Sudbury, Ontario, Canada. While Sudbury INO has historically processed mostly small portable batteries, it is now handling large format EV batteries as well. EV batteries do not represent a significant percentage of what Sudbury INO processes, but are a niche market that it wants to grow. Retrie is one of the largest EV battery recyclers in North America, receiving all types of EV batteries and chemistries and directing them to its two recycling facilities depending on location and capacity. Retrie has recycling facilities in British Columbia, Canada, and in Ohio. Retrie Technologies appears to be the most widely used recycler by companies that sell hybrids and EVs in North America and has a Li-ion recycling capacity of 9,500 tons/year. Battery Solutions, based in Wixom, Michigan, recycles several types of batteries, including portable batteries, stationary and backup batteries, special purpose batteries, and EV batteries. The company has its own fleet and a nationwide network of more than 200 service providers who can provide on-site service, removal, packaging, and transportation and recycling. Once picked up, EV batteries are disassembled in a way that ensures that each piece of the battery, including the housing, electronics, and wiring, is ~~are~~ separated and recycled ~~in a compliant manner~~. Additionally, Inmetco, located in Ellwood City, Pennsylvania, recycles nickel, chrome, and iron from NiMH batteries. Inmetco has an approximate rated capacity of 6,000 tons/year.³ Li-Cycle is North America's largest capacity lithium-ion battery recycling company. Li-Cycle's facility in Rochester, New York, has the capacity to process up to 5,000 tons of spent Li-ion batteries per year. The company's second facility in Ontario, Canada, has a recycling capacity of another 5,000 tons/year.⁴

Ballard Power Systems recycles the membrane electrode assembly (MEA) from fuel cells. Typically, more than 95 percent of the precious metals in the MEA are reclaimed during this process. The remainder of components in a fuel cell stack are recycled using ordinary recycling processes.⁵

3.3.2 Battery Recycling Regulations and Plans

Hazardous waste regulations are enforcement by CalEPA's Department of Toxic Substances Control (DTSC).

³ Kelleher Environmental, September 2019, Research Study on Reuse and Recycling of Batteries Employed in Electric Vehicles, <https://www.api.org/~media/Files/Oil-and-Natural-Gas/Fuels/Kelleher%20Final%20EV%20Battery%20Reuse%20and%20Recycling%20Report%20to%20API%2018Sept2019%20edits%2018Dec2019.pdf>, accessed January 5, 2021.

3.3.2.1 Federal Regulations and Plans

Mercury-Containing and Rechargeable Battery Management Act (Battery Act): On May 13, 1996, President Clinton signed into law the Mercury-Containing and Rechargeable Battery Management Act (Battery Act). Congress passed the Battery Act to facilitate the increased collection and recycling of NiCad and certain small sealed lead acid (SSLA)⁶ rechargeable batteries. The Battery Act targets battery and product manufacturers and battery waste handlers, not consumers. Different sections of the Battery Act apply to different types of batteries. Specifically, the Battery Act:

- Establishes national, uniform labeling requirements for NiCad and certain SSLA rechargeable batteries.
- Mandates that NiCad and certain SSLA rechargeable batteries be ‘easily removable’ from consumer products.
- Makes the Universal Waste Rule effective in all 50 states for the collection, storage, and transportation of batteries covered by the Battery Act.
- Requires the U.S. EPA to establish a public education program on battery recycling and the proper handling and disposal of used batteries.
- Prohibits, or otherwise conditions, the sale of certain types of mercury-containing batteries in the United States.⁷

The Battery Act requires NiCad and SSLA batteries to be labeled with a recycling symbol. NiCad batteries must be labeled with the words “NiCad” and the phrase “Battery must be recycled or disposed of properly.” Lead-acid batteries must be labeled with the words “Lead,” “Return,” and “Recycle.”

Resource Conservation and Recovery Act: The generation, transportation, treatment, storage, and disposal of batteries is conducted in compliance with the Resource Conservation and Recovery Act (RCRA) (Code of Federal Regulations [CFR], Title 40, Parts 239 through 282). Generators of spent batteries have two options for on-site handling and disposal under the regulations of the RCRA:

- Manage as a universal waste pursuant to the requirements of 40 CFR Part 273.
- Manage per the regulations created for the reclamation of spent lead-acid batteries: 40 CFR Part 266, Subpart G. These regulations are related to the handling and disposal of spent lead-acid batteries that are destined for reclamation and not disposal.

In California, the U.S. EPA has delegated RCRA enforcement to CalEPA’s Department of Toxic Substances Control (DTSC).

⁶ Small sealed lead acid batteries are used in emergency lighting, security and alarm systems, computer backup devices, and hospital equipment. They are also used in cellular phones, laptop computers, and power tools and do not apply to the proposed project.

⁷ U.S. Environmental Protection Agency, November 1997, Implementation of the Mercury-Containing and Rechargeable Battery Management Act, <https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=10000MXZ.TXT>, Accessed December 21, 2020.

Federal Universal Waste Rule: In May 1995, the U.S. EPA promulgated the Universal Waste Rule to reduce the amount of hazardous waste entering the municipal solid waste stream, encourage the recycling and proper disposal of certain common hazardous waste, and reduce the regulatory burden on businesses that generate these wastes by simplifying the applicable regulations and making them easier to comply with. This rule recognizes that some common hazardous waste, such as used NiCad rechargeable batteries, do not require the full array of hazardous waste regulatory requirements. It also eases the regulatory burden on battery handlers and transporters by streamlining a number of RCRA's hazardous waste collection and management requirements, including those related to notification, labeling/marketing, accumulation time limits, employee training, and offsite shipment, among others.⁸

3.3.2.2 State Regulations and Plans

The Rechargeable Battery Recycling Act: The Rechargeable Battery Recycling Act of 2006 required every retailer, as defined, to have in place a system for the acceptance and collection of used rechargeable batteries for reuse, recycling, or proper disposal. Existing law requires the system for the acceptance and collection of used rechargeable batteries to include, at a minimum, specified elements, including, among others, the take-back at no cost to the consumer of a used rechargeable battery of the type or brand that the retailer sold or previously sold. Existing law defines 'rechargeable battery' to mean a small, nonvehicular, rechargeable nickel-cadmium, nickel metal hydride, lithium-ion, or sealed lead-acid battery, or a battery pack containing these types of batteries.

AB 2382 - Recycling lithium-ion vehicle batteries, advisory group: AB 2382 requires the Secretary for Environmental Protection to convene the Lithium-Ion Car Battery Recycling Advisory Group to review and advise the legislature on policies pertaining to the recovery and recycling of lithium-ion batteries sold with motor vehicles in the state. The bill requires the advisory group to consult with specified entities and, on or before April 1, 2022, to submit policy recommendations to the legislature aimed at ensuring that as close to 100 percent as possible of lithium-ion batteries in the state are reused or recycled at end-of-life in a safe and cost-effective manner. The bill would repeal these provisions on January 1, 2027.

The advisory board is being led by CalEPA, DTSC, and the Department for Resources Recycling and Recovery (CalRecycle). Additional members come from the environmental community; auto dismantlers; public and private representatives involved in the manufacturing, collection, processing and recycling of electric vehicle batteries; and other interested parties. The advisory group was formed in 2019 and in December 2020 established a draft work plan. The work plan states that policy recommendations shall reflect entire life cycle considerations for lithium-ion vehicle batteries, including, but not limited to the following:

- Opportunities and barriers to the reuse of those batteries as energy storage systems after they are removed from the vehicle.
- Best management considerations for those batteries at end-of-life.
- The overall effect of different management practices on the environment.

⁸ U.S. Environmental Protection Agency, November 1997, Implementation of the Mercury-Containing and Rechargeable Battery Management Act, <https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=10000MXZ.TXT>, Accessed December 21, 2020.

In developing the policy recommendations, the advisory group shall consider both in-state and out-of-state options for the recycling of lithium-ion vehicle batteries.

The work plan proposes three subgroups to the advisory group. These subgroups will work simultaneously and be comprised of advisory group members. The goal of the subgroups is to portion the work of the larger advisory group into more manageable loads, while facilitating more frequent meetings and discussions within the smaller bodies. The three proposed subgroups, along with their draft scopes and definitions, are as follows:

- **Reuse:** May refer to cases where the batteries are reused in another vehicle or repurposed for other applications, such as stationary energy storage.
- **Recycling:** Material recovery via mechanical separation, pyrometallurgical, and/or hydrometallurgical recycling processes.
- **Logistics:** Encompasses removal of batteries from vehicles, testing to determine appropriate next use (reuse in vehicle, stationary storage, or material recovery), collection and sorting, transportation, and tracking.^{9,10}

The Hazardous Waste Control Act (HWCA): The HWCA created the state’s Hazardous Waste Management Program, which is similar to, but more stringent than, the federal RCRA program. The act is implemented by regulations contained in Title 26 of the California Code of Regulations (CCR), which describes the following required aspects for the proper management of hazardous waste: identification and classification; generation and transportation; design and permitting of recycling, treatment, storage, and disposal facilities; treatment standards; operation of facilities and staff training; and closure of facilities and liability requirements. These regulations list more than 800 materials that may be hazardous and establish criteria for identifying, packaging, and disposing of such waste. Under the HWCA and Title 26, the generator of hazardous waste must complete a manifest that accompanies the waste from generator, to transporter, to the ultimate disposal location. Copies of the manifest must be filed with DTSC.¹¹

California’s Universal Waste Rule (CCR, Title 22, Section 66273.2): California’s Universal Waste Rule allows individuals and businesses to transport, handle, and recycle certain common hazardous waste, termed universal wastes, in a manner that differs from the requirements for most hazardous waste. This includes lead-acid, NiCad batteries, and Li-ion batteries. Universal waste may not be sent to a municipal solid waste (garbage) landfill or to a nonhazardous waste recycling center.

The Lead-Acid Battery Recycling Act (Assembly Bill (AB) 2153): The Lead-Acid Battery Recycling Act created a state mandated lead-acid battery fee that serves as a funding mechanism for cleanup of areas that have been contaminated by the production and recycling of lead-acid

⁹ CalEPA, 2021, Lithium-ion Car Battery Recycling Advisory Group, <https://calepa.ca.gov/climate/lithium-ion-car-battery-recycling-advisory-group/>, accessed January 8, 2021.

¹⁰ CalEPA, 2021, AB 2832 Advisory Group: Draft Work Plan - Working Draft for Discussion Dec. 14, 2020, <https://calepa.ca.gov/climate/lithium-ion-car-battery-recycling-advisory-group/draft-workplan-for-discussion-on-12-14-20-by-the-lithium-ion-car-battery-recycling-advisory-group/>, accessed January 8, 2020.

¹¹ South Coast Air Quality Management District, January 2017, Final Program Environmental Impact Report for the 2016 Air Quality Plan, <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfpeir.pdf>, accessed December 21, 2020.

batteries. AB 2153 also represents a collaborative effort to codify an effective consumer recycling program for lead-acid batteries. Consumers are charged a refundable deposit as part of the purchase to encourage return of their spent battery for environmental recycling.

Requirements for Management of Spent Lead-Acid Storage Batteries (CCR, Title 22, Sections 66266.80 and 66266.81): The regulations addressing used lead-acid battery management are found in 22 CCR Sections 66266.80 and 66266.81. Generators of lead-acid batteries include vehicle owners, garages, parts stores, and service stations as well as other businesses and factories that generate dead or damaged batteries. Entities that generate no more than 10 batteries per year or store or transport no more than 10 batteries at one time are not subject to the reporting and record-keeping requirements given in the battery regulations as long as the batteries are transported to a facility that stores, recycles, uses, reuses, or reclaims them. This also applies to trade-ins. Persons or businesses that generate more than 10 batteries per year or who store or transport more than 10 at one time must keep records about the batteries as described in 22 CCR Section 66266.81.

3.4 TRANSPORTATION

Under CEQA, potentially significant transportation impacts may occur if a project is inconsistent with adopted transportation programs, plans, or policies that address the circulation system and multimodal travel. This would include short- and long-range transportation plans, including pedestrian, bicycle, equestrian, and transit plans (also referred to as active transportation plans, non-motorized plans, or complete street plans), and the Southern California Association of Governments' (SCAG's) 2020 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

In the past, CEQA documents also analyzed whether a project would increase traffic congestion, e.g., by negatively impacting the 'level of service' at intersections, or otherwise delaying travel times. In 2013, the legislature changed how agencies are to analyze transportation impacts. Now, instead of looking at these indicators of congestion, lead agencies must consider whether a project will significantly increase 'vehicle miles travelled' or 'VMT'. The purpose of this shift was to ensure that transportation analysis focuses on the environmental impacts associated with increased vehicle traffic, rather than the traffic itself. Thus, VMT transportation criteria are designed to promote the reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses. The Office of Planning and Research (OPR) has developed a technical advisory, based on VMT, that lead agencies may use in analyzing transportation impacts. This EA relies on the OPR Technical Advisory for evaluating transportation impacts of the proposed project.

3.4.1 Transportation Regulations and Plans

Several state and regional laws have been enacted to regulate transportation planning, reduction of VMT, and compliance with regional transportation-related air quality standards. The most relevant transportation laws and regulations and plans prepared to implement them are summarized in this section.

3.4.1.1 Federal Regulations

Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991: The Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 seeks to develop a National Intermodal Transportation System that is economically efficient, environmentally sound, provides the foundation for the Nation to compete in the global economy and will move people and goods in an energy efficient manner. The ISTEA imposes planning and regulatory requirements on states and cities in developing transportation plans and programs. There have been additional federal planning laws enacted since ISTEA. Specifically, subsequent federal regulations regarding transportation infrastructure include the Transportation Equity Act for the 21st Century (TEA-21) in 1998 and the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) in 2005.

Moving Ahead for Progress in the 21st Century Act (MAP-21): MAP-21 was signed into law by President Obama on July 6, 2012. The act transformed the policy and programmatic framework for investments to the transportation system to guide growth and development. MAP-21 created a streamlined and performance-based surface transportation program and builds on many of the

highway, transit, bike, and pedestrian programs and policies established in 1991.¹ The act included provisions to address challenges facing the U.S. transportation system, including improving safety, maintaining infrastructure condition, reducing traffic congestion, improving efficiency of the system and freight movement, protecting the environment, and reducing delays in project delivery.²

Fixing America's Surface Transportation Act or (FAST Act): On December 4, 2015, President Obama signed ~~into law~~ Public Law 114-94, the Fixing America's Surface Transportation Act (FAST Act). The FAST Act funds surface transportation programs, including, but not limited to, federal-aid highways, at over \$305 billion for fiscal years (FY) 2016 through 2020. The FAST Act builds on the changes made by MAP-21.³

~~3.4.2 State Regulations and Plans~~

3.4.1.2 State Regulations and Plans

CARB's Mobile Source Strategy: The 2016 Mobile Source Strategy (2016 Strategy) was CARB's first integrated planning effort looking specifically at mobile sources to identify complementary policies to reduce emissions of criteria pollutants, ~~greenhouse gases (GHGs)~~, and toxic air contaminants (TACs). The California Legislature passed Senate Bill (SB) 44, acknowledging the ongoing need to evaluate opportunities for mobile source emissions reductions and requiring CARB to update the 2016 Strategy by January 1, 2021, and every five years thereafter. Specifically, SB 44 requires CARB to update the 2016 Strategy to include a comprehensive strategy for the deployment of medium- and heavy-duty vehicles for the purpose of meeting air quality standards and reducing GHG emissions. It also directs CARB to set reasonable and achievable goals for reducing emissions by 2030 and 2050 from medium- and heavy-duty vehicles that are consistent with the State's overall goals and maximizes the reduction of criteria air pollutants. The 2020 Mobile Source Strategy (2020 Strategy) continues this multi-pollutant planning approach to determine the pathways forward for the various mobile sectors that are necessary in order to achieve California's numerous goals and targets over the next 30 years.

State Transportation Improvement Program: The California Transportation Commission (CTC) administers the State Transportation Improvement Program, a multiyear capital improvement program of transportation projects on and off the state highway system, funded with revenues from the State Highway Account and other funding sources.

California Department of Transportation (Caltrans) Policies, Standards, Procedures, and Plans: Caltrans is the primary state agency responsible for transportation issues. One of its duties is the construction and maintenance of the state highway system. Caltrans approves the planning, design, and construction of improvements for all state-controlled facilities and has developed policies and procedures for the construction, design, and maintenance of such improvements. Caltrans has standards for roadway traffic flow and has developed procedures to determine if state-controlled facilities require improvements. For projects that may physically affect facilities under its administration, Caltrans requires encroachment permits before any construction work may be undertaken. Caltrans also prepares comprehensive planning documents, including corridor system

¹ Federal Highway Administration, November 7, 2018, MAP-21, <https://www.fhwa.dot.gov/map21/>, accessed January 9, 2021.

² Federal Highway Administration, July 2016, Fixing America's Surface Transportation Act or "FAST Act", <https://www.fhwa.dot.gov/fastact/summary.cfm>, accessed January 9, 2021.

³ Federal Highway Administration, July 2016, Fixing America's Surface Transportation Act or "FAST Act", <https://www.fhwa.dot.gov/fastact/summary.cfm>, accessed January 9, 2021.

management plans and transportation concept reports, which are long-range planning documents that establish a planning concept for state facilities.

Senate Bill 743: On September 27, 2013, Senate Bill (SB) 743, which modifies how lead agencies analyze transportation impacts under CEQA, was signed into law. A key element is the potential elimination or deemphasizing of auto delay, level of service (LOS), and other similar measures of vehicular capacity or traffic congestion as a basis for determining significant impacts in many parts of the state. According to the legislative intent of SB 743, these changes to current practice were necessary to balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of GHG emissions. The legislature found that, with adoption of the Sustainable Communities and Climate Protection Act of 2008 (SB 375), the state had signaled its commitment to encourage land use and transportation planning decisions and investments that reduce VMT and thereby contribute to the reduction of GHG emissions, as required by the California Global Warming Solutions Act of 2006, Assembly Bill (AB) 32. Additionally, AB 1358, described below, requires local governments to plan for a balanced, multimodal transportation network that meets the needs of all users.

SB 743 started a process that fundamentally changes transportation impact analysis as part of CEQA compliance. These changes include the elimination of auto delay, LOS, and similar measures of vehicular capacity or traffic congestion as the basis for determining significant transportation impacts. In place of these thresholds OPR developed alternative metrics and thresholds based on VMT. These new thresholds were designed to promote the reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses. New CEQA guidelines for analyzing transportation impacts were certified by the Secretary of the Natural Resources Agency in December 2018, and automobile delay, as described solely by LOS or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment. Agencies had until July 1, 2020, to implement the new VMT-based criteria.

AB 1358: California Complete Streets Act of 2008: The California Complete Streets Act of 2008 was signed into law on September 30, 2008. Beginning January 1, 2011, AB 1358 required circulation elements to address the transportation system from a multimodal perspective. The bill states that streets, roads, and highways must “meet the needs of all users...in a manner suitable to the rural, suburban, or urban context of the general plan.” Essentially, this bill requires a circulation element to plan for all modes of transportation where appropriate—including walking, biking, car travel, and transit.

The Complete Streets Act also requires circulation elements to consider the multiple users of the transportation system, including children, adults, seniors, and the disabled. For further clarity, AB 1358 tasked OPR to release guidelines for compliance, which were released in December 2010.

SB 375: Sustainable Communities and Climate Protection Act: On December 11, 2008, the California Air Resources Board adopted its proposed Scoping Plan for AB 32, the Global Warming Act. This scoping plan included the approval of SB 375 as the means for achieving regional transportation related GHG targets. SB 375 provides guidance on how curbing emissions from cars and light trucks (e.g. pickup trucks) can help the state comply with AB 32.

There are five major components to SB 375. First, SB 375 addresses regional GHG emission targets. CARB’s Regional Targets Advisory Committee guides the adoption of targets to be met by 2020 and 2035 for each metropolitan planning organization (MPO) in the state. These targets,

which MPOs may propose themselves, are updated every eight years in conjunction with the revision schedule of housing and transportation elements.

Second, MPOs are required to create a sustainable communities strategy (SCS) that provides a plan for meeting regional targets. The SCS and the regional transportation plan (RTP) must be consistent with each other, including action items and financing decisions. If the SCS does not meet the regional target, the MPO must produce an Alternative Planning Strategy (APS) that details an alternative plan to meet the target.

Third, SB 375 requires that regional housing elements and transportation plans be synchronized on eight-year schedules. In addition, Regional Housing Needs Assessment allocation numbers must conform to the SCS. If local jurisdictions are required to rezone land as a result of changes in the housing element, rezoning must take place within three years.

Fourth, SB 375 provides CEQA streamlining incentives for preferred development types. Residential or mixed-use projects qualify if they conform to the SCS. Transit-oriented developments also qualify if they 1) are at least 50 percent residential, 2) meet density requirements, and 3) are within one-half mile of a transit stop. The degree of CEQA streamlining is based on the degree of compliance with these development preferences.

Fifth and finally, MPOs must use transportation and air emission modeling techniques consistent with guidelines prepared by the CTC. Regional transportation planning agencies, cities, and counties are encouraged but not required to use travel demand models consistent with the CTC guidelines.

Recognizing the importance of measuring the benefits identified through SB 375 planning work, in 2017, the legislature tasked CARB with issuing a report every four years analyzing the progress made under SB 375. The 2018 progress report found that California was not on track to meet greenhouse gas reductions expected under SB 375. This finding was based on CARB's analysis of 24 data-supported indicators to help assess what on-the-ground change has occurred since SB 375 was enacted related to strategies identified in SCSs to meet the targets. While positive gains have been made to improve the alignment of transportation, land use, and housing policies with state goals, the data suggest that more and accelerated action is critical for public health, equity, economic, and climate success.⁴

3.4.3—Regional Regulations and Plans

3.4.1.3 Regional Regulations and Plans

Southern California Association of Governments' Regional Transportation Plan and Sustainable Communities Strategy: SCAG's Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) is a long-range plan that provides a vision for transportation investments throughout the southern California region. The SCS integrates land use and transportation strategies that will achieve CARB's emissions reduction targets. SCAG is the metropolitan planning organization for a six-county region that includes South Coast AQMD's jurisdiction. The RTP/SCS is supported by a combination of transportation and land use strategies that are designed to help the region achieve state GHG emission reduction goals and federal Clean

⁴ California Air Resources Control Board, November 2018, 2018 Progress Report California's Sustainable Communities and Climate Protection Act, https://ww2.arb.ca.gov/sites/default/files/2018-11/Final2018Report_SB150_112618_01_ExecutiveSummary.pdf, accessed January 10, 2021.

Air Act requirements, preserve open space areas, improve public health and roadway safety, support the vital goods movement industry, and utilize resources more efficiently. The latest RTP/SCS, Connect SoCal, was completed and adopted in September 2020.

South Coast Air Quality Management District, Air Quality Management Plan: The 2016 AQMP is a regional blueprint for how the South Coast AQMD will achieve air quality standards and healthful air. The 2016 AQMP⁵ contains multiple goals promoting reductions of criteria air pollutants, GHGs, and TACs. In particular, the 2016 AQMP states both oxides of nitrogen (NOx) and volatile organic compound (VOC) emissions need to be reduced to meet air quality standards, with emphasis that NOx emission reductions are more effective to reduce the formation of ozone and PM2.5. The South Coast AQMD has also initiated development of the 2022 AQMP that will focus on meeting the 70 ppb NAAQS for ozone by 2037.

~~3.4.4 Local Regulations and Plans~~

3.4.1.4 Local Regulations and Plans

Orange County Transportation Authority Long Range Transportation Plan: The Orange County Transportation Authority (OCTA) Long Range Transportation Plan (LRTP) outlines the vision and plan for multimodal transportation in Orange County. OCTA prepares the LRTP and submits it to SCAG so that county transportation projects will be incorporated into the regional transportation plan and subsequently programmed into the Federal Transportation Improvement Program.

Orange County's Master Plan of Arterial Highways: The Master Plan of Arterial Highways (MPAH) was established in 1956 to ensure that a regional arterial highway network would be developed to supplement Orange County's developing freeway system. OCTA is responsible for administering the MPAH, including the review and approval of amendments. The MPAH map is a critical element of transportation planning and operations because it defines a countywide circulation system in response to existing and planned land uses. It is regularly updated to reflect changing development and traffic patterns.

Orange County's Districts 1 and 2 Bikeways Strategy (2013): OCTA's regional bikeways planning expanded the 2009 OCTA Commuter Bicycle Strategic Plan to identify potential regional bikeway improvements. The Districts 1 and 2 Bikeways Strategy identifies 11 regional bikeway corridors that connect to major activity centers, including employment areas, transit stations, and colleges and universities. The corridors include key connections to regional bikeway routes and major destinations within the districts.

OCTA's OC Transit Vision: The OC Transit Vision is a 20-year plan for enhancing and expanding public transit service in Orange County. Adopted in 2018, the Transit Vision focuses future investments along transit opportunity corridors on major arterials and freeways. The Transit Vision also supports improvements to rail service planned by Metrolink and other partner agencies, including plans to improve station access and reduce the number of at-grade road crossings.

San Bernardino Countywide Transportation Plan: The San Bernardino County Transportation Authority (SBCTA), formerly known as the San Bernardino Associated Governments (SANBAG), developed the ~~County's~~ Countywide Transportation Plan (CTP), which was released in September

⁵ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

2015. The plan has a horizon year of 2040 and serves as the County’s input into the Southern California Associated Governments’ (SCAG) RTP/SCS. The purpose of the CTP is to lay out a strategy for long-term investment in and management of the County’s transportation system. Key issues addressed by the CTP include transportation funding, congestion relief, economic competitiveness, system preservation and operations, transit system interconnectivity, air quality, sustainability, and GHG emission reductions.

San Bernardino County Non-motorized Transportation Plan: The San Bernardino County Non-motorized Transportation Plan was developed in March 2011, with the most recent update in June 2018. The goal of the plan is to develop an integrated plan and identify sources of funds to implement that plan to promote increased bicycle and pedestrian access, increased travel by cycling and walking, routine accommodation in transportation and land use planning, and improved bicycle and pedestrian safety. The plan lays out design guidelines, bikeway and pedestrian system recommendations, implementation strategies and priorities, and funding opportunities.

San Bernardino County Short-Range Transit Plan: SBCTA developed a Short-Range Transit Plan (SRTP) to help guide transit service improvements in the region over the next five years. The SRTP identifies transit service plans and helps prioritize major capital improvement projects for the region’s transit needs. Goals of the SRTP include connectivity between the various transit agencies in the county, facilitating transit travel between regions of the county and between the county and surrounding counties, and cost-effective accessibility programs for seniors and persons with disabilities. The SRTP was released in December 2016.

San Bernardino County Long-Range Transit Plan: SBCTA developed a Long-Range Transit Plan to address the county’s current and future travel challenges and create a transportation system that can increase the role of transit in the future. The Long Range Transit Plan establishes a transit vision for the next 25 years, prioritizes goals and projects for transit growth, and prioritizes connecting land use and transportation strategies. The SRTP was released in April 2010.

San Bernardino Countywide Points of Interest Pedestrian Plan: SBCTA developed a Countywide Points of Interest Pedestrian Plan to assist member agencies with the development of tools and guidelines for identifying and prioritizing pedestrian improvements. The project’s goals include connecting various SBCTA member agencies and synchronizing project planning and implementation, given that each agency has varying pedestrian accommodations, capital improvement programs, and maintenance regimes.

Riverside County Long-Range Transportation Study: The Riverside County Transportation Commission (RCTC) developed the first countywide Long-Range Transportation Study in December 2019. The study provides a vision for what an integrated transportation system will look like in Riverside County in the next 20 years. The plan encompasses the state highway system, regional arterials, rail and bus, freight networks, and active transportation. The study helps RCTC better prioritize and coordinate the different planning efforts across the county with state, regional, and local agencies.^{6,7}

⁷ Riverside County Transportation Commission, Funding and Planning, 2020, <https://www.rctc.org/funding-and-planning/>

LA Metro 2020 Long Range Transportation Plan: The Los Angeles County Metropolitan Transportation Authority (LA Metro) adopted a 2020 LRTP that provides a detailed roadmap for how LA Metro will plan, build, operate, maintain, and partner for improved mobility in the next 30 years. The LRTP guides future funding plans and policies needed to move LA County forward for a more mobile, resilient, accessible, and sustainable future. The LRTP was adopted by the Metro Board of Directors on September 24, 2020.⁸

LA Metro Active Transportation Strategic Plan: LA Metro's Active Transportation Strategic Plan focuses on enhancing access to transit stations and developing a regional network for people who choose to take transit, walk, and/ or bike. LA Metro initiated this process with the Bicycle Transportation Strategic Plan in 2006. There are three main components to the plan:

- First/last mile station area access improvements.
- A regional active transportation network.
- Support programs, including performance metrics and monitoring.

The purpose of the plan is to serve as a roadmap for stakeholders and partners to help identify transportation concepts and changes and helps the region respond to regional and state regulations for the development of the transportation system and reductions in greenhouse gas emissions, including the development of Complete Streets networks.⁹

LA Metro Vision 2028 Plan: The Metro Vision 2028 Plan is the agencywide strategic plan that creates the foundation for transforming mobility in Los Angeles County over the next 10 years. Based on more than a year of outreach, it sets the mission, vision, performance outcomes, and goals for LA Metro and puts in motion specific initiatives and performance outcomes towards which LA Metro and its partners will strive in pursuit of a better transportation future. LA Metro's vision is composed of three elements:

- Increased prosperity for all by removing mobility barriers.
- Swift and easy mobility throughout LA County, anytime.
- Accommodating more trips through a variety of high-quality mobility options.¹⁰

Los Angeles County Goods Movement Strategic Plan: LA Metro initiated the Los Angeles County Goods Movement Strategic Plan in November 2018 to develop a stakeholder-supported vision and guiding principles that facilitate a sustainable goods movement transportation system throughout the county. The plan aims to develop policies and strategies consistent with Metro's Vision 2028 Plan.

The plan outlines policies that support a competitive global economy and steward equitable and sustainable investments and technological innovation that will advance environmental goals for county residents. The plan lays out the following goods movement core values and priorities: equity and sustainability, safe and efficient multimodal system, culture of investment and

innovation, strong markets and reliable supply chains, and strong labor force. These core values and priorities were developed to establish comprehensive approaches in addressing a myriad of interconnected freight-related challenges—witnessed across the county and will serve as guiding principles for LA Metro’s goods movement planning activities to improve quality of life while supporting economic sustainability and prosperity.¹¹

3.5 OTHER IMPACT AREAS

The existing setting for other impact areas, including Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Land Use and Planning, Noise, Mineral Resources, Population and Housing, Public Services, Recreation, and Utilities and Service Systems is incorporated by reference from the California Air Resources Board's (CARB) Advanced Clean Trucks Regulation (ACT) Regulation Final Environmental Analysis (EA). These impact areas are only relevant to this EA to the extent they may be impacted by potential future construction of new manufacturing and recycling facilities and grid improvements to support the transition to near-zero emissions (NZE) and zero-emissions (ZE) vehicles. Because it is uncertain how many new manufacturing and recycling facilities would be built, where they would be built, and whether the local land use permitting authority would require mitigation, it is not possible to analyze the specific, potential impacts of this new development.

Nonetheless, CARB provided a general analysis of these impacts in its Final EA for the ACT Regulations. These regulations require truck manufacturers to sell medium- and heavy-duty ZE vehicles as an increasing percentage of California sales. The Final EA for the ACT Regulation described the potential for these regulations to result in the construction of new manufacturing, recycling, and other facilities in this way:

Reasonably foreseeable compliance responses under this measure would include an increase in manufacturing and associated facilities to increase the supply of ZEVs, along with construction of new hydrogen fueling stations and battery electric vehicle (BEV) charging stations to support ZEV operations. Increased deployment of ZEVs could increase production of electricity and hydrogen fuel, reduce rates of oil and gas extraction, and result in associated increases in lithium and platinum mining and exports from source countries or other states. Increased demand for lithium-ion batteries could increase production and manufacture, which could result in the expansion of or construction of new facilities along with associated increases in lithium mining and exports from source countries or other states. Disposal of any portion of vehicles, including batteries, would be subject to and have to comply with existing laws and regulations governing solid and hazardous waste, such as California's Hazardous Waste Control law, and implementing regulations, such as the Universal Waste Rule (22 California Code of Regulations (CCR) Chapter 23). That is, disposal of used batteries into solid waste landfills is prohibited; however, they could be refurbished, reused or disposed of as hazardous waste. To meet an increased demand of refurbishing or reusing batteries, new facilities or modifications to existing facilities are anticipated to accommodate battery recycling activities. Fleet turnover would be largely unaffected because the proposed sales requirement applies at time of new vehicle sales. (CARB ACT Regulation Final EA, pp. 19–20)

The Final EA for the ACT Regulation further noted that “CARB does not have the ability to determine specific projects or locations, facility size and character, or site-specific environmental characteristics affected by any potential future facilities” (CARB ACT Regulation Final EA, pp. 19–20). Nonetheless:

This Final EA takes a conservative approach and considers some environmental impacts as potentially significant because of the inherent uncertainties in the relationship between physical actions that are reasonably foreseeable under the Proposed Project and environmentally sensitive resources or conditions that may be affected. This approach tends to overstate environmental impacts considering these uncertainties and is intended to satisfy the good-faith, full-disclosure intention of CEQA. If specific projects are proposed and subjected to project-level environmental review, it is expected that many of the impacts recognized as potentially significant in the Final EA that are not already mitigated or avoided with this proposed project, can later be avoided or reduced to a less-than-significant level. If a potentially significant environmental effect cannot be feasibly mitigated with certainty, this Final EA identifies the impact as significant and unavoidable. (CARB ACT Regulation Final EA, pp. 19–20)

With respect to mitigation for any potential impacts resulting from development of new facilities, CARB's Final EA for the ACT Regulation stated:

The Final Draft EA contains a degree of uncertainty regarding implementation of mitigation for potentially significant impacts. While CARB is responsible for adopting the Proposed Project, it does not have authority over all the potential infrastructure and development projects that could be carried out in response to the Proposed Project. Other agencies are responsible for the review and approval, including any required environmental analysis, of any facilities and infrastructure that are reasonably foreseeable, including any definition and adoption of feasible project-specific mitigation measures, and any monitoring of mitigation implementation. For example, local cities or counties must approve proposals to construct new facilities. Additionally, State and/or federal permits may be needed for specific environmental resource impacts, such as take of endangered species, filling of wetlands, and streambed alteration.

Because CARB cannot predict the location, design, or setting of specific projects that may result and does not have authority over implementation of specific infrastructure projects that may occur, the programmatic analysis in the Final Draft EA does not allow for identification of the precise details of project-specific mitigation. As a result, there is inherent uncertainty in the degree of mitigation that would ultimately need to be implemented to reduce any potentially significant impacts identified in the Final Draft EA. Consequently, this Final Draft EA takes the conservative approach in its post-mitigation significance conclusions (i.e., tending to overstate the risk that feasible mitigation may not be sufficient to mitigate an impact to less than significant) and discloses, for CEQA compliance purposes, that potentially significant environmental impacts may be unavoidable, where appropriate. It is also possible that the amount of mitigation necessary to reduce environmental impacts to below a significant level may be far less than disclosed in this Final Draft EA on a case-by-case basis. It is expected that many potentially significant impacts of facility and infrastructure projects would be avoidable or mitigable to a less-than-significant level as an outcome of their project-specific environmental review processes. (CARB ACT Regulation Final EA, p. 20)

CARB's Final EA for the ACT Regulation then described the environmental and regulatory setting for each of the potential impact areas affected by the potential facility and infrastructure development in Attachment A of the CARB's Final EA for the ACT Regulation. These settings are briefly summarized below.

3.5.1 Aesthetics

The existing setting for aesthetic impacts is discussed on pages A-126 of Attachment A of the CARB ACT Regulation Final EA. Aesthetic value can be affected by visibility, which is directly related to the presence of airborne particles. Visibility-reducing particles consist of suspended particulate matter, a complex mixture of tiny particles consisting of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. Particles vary greatly in shape, size, and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt.

The visual character of California varies greatly related to topography and climate. The foothills form a transitional landform from the valley floor to the higher Sierra Nevada, Cascade, and Coast Ranges. The valley floor is cut by two rivers that flow west out of the Sierra Nevada and east out of the Coast Ranges. Irrigated agriculture land is the primary landscape in the Sacramento and San Joaquin Valleys, and the foothill landscape has been altered by grazing, mining, reservoir development, and residential and commercial development. The visual character of the state also varies dramatically from the north, which is dominated by forest lands, and the south, which is primarily residential and commercial development.

3.5.1.1 Regulatory Setting

Applicable laws and regulations associated with aesthetics and scenic resources are discussed in Table 3.5-1.

Table 3.5-1
Applicable Laws and Regulations for Aesthetic Resources

Applicable Regulations	Description
Federal	
Federal Land Policy and Management Act of 1976 (FLPMA)	FLPMA is the enabling legislation establishing the Bureau of Land Management's (BLM's) responsibilities for lands under its jurisdiction. Section 102 (a) of the FLPMA states that "...the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resources, and archeological values..." Section 103(c) identifies "scenic values" as one of the resources for which public land should be managed.
BLM Contrast Rating System	The contrast rating system is a systematic process used by BLM to analyze visual impacts of proposed projects and activities. It is primarily intended to assist BLM personnel in the resolution of visual impact assessment.

Table 3.5-1
Applicable Laws and Regulations for Aesthetic Resources

Applicable Regulations	Description
Natural Historic Preservation Act (NHPA)	Under regulations of the NHPA, visual impacts to a listed or eligible National Register property that may diminish the integrity of the property's "setting ... [or] ... feeling" in a way that affects the property's eligibility for listing may result in a potentially significant adverse effect. "Examples of adverse effects ... include...: Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features." (Title 36 Code of Federal Regulations (CFR) Part 800.5)
National Scenic Byways Program	Title 23, Sec 162 of the <u>United States Code</u> outlines the National Scenic Byways Program. This program is used to recognize roads having outstanding scenic, historic, cultural, natural, recreational, and archaeological qualities through designation of road as: National Scenic Byways, All-American Roads, or America's Byways. Designation of the byways provides eligibility for federal assistance for safety improvement, corridor management plans, recreation access, or other project that protect scenic, historical, recreational, cultural, natural, and archaeological resources.
State	
Ambient Air Quality Standard for Visibility-Reducing Particles	Extinction coefficient (measure of absorption of light in a medium) of 0.23 per kilometer—visibility of 10 miles or more (0.07—30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent.
California Streets and Highway Code, Section 260 through 263 – Scenic Highways	The State Scenic Highway Program promotes protection of designated State scenic highways through certification and adoption of local scenic corridor protection programs that conform to requirements of the California Scenic Highway Program.
Local	
County and City Controls	Most local planning guidelines to preserve and enhance the visual quality and aesthetic resources of urban and natural areas are established in the jurisdiction's general plan. The value attributed to a visual resource generally is based on the characteristics and distinctiveness of the resource and the number of persons who view it. Vistas of undisturbed natural areas, unique or unusual features forming an important or dominant portion of a viewshed, and distant vistas offering relief from less attractive nearby features are frequently considered to be scenic resources. In some instances, a case-by-case determination of scenic value may be needed, but often there is agreement within the relevant community about which features are valued as scenic resources.

Table 3.5-1
Applicable Laws and Regulations for Aesthetic Resources

Applicable Regulations	Description
	In addition to federal and State designations, counties and cities have their own scenic highway designations, which are intended to preserve and enhance existing scenic resources. Criteria for designation are commonly included in the conservation/open space element of the city or county general plan.
Source: California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Proposed Advanced Clean Trucks Rule Regulation. https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf	

3.5.2 Agricultural and Forestry Resources

The existing setting for ~~aesthetic~~ impacts to agriculture and forestry resources is discussed on pages A-128 of Attachment A of the CARB ACT Regulation Final EA. The State maps and classifies farmland through the California Department of Conservation Farmland Mapping and Monitoring Program (FMMP). Classifications are based on a combination of physical and chemical characteristics of the soil and climate that determine the degree of suitability of the land for crop production. The classifications under the FMMP are as follows:

- **Prime Farmland**—land that has the best combination of features to produce agricultural crops.
- **Farmland of Statewide Importance**—land other than Prime Farmland that has a good combination of physical and chemical features to produce agricultural crops, but that has more limitations than Prime Farmland, such as greater slopes or less ability to store soil moisture.
- **Unique Farmland**—land of lesser quality soils used to produce the state’s leading agricultural cash crops.
- **Farmland of Local Importance**—land of importance to the local agricultural economy.
- **Grazing Land**—existing vegetation that is suitable for grazing.
- **Urban and Built-Up Land**—land occupied by structures in density of at least one dwelling unit per 1.5 acres.
- **Land Committed to Nonagricultural Use**—vacant areas; existing land that has a permanent commitment to development but has an existing land use of agricultural or grazing lands.
- **Other Land**—land not included in any other mapping category, common examples of which include low-density rural developments, brush, timber, wetland, and vacant and nonagricultural land surrounded on all sides by urban development.

CEQA Public Resources Code Section 21095 and CEQA Guidelines Appendix G, together, define Prime, Unique, and Farmland of Statewide Importance as “Important Farmland” whose conversion may be considered significant. Local jurisdictions can further consider other classifications of farmland as important and can also use an agricultural land evaluation and site assessment (LESA) model to determine farmland importance and impacts from conversion.

As of 2012, California contained approximately 5 million acres of Prime Farmland; approximately 2.6 million acres of Farmland of Statewide Important; approximately 1.3 million acres of Unique Farmland; approximately 3.2 million acres of Farmland of Local Importance; and approximately 19.2 million acres of grazing land.

California produces over a third of the vegetables and two-thirds of the fruits and nuts in the U.S. California's agricultural abundance includes more than 400 commodities and supplies 99 percent or more of the following to the U.S.—almonds, artichokes, dates, dried plums, figs, garlic, kiwifruit, olives and olive oil, pistachios, raisins, table grapes, and walnuts. In 2016, 76,700 farms operated in California, which is less than 1 percent less than in 2015. Over 27 percent of California farms generated commodity sales over \$100,000, ~~greater than the national average of 20 percent.~~ The amount of land devoted to farming and ranching in California decreased slightly to 25.4 million acres in 2016. The average farm size was 331 acres in 2016, up from the 2015 farm size, but still below the national average of 442 acres.

Williamson Act. The California Land Conservation Act of 1965, commonly referred to as the Williamson Act, enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space use. In return, landowners receive property tax assessments which are much lower than normal because they are based upon farming and open space uses as opposed to full market value. The Open Space Subvention Act of 1971 provided local governments an annual subvention of forgone property tax revenues from the state through the year 2009; these payments have been suspended in more recent years due to revenue shortfalls. Of California's 58 counties, 52 have executed contracts under the Land Conservation Act Program. The 14.8 million acres reported as enrolled in Land Conservation Act contracts statewide as of December 2015, represents approximately 50 percent of California's farmland total of about 30 million acres, or about 31 percent of the State's privately owned land (~~California Department of Conservation~~).

Forestry Resources. Forestland is defined as land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits (Public Resources Code (PRC) Section 12220(g)). There are 40,233,000 acres of forested land within California including oak woodlands and conifer forests (California Department of Fish and Wildlife). Timberland is privately owned land, or land acquired for State forest purposes, which is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, of, at minimum 15 cubic feet per acre (Government Code Section 51104(f)). Forest managed for harvest is called timberland and includes 2,932,000 acres in private ownership; 146,000 acres in State ownership; 10,130,000 acres in federal ownership; and 4,551,000 acres of non-industrial timberland in private ownership.

3.5.2.1 Regulatory Setting

Table 3.5-2 provides a general description of applicable laws and regulations that may pertain to agriculture and forest resources.

Table 3.5-2
Applicable Laws and Regulations for Agriculture and Forest Resources

Applicable Regulations	Description
Federal	
Farmland Protection Policy Act (FPPA)	The FPPA directs federal agencies to consider the effects of federal programs or activities on farmland, and ensure that such programs, to the extent practicable, are compatible with state, local, and private farmland protection programs and policies. The rating process established under the FPPA was developed to help assess options for land use on an evaluation of productivity weighed against commitment to urban development.
National Forest Management Act (NFMA) of 1976	The NFMA is the primary statute governing the administration of national forests. The NFMA requires the Secretary of Agriculture to assess forest lands, develop a management program based on multiple-use, sustained-yield principles, and implement a resource management plan for each unit of the National Forest System. Goal 4 of the USFS's National Strategic Plan for the National Forests states that the nation's forests and grasslands play a significant role in meeting America's need for producing and transmitting energy. Unless otherwise restricted, National Forest Service lands are available for energy exploration, development, and infrastructure (e.g., well sites, pipelines, and transmission lines). However, the emphasis on non-recreational special uses, such as utility corridors, is to authorize the special uses only when they cannot be reasonably accommodated on non-National Forest Service lands.
State	
The California Land Conservation Act, also known as the Williamson Act (Government Code Section 51200 et seq.)	The Department of Conservation's Division of Land Resource Protection administers the Williamson Act program, which permits property tax adjustments for landowners who contract with a city or county to keep their land in agricultural production or approved open space uses for at least 10 years. Lands covered by Williamson Act contracts are assessed on the basis of their agricultural value instead of their potential market value under nonagricultural uses. In return for the preferential tax rate, the landowner is required to contractually agree to not develop the land for a period of at least 10 years. Williamson Act contracts are renewed annually for 10 years unless a party to the contract files for nonrenewal. The filing of a non-renewal application by a landowner ends the automatic annual extension of a contract and starts a 9-year phase-out of the contract. During the phase-out period, the land remains restricted to agricultural and open-space uses, but property taxes gradually return to levels associated with the market value of the land. At the end of the 9-year non-renewal process, the contract expires, and the owner's uses of the land are restricted only by applicable local zoning. The Williamson Act defines compatible use of contracted lands as any use determined by the county or city administering the agricultural preserve to be compatible with the agricultural, recreational, or open space use of land within the preserve and subject to contract (Government Code, Section 51201 (e)). However, uses deemed compatible by a county or city government must be consistent with the principles of compatibility set forth in Government

Table 3.5-2
Applicable Laws and Regulations for Agriculture and Forest Resources

Applicable Regulations	Description
	Code, Section 51238.1. Approximately 16 million acres of farmland (about 50 percent of the State's total farmland) are enrolled in the program.
California Farmland Conservancy Program (CFCP) (PRC Section 10200 et seq.)	The CFCP provides grant funding for agricultural conservation easements. Although the easements are always written to reflect the benefits of multiple resource values, there is a provision in the CFCP statute that prevents easements funded under the program from restricting husbandry practices. This provision could prevent restricting those practices to benefit other natural resources.
FMMP (Government Code Section 65570, PRC Section 612)	Under the FMMP, the Department of Conservation assesses the location, quality, and quantity of agricultural lands and conversion of these lands over time. Agricultural designations include the categories of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Grazing Land, Urban and Built-Up Land, and Other Land.
State Lands Commission Significant Land Inventory	<p>The State Lands Commission is responsible for managing lands owned by the State, including lands that the State has received from the federal government.</p> <p>These lands total more than 4 million acres and include tide and submerged lands, swamp and overflow lands, the beds of navigable waterways, and State School Lands. The State Lands Commission has a legal responsibility for, and a strong interest in, protecting the ecological and Public Trust values associated with the State's sovereign lands, including the use of these lands for habitat preservation, open space, and recreation. Projects located within these lands would be subject to the State Lands Commission permitting process.</p>
Local	
Open Space Element (Government Code Section 65300 et seq.)	State law requires each city and county to adopt a general plan containing at least seven mandatory elements including an open space element. The open space element identifies open space resources in the community and strategies for protection and preservation of these resources. Agricultural and forested lands are among the land use types identified as open space in general plans.
Zoning	The city or county zoning code is the set of detailed requirements that implement the general plan policies at the level of the individual parcel. The zoning code presents standards for different land uses and identifies which land uses (e.g., agriculture, residential, commercial, industrial) are allowed in the various zoning districts of the jurisdiction. Since 1971, State law has required the city or county zoning code to be consistent with the jurisdiction's general plan, except in charter cities.

3.5.3 Biological Resources

The existing setting for ~~aesthetic~~ biological resources impacts is discussed beginning on pages A-137 of Attachment A of the CARB ACT Regulation Final EA. The state's geography and topography have created distinct local climates ranging from high rainfall in northwestern mountains to the driest place in North America, Death Valley. North to south, the state extends for almost 800 miles, bridging the temperate rainforests in the Pacific Northwest and the subtropical arid deserts of Mexico. Many parts of the state experience Mediterranean weather patterns, with cool, wet winters and hot, dry summers. Summer rain is indicative of the eastern mountains and deserts, driven by the western margin of the North American monsoon. Along the northern coast abundant precipitation and ocean air produces foggy, moist conditions. High mountains have cooler conditions, with a deep winter snowpack in normal climate years. Desert conditions exist in the rain shadow of the mountain ranges.

While the state is largely considered to have a Mediterranean climate, it can be further subdivided into six major climate types: Desert, Marine, Cool Interior, Highland, Steppe, and Mediterranean. California deserts, such as the Mojave, are typified by a wide range of elevation with more rain and snow in the high ranges, and hot, dry conditions in valleys. Cool Interior and Highland climates can be found on the Modoc Plateau, Klamath, Cascade, and Sierra ranges. Variations in slope, elevation, and aspect of valleys and mountains result in a range of microclimates for habitats and wildlife. For example, the San Joaquin Valley, exhibiting a Mediterranean climate, receives sufficient springtime rain to support grassland habitats, while still remaining hot and relatively dry in summer. Steppe climates include arid, shrub-dominated habitats that can be found in the Owens Valley, east of the Sierra Nevada, and San Diego, located in coastal southern California.

The Marine climate has profound influence over terrestrial climates, particularly near the coast. Additionally, the state is known for variability in precipitation because of the El Niño-Southern Oscillation (ENSO) and the Pacific Decadal Oscillation (PDO). Oscillations are the cyclical shifting of high- and low-pressure systems, as evidenced by the wave pattern of the jet stream in the northern hemisphere. The ENSO is the cycle of air pressure systems influenced by the location of warm and cold sea temperatures. El Niño events occur when waters are warmer in the eastern Pacific Ocean, typically resulting in greater precipitation in southern California and less precipitation in northern California, and La Niña events occur when waters are colder in the eastern Pacific, resulting in drier than normal conditions in southern California and wetter conditions in northern California during late summer and winter. The warmer ocean temperatures associated with El Niño conditions also result in decreased upwelling in the Pacific Ocean.

California has the highest numbers of native and endemic plant species of any state, with approximately 6,500 species, subspecies, and varieties of plants, representing 32 percent of all vascular plants in the United States. Nearly one-third of the state's plant species are endemic, and California has been recognized as one of 34 global hotspots for plant diversity. Within the California Floristic Province, which encompasses the Mediterranean area of Oregon, California, and northwestern Baja, 2,124 of the 3,488 species are endemic, representing a 61 percent rate of endemism. Over 200 species, subspecies, and varieties of native plants are designated as rare, threatened, or endangered by state law, and over 2,000 more plant taxa are considered to be of conservation concern.

California has a large number of animal species, representing a substantial proportion of the wildlife species nationwide. The state's diverse natural communities provide a wide variety of

habitat conditions for wildlife. The state’s wildlife species include approximately 100 reptile species, 75 amphibian species, 650 bird species, and 220 mammal species. Additionally, 48 mammals, 64 birds, 72 amphibians and reptiles, and 20 freshwater fish live in California and nowhere else.

California exhibits a wide range of aquatic habitats—from the Pacific Ocean to isolated hillside seeps, to desert oases that support both water-dependent species and provide essential seasonal habitat for terrestrial species. Perennial and ephemeral rivers and streams, riparian areas, vernal pools, and coastal wetlands support a diverse array of flora and fauna, including 150 animal and 52 plant species that are designated special-status species. The California Natural Diversity Database identifies 123 different aquatic habitat-types in California, based on fauna. Of these, 78 are stream habitat-types located in seven major drainage systems: Klamath, Sacramento-San Joaquin, North/Central Coast, Lahontan, Death Valley, South Coast, and Colorado River systems. These drainage systems are geologically separated and contain distinctive fishes and invertebrates. California has approximately 70 native resident and anadromous fish species, and 72 percent of the native freshwater fishes in California are either listed or possible candidates for listing as threatened or endangered, or are extinct.

3.5.3.1 Regulatory Setting

Applicable laws and regulations associated with biological resources are discussed in Table 3.5-3.

Table 3.5-3
Applicable Laws and Regulations for Biological Resources

Applicable Regulations	Description
Federal	
Federal Endangered Species Act (ESA) (16 USC Section 1531 et seq.)	The ESA designates and provides for protection of threatened and endangered plant and animal species, and their critical habitat. Two sections of the ESA address take of threatened and endangered species. Section 7 covers actions that would result in take of a federally-listed species and have a federal discretionary action. Section 10 regulates actions that would result in take of threatened or endangered species and a non-federal agency is the lead agency for the action. Section 10 of the ESA requires preparation of a habitat conservation plan (HCP). More than 430 HCPs have been approved nationwide (U.S. Fish and Wildlife Service).
Migratory Bird Treaty Act (MBTA) (16 USC Section 703 et seq.)	The MBTA makes it unlawful to take or possess any migratory nongame bird (or any part of such migratory nongame bird) as designated under the MBTA.

Table 3.5-3
Applicable Laws and Regulations for Biological Resources

Applicable Regulations	Description
Clean Water Act (CWA) (33 USC Section 1251 et seq.)	The CWA requires the permitting and monitoring of all discharges to surface water bodies. Section 404 requires a permit from the U.S. Army Corps of Engineers (USACE) for a discharge from dredged or fill materials into Waters of the U.S., including wetlands. Section 401 requires a permit from a regional water quality control board (RWQCB) for the discharge of pollutants. By federal law, every applicant for a federal permit or license for an activity that may result in a discharge into a California water body, including wetlands, must request State certification that the proposed activity would not violate State and federal water quality standards.
Rivers and Harbors Act of 1899	The Rivers and Harbors Act requires a permit or letter of permission from USACE prior to any work being completed within navigable waters.
U.S EPA Section 404 (b)(1) Guidelines	Section 404 requires USACE to analyze alternatives in a sequential approach such that USACE must first consider avoidance and minimization of impacts to the extent practicable to determine whether a proposed discharge can be authorized.
California Desert Conservation Area (CDCA) Plan	The CDCA Plan comprises one of two national conservation areas established by Congress in 1976. The FLPMA outlines how BLM would manage public lands. Congress specifically provided guidance for the management of the CDCA Plan and directed the development of the 1980 CDCA Plan.
Federal Noxious Weed Act of 1974 (P.L. 93-629) (7 USC 2801 et seq.; 88 Stat. 2148)	The Federal Noxious Weed Act establishes a federal program to control the spread of noxious weeds. Authority is given to the Secretary of Agriculture to designate plants as noxious weeds by regulation, and the movement of all such weeds in interstate or foreign commerce was prohibited except under permit.
Executive Order 13112, “Invasive Species,” February 3, 1999	Executive Order 13112 mandates that federal agencies take actions to prevent the introduction of invasive species, provide for their control, and minimize the economic, ecological, and human health impacts that invasive species cause.
Executive Order 11988, “Floodplain Management,” May 24, 1977	Executive Order 11988 requires federal agencies to avoid to the extent possible the long- and short-term adverse impacts associated with the occupancy and modification of flood plains and to avoid direct and indirect support of floodplain development wherever there is a practicable alternative.
Executive Order 11990, “Protection of Wetlands,” May 24, 1977	Executive Order 11990 requires all federal agencies to consider wetland protection as an important part of their policies and take action to minimize the destruction, loss, or degradation of wetlands, and to preserve and enhance the natural and beneficial values of wetlands.

Table 3.5-3
Applicable Laws and Regulations for Biological Resources

Applicable Regulations	Description
Executive Order 13186, “Responsibilities of Federal Agencies to Protect Migratory Birds,” January 10, 2001	Executive Order 13186 requires that each federal agency taking actions that have, or are likely to have, a measurable negative effect on migratory bird populations develop and implement a Memorandum of Understanding (MOU) with USFWS that shall promote the conservation of migratory bird populations.
Bald and Golden Eagle Protection Act (16 USC Section 668 et seq.)	The Bald and Golden Eagle Protection Act declares it is illegal to take, possess, sell, purchase, barter, offer to sell or purchase or barter, transport, export or import a bald or golden eagle, alive or dead, or any part, nest or egg of these eagles unless authorized. Active nest sites are also protected from disturbance during the breeding season.
BLM Manual 6840 — Special Status Species Management	This policy establishes special status species policy on BLM land for plant and animal species and the habitats on which they depend. The policy refers to species designated by the BLM State Director as sensitive.
Listed Species Recovery Plans and Ecosystem Management Strategies	These plans and strategies provide guidance for the conservation and management of sufficient habitat to maintain viable populations of listed species and ecosystems. Relevant examples include, but are not limited to, the Desert Tortoise Recovery Plan, Flat-Tailed Horned Lizard Rangeland Management Strategy; Amargosa Vole Recovery Plan; and Recovery Plan for Upland Species of the San Joaquin Valley.
State	
California Endangered Species Act of 1984 (Fish and Game Code, Section 2050 et seq.)	Protects California’s rare, threatened, and endangered species.
Natural Community Conservation Planning (NCCP) Act 1991 (Fish and Game Code, Section 2800 et seq.)	The primary objective of the NCCP Act is to conserve natural communities at the ecosystem level while accommodating compatible land use. An NCCP identifies and provides for the regional or area-wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. There are currently 23 NCCPs that have been adopted or are in progress in California.
Porter-Cologne Water Quality Control Act (Water Code Sections 13000 et seq.)	The Porter-Cologne Water Quality Control Act requires that each of the nine RWQCBs prepare and periodically update basin plans for water quality control. Each basin plan sets forth water quality standards for surface water and groundwater and actions to control nonpoint and point sources of pollution to achieve and maintain these standards.
Keene-Nejedly California Wetlands Preservation Act (PRC Section 5810 et seq.)	California has established a successful program of regional, cooperative efforts to protect, acquire, restore, preserve, and manage wetlands. These programs include, but are not limited to, the Central Valley Habitat Joint Venture, the San Francisco Bay Joint Venture, the Southern California Wetlands Recovery Project, and the Inter-Mountain West Joint Venture.

Table 3.5-3
Applicable Laws and Regulations for Biological Resources

Applicable Regulations	Description
California Wilderness Act (PRC Section 5093.30 et seq.)	The California Wilderness Act establishes a California wilderness preservation system that consists of State-owned areas to be administered for the use and enjoyment of the people in such manner as will leave them unimpaired for future use and enjoyment as wilderness, provide for the protection of such areas, preserve their wilderness character, and provide for the gathering and dissemination of information regarding their use and enjoyment as wilderness.
Significant Natural Areas (Fish and Game Code Section 1930 et seq.)	This policy designates certain areas such as refuges, natural sloughs, riparian areas, and vernal pools as significant wildlife habitat.
Protection of Birds and Nests (Fish and Game Code Sections 3503 and 3503.5)	These policies protect California's birds by making it unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Raptors (e.g., hawks and owls) are specifically protected.
Migratory Birds (Fish and Game Code Section 3513)	This policy protects California's migratory birds by making it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame birds.
Fur-bearing Mammals (Fish and Game Code Sections 4000 and 4002)	This policy lists fur-bearing mammals require a permit for take.
Fully Protected Species (Fish and Game Code Sections 3511, 4700, 5050, and 5515)	These policies identify several amphibian, reptile, fish, bird, and mammal species that are Fully Protected. CDFW cannot issue a take permit for these species, except for take related to scientific research.
CEQA Guidelines Section 15380	CEQA defines rare species more broadly than the definitions for species listed under the State and federal Endangered Species Acts. Under Section 15830, species not protected through State or federal listing but nonetheless demonstrable as "endangered" or "rare" under CEQA should also receive consideration in environmental analyses. Included in this category are many plants considered rare by the California Native Plant Society and some animals on the CDFW's Special Animals List.
Oak Woodlands (PRC Section 21083.4)	This policy requires counties to determine if a project within their jurisdiction may result in conversion of oak woodlands that would have a significant adverse effect on the environment. If the lead agency determines that a project would result in a significant adverse effect on oak woodlands, mitigation measures to reduce the significant adverse effect of converting oak woodlands to other land uses are required.

Table 3.5-3
Applicable Laws and Regulations for Biological Resources

Applicable Regulations	Description
Lake and Streambed Alteration Agreement (Fish and Game Code section 1600 et seq.)	This policy regulates activities that may divert, obstruct, or change the natural flow or the bed, channel, or bank of any river, stream, or lake in California designated by CDFW in which there is at any time an existing fish or wildlife resource or from which these resources derive benefit. Impacts to vegetation and wildlife resulting from disturbances to waterways are also reviewed and regulated during the permitting process.
California Desert Native Plants Act of 1981 (Food and Agricultural Code Section 80001 et seq. and California Fish and Game Code sections 1925-1926)	The California Desert Native Plants Act protects non-listed California desert native plants from unlawful harvesting on both public and private lands in Imperial, Inyo, Kern, Los Angeles, Mono, Riverside, San Bernardino, and San Diego counties. Unless issued a valid permit, wood receipt, tag, and seal by the commissioner or sheriff, harvesting, transporting, selling, or possessing specific desert plants is prohibited.
Food and Agriculture Code Section 403	CDFA is designated to prevent the introduction and spread of injurious insect or animal pests, plant diseases, and noxious weeds.
Noxious Weeds (Title 3, CCR Section 4500)	List of plant species that are considered noxious weeds.
Local	
Various City and County General Plans	General plans typically designate areas for land uses, guiding where new growth and development should occur while providing a plan for the comprehensive and long-range management, preservation, and conservation of and natural resources and open-space lands.
Various Local Ordinances	Local ordinances provide regulations for proposed projects for activities such as grading plans, erosion control, tree removal, protection of sensitive biological resources and open space.
Source: California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Proposed Advanced Clean Trucks Rule Regulation. https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf	

3.5.4 Cultural Resources

The existing setting for ~~aesthetic~~ cultural resources impacts is discussed beginning on pages A-142 of Attachment A of the CARB ACT Regulation Final EA. Cultural resources include archaeological sites of prehistoric or historic origin, built or architectural resources older than 50 years, traditional or ethnographic resources, and fossil deposits of paleontological importance. America has a cultural heritage that dates to some 25,000 to 60,000 years ago, when the first known inhabitants of the land that would eventually become the U.S. crossed the Bering Land Bridge into Alaska.

All areas within the U.S. have the potential for yielding yet-undiscovered archaeological and paleontological resources and undocumented human remains not interred in cemeteries or marked

formal burials. These resources have the potential to contribute to our knowledge of the fossil record or local, regional, or national prehistory or history.

Archaeological resources include both prehistoric and historic remains of human activity. Built-environment resources include an array of historic buildings, structures, and objects serving as a physical connection to America's past. Traditional or ethnographic cultural resources may include Native American sacred sites and traditional resources of any ethnic community that are important for maintaining the cultural traditions of any group. "Historical resources" is a term with defined statutory meaning and includes any prehistoric or historic archaeological site, district, built environment resource, or traditional cultural resource recognized as historically or culturally significant (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)).

Paleontological resources, including mineralized, partially mineralized, or unmineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains, are more than 5,000 years old and occur mainly in Pleistocene or older sedimentary rock units.

3.5.4.1 Prehistoric Overview

California was occupied by different prehistoric cultures dating to at least 12,000 to 13,000 years ago. Evidence for the presence of humans during the Paleoindian Period prior to about 8,000 years ago is relatively sparse and scattered throughout the state; most surface finds of fluted Clovis or Folsom projectile points or archaeological sites left by these highly mobile hunter-gatherers are associated with Pleistocene lakeshores, the Channel Islands, or the central and southern California coast. Archaeological evidence from two of the Northern Channel Islands located off the coast from Santa Barbara indicates the islands were colonized by Paleoindian peoples at least 12,000 years ago, likely via seaworthy boats. By 10,000 years ago, inhabitants of this coastal area were using fishhooks, weaving cordage and basketry, hunting marine mammals and sea birds, and producing ornamental shell beads for exchange with people living in the interior of the state. This is the best record of early maritime activity in the Americas, and combined with the fluted points, indicates California was colonized by both land and sea during the Paleoindian period.

With climate changes between 10,000 and 7,000 years ago at the end of the Pleistocene and into the early Holocene, Lower Archaic peoples adjusted to the drying of pluvial lakes, rise in sea level, and substantial alterations in vegetation communities. Approximately 6,000 years ago, vegetation communities like those of the present were established in the majority of the state, while the changes in sea level also affected the availability of estuarine resources. The archaeological record indicates subsistence patterns during the Lower Archaic and subsequent Middle Archaic Period shifted to an increased emphasis on plant resources, as evidenced by an abundance of milling implements in archaeological sites dating between 8,000 and 3,000 years ago.

Approximately 3,000 years ago, during the Upper Archaic and Late Prehistoric Periods, the complexity of the prehistoric archaeological record reflects increases in specialized adaptations to locally available resources such as acorns and salmon, in permanently occupied settlements, and in the expansion of regional populations and trade networks. During the Upper Archaic, marine shell beads and obsidian continued to be the hallmark of long-distance trade and exchange networks developed during the preceding period. Large shell midden/mounds at coastal and inland sites in central and southern California, for example, attest to the regular reuse of these locales over hundreds of years or more from the Upper Archaic into the Late Prehistoric period. In the San Francisco Bay region alone, over 500 shell mounds were documented in the early 1900s.

Changes in the technology used to pursue and process resources are some of the hallmarks of the Late Prehistoric period. These include an increase in the prevalence of mortars and pestles, a diversification in types of watercraft and fishhooks, and the earliest record for the bow and arrow in the state that occurs in both the Mojave Desert and northeast California nearly 2,000 years ago. The period also witnessed the beginning of ceramic manufacture in the southeast desert region, southwest Great Basin, and parts of the Central Valley.

During the Late Prehistoric period, the development of social stratification and craft specialization accompanied the increase in sedentism, as indicated by the variety of artifacts, including bone tools, coiled and twined basketry, obsidian tools, marine shell beads, personal ornaments, pipes, and rattles; by the use of clamshell disk beads and strings of dentalium shell as a form of currency; and by variation in burial types and associated grave goods. Pictographs, painted designs that are likely less than 1,000 years old, and other non-portable rock art created during this period likely had a religious or ceremonial function. Osteological evidence points to intergroup conflict and warfare in some regions during this period, and there also appears to have been a decline or disruption in the long-distance trade of obsidian and shell beads approximately 1,200 years ago in parts of the state.

3.5.4.2 *Ethnographic Overview*

At the time of European contact, California was the home of approximately 310,000 indigenous peoples with a complex of cultures distinguished by linguistic affiliation and territorial boundaries. At least 70 distinct native Californian cultural groups, with even more subgroups, inhabited the vast lands within the state. The groups and subgroups spoke between 74 and 90 languages, plus a large number of dialects.

In general, these mainly sedentary, complex hunter-gatherer groups of indigenous Californians shared similar subsistence practices (hunting, fishing, and collecting plant foods), settlement patterns, technology, material culture, social organization, and religious beliefs. Permanent villages were situated along the coast, interior waterways, and near lakes and wetlands. Population density among these groups varied, depending mainly on availability and dependability of local resources, with the highest density of people in the northwest coast and Santa Barbara Channel areas and the least in the state's desert region. Networks of foot trails were used to connect groups to hunting or plant gathering areas, rock quarries, springs or other water sources, villages, ceremonial places, or distant trade networks.

The social organization of California's native peoples varied throughout the state, with villages or political units generally organized under a headman who was also the head of a lineage or extended family or achieved the position through wealth. For some groups, the headman also functioned as the religious ceremonial leader. Influenced by their Northwest Coast neighbors, the differential wealth and power of individuals was the basis of social stratification and prestige between elites and commoners for the Chilula, Hupa, Karok, Tolowa, Wiyot, and Yurok in the northwest corner of the state. Socially complex groups were also located along the southern California coast where differential wealth resulted in hierarchical classes and hereditary village chiefs among the Chumash, Gabrielino, Juaneño, and Luiseño.

At the time of Spanish colonialization, there were numerous religious practices among native Californian groups. Many of the indigenous groups in the north-central part of the state practiced the Kuksu cult, practicing ceremonies and dances with a powerful shaman as the leader. Log drums, flutes, rattles, and whistles accompanied the elaborate ceremonial dances. The World

Renewal cult in the northwestern corner of the state extended as far north as Alaska and was funded by the wealthy class. It entailed a variety of annual rites to prevent natural disasters and maintain natural resources and individual health. The Toloache cult was widespread in central and southern California and involved the use of narcotic plant materials (commonly known as datura or jimsonweed) to facilitate the acquisition of power. On the southern coast among Takic-speaking groups, the basis of Gabrielino, Juaneño and Luiseño religious life was the Chinigchinich cult, which appeared to have developed from the Toloache cult. Chinigchinich, the last of a series of heroic mythological figures, gave instruction on laws and institutions, taught people how to dance, and later withdrew into heaven where he rewarded the faithful and punished those who disobeyed his laws. The Chinigchinich religion seems to have been relatively new when the Spanish arrived, and could have been influenced by Christianity.

Trade and exchange networks were a significant part of the economy and social organization among California's Native American groups. Obsidian, steatite, beads, acorns, baskets, animal skins, and dried fish were among the variety of traded commodities. Inland groups supplied obsidian from sources along the Sierra Nevada Mountains, in Napa Valley, and in the northeast corner of the state. Coastal groups supplied marine shell beads, ornaments, and marine mammal skins. In addition to trading specific items, clamshell disk beads made from two clam species available on the Pacific coast were widely used as a form of currency. In northwestern California, groups used strings of dentalium shell as currency.

The effect of Spanish settlement and missionization in California marks the beginning of a devastating disruption of native culture and life ways, with forced population movements, loss of land and territory (including traditional hunting and gathering locales), enslavement, and decline in population numbers from disease, malnutrition, starvation, and violence during the historic period. In the 1830s, foreign disease epidemics swept through the densely populated Central Valley, adjacent foothills, and North Coast Ranges, decimating indigenous populations ~~number~~. By 1850, with their lands, resources, and way of life being overrun by the steady influx of non-native people during the Gold Rush, California's native population was reduced to about 100,000. By 1900, there were only 20,000, or less than 7 percent of the pre-contact number. Existing reservations were created in California by the federal government beginning in 1858 but encompass only a fraction of native lands.

In 2018, the Native American population in California was estimated at over 672,123 (U.S. Census Bureau). Although acknowledged as non-federally recognized California Native American tribes on the contact list maintained by the Native American Heritage Commission (NAHC), many groups continue to await federal tribal status recognition. There are currently 164 federally and non-federally recognized tribes within the state. Members of these tribes have specific cultural beliefs and traditions with unique connections to areas of California that are their ancestral homelands.

3.5.4.3 Historic Overview

Post-contact history for the state is generally divided into the Spanish period (1769–1822), Mexican period (1822–1848), and American period (1848–present). The establishment of Fort Ross by Alaska-based Russian traders also influenced post-contact history for a short period (1809–1841) in the region north of San Francisco Bay. Although there were brief visits along the Pacific coast by European explorers (Spanish, Russian, and British) between 1529 and 1769 of the territory claimed by Spain, the expeditions did not journey inland.

3.5.4.3.1 *Spanish Period (1769–1822)*

Spain's colonization of California began in 1769 with the overland expeditions from San Diego to San Francisco Bay by Lt. Colonel Gaspar de Portolá, and the establishment of a mission and settlement at San Diego. Between 1769 and 1823, the Spanish and the Franciscan Order established a series of 21 missions paralleling the coast along El Camino Real between San Diego and Sonoma ~~(Rolle, 1969)~~. Between 1769 and 1782, Spain built four presidios (i.e., San Diego, Monterey, San Francisco, and Santa Barbara) to protect the missions, and by 1871 had established two additional pueblos at Los Angeles and San José.

Under Spanish law, large tracts of land, including cattle ranches and farms, fell under the jurisdiction of the missions. Native Americans were removed from their traditional lands, converted to Christianity, concentrated at the missions, and used as labor on the mission farms and ranches. Since the mission friars had civil as well as religious authority over their converts, they held title to lands in trust for indigenous groups. The lands were to be repatriated once the native peoples learned Spanish laws and culture.

3.5.4.3.2 *Russian Period (1809–1841)*

In 1809, Russian fur traders started exploring the northern California coast with the goal of hunting sea otters and farming to support their settlements in Alaska. The first Russian settlement was established in 1811 and 1812 by the Russian-American Fur Company to protect the lucrative marine fur trade and to grow produce for their Alaskan colonies. Not all Russians stayed in California for the fur trade, partly due to declined sea otter population and also to settler resistance.

3.5.4.3.3 *Mexican Period (1822–1848)*

Following independence from Spain in 1822, the economy during the Mexican period depended on the extensive rancho system, carved from the former Franciscan missions and at least 500 land grants awarded in the state's interior to Mexican citizens. Captain John Sutter, who became a Mexican citizen, received the two largest land grants in the Sacramento Valley. In 1839, Sutter founded the trading and agricultural empire named New Helvetia that was headquartered at Sutter's Fort, near the confluence of the Sacramento and American Rivers in today's City of Sacramento.

Following adoption of the Secularization Act of 1833, the Mexican government privatized most Franciscan lands, including holdings of their California missions. Although secularization schemes had called for redistribution of lands to Native American neophytes who were responsible for construction of the mission empire, the vast mission lands and livestock holdings were instead redistributed by the Mexican government through several hundred land grants to private, non-indigenous ranchers. Most Native American converts returned to traditional lands that had not yet been colonized or found work with the large cattle ranchos being carved out of the mission lands.

3.5.4.3.4 *American Period (1848–present)*

In 1848, shortly after California became a territory of the U.S. with the signing of the Treaty of Guadalupe Hidalgo ending Mexican rule, gold was discovered on the American River at Sutter's Mill in Coloma. The resulting Gold Rush era influenced the history of the state, the nation, and the world. Thousands of people flocked to the gold fields in the Mother Lode region that stretches along the western foothills of the Sierra Nevada Mountains, and to the areas where gold was also discovered in other parts of the state, such as the Klamath and Trinity River basins. In 1850, California became the 31st state, largely as a result of the Gold Rush.

3.5.4.4 Paleontological Setting

California's fossil record is exceptionally prolific with abundant specimens representing a diverse range of marine, lacustrine, and terrestrial organisms recovered from Precambrian rocks as old as a billion years to as recent as 6,000-year-old Holocene deposits. These fossils provide key data for charting the course of the evolution or extinction of a variety of life on the planet, both locally and internationally. Paleontological specimens also provide key evidence for interpreting paleoenvironmental conditions, sequences and timing of sedimentary deposition, and other critical components of the earth's geologic history. Fossils are considered our most significant link to the biological prehistory of the earth.

Because the majority of the state was underwater until the Tertiary period, marine fossils older than 65 million years are not common and are exposed mainly in the mountains along the border with Nevada and the Klamath Mountains, and Jurassic shales, sandstones, and limestones are exposed along the edges of the Central Valley, portions of the Coast, Transverse, and Peninsular Ranges and the Mojave and Colorado Deserts. Some of the oldest fossils in the state, extinct marine vertebrates called conodonts, have been identified at Anza-Borrego Desert State Park in Ordovician sediments dating to circa 450 million years ago. Limestone outcrops of Pennsylvanian and Permian in the Providence Mountains State Recreation Area contain a variety of marine life, including brachiopods, fusulinids, and crinoids, that lived some 300 to 250 million years ago.

Fossils from the Jurassic sedimentary layers in San Joaquin, San Luis Obispo, and Stanislaus counties include ammonites, bivalves, echinoderms, and marine reptiles, all of which were common in the coastal waters. Gymnosperms (seed-bearing plants) such as cycads, conifers, and ginkgoes are preserved in terrestrial sediments from this period, evidence that the Jurassic climate was warm and moderately wet. In the great Central Valley, marine rocks record the position of the Cretaceous shoreline as the eroded ancestral Sierra Nevada sediments were deposited east of the rising Coast Ranges and became the rock layers of the Sacramento and San Joaquin valleys. These Cretaceous sedimentary deposits have yielded abundant fossilized remains of plants, bivalves, ammonites, and marine reptiles.

Along coastal southern California where steep coastal mountains plunged into the warm Pacific Ocean, an abundance of fossil marine invertebrates, such as ammonites, nautilus, tropical snails, and sea stars, have been found in today's coastal and near-coastal deposits from the Cretaceous Period. A rare, armored dinosaur fossil dated to about 75 million years ago during the Cretaceous was discovered in San Diego County during a highway project. It is the most complete dinosaur skeleton ever found in California. The lack of fossil remains of the majority of earth's large vertebrates, particularly terrestrial, marine, and flying reptiles (dinosaurs, ichthyosaurs, mosasaurs, plesiosaurs, and pterosaurs), as well as many species of terrestrial plants, after the end of the Cretaceous and the start of the Tertiary periods 65 million years ago (the K-T boundary) attests to their abrupt extinction.

3.5.4.5 Regulatory Setting

Applicable laws and regulations associated with cultural resources are discussed in Table 3.5-4.

Table 3.5-4
Applicable Laws and Regulations for Cultural Resources

Applicable Regulations	Description
Federal	
NHPA of 1966	The NHPA requires federal agencies to consider the preservation of historic and prehistoric resources. The NHPA authorizes the Secretary of the Interior to expand and maintain a National Register of Historic Places (NRHP), and it establishes an Advisory Council on Historic Preservation as an independent federal entity. Section 106 of the NHPA requires federal agencies to consider the effects of their undertakings on historic properties and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment on the undertaking prior to licensing or approving the expenditure of funds on any undertaking that may affect properties listed, or eligible for listing, in the NRHP.
National Environmental Policy Act (NEPA) of 1969	NEPA requires federal agencies to foster environmental quality and preservation. Section 101(b)(4) declares that one objective of the national environmental policy is to “preserve important historic, cultural, and natural aspects of our national heritage.” For major federal actions significantly affecting environmental quality, federal agencies must prepare, and make available for public comment, an environmental impact statement.
Archaeological Resources Protection Act of 1979 (NRPA) (16 USC Sections 470aa–470ii)	The NRPA requires a permit for any excavation or removal of archaeological resources from public lands or Indian lands. The statute provides both civil and criminal penalties for violation of permit requirements and for excavation or removal of protected resources without a permit.
Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (PL 101–601) (25 USC Section 3001 et seq.)	The NAGPRA vests ownership or control of certain human remains and cultural items excavated or discovered on federal or tribal lands, in designated Native American tribes, organizations, or groups. The NAGPRA further requires notification of the appropriate Secretary or other head of any federal agency upon the discovery of Native American cultural items on federal or tribal lands; proscribes trafficking in Native American human remains and cultural items; requires federal agencies and museums to compile an inventory of Native American human remains and associated funerary objects, and to notify affected Indian tribes of this inventory; and provides for the repatriation of Native American human remains and specified objects possessed or controlled by federal agencies or museums.

Table 3.5-4
Applicable Laws and Regulations for Cultural Resources

Applicable Regulations	Description
Advisory Council Regulation, Protection of Historic Properties (36 CFR Part 800)	This regulation establishes procedures for compliance with Section 106 of the NHPA. These regulations define the Criteria of Adverse Effect, define the role of State Historic Preservation Officer (SHPO) in the Section 106 review process, set forth documentation requirements, and describe procedures to be followed if significant historic properties are discovered during implementation of an undertaking. Prehistoric and historic resources deemed significant (i.e., eligible for listing in the NRHP, per 36 CFR 60.4) must be considered in project planning and construction. The responsible federal agency must submit any proposed undertaking that may affect NRHP-eligible properties to the SHPO for review and comment prior to project approval.
National Park Service Regulations, NRHP (36 CFR Part 60)	These regulations set forth procedures for nominating properties to the NRHP and present the criteria to be applied in evaluating the eligibility of historic and prehistoric resources for listing in the NRHP.
Archaeology and Historic Preservation; Secretary of the Interior's Standards and Guidelines (Federal Register (FR) 190:44716–44742)	Non-regulatory technical advice about the identification, evaluation, documentation, study, and other treatment of cultural resources. Notable in these Guidelines are the “Standards for Archaeological Documentation” (p. 44734) and “Professional Qualifications Standards for Archaeology” (pp. 44740–44741).
American Indian Religious Freedom Act of 1978	The American Indian Religious Freedom Act pledges to protect and preserve the traditional religious rights of American Indians, Aleuts, Eskimos, and Native Hawaiians. Before the act was passed, certain federal laws interfered with the traditional religious practices of many American Indians. The Act establishes a national policy that traditional Native American practices and beliefs, sites (and right of access to those sites), and the use of sacred objects shall be protected and preserved.
Department of Transportation Act of 1966 Section 4(f)	Section 4(f) of the Act requires a comprehensive evaluation of all environmental impacts resulting from federal-aid transportation projects administered by the Federal Housing Administration (FHA), Federal Transit Administration (FTA), and Federal Aviation Administration (FAA) that involve the use—or interference with use—of several types of land: public park lands, recreation areas, and publicly or privately owned historic properties of federal, state, or local significance. The Section 4(f) evaluation must be sufficiently detailed to permit the U.S. Secretary of Transportation to determine that there is no feasible and prudent alternative to the use of such land, in which case the project must include all possible planning to minimize harm to any park, recreation, wildlife and waterfowl refuge, or historic site that would result from the use of such lands. If there is a feasible and prudent alternative, a proposed project using Section 4(f) lands cannot

Table 3.5-4
Applicable Laws and Regulations for Cultural Resources

Applicable Regulations	Description
	be approved by the Secretary. Detailed inventories of the locations and likely impacts on resources that fall into the Section 4(f) category are required in project-level environmental assessments.
State	
Health and Safety Code Sections 7052 and 7050.5 and PRC Section 5097.98	Disturbance of human remains without the authority of law is a felony (Health and Safety Code Section 7052). According to State law (Health and Safety Code Section 7050.5; PRC Section 5097.98), if human remains are discovered or recognized in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until 1) the coroner of the county has been informed and has determined that no investigation of the cause of death is required; 2) and if the remains are of Native American origin, and if the descendants from the deceased Native Americans have made a recommendation to the landowner or the person responsible for the excavation work for means of treating or disposing of with appropriate dignity the human remains and any associated grave goods as provided in PRC Section 5097.98; or the Native American Heritage Commission was unable to identify a descendent or the descendent failed to make a recommendation within 24 hours after being notified by the Commission. According to the Health and Safety Code, six or more human burials at one location constitute a cemetery (Health and Safety Code Sections 8100 and 7003), and disturbance of Native American cemeteries is a felony (Health and Safety Code Section 7052). Section 7050.5 requires that construction or excavation be stopped near discovered human remains until the coroner can determine whether the remains are those of a Native American. If the remains are determined to be Native American, the coroner must contact the Native American Heritage Commission, who has jurisdiction over Native American remains (Health and Safety Code 7050.5(c); PRC Section 5097.98).
CEQA (Guidelines Section 15380)	CEQA requires that public agencies financing or approving public or private projects must assess the effects of the project on cultural resources. Furthermore, it requires that, if a project results in significant impacts on important cultural resources, alternative plans or mitigation measures must be considered; only significant cultural resources, however, need to be addressed. Thus, prior to the development of mitigation measures, the importance of cultural resources must be determined.
Assembly Bill (AB) 52 (Statutes of 2014)	AB 52 (Gatto, Chapter 532, Statutes of 2014) recognizes that tribal sovereignty and the unique relationship of California local governments and public agencies with California Native American tribal governments, while respecting the interests and roles of project proponents. This requires specific consultation processes for project review and approval.

Table 3.5-4
Applicable Laws and Regulations for Cultural Resources

Applicable Regulations	Description
Local	
City/County General Plans	Policies, goals, and implementation measures in county or city general plans may contain measures applicable to cultural and paleontological resources. In addition to the enactment of local and regional preservation ordinances, CEQA requires that resources included in local registers be considered (local register of historical resources is defined in PRC Section 5020.1(k)). Therefore, local county and municipal policies, procedures, and zoning ordinances must be considered in the context of project-specific undertakings. Cultural resources are generally discussed in either the open space element or the conservation element of the general plan. Many local municipalities include cultural resources preservation elements in their general plans that include some mechanism pertaining to cultural resources in those communities. In general, the sections pertaining to archaeological and historical properties are put in place to afford the cultural resources a measure of local protection. The policies outlined in the individual general plans should be consulted prior to any undertaking or project.
Cooperative Agreements Among Agencies	Cooperative agreements among land managing agencies (BLM, National Park Service, U.S. Forest Service, California State Parks, Bureau of Indian Affairs, Department of Defense, and others) the State Historic Preservation Office and the Advisory Council on Historic Preservation may exist and will need to be complied with on specific projects. In addition, certain agencies have existing Programmatic Agreements requiring permits (California Public Utilities Commission (CPUC), BLM) to complete archaeological investigations and employ the Secretary of Interior's Professional Qualification Standards and Guidelines (36 CFR Part 61).

3.5.5 Geology and Soils

The existing setting for ~~aesthetic~~ geology and soils impacts is discussed on pages A-158 of Attachment A of the CARB ACT Regulation Final EA. The state's topography is highly varied and includes 1,340 miles of seacoast, as well as high mountains, inland flat valleys, and deserts. Elevations in California range from 282 feet below sea level in Death Valley to 14,494 feet at the peak of Mount Whitney. The mean elevation of California is approximately 2,900 feet. The climate of California is as highly varied as its topography. Depending on elevation, proximity to the coast, and altitude, climate types include temperate oceanic, highland, sub-arctic, Mediterranean, steppe, and desert. Precipitation in California is highly variable year-to-year and across the state. The southeast deserts typically receive less than 5 inches a year, and the north coast can often receive up to 100 inches per year, averaging about 50 inches across the state.

Approximately 75 percent of the state's annual precipitation falls between October and April, primarily in the form of rain, except for high mountain elevations. Overall, northern California is

wetter than southern California, with most of the state's annual precipitation occurring in the northern coastal region.

3.5.5.1 Geology

Plate tectonics and climate have played major roles in forming California's dramatic landscape. California is located on the active western boundary of the North American continental plate in contact with the oceanic Pacific Plate and the Gorda Plate north of the Mendocino Triple Junction. The dynamic interactions between these three plates and California's climate are responsible for the unique topographic characteristics of California, including rugged mountain ranges, long and wide flat valleys, and dramatic coastlines. Tectonics and climate also have a large effect on the occurrence of natural environmental hazards, such as earthquakes, landslides, and volcanic formations.

Landslides. Landsliding or mass wasting is a common erosional process in California and has played an integral part in shaping the state's landscape. Typically, landslides occur in mountainous regions of the state, but they can also occur in areas of low relief, including coastal bluffs, along river and stream banks, and inland desert areas. Landsliding is the gravity-driven downhill mass movement of soil, rock, or both and can vary considerably in size, style and rate of movement, and type depending on the climate of a region, the steepness of slopes, rock type and soil depth, and moisture regime.

Earthquakes. Earthquakes are a common and unpredictable occurrence in California. The tectonic development of California began millions of years ago by a shift in plate tectonics that converted the passive margin of the North American plate into an active margin of compressional and translational tectonic regimes. This shift in plate tectonics continues to make California one of the most geomorphically diverse, active, and picturesque locations in the U.S. While some areas of California are more prone to earthquakes, such as northern, central, and southern coastal areas of California, all areas of California are prone to the effects of ground shaking due to earthquakes. While scientists have made substantial progress in mapping earthquake faults where earthquakes are likely to occur and predicting the potential magnitude of an earthquake in any particular region, they have been unable to precisely predict where or when an earthquake will occur and what its magnitude will be.

Tsunamis. Coastal communities around the circum-Pacific have long been prone to the destructive effects of tsunamis. Tsunamis are a series of long-period, high-magnitude ocean waves that are created when an outside force displaces large volumes of water. Throughout time, major subduction zone earthquakes in both the northern and southern hemispheres have moved the Earth's crust at the ocean bottom, sending vast amounts of waters into motion and spreading tsunami waves throughout the Pacific Ocean. Tsunamis can also occur from subareal and submarine landslides that displace large volumes of water. Subaerial landslide-generated tsunamis can be caused by seismically generated landslides, rock falls, rock avalanches, and eruption or collapse of island or coastal volcanoes. Submarine landslide-generated tsunamis are typically caused by major earthquakes or coastal volcanic activity. In contrast to a seismically generated tsunami, seismic seiches are standing waves that are caused by seismic waves traveling through a closed (lake) or semi-enclosed (bay) body of water. Due to the long-period seismic waves that originate after an earthquake, seiches can be observed several thousand miles away from the origin of the earthquakes. Small bodies of water, including lakes and ponds, are especially vulnerable to seismic seiches.

Volcanoes. A volcano is an opening in the Earth’s crust through which magma escapes to the surface where it is extruded as lava. Volcanism may be spectacular, involving great fountains of molten rock, or tremendous explosions that are caused by the buildup of gases within the volcano. Some of the most active volcanic areas in California are located within the Cascade Range—a volcanic chain that is a result of compressional tectonics along the Cascadia subduction zone.

Active Faults. A fault is defined as a fracture or zone of closely associated fractures along rocks that on one side have been displaced with respect to those on the other side. Most faults are the result of repeated displacement that may have taken place suddenly or by slow creep. A fault is distinguished from fractures or shears caused by landsliding or other gravity-induced surficial failures. A fault zone is a zone of related faults that commonly are braided and subparallel but may be branching and divergent. A fault zone has significant width (with respect to the scale of the fault being considered, portrayed, or investigated), ranging from a few feet to several miles. In the State of California earthquake faults have been designated as being active through a process that has been described by the 1972 Alquist-Priolo Earthquake Fault Zoning Act. An active fault is defined by the State as one that has “had surface displacement within Holocene time (about the last 11,000 years).” This definition does not, of course, mean that faults lacking evidence for surface displacement within Holocene time are necessarily inactive. A fault may be presumed to be inactive based on satisfactory geologic evidence; however, the evidence necessary to prove inactivity sometimes is difficult to obtain and locally may not exist.

3.5.5.2 Regulatory Setting

Applicable laws and regulations associated with geology and soils are discussed in Table 3.5-5.

Table 3.5-5
Applicable Laws and Regulations for Geology and Soils

Applicable Regulations	Description
Federal	
Safe Drinking Water Act (SDWA) – Federal Underground Injection Control (UIC) Class VI Program for Carbon Dioxide Geology Sequestration Wells	Under the SDWA, the UIC Class VI Program for Carbon Dioxide Geologic Sequestration Wells requires states and owners or operators to submit all permit applications to the appropriate U.S. EPA Region for a Class VI permit to be issued. These requirements, also known as the Class VI rule, are designed to protect underground sources of drinking water. The Class VI rule builds on existing UIC Program requirements, with extensive tailored requirements that address carbon dioxide (CO ₂) injection for long-term storage to ensure that wells used for geologic sequestration are appropriately sited, constructed, tested, monitored, funded, and closed. The rule affords owners or operator’s injection depth flexibility to address injection in various geologic settings in the U.S. in which geologic sequestration may occur, including very deep formations and oil and gas fields that are transitioned for use as CO ₂ storage sites.
SDWA - Federal UIC Class II Program for Oil and Gas Related Injection Wells	The Class II Program for Oil and Gas Related Injection Wells requires states to meet U.S. EPA’s minimum requirements for UIC programs including strict construction and conversion standards and regular testing and inspection. Enhanced oil and gas recovery wells may either be issued permits or be authorized by rule. Disposal wells are issued permits.

Table 3.5-5
Applicable Laws and Regulations for Geology and Soils

Applicable Regulations	Description
CWA (40 CFR 112)	The CWA was enacted to restore and maintain the chemical, physical, and biological integrity of the nation's waters by regulating point and nonpoint pollution sources, helping publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands. This includes the creation of a system that requires states to establish discharge standards specific to water bodies (National Pollution Discharge Elimination System (NPDES)), which regulates storm water discharge from construction sites through the implementation of Storm Water Pollution Prevention Plans (SWPPPs). In California, the state's NPDES permit program is implemented and administered by the local RWQCBs.
Earthquake Hazards Reduction Act and National Earthquake Hazards Reduction Program Act	This Act established the National Earthquake Hazards Reduction Program to reduce the risks to life and property from future earthquakes. This program was significantly amended in November 1990 by the National Earthquake Hazards Reduction Program Act by refining the description of agency responsibilities, program goals and objectives.
Mining and Mineral Policy Act	The Mining and Mineral Act of 1970 declared that the Federal Government policy is to encourage private enterprise in the development of a sound and stable domestic mineral industry, domestic mineral deposits, minerals research, and methods for reclamation in the minerals industry.
State	
Seismic Hazards Mapping Act (PRC Section 2690 et seq.)	The Seismic Hazards Mapping Act of 1990 (PRC, Chapter 7.8, Division 2) directs the DOC Division of Mines and Geology (now called California Geological Survey (CGS)) to delineate Seismic Hazard Zones. The purpose of the Act is to reduce the threat to public health and safety and to minimize the loss of life and property by identifying and mitigating seismic hazards. These include areas identified that are subject to the effects of strong ground shaking, such as liquefaction, landslides, tsunamis, and seiches. Cities, counties, and state agencies are directed to use seismic hazard zone maps developed by CGS in their land-use planning and permitting processes. The Act requires that site-specific geotechnical investigations be performed prior to permitting most urban development projects within seismic hazard zones.

Table 3.5-5
Applicable Laws and Regulations for Geology and Soils

Applicable Regulations	Description
Alquist-Priolo Earthquake Fault Zoning Act (PRC Section 2621 et seq.)	<p>California's Alquist-Priolo Act (PRC Section 2621 et seq.), originally enacted in 1972 as the Alquist-Priolo Special Studies Zones Act and renamed in 1994, is intended to reduce the risk to life and property from surface fault rupture during earthquakes.</p> <p>The Alquist-Priolo Act prohibits the location of most types of structures intended for human occupancy across the traces of active faults and strictly regulates construction in the corridors along active faults (Earthquake Fault Zones). It also defines criteria for identifying active faults, giving legal weight to terms such as "active," and establishes a process for reviewing building proposals in and adjacent to Earthquake Fault Zones. Under the Alquist-Priolo Act, faults are zoned, and construction along or across them is strictly regulated if they are "sufficiently active" and "well-defined." A fault is considered sufficiently active if one or more of its segments or strands shows evidence of surface displacement during Holocene time (defined for the purposes of the act as within the last 11,000 years). A fault is considered well-defined if its trace can be clearly identified by a trained geologist at the ground surface or in the shallow subsurface, using standard professional techniques, criteria, and judgment.</p>
California Division of Oil, Gas, and Geothermal Resources (DOGGR) (PRC Section 3106)	PRC Section 3106 mandates the supervision of drilling, operation, maintenance, and abandonment of oil wells for preventing: damage to life, health, property, and natural resources; damage to underground and surface waters suitable for irrigation or domestic use; loss of oil, gas, or reservoir energy; and damage to oil and gas deposits by infiltrating water and other causes. In addition, the DOGGR regulates drilling, production, injection, and gas storage operations in accordance with 14 CCR Chapter 4, Subchapter 1 (commencing with Section 1710 et seq.).
Landslide Hazard Identification Program (PRC Section 2687(a))	The Landslide Hazard Identification Program requires the State Geologist to prepare maps of landslide hazards within urbanizing areas. According to PRC Section 2687(a), public agencies are encouraged to use these maps for land use planning and for decisions regarding building, grading, and development permits.
California Building Standards Code (CBSC) (24 CCR)	California's minimum standards for structural design and construction are given in the CBSC (24 CCR). The CBSC is based on the Uniform Building Code (International Code Council 1997), which is used widely throughout U.S. (generally adopted on a state-by-state or district-by-district basis) and has been modified for California conditions with numerous, more detailed, or more stringent regulations. The CBSC provides standards for various aspects of construction, including (i.e., not limited to) excavation, grading, and earthwork construction; fills and embankments; expansive soils; foundation investigations; and liquefaction potential and soil strength loss. In accordance with California law, proponents of specific projects would be required to comply with all provisions of the CBSC for certain aspects of design and construction.

Table 3.5-5
Applicable Laws and Regulations for Geology and Soils

Applicable Regulations	Description
Surface Mining and Reclamation Act (SMARA) (PRC Section 2710 et seq.)	The intent of the SMARA of 1975 was to promote production and conservation of mineral resources, minimize environmental effects of mining, and to assure that mined lands will be reclaimed to conditions suitable for alternative uses. An important part of the SMARA legislation requires the State Geologist to classify land according to the presence or absence of significant mineral deposits. Local jurisdictions are given the authority to permit or restrict mining operations, adhering to the SMARA legislation. Classification of an area using Mineral Resource Zones (MRZs) to designate lands that contain mineral deposits are designed to protect mineral deposits from encroaching urbanization and land uses that are incompatible with mining. The MRZ classifications reflect varying degrees of mineral significance, determined by available knowledge of the presence or absence of mineral deposits as well as the economic potential of the deposits.
Local	
Geotechnical Investigation	Local jurisdictions typically regulate construction activities through a process that may require the preparation of a site-specific geotechnical investigation. The purpose of a site-specific geotechnical investigation is to provide a geologic basis for the development of appropriate construction design. Geotechnical investigations typically assess bedrock and Quaternary geology, geologic structure, soils, and the previous history of excavation and fill placement. Proponents of specific projects that require design of earthworks and foundations for proposed structures will need to prepare geotechnical investigations on the physical properties of soil and rock at the site prior to project design.
Local Grading and Erosion Control Ordinances	Many counties and cities have grading and erosion control ordinances. These ordinances are intended to control erosion and sedimentation caused by construction activities. A grading permit is typically required for construction-related projects. As part of the permit, project applicants usually must submit a grading and erosion control plan, vicinity and site maps, and other supplemental information. Standard conditions in the grading permit include a description of best management practices similar to those contained in a SWPPP.
City/County General Plans	Most city and county general plans include an element that covers geology and soil resources within that jurisdiction.

3.5.6 Hydrology and Water Quality

3.5.6.1 Surface Waters

The existing setting for ~~aesthetic~~ hydrology and water quality impacts is discussed on pages A-181 of Attachment A of the CARB ACT Regulation Final EA. Surface waters occur as streams, lakes, ponds, coastal waters, lagoons, estuaries, floodplains, dry lakes, desert washes, wetlands, and other collection sites. Water bodies modified or developed by man, including reservoirs and aqueducts, are also considered surface waters.

Surface water resources are very diverse throughout the state due to the high variance in tectonics, topography, geology/soils, climate, precipitation, and hydrologic conditions. Overall, California has the most diverse range of watershed conditions in the U.S., with varied climatic regimes ranging from Mediterranean climates with temperate rainforests in the north coast region to desert climates containing dry desert washes and dry lakes in the southern central region.

The average annual runoff for the state is 71 million acre-feet. The state has more than 60 major stream drainages and more than 1,000 smaller but significant drainages that drain coastal mountains and inland mountainous areas. High snowpack levels and resultant spring snowmelt yield high surface runoff and peak discharge in the Sierra Nevada and Cascade Mountains that feed surface flows, fill reservoirs, and recharge groundwater.

Federal, state, and local engineered water projects, aqueducts, canals, and reservoirs serve as the primary conduits of surface water sources to areas that have limited surface water resources. Most of the surface water storage is transported for agricultural, urban, and rural residential needs to the San Francisco Bay Area and to cities and areas extending to southern coastal California. Surface water is also transported to southern inland areas, including Owens Valley, Imperial Valley, and Central Valley areas.

3.5.6.2 Groundwater

The majority of runoff from snowmelt and rainfall flows down mountain streams into low gradient valleys and either percolates into the ground or is discharged to the sea. This percolating flow is stored in alluvial groundwater basins that cover approximately 40 percent of the geographic extent of the state. Groundwater recharge occurs more readily in areas underlain by coarse sediments, primarily in mountain base alluvial fan settings. As a result, most of California's groundwater basins are located in broad alluvial valleys flanking mountain ranges, such as the Cascade Range, Coast Ranges, Transverse Ranges, and the Sierra Nevada.

There are 250 major groundwater basins that serve approximately 30 percent of California's urban, agricultural, and industrial water needs, especially in southern portion of San Francisco Bay, the Central Valley, greater Los Angeles area, and inland desert areas where surface water is limited. On average, more than 15 million acre-feet of groundwater are extracted each year in the state, of which more than 50 percent is extracted from 36 groundwater basins in the Central Valley.

3.5.6.3 Water Quality

Land uses have a great effect on surface water and groundwater water quality in the State of California. Water quality degradation of surface waters occurs through nonpoint- and point- source discharges of pollutants. Nonpoint source pollution is defined as not having a discrete or discernible source and is generated from land runoff, precipitation, atmospheric deposition, seepage, and hydrologic modification. Nonpoint-source pollution includes runoff containing

pesticides, insecticides, and herbicides from agricultural areas and residential areas; acid drainage from inactive mines; bacteria and nutrients from septic systems and livestock; VOCs and toxic chemicals from urban runoff and industrial discharges; sediment from timber harvesting, poor road construction, improperly managed construction sites, and agricultural areas; and atmospheric deposition and hydromodification. In comparison, point- source pollution is generated from identifiable, confined, and discrete sources, such as a smokestack, sewer, pipe or culvert, or ditch. These pollutant sources are regulated by U.S. EPA and the State Water Resources Control Board (SWRCB) through RWQCBs. Many of the pollutants discharged from point-sources are the same as for nonpoint-sources, including municipal (bacteria and nutrients), agricultural (pesticides, herbicides, and insecticides), and industrial pollutants (VOCs and other toxic effluent).

3.5.6.4 Regulatory Setting

Applicable laws and regulations associated with hydrology, water quality, and water supply are discussed in Table 3.5-6.

Table 3.5-6
Applicable Laws and Regulations for Hydrology, Water Quality, and Water Supply

Applicable Regulations	Description
Federal	
National Flood Insurance Program (FEMA)	Designated floodplain mapping program, flooding and flood hazard reduction implementation, and federal subsidized flood insurance for residential and commercial property. Administered by FEMA.
EO 11988	Requires actions to be taken for federal activities to reduce the risks of flood losses, restore and preserve floodplains, and minimize flooding impacts to human health and safety.
CWA	Administered primarily by U.S. EPA, the CWA pertains to water quality standards, state responsibilities, and discharges of waste to waters of the U.S. Sections 303, 401, 402, and 404.
CWA Section 303	Defines water quality standards consisting of 1) designated beneficial uses of a water, 2) the water quality criteria (or “objectives” in California) necessary to support the uses, and 3) an antidegradation policy that protects existing uses and high-water quality. Section 303(d) requires states to identify water quality impairments where conventional control methods will not achieve compliance with the standards and establish total maximum daily load (TMDL) programs to achieve compliance.
CWA Section 401	State certification system for federal actions which may impose conditions on a project to ensure compliance with water quality standards.

Table 3.5-6
Applicable Laws and Regulations for Hydrology, Water Quality, and Water Supply

Applicable Regulations	Description
CWA Section 402	Section 402 mandates permits for municipal stormwater discharges, which are regulated under the NPDES General Permit for Municipal Separate Storm Sewer Systems (MS4) (MS4 Permit). Several of the cities and counties issue their own NPDES municipal stormwater permits for the regulations of stormwater discharges. These permits require that controls are implemented to reduce the discharge of pollutants in stormwater discharges to the maximum extent possible, including management practices, control techniques, system design and engineering methods, and other measures as appropriate. As part of permit compliance, these permit holders have created Stormwater Management Plans for their respective locations. These plans outline the requirements for municipal operations, industrial and commercial businesses, construction sites, and planning and land development. These requirements may include multiple measures to control pollutants in stormwater discharge. During implementation of specific projects, applicants will be required to follow the guidance contained in the Stormwater Management Plans as defined by the permit holder in that location.
CWA Section 404	Permit system for dredging or filling activity in waters of the U.S., including wetlands, and administered by USACE.
National Toxics Rule and California Toxics Rule	Applicable receiving water quality criteria promulgated by U.S. EPA for priority toxic pollutants consisting generally of trace metals, synthetic organic compounds, and pesticides.
State	
California Water Rights	SWRCB administers review, assessment, and approval of appropriative (or priority) surface water rights permits/licenses for diversion and storage for beneficial use. Riparian water rights apply to the land and allow diversion of natural flows for beneficial uses without a permit, but users must share the resources equitably during drought. Groundwater management planning is a function of local government. Groundwater use by overlying property owners is not formally regulated, except in cases where the groundwater basin supplies are limited and uses have been adjudicated, or through appropriative procedures for groundwater transfers.
Public Trust Doctrine	Body of common law that requires the State to consider additional terms and conditions when issuing or reconsidering appropriative water rights to balance the use of the water for many beneficial uses irrespective of the water rights that have been established. Public trust resources have traditionally included navigation, commerce, and fishing and have expanded over the years to include protection of fish and wildlife, and preservation goals for scientific study, scenic qualities, and open-space uses.

Table 3.5-6
Applicable Laws and Regulations for Hydrology, Water Quality, and Water Supply

Applicable Regulations	Description
Porter-Cologne Water Quality Control Act (Water Code Sections 13000 et seq. and Title 23)	SWRCB is responsible for statewide water quality policy development and exercises the powers delegated to the State by the federal government under the CWA. Nine RWQCBs adopt and implement water quality control plans (Basin Plans) which designate beneficial uses of surface waters and groundwater aquifers and establish numeric and narrative water quality objectives for beneficial use protection. RWQCBs issue waste discharge requirements for discharge activities to water and land, require monitoring and maintain reporting programs, and implement enforcement and compliance policies and procedures. Other State agencies with jurisdiction in water quality regulation in California include the Department of Pesticide Regulation, DTSC, CDFW, and OEHHA.
Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California	The State Implementation Policy provides implementation procedures for discharges of toxic pollutants to receiving waters.
Thermal Plan	The Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California was adopted by SWRCB in 1972 and amended in 1975. The Thermal Plan restricts discharges of thermal waste or elevated temperature waste to waters of the state. Generally, the Thermal Plan prohibits discharges from increasing ambient temperatures by more than 1°F over more than 25 percent of a stream cross section, increasing ambient temperatures by more than 4°F in any location, and prohibits discharge of waste that exceeds more than 20°F above the ambient temperature.
Statewide NPDES General Permit for Stormwater Associated with Land Disturbance and Construction Activity (Order No. 2009-0009- DWQ, NPDES No. CAR000002)	NPDES permit for stormwater and non-storm discharges from construction activity that disturbs greater than 1 acre. The general construction permit requires the preparation of a SWPPP that identifies Best Management Practices (BMPs) to be implemented to control pollution of storm water runoff. The permit specifies minimum construction BMPs based on a risk-level determination of the potential of the project site to contribute to erosion and sediment transport and sensitivity of receiving waters to sediment. While small amounts of construction-related dewatering are covered under the General Construction Permit, RWQCBs have also adopted a General Order for Dewatering and Other Low Threat Discharges to Surface Waters (General Dewatering Permit). This permit applies to various categories of dewatering activities and may apply to some construction sites, if construction of specific projects required dewatering in greater quantities than that allowed by the General Construction Permit and discharged the effluent to surface waters. The General Dewatering Permit contains waste discharge limitations and prohibitions similar to those in the General Construction Permit.

Table 3.5-6
Applicable Laws and Regulations for Hydrology, Water Quality, and Water Supply

Applicable Regulations	Description
Statewide NPDES General Permit for Discharges of Stormwater Associated with Industrial Facilities (Order No. 97-003-DWQ, NPDES No. CAS000001)	NPDES permit for stormwater and non-storm discharges from types of industrial sites based on the Standard Industrial Classification. The general industrial permit requires the preparation of a SWPPP that identifies potential onsite pollutants, BMPs to be implemented, and inspection/monitoring.
SB 1168, Statutes of 2014 Chapter 346, Pavely	This bill requires all groundwater basins designated as high- or medium-priority basins by the Department of Water Resources that are designated as basins subject to critical conditions of overdraft to be managed under a groundwater sustainability plan or coordinated groundwater sustainability plans by January 31, 2020, and requires all other groundwater basins designated as high- or medium-priority basins to be managed under a groundwater sustainability plan or coordinated groundwater sustainability plans by January 31, 2022. This bill would require a groundwater sustainability plan to be developed and implemented to meet the sustainability goal, established as prescribed, and would require the plan to include prescribed components.
AB 1739, Statutes of 2014, Dickinson, Chapter 347	This bill establishes groundwater reporting requirements for a person extracting groundwater in an area within a basin that is not within the management area of a groundwater sustainability agency or a probationary basin. The bill requires the reports to be submitted to State Water Resources Control Board or, in certain areas, to an entity designated as a local agency by State Water Resources Control Board.
SB 1319, Statutes of 2014, Chapter 348, Pavely	This bill allows State Water Resources Control Board to designate a groundwater basin as a probationary basin subject to sustainable groundwater management requirements. This bill also authorizes State Water Resources Control Board to develop an interim management plan in consultation with the Department of Water Resources under specified conditions.
Mining and Mineral Policy Act	The Mining and Mineral Act of 1970 declared that the Federal Government policy is to encourage private enterprise in the development of a sound and stable domestic mineral industry, domestic mineral deposits, minerals research, and methods for reclamation in the minerals industry.
Local	
Water Agencies	Water agencies enter into contracts or agreements with the federal and State governments to protect the water supply and to ensure the lands within the agency have a dependable supply of suitable quality water to meet present and future needs.

Table 3.5-6
Applicable Laws and Regulations for Hydrology, Water Quality, and Water Supply

Applicable Regulations	Description
Floodplain Management	General plans guide county land use decisions, and require the identification of water resource protection goals, objectives, and policies. Floodplain management is addressed through ordinances, land use planning, and development design review and approval. Local actions may be coordinated with FEMA for the National Flood Insurance Program. Typical provisions address floodplain use restrictions, flood protection requirement, allowable alteration of floodplains and stream channels, control of fill and grading activities in floodplains, and prevention of flood diversions where flows would increase flood hazards in other areas.
Drainage, Grading, and Erosion Control Ordinances	Counties regulate building activity under the federal Uniform Building Code, local ordinances, and related development design review, approval, and permitting. Local ordinances are common for water quality protection addressing drainage, stormwater management, land grading, and erosion and sedimentation control.
Environmental Health	RWQCBs generally delegate permit authority to county health departments to regulate the construction and operation/maintenance of on-site sewage disposal systems (e.g., septic systems and leach fields, cesspools).

3.5.7 Land Use and Planning

The existing setting for ~~aesthetic~~ land use and planning impacts is discussed on pages A-186 of Attachment A of the CARB ACT Regulation Final EA. The way physical landscapes are used or developed is commonly referred to as land use. Public agencies are the primary entities that determine the types of land use changes that can occur for specific purposes within their authority or jurisdiction. In most states, land uses decisions are made by local governments. In incorporated areas, land use decisions are typically made by the city. In unincorporated areas, land use decisions are typically made by the county. Sometimes state, regional, or federal land management agencies also make land use decisions. Generally, State law establishes the framework for local planning procedures, which local governments follow in adopting their own set of land use policies and regulations in response to the unique issues they face.

In California, the State Planning and Zoning Law (Government Code Section 65000 et seq.) provides the primary legal framework that cities and counties must follow in land use planning and controls. Planned land uses are designated in the city or county general plan, which serves as the comprehensive master plan for the community. Also, city and county land use and other related resource policies are defined in the general plan. The primary land use regulatory tool provided by the California Planning and Zoning Law is the zoning ordinance adopted by each city and county. Planning and Zoning Law requirements are discussed in the regulatory setting below.

When approving land use development, cities and counties must comply with CEQA, which requires that they consider the significant environmental impacts of their actions and the adoption

of all feasible mitigation measures to substantially reduce significant impacts, in the event a project causes significant or potentially significant effects on the environment. In some cases, building permits may be ministerial, and therefore exempt from CEQA, but most land use development approval actions by cities and counties require CEQA compliance.

Land use decisions in California are also be governed by State agencies such as the California Coastal Commission, California State Lands Commission, California Department of Parks and Recreation, and others, where the State has land ownership or permitting authority with respect to natural resources or other State interests.

3.5.7.1 Regulatory Setting

Applicable laws and regulations associated with land use and planning are discussed in Table 3.5-7.

Table 3.5-7
Applicable Laws and Regulations for Land Use and Planning

Applicable Regulations	Description
Federal	
Federal Land Policy and Management Act – (FLPMA)	FLPMA is the principal law governing how BLM manages public lands. FLPMA requires BLM to manage public land resources for multiple use and sustained yield for both present and future generations. Under FLPMA, BLM is authorized to grant rights-of- way for generation, transmission, and distribution of electrical energy. Although local agencies do not have jurisdiction over the federal lands managed by BLM, under FLPMA and BLM regulations at 43 CFR Part 1600, BLM must coordinate its planning efforts with State and local planning initiatives. FLPMA defines an Area of Critical Environmental Concern (ACEC) as an area within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards. BLM identifies, evaluates, and designates ACECs through its resource management planning process. Allowable management practices and uses, mitigation, and use limitations, if any, are described in the planning document and the concurrent or subsequent ACEC Management Plan. ACECs are considered land use authorization avoidance areas because they are known to contain resource values that could result in denial of applications for land uses that cannot be designed to be compatible with management objectives and prescriptions for the ACEC.
Resource Management Plans (RMPs)	Established by FLPMA, RMPs are designed to protect present and future land uses and to identify management practices needed to achieve desired conditions within the management area covered by the RMPs. Management direction is set forth in the RMPs in the form of goals, objectives, standards, and guidelines. These, in turn, direct management actions, activities, and uses that affect land management, and water, recreation, visual, natural, and cultural resources.

Table 3.5-7
Applicable Laws and Regulations for Land Use and Planning

Applicable Regulations	Description
National Forest Management Act (NFMA)	The NFMA is the primary statute governing the administration of national forests. The act requires the Secretary of Agriculture to assess forest lands, develop a management program based on multiple-use, sustained-yield principles, and implement a resource management plan for each unit of the National Forest System. Goal 4 of the USFS's National Strategic Plan for the National Forests states that the nation's forests and grasslands play a significant role in meeting America's need for producing and transmitting energy. Unless otherwise restricted, National Forest Service lands are available for energy exploration, development, and infrastructure (e.g., well sites, pipelines, and transmission lines). However, the emphasis on non-recreational special uses, such as utility corridors, is to authorize the special uses only when they cannot be reasonably accommodated on non-National Forest Service lands.
State	
State Planning and Zoning Law (Government Code Section 65300 et seq.)	Establishes the obligation of cities and counties to adopt and implement general plans. The general plan is a comprehensive, long-term, and general document that describes plans for the physical development of the city or county. The general plan addresses a broad range of topics, including, at a minimum, land use, circulation, housing, conservation, open space, noise, and safety. In addressing these topics, the general plan identifies the goals, objectives, policies, principles, standards, and plan proposals that support the city or county's vision for the area. The general plan is also a long-range document that typically addresses the physical character of an area over a 20-year period. Although the general plan serves as a blueprint for future development and identifies the overall vision for the planning area, it remains general enough to allow for flexibility in the approach taken to achieve the plan's goals.
Subdivision Map Act (Government Code Section 66410 et seq.)	In general, land cannot be divided in California without local government approval. The primary goals of the Subdivision Map Act are: (a) to encourage orderly community development by providing for the regulation and control of the design and improvements of the subdivision with a proper consideration of its relation to adjoining areas; (b) to ensure that the areas within the subdivision that are dedicated for public purposes will be properly improved by the subdivider so that they will not become an undue burden on the community; and (c) to protect the public and individual transferees from fraud and exploitation. (61 Ops. Cal. Atty. Gen. 299, 301 (1978); 77 Ops. Cal. Atty. Gen. 185 (1994)). Dividing land for sale, lease or financing is regulated by local ordinances based on the State Subdivision Map Act (Government Code Section 66410 et seq.).

Table 3.5-7
Applicable Laws and Regulations for Land Use and Planning

Applicable Regulations	Description
SB 375, Statutes of 2008	SB 375 augments the existing federal requirement for MPOs to develop RTPs for their respective regions. Under SB 375, MPOs must prepare an SCS to supplement their RTPs. RTP/SCSs contain land use strategies to reduce VMT-related emissions of GHGs. Following the adoption of an RTP/SCSs, land use strategies must be implemented at the local level by land use agencies.
Local	
General Plans	The most comprehensive land use planning is provided by city and county general plans, which local governments are required by State law to prepare as a guide for future development. The general plan contains goals and policies concerning topics that are mandated by State law or which the jurisdiction has chosen to include. Required topics are land use, circulation, housing, conservation, open space, noise, and safety. Other topics that local governments frequently choose to address are public facilities, parks and recreation, community design, or growth management, among others. City and county general plans must be consistent with each other. County general plans must cover areas not included by city general plans (i.e., unincorporated areas).
Specific and Community Plans	A city or county may also provide land use planning by developing community or specific plans for smaller, more specific areas within their jurisdiction. These more localized plans provide for focused guidance for developing a specific area, with development standards tailored to the area, as well as systematic implementation of the general plan. Specific and community plans are required to be consistent with the city or county's general plan.
Zoning	The city or county zoning code is the set of detailed requirements that implement the general plan policies at the level of the individual parcel. The zoning code presents standards for different uses and identifies which uses are allowed in the various zoning districts of the jurisdiction. Since 1971, State law has required the city or county zoning code to be consistent with the jurisdiction's general plan, except in charter cities.
CEQA Guidelines Section 15332	CEQA Guidelines Section 15332 provides for certain types of infill projects that may be determined to be categorically exempt from CEQA review by local lead agencies. Infill projects that may be exempt from environmental review under this class of categorical exemption must: be consistent with the applicable general plan and zoning designations; be within city limits and on a parcel no greater than five acres; not contain valuable habitat for any federal or State listed species; not contribute to any significant effects to traffic, noise, or air and water quality; and be adequately served by existing utilities and public services.

3.5.8 Mineral Resources

The existing setting for ~~aesthetic~~ mineral resources impacts is discussed on pages A-189 of Attachment A of the CARB ACT Regulation Final EA. Various countries export the mineral resources used in the production of lithium-ion batteries (e.g. lithium, cobalt, platinum) to international manufacturers. In 2018, Australia exported 51,000 tons of lithium, Chile exported 16,000 tons, Argentina exported 6,200 tons, and China exported 8,000. The U.S. currently imports lithium from Argentina (51 percent), Chile (44 percent), China (3 percent), Russia (1 percent), and others (1 percent). Major suppliers of cobalt, a precious metal used in the manufacturing of batteries, include the Democratic Republic of the Congo, which mined 90,000 tons of cobalt in 2018—well over half of the world’s total supply of cobalt. Other countries’ cobalt mining totals for 2018 include Russia (5,900 tons), Cuba (4,900 tons), Australia (4,700 tons) Canada (3,800 tons), and China (3,100 tons).

Additionally, platinum ~~comprises~~ is an important component of catalytic converters found in hydrogen fuel cells. In 2018, South Africa exported 110,000 tons of platinum, Russia exported 21,000 tons, Zimbabwe exported 14,000 tons, Canada exported 9,500 tons, and the U.S. exported 4,100. Currently, the U.S. imports platinum from South Africa (44 percent), Germany (15 percent), the United Kingdom (10 percent each), Italy (7 percent), and other countries (24 percent). The U.S. also imports ~~ant~~ palladium from South Africa (31 percent), Russia (28 percent), Italy (12 percent), the United Kingdom (6 percent), and other countries (23 percent) (USGS, 2019c).

The CGS classifies the regional significance of mineral resources in accordance with the California Surface Mining and Reclamation Act of 1975 and assists in the designation of land containing significant aggregate resources. MRZs have been designated to indicate the significance of mineral deposits. The MRZ categories follow:

- MRZ-1: Areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence.
- MRZ-2: Areas where adequate information indicates significant mineral deposits are present, or where it is judged that a high likelihood exists for their presence.
- MRZ-3: Areas containing mineral deposits the significance of which cannot be evaluated from available data.
- MRZ-4: Areas where available information is inadequate for assignment to any other MRZ.

California ranks as 7th in the U.S. for non-fuel mineral production, accounting for approximately 3.9 percent of the nation’s total. In 2011, there were approximately 700 active mineral mines that produced sand and gravel, boron, Portland cement, crushed stone, gold, masonry cement, clays, gemstones, gypsum, salt, silver, and other minerals.

3.5.8.1 Regulatory Setting

Applicable laws and regulations associated with mineral resources are discussed in Table 3.5-8.

Table 3.5-8
Applicable Laws and Regulations for Mineral Resources

Applicable Regulations	Description
Federal	
Mining and Mineral Policy Act	The Mining and Mineral Act of 1970 declared that the Federal Government policy is to encourage private enterprise in the development of a sound and stable domestic mineral industry, domestic mineral deposits, minerals research, and methods for reclamation in the minerals industry.
State	
Surface Mining and Reclamation Act of 1975 (SMARA)	The intent of SMARA of 1975 is to promote production and conservation of mineral resources, minimize environmental effects of mining, and to assure that mined lands will be reclaimed to conditions suitable for alternative uses. An important part of the SMARA legislation requires the State Geologist to classify land according to the presence or absence of significant mineral deposits. Local jurisdictions are given the authority to permit or restrict mining operations, adhering to the SMARA legislation. Classification of an area using MRZs to designate lands that contain mineral deposits are designed to protect mineral deposits from encroaching urbanization and land uses that are incompatible with mining. The MRZ classifications reflect varying degrees of mineral significance, determined by available knowledge of the presence or absence of mineral deposits as well as the economic potential of the deposits.
California Building Standards Code (CBSC) (24 CCR)	California's minimum standards for structural design and construction are given in the CBSC (24 CCR). The CBSC is based on the Uniform Building Code (International Code Council 1997), which is used widely throughout U.S. (generally adopted on a state-by-state or district-by-district basis) and has been modified for California conditions with numerous, more detailed or more stringent regulations. The CBSC provides standards for various aspects of construction, including (i.e., not limited to) excavation, grading, and earthwork construction; fills and embankments; expansive soils; foundation investigations; and liquefaction potential and soil strength loss. In accordance with California law, proponents of specific projects would be required to comply with all provisions of the CBSC for certain aspects of design and construction.
PRC Sections 2762–2763	<p>PRC Section 2762 states that the general plan must establish mineral resource management policies if the State Geologist has identified resources of statewide or regional significance within the city or county.</p> <p>PRC Section 2763 requires that city and county land use decisions affecting areas with minerals of regional or statewide significance be consistent with mineral resource management policies in the general plan, including protection of known mineral resources.</p>

Table 3.5-8
Applicable Laws and Regulations for Mineral Resources

Applicable Regulations	Description
Local	
Local Grading and Erosion Control Ordinances	Many counties and cities have grading and erosion control ordinances. These ordinances are intended to control erosion and sedimentation caused by construction activities. A grading permit is typically required for construction-related projects. As part of the permit, project applicants usually must submit a grading and erosion control plan, vicinity and site maps, and other supplemental information. Standard conditions in the grading permit include a description of BMPs similar to those contained in a SWPPP.
City/County General Plans	Most city and county general plans have an element that addresses mineral resources within that jurisdiction.

3.5.9 Noise

The existing setting for ~~aesthetic~~ noise impacts is discussed beginning on pages A-192 of Attachment A of the CARB ACT Regulation Final EA. Acoustics is the scientific study that evaluates perception, propagation, absorption, and reflection of sound waves. Sound is a mechanical form of radiant energy, transmitted by a pressure wave through a solid, liquid, or gaseous medium. Sound that is loud, disagreeable, unexpected, or unwanted is generally defined as noise.

3.5.9.1 Sound Properties

A sound wave is initiated in a medium by a vibrating object (e.g., vocal chords, the string of a guitar, the diaphragm of a radio speaker). The wave consists of minute variations in pressure, oscillating above and below the ambient atmospheric pressure. The number of pressure variation cycles occurring per second is referred to as the frequency of the sound wave and is expressed in hertz. Directly measuring sound pressure fluctuations would require the use of a very large and cumbersome range of numbers. To avoid this and have a more useable numbering system, the dB scale was introduced. A sound level expressed in decibels is the logarithmic ratio of two like pressure quantities, with one pressure quantity being a reference sound pressure. For sound pressure in air, the standard reference quantity is generally considered ~~to be~~ 20 micropascals, which directly corresponds to the threshold of human hearing. The use of the decibel is a convenient way to handle the millionfold range of sound pressures to which the human ear is sensitive. A decibel is logarithmic; it does not follow normal algebraic methods and cannot be directly summed. For example, a 65-dB source of sound, such as a truck, when joined by another 65 dB source results in a sound amplitude of 68 dB, not 130 dB (i.e., doubling the source strength increases the sound pressure by 3 dB). A sound level increase of 10 dB corresponds to 10 times the acoustical energy, and an increase of 20 dB equates to a 100-fold increase in acoustical energy.

The loudness of sound perceived by the human ear depends primarily on the overall sound pressure level and frequency content of the sound source. The human ear is not equally sensitive to loudness at all frequencies in the audible spectrum. To better relate overall sound levels and loudness to human perception, frequency-dependent weighting networks were developed. The standard weighting networks are identified as A through E. There is a strong correlation between the way humans perceive sound and A-weighted sound levels (dBA). For this reason, the dBA can be used to predict community response to noise from the environment, including noise from transportation and stationary sources. Sound levels expressed as dB in this section are A-weighted sound levels, unless noted otherwise.

Noise can be generated by many sources, including mobile sources (i.e., transportation) such as automobiles, trucks, and airplanes and stationary sources (i.e., non-transportation) such as construction sites, machinery, and commercial and industrial operations. As acoustic energy spreads through the atmosphere from the source to the receiver, noise levels attenuate (i.e., decrease) depending on ground absorption characteristics, atmospheric conditions, and the presence of physical barriers. Noise generated from mobile sources generally attenuate at a rate of 4.5 dB per doubling of distance. Stationary noise sources spread with more spherical dispersion patterns that attenuate at a rate of 6 to 7.5 dB per doubling of distance.

Atmospheric conditions such as wind speed, turbulence, temperature gradients, and humidity may additionally alter the propagation of noise and affect levels at a receiver. Furthermore, the presence of a large object (e.g., barrier, topographic features, and intervening building façades) between the source and the receptor can provide significant attenuation of noise levels at the receiver. The amount of noise level reduction (i.e., shielding) provided by a barrier primarily depends on the size of the barrier, the location of the barrier in relation to the source and receivers, and the frequency spectra of the noise. Natural (e.g., berms, hills, and dense vegetation) and human-made features (e.g., buildings and walls) may be used as noise barriers.

All buildings provide some exterior-to-interior noise reduction. A building constructed with a wood frame and a stucco or wood sheathing exterior typically provides a minimum exterior-to-interior noise reduction of 25 dB with its windows closed, whereas a building constructed of a steel or concrete frame, a curtain wall or masonry exterior wall, and fixed plate glass windows of one-quarter-inch thickness typically provides an exterior-to-interior noise reduction of 30–40 dB with its windows closed.

3.5.9.2 Common Noise Descriptors

The intensity of environmental noise fluctuates over time, and several different descriptors of time-averaged noise levels are used. The selection of a proper noise descriptor for a specific source depends on the spatial and temporal distribution, duration, and fluctuation of both the noise source and the environment. The noise descriptors most often in relation to the environment are defined below.

- **Equivalent Noise Level (Leq):** The equivalent steady-state noise level in a stated period of time that would contain the same acoustic energy as the time-varying noise level during the same period (i.e., average noise level).
- **Maximum Noise Level (Lmax):** The highest instantaneous noise level during a specified time.
- **Minimum Noise Level (Lmin):** The lowest instantaneous noise level during a specified time.

- **Day-Night Noise Level (Ldn):** The 24-hour Leq with a 10-dB penalty applied during the noise-sensitive hours from 10 p.m. to 7 a.m., which are typically reserved for sleeping.
- **Community Noise Equivalent Level (CNEL):** Like the Ldn described above with an additional 5-dB penalty applied during the noise-sensitive hours from 7 p.m. to 10 p.m., which are typically reserved for relaxation, conversation, reading, and watching television. Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the Leq descriptor listed above, which corresponds to a steady-state A-weighted sound level containing the same total energy as a time-varying signal over a given time period (usually one hour). The Leq is the foundation of the composite noise descriptors such as Ldn and CNEL, as defined above, and shows very good correlation with community response to noise.

3.5.9.3 Effects of Noise on Humans

Excessive and chronic exposure to elevated noise levels can result in auditory and non-auditory effects on humans. Auditory effects of noise on people are those related to temporary or permanent hearing loss caused by loud noises. Non-auditory effects of exposure to elevated noise levels are those related to behavioral and physiological effects. The non-auditory behavioral effects of noise on humans are associated primarily with the subjective effects of annoyance, nuisance, and dissatisfaction, which lead to interference with activities such as communications, sleep, and learning. The non-auditory physiological health effects of noise on humans have been the subject of considerable research attempting to discover correlations between exposure to elevated noise levels and health problems, such as hypertension and cardiovascular disease. The mass of research infers that noise-related health issues are predominantly the result of behavioral stressors and not a direct noise-induced response. The extent to which noise contributes to non-auditory health effects remains a subject of considerable research, with no definitive conclusions.

The degree to which noise results in annoyance and interference is highly subjective and may be influenced by several non-acoustic factors. The number and effect of these non-acoustic environmental and physical factors vary depending on individual characteristics of the noise environment such as sensitivity, level of activity, location, time of day, and length of exposure. One key aspect in the prediction of human response to new noise environments is the individual level of adaptation to an existing noise environment. The greater the change in the noise levels that are attributed to a new noise source, relative to the environment an individual has become accustomed to, the less tolerable the new noise source will be perceived.

With respect to how humans perceive and react to changes in noise levels, a 1-dB increase is imperceptible, a 3-dB increase is barely perceptible, a 6-dB increase is clearly noticeable, and a 10-dB increase is subjectively perceived as approximately twice as loud. These subjective reactions to changes in noise levels was developed based on test subjects' reactions to changes in the levels of steady-state pure tones or broad-band noise and to changes in levels of a given noise source. It is probably most applicable to noise levels in the range of 50 to 70 dB, as this is the usual range of voice and interior noise levels. For these reasons, a noise level increase of 3 dB or more is typically considered substantial in terms of the degradation of the existing noise environment.

Negative effects of noise exposure include physical damage to the human auditory system, interference, and disease. Exposure to noise may result in physical damage to the auditory system, which may lead to gradual or traumatic hearing loss. Gradual hearing loss is caused by sustained

exposure to moderately high noise levels over a period of time; traumatic hearing loss is caused by sudden exposure to extremely high noise levels over a short period. Gradual and traumatic hearing loss both may result in permanent hearing damage. In addition, noise may interfere with or interrupt sleep, relaxation, recreation, and communication. Although most interference may be classified as annoying, the inability to hear a warning signal may be considered dangerous. Noise may also be a contributor to diseases associated with stress, such as hypertension, anxiety, and heart disease. The degree to which noise contributes to such diseases depends on the frequency, bandwidth, and level of the noise, and the exposure time.

3.5.9.4 *Vibration*

Vibration is the periodic oscillation of a medium or object with respect to a given reference point. Sources of vibration include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) and those introduced by human activity (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, (e.g., operating factory machinery or transient in nature, explosions). Vibration levels can be depicted in terms of amplitude and frequency, relative to displacement, velocity, or acceleration.

Vibration amplitudes are commonly expressed in peak particle velocity (PPV) or root-mean-square (RMS) vibration velocity. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is typically used in the monitoring of transient and impact vibration and has been found to correlate well to the stresses experienced by buildings/ PPV and RMS vibration velocity are normally described in inches per second (in/sec).

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response. It takes some time for the human body to respond to vibration signals. In a sense, the human body responds to average vibration amplitude. The RMS of a signal is the average of the squared amplitude of the signal, typically calculated over a 1-second period. As with airborne sound, the RMS velocity is often expressed in decibel notation as vibration decibels (VdB), which serves to compress the range of numbers required to describe vibration. This is based on a reference value of 1micro (μ) inch/second.

The typical background vibration-velocity level in residential areas is approximately 50 VdB. Groundborne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels.

Typical outdoor sources of perceptible groundborne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the groundborne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Construction activities could generate groundborne vibrations that potentially pose a risk to nearby structures. Constant or transient vibrations can weaken structures, crack facades, and disturb occupants.

Construction vibrations can be transient, random, or continuous. Transient construction vibrations are generated by blasting, impact pile driving, and wrecking balls. Continuous vibrations result from vibratory pile drivers, large pumps, and compressors. Random vibration can result from jackhammers, pavement breakers, and heavy construction equipment.

3.5.9.5 Sensitive Land Uses

Noise-sensitive land uses are generally considered to include those uses where noise exposure could result in health-related risks to individuals, as well as places where quiet is an essential element of their intended purpose. Residential dwellings are of primary concern because of the potential for increased and prolonged exposure of individuals to both interior and exterior noise levels. Additional land uses such as parks, schools, historic sites, cemeteries, and recreation areas are also generally considered sensitive to increases in exterior noise levels. Places of worship and transit lodging, and other places where low interior noise levels are essential are also considered noise-sensitive. These types of receptors are also considered vibration-sensitive land uses in addition to commercial and industrial buildings where vibration would interfere with operations within the building, including levels that may be well below those associated with human annoyance.

3.5.9.6 Regulatory Setting

Applicable laws and regulations associated with noise are discussed in Table 3.5-9.

Table 3.5-9
Applicable Laws and Regulations for Noise

Applicable Regulations	Description
Federal	
Federal Noise Control Act (1972) U.S. EPA (40 CFR Sections 201–211)	This act established a requirement that all federal agencies administer their programs to promote an environment free of noise that jeopardizes public health or welfare. U.S. EPA was given the responsibility for providing information to the public regarding identifiable effects of noise on public health or welfare, publishing information on the levels of environmental noise that will protect the public health and welfare with an adequate margin of safety, coordinating federal research and activities related to noise control, and establishing federal noise emission standards for selected products distributed in interstate commerce. This act also directed that all federal agencies comply with applicable federal, state, interstate, and local noise control regulations.
Quiet Communities Act (1978)	This act promotes the development of effective State and local noise control programs, to provide funds for noise research, and to produce and disseminate educational materials to the public on the harmful effects of noise and ways to effectively control it.
14 CFR, Part 150 (FAA)	These address airport noise compatibility planning and include a system for measuring airport noise impacts and present guidelines for identifying incompatible land uses. All land uses are considered compatible with noise levels of less than 65 dBA L_{dn} . At higher noise levels, selected land uses are also deemed acceptable, depending on the nature of the use and the degree of structural noise attenuation provided.

Table 3.5-9
Applicable Laws and Regulations for Noise

Applicable Regulations	Description
International Standards and Recommended Practices (International Civil Aviation Organization)	This contains policies and procedures for considering environmental impacts (e.g., aircraft noise emission standards and atmospheric sound attenuation factors).
32 CFR, Part 256 (Department of Defense Air Installations Compatible Use Zones (AICUZ) Program)	AICUZ plans prepared for individual airfields are primarily intended as recommendations to local communities regarding the importance of maintaining land uses which are compatible with the noise and safety impacts of military aircraft operations.
23 CFR, Part 772, Federal Highway Administration (FHWA) standards, policies, and procedures	FHWA standards, policies, and procedures provide procedures for noise studies and noise abatement measures to help protect the public health and welfare, to supply noise abatement criteria, and to establish requirements for information to be given to local officials for use in the planning and design of highways.
29 CFR, Part 1910, Section 1910.95 (U.S. Department of Labor Occupational Safety and Health Administration)	This regulation established a standard for noise exposure in the workplace.
FTA Guidance	<p>This guidance presents procedures for predicting and assessing noise and vibration impacts of proposed mass transit projects. All types of bus and rail projects are covered. Procedures for assessing noise and vibration impacts are provided for different stages of project development, from early planning before mode and alignment have been selected through preliminary engineering and final design.</p> <p>Both for noise and vibration, there are three levels of analysis described. The framework acts as a screening process, reserving detailed analysis for projects with the greatest potential for impacts while allowing a simpler process for projects with little or no effects. This guidance contains noise and vibration impact criteria that are used to assess the magnitude of predicted impacts. A range of mitigation is described for dealing with adverse noise and vibration impacts.</p>
49 CFR 210 (Federal Rail Administration (FRA) Railroad Noise Emission Compliance Standards) and FRA Guidance (2005)	This section and guidance provides contains criteria and procedures for use in analyzing the potential noise and vibration impacts of various types of high-speed fixed guideway transportation systems.

Table 3.5-9
Applicable Laws and Regulations for Noise

Applicable Regulations	Description
State	
CPUC Section 21670	The State Aeronautics Act of CPUC establishes statewide requirements for airport land use compatibility planning and requires nearly every county to create an Airport Land Use Commission or other alternative.
California Airport Noise Regulations promulgated in accordance with the State Aeronautics Act (21 CCR Section 5000 et seq.)	In Section 5006, the regulations state that: “The level of noise acceptable to a reasonable person residing in the vicinity of an airport is established as a CNEL value of 65 dBA for purposes of these regulations. This criterion level has been chosen for reasonable persons residing in urban residential areas where houses are of typical California construction and may have windows partially open. It has been selected with reference to speech, sleep, and community reaction”.
24 CCR, Part 2	These establish standards governing interior noise levels that apply to all new single-family and multi-family residential units in California. These standards require that acoustical studies be performed before construction at building locations where the existing L_{dn} exceeds 60 dBA. Such acoustical studies are required to establish mitigation that will limit maximum L_{dn} levels to 45 dBA in any habitable room.
Local	
City/County General Plan Noise Elements	<p>Local general plans in California must include a noise element per Government Code Section 65302(f).</p> <p>The General Plan Guidelines maintained and published by OPR provide detailed guidance to local agencies on standards and methods of analysis that should be used when developing or updating a noise element.</p> <p>Local governments must analyze and quantify noise levels and the extent of noise exposure through actual measurement or the use of noise modeling. Technical data relating to mobile and point sources must be collected and synthesized into a set of noise control policies and programs that minimizes the exposure of community residents to excessive noise. Noise level contours must be mapped, and the conclusions of the element used as a basis for land use decisions. The noise element must include implementation measures and possible solutions to existing and foreseeable noise problems. Furthermore, the policies and standards must be sufficient to serve as a guideline for compliance with sound transmission control requirements. The noise element directly correlates to the land use, circulation, and housing elements.</p> <p>A noise element is to be used as a guide for establishing a pattern of land uses in the land use element that minimizes the exposure of community residents to excessive noise.</p>

Table 3.5-9
Applicable Laws and Regulations for Noise

Applicable Regulations	Description
City/County Noise Regulations	Most local governments in California maintain and enforce noise regulations contained in local codes and ordinances that apply to diverse types of activities in the community. These regulations may include noise standards that apply to construction activities associated with new development projects, as well as ongoing operational activities associated with existing or future land uses.
Source: California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Proposed Advanced Clean Trucks Rule Regulation. https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf	

3.5.10 Population and Housing

The existing setting for ~~aesthetic~~ population and housing impacts is discussed beginning on pages A-199 of Attachment A of the CARB ACT Regulation Final EA.

Population. According to the Census Bureau data, the estimated population of California in 2017 was 39,536,563. Since California became a state in 1850, the population has been increasing rapidly. Within the first 150 years of California’s statehood, the population increased from fewer than 100,000 citizens to almost 34 million in 2000. It is expected that the population of California will reach and surpass the 50 million mark sometime between 2040 and 2050 if the current growth rates persist.

Housing. As population within the state increases, housing distribution and household conditions are expected to evolve. Estimated housing units, households, and vacancy rates for the state of California in 2019 are shown ~~below~~ in Table 3.5-10.

Table 3.5-10
California Housing Profile

Total housing units	13,680,081
Total households	12,577,498
Vacant housing units	1,102,583
Owner occupied	7,035,371
Renter occupied	15,691,211
Homeowner vacancy rate	2.1
Rental vacancy rate	6.3

Employment. In June 2018, the civilian labor force in California was approximately 19,341,000, and the unemployment rate decreased from 5.7 percent in January 2016 to 4.2 percent in June 2018.

3.5.10.1 Regulatory Setting

See land use planning and housing-related regulations in Section 3.5.7.1, Land Use and Planning.

3.5.11 Public Services

The existing setting for ~~aesthetic impacts~~ to public services is discussed beginning on pages A-201 of Attachment A of the CARB ACT Regulation Final EA.

3.5.11.1 Law Enforcement

California's environmental laws are enforced by a matrix of State and local agencies, some at CalEPA, each charged with enforcing the laws governing a specific ~~media component~~, such as air, water, hazardous waste, solid waste, and pesticides ~~laws, the Attorney General's Office, local District Attorneys and City Attorneys~~. The Attorney General represents the people of California in civil and criminal matters before trial courts, appellate courts, and the supreme courts of California and the U.S. Regarding environmental issues, the Attorney General enforces laws that safeguard the environment and natural resources in the state. Recent actions by the Attorney General related to air quality and climate change issues include filing numerous actions against the Trump Administration opposing federal rollbacks of environmental protection regulations and requiring implementation of existing rules. These actions involve a range of regulations, including those concerning GHG emissions from stationary sources and vehicles, regulations of toxic air pollution, and planning requirements for criteria pollution planning. The Attorney General also continues to work broadly to support CARB actions, including working with local governments to ensure that land use planning processes take account of global warming, promoting renewable energy and enhanced energy efficiency in California, and working with other State leaders and agencies to implement AB 32, the Global Warming Solutions Act of 2006.

CalEPA was created in 1991 by Governor's Executive Order. CalEPA's mission is to restore, protect and enhance the environment, to ensure public health, environmental quality, and economic vitality. CalEPA is composed of various boards, departments, and offices, including: CARB, Department of Pesticide Regulation, DTSC, OEHHA, and SWRCB (including the nine RWQCBs).

~~California's environmental laws are enforced by State and local agencies, each charged with enforcing the laws governing a specific media component such as air, water, hazardous waste, solid waste, and pesticides. Other Enforcement agencies include for these media are as follows:~~

- Air: CARB (part of CalEPA) and Local Air Districts.
- Water: SWRCB (part of CalEPA), RWQCBs (part of CalEPA), local wastewater officials, and the California Department of Public Health.
- Hazardous Waste: DTSC (part of CalEPA) and CUPAs.
- Carcinogens/Reproductive Toxins: Prop. 65 through OEHHA (part of CalEPA).
- Pesticides: Department of Pesticide Regulation (part of CalEPA) and County Agricultural Commissioners

Statewide law enforcement service is provided by the California Highway Patrol, which is responsible for protecting State resources and providing crime prevention services and traffic enforcement along the State's highways and byways.

Community law enforcement service is provided by local police and sheriff agencies (i.e., cities and counties, respectively) to prevent crime, respond to emergency incidents, and provide traffic enforcement on local roadways.

3.5.11.2 Fire Protection and Emergency Medical Response Services

State-level fire protection and emergency response service is provided by the California Department of Forestry and Fire Protection (CAL FIRE), primarily in rural areas of the state. CAL FIRE is an emergency response and resource protection department. CAL FIRE protects lives, property, and natural resources from fire; responds to emergencies of all types; and protects and preserves timberlands, wildlands, and urban forests.

Local and urban fire protection service is provided by local fire districts and/or local agencies (e.g., fire departments of cities and counties). In addition to providing fire response services, most fire agencies also provide emergency medical response services (i.e., ambulance services) within their service areas.

3.5.11.3 Schools

Statewide, the regulation of education for youth is provided by the California Department of Education. The State Board of Education (SBE) is the governing and policy-making body of the California Department of Education. SBE sets K-12 education policy in the areas of standards, instructional materials, assessment, and accountability. Locally, school districts are responsible for the management and development of elementary, middle, and high-school facilities.

3.5.11.4 Regulatory Setting

Applicable laws and regulations associated with public services are discussed in Table 3.5-11.

Table 3.5-11
Applicable Laws and Regulations for Public Services

Applicable Regulations	Description
Federal	
American with Disabilities Act	Guidelines to ensure that facilities are accessible to individuals with disabilities. Implements requirements for the design and construction of buildings.
State	
State Fire Responsibility Areas	Areas delineated by CAL FIRE for which the State assumes primary financial responsibility for protecting natural resources from damages of fire. Local jurisdictions are required to adopt minimum recommended requirements for road design, road identification, emergency fire suppression and fuel breaks and greenbelts. All projects within or adjacent to a State Fire Responsibility Area must meet these requirements.
State School Funding	Education Code Section 17620 authorizes school districts to levy a fee, charge, dedication, or other requirement for any development project for the construction or reconstruction of school facilities.
Source: California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Proposed Advanced Clean Trucks Rule Regulation. https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf	

3.5.12 Recreation

The existing setting for ~~aesthetic~~ recreation impacts is discussed on pages A-203 of Attachment A of the CARB ACT Regulation Final EA. California contain approximately 14,000 parks, managed by nearly 1,000 agencies (CSP 2018). The California Outdoor Recreation Plan and associated research provide policy guidance to all public agencies—federal, state, local, and special districts that oversee outdoor recreation on lands, facilities, and services throughout California. Agencies and departments that are involved in recreational activities include Boating and Waterways, Fish and Wildlife, Tahoe Regional Planning Association, various conservancies, and others.

Recreational lands and facilities are also managed by regional and local park and recreation agencies and open space districts. City and county general plans contain recreation elements that provide framework for planning agencies to consider when projects are developed and implemented.

3.5.12.1 Regulatory Setting

Applicable laws and regulations associated with recreation are discussed in Table 3.5-12.

Table 3.5-12
Applicable Laws and Regulations for Recreation

Applicable Regulations	Description
Federal	
FLPMA, 1976 43 CFR Section 1600	Establishes public land policy; guidelines for administration; and provides for the “multiple use” management, protection, development, and enhancement of public lands. Multiple use management, defined as “management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people” with recreation identified as one of the resource values.
Local	
General Plans	General plans for cities and counties contain designations for recreational areas. These are policy documents with planned land use maps and related information that are designed to give long-range guidance to those local officials making decisions affecting the growth and resources of their jurisdictions. Because of the number and variety of general plans and related local plans, they are not listed individually.
Source: California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Proposed Advanced Clean Trucks <u>RuleRegulation</u> . https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf	

3.5.13 Utilities and Service Systems

The existing setting for ~~aesthetic~~ impacts to utilities and service systems is discussed on pages A-206 of Attachment A of the CARB ACT Regulation Final EA.

3.5.13.1 Water Supply and Distribution

The principal water supply facilities in California are operated by the U.S. Bureau of Reclamation (USBR) and the California Department of Water Resources (DWR). In California, the Mid-Pacific

Region of USBR is responsible for the management of the Central Valley Project (CVP). The CVP serves farms, homes, and industry in California's Central Valley as well as the major urban centers in the San Francisco Bay Area. The CVP consists of 20 dams and reservoirs, 11 power plants, and 500 miles of major canals and reaches from the Cascade Mountains near Redding in the north to the Tehachapi Mountains near Bakersfield in the south. In addition to delivering water for municipal and industrial uses and the environment, the CVP produces electric power and provides flood protection, navigation, recreation, and water quality benefits.

DWR is a State agency that is responsible for managing and implementing the State Water Project (SWP). The SWP is a water storage and delivery system of reservoirs, aqueducts, power plants, and pumping plants. Its main purpose is to store water and distribute it to 29 urban and agricultural water suppliers in Northern California, the San Francisco Bay Area, the San Joaquin Valley, the Central Coast, and Southern California.

Local water districts, irrigation districts, special districts, and jurisdictions (e.g., cities and counties) manage and regulate the availability of water supplies and the treatment and delivery of water to individual projects. Depending on their location and the source of their supplies, these agencies may use groundwater, surface water through specific water entitlements, or surface water delivered through the CVP or SWP. In some remote areas not served by a water supply agency, individual developments may need to rely upon the underlying groundwater basin for their water supply. In these cases, the project would be required to secure a permit from the local or State land use authority and seek approval for development of the groundwater well(s).

3.5.13.2 Wastewater Collection and Treatment

SWRCB is the State agency responsible for the regulation of wastewater discharges to surface waters and groundwater via land discharge. SWRCB and nine RWQCBs are responsible for development and enforcement of water quality objectives and implementation plans that protect the beneficial uses of the federal and State waters. SWRCB also administers water rights in California. The RWQCB's are responsible for issuing permits or other discharge requirements to individual wastewater dischargers and for ensuring that they are meeting the requirements of the permit through monitoring and other controls.

Wastewater collection, treatment, and discharge service for developed and metropolitan areas is typically provided by local wastewater service districts or agencies that may or may not be operated by the local jurisdiction (e.g., city or county). These agencies are required to secure treatment and discharge permits for the operation of a wastewater facility from the RWQCB. Wastewater is typically collected from a specific development and conveyed through a series of large pipelines to the treatment facility where it is treated to permitted levels and discharged to surface waters or the land.

In areas that are remote or that are not served by an individual wastewater service provider, developments would be required to install an individual septic tank or other on-site wastewater treatment system. These facilities would need to be approved by the local or State land use authority and the RWQCB.

3.5.13.3 Solid Waste Collection and Disposal

Statewide, the California Department of Resources Recycling and Recovery (CalRecycle) is responsible for the regulation of the disposal and recycling of all solid waste generated in California. CalRecycle acts as an enforcement agency in the approval and regulation of solid waste

disposal and recycling facilities. Local agencies can create local enforcement agencies; and, once approved by CalRecycle, they can serve as the enforcement agency for landfills and recycling facilities with their jurisdictions.

Local agencies or private companies own and operate landfill facilities, and solid waste is typically hauled to these facilities by private or public haulers. Individual projects would need to coordinate with the local service provider and landfill to determine if adequate capacity exists to serve the project.

3.5.13.4 Regulatory Setting

Applicable laws and regulations associated with utilities are discussed in Table 3.5-13.

Table 3.5-13
Applicable Laws and Regulations for Utilities and Service Systems

Applicable Regulations	Description
Federal	
Federal Power Act of 1935	The Federal Power Act of 1935 (49 Stat. 803) created the Federal Power Commission, an independent regulatory agency with authority over both the interstate transmission of electricity and the sale of hydroelectric power at the wholesale level. The act requires the commission to ensure that electricity rates are “reasonable, nondiscriminatory and just to the consumer.” The Federal Power Act of 1935 also amended the criteria that the commission must apply in deciding whether to license the construction and operation of new hydroelectric facilities.
Natural Gas Act (NGA) of 1938	Together with the Federal Power Act of 1935, the NGA (P.L. 75-688, 52 Stat. 821) was an essential piece of energy legislation in the first half of the 20th century. These statutes regulated interstate activities of the electric and natural gas industries, respectively. The acts are similarly structured and constitute the classic form of command-and-control regulation authorizing the federal government to enter into a regulatory compact with utilities. In short, the NGA enabled federal regulators to set prices for gas sold in interstate commerce in exchange for exclusive rights to transport the gas.
Natural Gas Policy Act (NGPA) of 1978	The NGPA granted the <u>Federal Energy Regulatory Commission (FERC)</u> authority over intrastate as well as interstate natural gas production. The NGPA established price ceilings for wellhead first sales of gas that vary with the applicable gas category and gradually increase over time.
State	
Waste Heat and Carbon Emissions Reduction Act of 2007	The Waste Heat and Carbon Emissions Reduction Act of 2007 (AB 1613), placed requirements on CPUC, CEC, and local electric utilities to develop incentive programs and technical efficiency guidelines to encourage the installation of small CHP systems. CEC approved efficiency and certification guidelines for eligible systems under AB 1613 in January 2010, and CPUC approved standardized contracting and pricing provisions between CHP operators and the Investor Owned Utilities in November 2012.

Table 3.5-13
Applicable Laws and Regulations for Utilities and Service Systems

Applicable Regulations	Description
AB 1900 (Statutes of 2012)	AB 1900 (Gatto, Chapter 602, Statutes of 2012) directed CPUC to adopt natural gas constituent standards (in consultation with CARB and OEHHA). The legislation is also designed to streamline and standardize customer pipeline access rules and encourage the development of statewide policies and programs to promote all sources of biomethane production and distribution.
Section 21151.9 of the PRC / Water Code Section 10910 et seq.	Required the preparation of a water supply assessment (WSA) for large developments. These assessments are prepared by public water agencies responsible for providing service and address whether there are adequate existing and projected future water supplies to serve the proposed project. All projects that meet the qualifications for preparing a WSA must identify the water supplies and quantities that would serve the project as well as project the total water demand for the service area (including the project's water demands) by source in 5-year increments over a 20-year period. This information must include data for a normal, single-dry, and multiple-dry years. The WSA is required to be approved by the water service agency before the project can be implemented.
Local	
City/County General Plan	<p>Local general plans in California must include a circulation element per Government Code Section 65302(b), which includes identification of the locations and extent of existing and proposed public utilities and facilities.</p> <p>The circulation element of a general plan should assess the adequacy and availability of community water, sewer, and drainage facilities and the need for expansion and improvements; trends in peak and average daily flows; the number and location of existing and proposed power plants, oil and gas pipelines, and major electric transmission lines and corridors; existing and projected capacity of treatment plants and trunk lines; and potential future development of power plants.</p>
City/County Codes and Ordinances	Most cities and counties have adopted municipal codes and ordinances that pertain to utilities and service systems. Local codes and ordinances include, but not limited to, limitations on the locations of wells, sewers, and other water-related facilities; and development standards for future utility land use projects.
<p>Source: California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Proposed Advanced Clean Trucks Rule Regulation. https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf</p>	

CHAPTER 4 ENVIRONMENTAL IMPACT ANALYSIS AND MITIGATION MEASURES

4.0 INTRODUCTION

The CEQA Guidelines require environmental documents to identify significant environmental effects that may result from a proposed project (CEQA Guidelines Section 15126.2(a)).

Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects. The discussion should include relevant specifics of the area, the resources involved, physical changes, alterations to ecological systems, and changes induced in population distribution, population concentration, the human use of the land including commercial and residential development), health and safety problems caused by the physical changes, and other aspects of the resource base such as water, historical resources, scenic quality, and public services....

The CEQA Guidelines further explain the level of specificity an Environmental Impact Report (EIR) must contain (CEQA Guidelines, Section 15151):

An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.

The CEQA Guidelines also indicate that the degree of specificity required in a CEQA document depends on the type of project being proposed (CEQA Guidelines Section 15146). The detail of the environmental analysis for certain types of projects cannot be as great as for others.

CEQA generally defers to lead agencies on the choice of methodology to analyze impacts. (*Santa Monica Baykeeper v. City of Malibu* (2011) 193 Cal.App.4th 1538, 1546; see *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 409 [“the issue is not whether the studies are irrefutable or whether they could have been better” ... rather, the “relevant issue is only whether the studies are sufficiently credible to be considered” as part of the lead agency’s overall evaluation].)

While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project’s potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144).

If, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (CEQA Guidelines Section 15145).

To assist in the determination of significance, many lead agencies rely on ‘thresholds of significance.’ The CEQA Guidelines define a ‘threshold of significance’ to mean “an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant” (CEQA Guidelines Section 15064.7(a)). Lead agencies have discretion to develop and adopt their own thresholds, or rely on thresholds recommended by other agencies, “provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.” [~~Id. at subd. CEQA Guidelines Section 15064.7(c);~~ *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1068.] Substantial evidence means “enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached.” [~~Id. at § CEQA Guidelines Section 15384 (emphasis added);~~ *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108–1109.]

In addition, this EA incorporates by reference analysis in the California Air Resources Board (CARB) Advanced Clean Trucks (ACT) Regulation Final EA, which analyzed potential impacts resulting from the construction of new manufacturing and recycling facilities that may occur as a result of the transition from conventional vehicles to near-zero emissions (NZE) and zero-emissions (ZE) vehicles. The CARB ACT Regulation Final EA concluded these actions may have potentially significant impacts in the following areas: Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Land Use and Planning, Mineral Resources (during operations), Noise, Public Services, Recreation, and Utilities and Service Systems (during operations). These impact areas are discussed in Chapter 4.5, Other Impact Areas.

This EA also tiers off of the South Coast AQMD’s 2017 Final Program EIR for the 2016 Air Quality Management Plan (AQMP), which analyzed the potential environmental impacts of the measures ~~included~~ in that program, including Control Measure MOB-03, an indirect source rule for warehouses. The 2016 AQMP Final Program EIR concluded that implementation of the AQMP, including Control Measure MOB-03, would have significant and unavoidable impacts in the following areas: aesthetics, construction air quality and greenhouse gas (GHG) emissions, energy (increased electricity demand), hazards and hazardous materials, water demand, construction noise and vibration, solid waste, and transportation and traffic. It also concluded that implementation of the AQMP would have significant and unavoidable cumulative impacts. The proposed project is consistent with the AQMP because it implements Control Measure MOB-03. The following impacts analysis incorporates the 2016 AQMP Final Program EIR by reference, where appropriate, as well.

Appendix G to the CEQA Guidelines contains a list of environmental factors and resources that may be impacted by a project, ranging from aesthetics to tribal cultural resources. Each of these factors and resources is discussed in the Notice of Preparation/Initial Study (NOP/IS) prepared for the proposed project. As explained in Chapter 1, this EA focuses primarily on the following impact areas for the direct impacts from the proposed project: Air Quality and Greenhouse Gas Emissions, Energy, Hazardous Materials and Solid and Hazardous Waste, and Transportation.

As explained in Chapter 1, the analysis of the proposed project indicated that an EA, which is equivalent to an Environmental Impact Report EIR, is the appropriate type of CEQA document to be prepared. If significant adverse environmental impacts are identified, the CEQA Guidelines

require a discussion of measures that could either avoid or substantially reduce any adverse environmental impacts to the greatest extent feasible (CEQA Guidelines Section 15126.4).

Subsequent to the release of the Draft EA for public review and comment, modifications were made to PR 2305 and PR 316 and some of the revisions were made in response to verbal and written comments received during the rule development process. Staff has reviewed the modifications to PR 2305 and PR 316 and concluded that none of the revisions constitute significant new information, because: 1) no new significant environmental impacts would result from the project or from a new mitigation measure proposed to be implemented; 2) there is no substantial increase in the severity of an environmental impact; 3) no other feasible project alternative or mitigation measures was identified that would clearly lessen the environmental impacts of the project and was considerably different from others previously analyzed and, 4) the Draft EA did not deprive the public from meaningful review and comment. In addition, revisions to the proposed project in response to verbal or written comments during the rule development process would not create new, unavoidable significant effects. As a result, these revisions to the Draft EA merely clarify, amplify, or make insignificant modifications which do not require recirculation of the Draft EA pursuant to CEQA Guidelines Sections 15073.5 and 15088.5. Therefore, the Draft EA has been revised to include the aforementioned modifications such that it is now the Final EA for PR 2305 and PR 316.

4.0.1 Overview of Impact Analysis

The proposed project (also referred to as the ‘WAIRE Program’) analyzed in this EA is PR 2305 and the mitigation program, and PR 316. The proposed project would require qualifying-sized warehouses located within the South Coast AQMD’s jurisdiction to earn WAIRE Points. By requiring warehouse operators to earn WAIRE Points that count towards a warehouse operator’s WPCO, implementation of the proposed project would accelerate use of cleaner technologies for mobile sources associated with warehouse operations.

Because the proposed project is a rule that will govern future activities, and because the rule allows regulated parties to comply in a variety of ways, it is impossible to predict or forecast precisely what the environmental impacts of the rule will be. However, to provide a conservative estimate of these impacts, the EA made certain assumptions based on modeling, studies, and other evidence, as explained below. It is important to note that due to the variety of compliance outcomes, annual updates on the implementation of the proposed project will be provided to the South Coast AQMD Mobile Source Committee to provide regular tracking, check-ins, and opportunity for public input.

4.0.1.1 Potentially Significant Environmental Impacts Analyzed

The Notice of Preparation/Initial Study (NOP/IS) for the proposed project circulated in November 2020 identified the topics of air quality and GHG emissions, energy, and transportation as potentially significant impacts of the proposed project. Comments on the NOP/IS further requested that this EA analyze the potential environmental effects associated with the development of new facilities, including manufacturing, recycling, and grid infrastructure facilities, that could result from warehouse operators purchasing or using zero-emissions vehicles to comply with the proposed project. This development, which is an indirect impact of the proposed project, could also have potentially significant impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Land Use and Planning, Mineral Resources (during operations), Noise, and Utilities and

Service Systems (during operations). Therefore, these environmental topics have been analyzed in this EA. Additionally, based on comments on the NOP/IS, hazardous materials and solid and hazardous waste impacts from increased disposal of batteries and hydrogen fuel cells on recycling infrastructure, construction waste, and routine transport, use, or disposal of liquefied natural gas fuel (LNG) are also included in this EA.

4.0.1.1.1 2016 AQMP Final Program EIR

This EA tiers off the 2016 Air Quality Management Plan (AQMP) Final Program Environmental Impact Report (EIR). The Final Program EIR concluded that the 2016 AQMP, including Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, would have significant, unavoidable impacts in the following areas:

- Aesthetics (glare from solar panels, construction and operation of catenary lines and use of bonnets at Ports of Los Angeles and Long Beach)
- Air Quality and Greenhouse Gases (Construction)
- Energy (increased electricity demand)
- Hazards and Hazardous Materials (flammability of replacement of solvents/coatings/adhesives/sealants; storage or accidental release of ammonia in the non-refinery sector; storage and transportation of LNG fuel; and transport of ammonia and impacts to schools)
- Noise (construction noise and vibration)
- Solid and Hazardous Waste (construction waste and vehicle/equipment scrapping)
- Transportation (traffic and circulation)

In reaching this conclusion, this EA considered the potential impacts associated with Control Measure MOB-03, which required the assessment and identification of potential actions to reduce emissions associated with mobile sources operating in and out of warehouse distribution centers. In particular, the 2016 AQMP Final Program EIR identifies that South Coast AQMD has lead responsibility for developing stationary, some area, and indirect source control measures and considers development of indirect source regulations in the Final Program EIR.

The Final Program EIR concluded that the 2016 AQMP, as mitigated, would have the following less than significant impacts:

- Air Quality and Greenhouse Gases (operational phase; increased electricity; operation of air pollution control equipment; lower VOC materials; mobile sources; miscellaneous sources; TAC emissions; and GHG emissions)
- Energy (increased demand of alternative fuels)
- Hazards and Hazardous Materials (routine use and transport of alternative fuels and caustic, catalysts, acidifiers, and sodium bisulfate; spills; transportation of alternative fuels; storage or accidental release of ammonia in the refinery sector; and sites on a government list)
- Hydrology and Water Quality (wastewater treatment; water quality standards from accidental spills; use of electric vehicles, ammonia, and bisulfate; water conveyance; and groundwater depletion)

- Noise (operational noise and vibration)
- Solid and Hazardous Waste (waste from ZE vehicles and air pollution control technology)

As explained in Chapter 1, the analysis in that Final Program EIR provided a “sufficient level of detail to enable those effects to be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the approval of” the proposed project with respect to the following impact areas: Energy, Hazards, Noise, Solid and Hazardous Waste, Aesthetics (California Public Resources Code Section 21094(a)(2)). Nonetheless, this EA provides additional information and analysis in each of these impact areas, as well.

4.0.1.2 WAIRE Points Scenario Modeling

Modeling was conducted by South Coast AQMD based on the proposed project Rule Stringency (see Chapter 2) to forecast the potential WAIRE Points that could be earned by warehouses in the South Coast AQMD region to satisfy the warehouse operator’s WAIRE Points Compliance Obligation (WPCO). The regulated warehouses can earn WAIRE Points by completing any combination of 1) implementing actions from the WAIRE Menu (PR 2305 Table 3); 2) implementing an approved Custom WAIRE Plan; and 3) paying a mitigation fee. The WAIRE Menu has 32 compliance options, and any approved Custom WAIRE Plan which could include compliance options that are not on the WAIRE Menu. The warehouse operator’s strategies to satisfy their WPCO may vary from year to year. Since it is speculative to determine individual market actions operators will choose to comply with the proposed project, this EA considers the scenarios in Table 4-1 as a way to identify the environmental impacts of the WAIRE Points isolated for each individual compliance option. The WAIRE Points scenarios modeled serve as a bounding analysis approach, whereby all 2,902 warehouses were assumed to only comply with a single scenario approach from 2021 through 2031. No single scenario in this bounding analysis is expected to occur. Rather, they present possible extreme compliance outcomes, and thus provide a conservative estimate of potential impacts. In reality, a hybrid of all scenarios (or other compliance approaches encompassed within the range of scenarios analyzed) is expected to occur.

**Table 4-1
WAIRE Points Scenario Modeling**

Scenario #	Description
Scenario 1	NZE Class 8 truck acquisitions and subsequent visits from those trucks
Scenario 2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase) ^a
Scenario 3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks ^{b, c}
Scenario 4	NZE Class 8 truck visits from non-owned fleets ^c
Scenario 5	ZE Class 8 truck visits from non-owned fleets ^{c,d}
Scenario 6	Level 3 charger installations followed by ZE Class 6 & Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers ^e
Scenario 7	Pay Mitigation Fee

Table 4-1
WAIRE Points Scenario Modeling

Scenario #	Description
<u>Scenario 7a</u>	<u>Pay Mitigation Fee and account for NZE trucks Class 8 and 4-7 visiting the facility incentivized from the WAIRE Mitigation Program</u>
Scenario 8	NZE Class 6 truck acquisitions and subsequent visits from those trucks
Scenario 9	NZE Class 6 truck visits from non-owned fleets ^c
Scenario 10	ZE Class 6 truck visits from non-owned fleets ^c
Scenario 11	Rooftop solar panel installations and usage ^f
Scenario 12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station ^g
Scenario 13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks
Scenario 14	ZE Class 2b-3 truck visits from non-owned fleets
Scenario 15	Filter System Installations
Scenario 16	Filter Purchases
Scenario 17	TRU plug installations and usage in cold storage facilities ^h
Scenario 18	ZE Hostler Acquisitions and Usage

Notes: MERV: Maximum Efficiency Reporting Value

^a One additional truck is acquired earlier than required, thus increasing WAIRE Points earned from truck visits in subsequent years.

^b Mitigation fees paid to earn WAIRE Points in first year of compliance.

^c No WAIRE Points earned for truck acquisitions.

^d ZE Class 8 trucks are assumed to not be commercially available until late 2022. Mitigation fees paid to earn WAIRE Points until then.

^e Chargers provide ~30,000 kWh/year per Class 6 truck, and ~90,000 kWh/yr per Class 8 truck. Class 8 trucks only acquired if 25 Class 6 trucks had been previously purchased for one warehouse.

^f Solar panel coverage limited to 50 percent of building square footage. Mitigation fees used to make up any shortfall in WAIRE Points.

^g System installation in first year is followed by a truck acquisition. In subsequent years trucks are only acquired if needed to earn WAIRE Points.

^h Scenario is only applied to cold storage warehouses. Plugs limited to 1:10,000 sq. ft. of building space.

The scenario modeling in this EA isolates the effect of the WAIRE Program from other South Coast AQMD and existing CARB regulations, including the Advanced Clean Trucks (ACT) Regulation, Low NOx Omnibus Regulation, and the upcoming Heavy-Duty Inspection and Maintenance Program. The incremental effect of the WAIRE Program above and beyond the existing regulations is based on the CARB Mobile Source Strategy Mobile Emissions Toolkit for Analysis (META), which estimates the potential emissions benefits from these planned rules not yet included in CARB's EMFAC2017 model for each vehicle category.¹ The scenario modeling is included in the Preliminary Draft Staff Report (PDSR) and the Draft Staff Report (DSR), and the modeling spreadsheet is included online: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/fbmsm-mtngs>.

Each scenario assumes the entire universe of warehouses meet their WPCO only through that action in each scenario. The currently proposed rule stringency is 0.0025 WAIRE Point per

¹ California Air Resources Board (CARB). Mobile Source Strategy Mobile Emissions Toolkit for Analysis (META). <https://content.govdelivery.com/accounts/CARB/bulletins/2a3e7dc>

Weighted Annual Truck Trips (WATTs) with a linear three-year phase-in schedule. As proposed, the full stringency of 0.0025 would not be achieved until the third compliance period for each warehouse, and all three phases will be at full stringency in the fifth compliance period. The universe of warehouses that are anticipated to earn points through the WAIRE Program includes a total of 2,902 warehouses totaling 759,287,371 square feet. This square footage is based on a model output in the 2018 Final Industrial Warehousing in the Southern California Association of Government's (SCAG) Region report, prepared for ~~Southern California Association of Government (SCAG)~~ by Cambridge Systematics, Inc, and accounts for possible growth.² The same three-phase distribution and split between warehouse secondary types (i.e., whether a warehouse was a cold storage or not) as at year 2020 were assumed for the growth analysis in each year.

Each warehouse's WPCO was obtained by considering the WATTs for each warehouse and rule stringency. Regardless of the action taken by each warehouse to comply in each scenario, the WPCO determines the level of implementation for each action with respect to its associated annualized metric in the WAIRE Menu. In the scenario modeling it was assumed that usage of equipment and/or trucks takes place a year after installation and/or truck purchase. Therefore, usage points are earned in the following year after installations and/or purchases points are earned. In scenarios involving trucks acquisition and visits, visits are considered to be only from the purchases and not from non-owned fleet. For the purpose of this analysis, 10 visits per week and total of 520 visits per year ~~was~~ were assumed in scenarios with truck visits. The algorithm in the scenario analysis always compares points earned under action implementation with the WPCO for each warehouse. If the number of WAIRE Points earned in a single year is greater than a warehouse's WPCO, the difference would be saved as banked points. If the sum of banked points from three prior years and concurrently earned WAIRE Points in a given year is greater than that warehouse's WPCO, no further action is required in that year. If not, then that warehouse is assumed to take additional action under that scenario based on its WPCO and points earned within that year. If a warehouse could not meet their WPCO requirement under the action considered in a scenario, they could pay a mitigation fee proportional to their points in deficit. The mitigation fee is set at \$1,000 per WAIRE Point. Specifically, the mitigation fee was considered as an alternative to meet WPCO requirements in Scenarios 3, 5, 11, and 17.

Key data sources used for developing the emission benefits under each scenario are: EMFAC2017 for developing class-specific truck emission rates (as discussed in WAIRE Program Technical Document) and CARB's Mobile Emissions Toolkit for Analysis (META) for South Coast to account for emission reductions from CARB's ACT Regulation, California Low NOx Omnibus regulations and Heavy-Duty Inspection and Maintenance (HD I/M) program; NOx Emission Rates from Continuous Emissions Monitoring Systems (CEMS) for Power Plants in South Coast AQMD Jurisdiction from 2016 to 2019 for Scenario 11; CARB's Draft 2019 TRU Emissions Inventory Output for Single Body Truck TRU Under Regulation Concept Scenario for Scenario 17; Power Systems Research Data on Population of hostlers and Carl Moyer Program Guidelines Appendix D for Emission Rates of NOx and DPM along with Orion off-road Emissions Inventory for CO2 for Scenario 18.

² Southern California Association of Governments (SCAG). 2018, April. Final Industrial Warehousing in the SCAG Region. https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf

In sum, because of the programmatic nature of the proposed project, it is not possible to predict how each of the warehouse operators will comply with the WAIRE Program. As a result, it is not possible to forecast a particular, regionwide compliance approach for the initial 2,902 warehouses that would likely need to earn WAIRE Points in any given year. Instead, the EA analyzes the potential environmental impacts that would result if all owners subject to the proposed project chose one of the ‘scenarios’ described above as their compliance path from 2021 through 2031 to meet their WPCO. This approach allows for the analysis of environmental impacts associated with each of the individual compliance options as well as the range of environmental impacts and benefits from the proposed project that could be anticipated. The EA provides ‘book-ends’ of the range of potential environmental consequences associated with the proposed project to provide a framework for understanding the greatest potential impacts in each topic area. The analysis in this EA uses the scenario approach outlined above in order to provide a conservative analysis of potential impacts of the WAIRE Program.

4.0.1.3 Goods Movement

4.0.1.3.1 Potential Warehouse Relocations

The warehousing industry in the South Coast AQMD is robust. It has grown at faster rates than surrounding areas, all while experiencing consistent increases in rent that have outpaced neighboring markets. The Industrial Economics Incorporated (IEc) Study titled “Assessment of Warehouse Relocations Associated with the South Coast AQMD Warehouse ISR” analyzes potential warehouse relocations to neighboring real estate markets outside of the South Coast AQMD’s jurisdiction in response to the WAIRE Program. Industry stakeholders interviewed as part of the IEc Study pointed to several benefits that warehouses rely on that are unique to this area, including the highly developed transportation network of multiple ports, railways, and interstate highways, along with a large labor pool that is difficult to access in more remote regions, and proximity to the large metropolitan customer base.

IEc modeled the potential relocation of warehouses with and without the proposed project using two different methods, taking into account different costs in neighboring markets such as rent, labor, utilities, transportation, etc., as well as costs associated with different potential stringencies of the proposed project. The IEc Study concluded that, using the most conservative methodology, the proposed rule would not lead operators to locate new warehouse outside of the South Coast AQMD’s jurisdiction if the rule stringency results in an annual compliance cost of \$1.50 per square foot or less of warehouse space. Under the more conservative modeling methodology, the Industrial Economics Incorporated (IEc) Study found up to 10 warehouses potentially would relocate to neighboring regions today, even without the proposed project in place. Under the most conservative scenario analyzed in the IEc Study at a rule stringency that results in an annual compliance cost of \$2.00 per square foot, which translates to a stringency factor greater than 0.0050 WAIRE points per WATT, the IEc Study concluded that the proposed rule could result in approximately six warehouses being built outside of the South Coast Air Basin (SCAB). Because the proposed rule stringency of 0.0025 WAIRE Points per Weighted Annual Truck Trips phased in over a three-year period ~~would result in compliance costs of approximately \$0.78 per square foot, the IEc Study supports the conclusion that the proposed project would not result in any warehouse relocations.~~ Nonetheless, this EA assumes the potential for up to three warehouse relocations to provide a conservative analysis of the project’s potential impacts on operational air quality, GHG emissions, energy, and transportation. An analysis of greater relocations is provided

in the Alternatives section of the EA, which includes an alternative rule that uses a stringency as high as 0.0050 WAIRE Points per WATT~~resulting in compliance costs of \$2.00 per square foot.~~

Although the EA assumes that the proposed project could result in more new warehouses being located outside of the South Coast AQMD's jurisdiction, it is important to note that the proposed project will not result in more warehouses being built overall. The proposed project will not create an increased demand for goods or warehouses. As a result, the EA does not analyze the potential impacts associated with the construction of new warehouses (which will occur either within the South Coast AQMD's jurisdiction or outside of it regardless of the proposed project). Moreover, any new warehouse would be subject to local government land use review and approval, including CEQA review.

4.0.1.3.2 *Cargo Growth Diversion*

The Ports of Los Angeles and Long Beach have recently studied the potential impacts of imposing clean truck fund rate on trucks transporting goods to and from the Ports pursuant to the Ports' Clean Truck Program. In particular, this study analyzed whether the cost of complying with that proposed update would cause cargo owners to ship their goods to other ports. The studies concluded that it would be more cost-effective for the vast majority of goods (98.6 percent) to continue using the ports of Los Angeles and Long Beach than to relocate to other ports, even if the Ports approved a new truck rate of \$70 per twenty-foot equivalent (TEU).³ The Ports ultimately approved a truck rate of \$10/TEU,⁴ though they have yet to implement the rate.

The Ports' Clean Truck Program affects goods movement differently than the proposed project because of where the costs are incurred. As a result, the Port study is not directly applicable to the proposed project. While cargo owners have only one option if they do not wish to pay the cost of complying with the Port's Clean Truck Program—i.e., ship their cargo to a different port—they have more options under the proposed project. Specifically, cargo owners could either pay for the cost of compliance with the WAIRE Program, ~~Program~~ by continuing to utilize warehouses within the South Coast AQMD, relocate to a different port, or continue shipping their goods to the Ports of Los Angeles and Long Beach but utilize warehouses just outside of the South Coast AQMD's jurisdiction in a nearby area. The IEc Study found that at annual compliance costs of \$2.00 per square foot (which translates to a stringency factor greater than 0.0050 WAIRE points per square foot and is higher than the currently proposed rule stringency ~~compliance cost~~ of the proposed project at 0.0025 WAIRE Points per WATT), only up to six warehouses might relocate to a nearby region. Because moving to a nearby region increases the travel time by only a few hours,⁵ rather than 10+ days from moving to a different port on the east coast, it is not reasonably foreseeable that cargo owners will ship their goods to other ports to avoid the cost of the proposed project if those costs are less than or equal to \$2.00 per square foot as analyzed in the IEc Study.

³ Port of Long Beach and Port of Los Angeles. 2020, February. Economic Study for the Clean Truck Fund Rate. <https://cleanairactionplan.org/documents/economic-study-for-clean-truck-fund-rate.pdf/>

⁴ Port of Long Beach and Port of Los Angeles. 2020. March. 9. Board of Harbor Commissioner Minutes. https://polb.granicus.com/MinutesViewer.php?view_id=77&clip_id=7245

⁵ For example, travel time without traffic from the ports to Bakersfield is about 2.5 hours, while travel time from the ports to Ontario (located in the Inland Empire) is about 1 hour.

While the Ports of Los Angeles and Long Beach have lost market share of containerized imports continuously since at least 2003,⁶ the reasons for this loss have been attributed to many macroeconomic causes that outweigh any increased regulatory costs in California, including labor stoppages in 2002 and 2014/2015, the widening of the Panama Canal in 2016, the recent shifting of some manufacturing from east China to southeast Asia in response to trade tensions,⁷ increased investments in infrastructure at competing ports, the lack of increased trade with areas outside of east Asia, etc. Despite this longer term shift in global trade flows, containerized traffic at the Ports of Long Beach and Los Angeles have steadily increased⁸ and is still expected to reach 34 million TEUs by 2040.⁹

Warehousing in the South Coast AQMD's jurisdiction has grown rapidly to accommodate this increased goods movement activity and is expected to continue.¹⁰ Therefore, cargo growth diversion to ports outside of the Southern California region is not an anticipated consequence associated with the proposed project. However, this EA conservatively considers that the proposed project could contribute to potential cargo growth diversion at the Ports because of the uncertainty in the market response. While the Port Study¹¹ identifies up to 1.4 percent diversion, the percentage contribution associated with the proposed project to this potential diversion cannot be determined because, as noted above, that study is not directly applicable to the proposed project. Thus, the amount of potential cargo diversion associated with the proposed project is also speculative.¹² Similarly, it is speculative to identify where cargo would be diverted given the number of options of ports outside the South Coast AQMD's jurisdiction for international shipping companies. Therefore, these impacts are discussed qualitatively throughout this EA, where applicable.

4.0.1.4 Truck Replacements

The WAIRE Program creates a WAIRE Points incentive for warehouse operators and truck fleet operators to purchase new NZE and ZE trucks, because purchasing and using these new, cleaner trucks is one way for warehouse operators to meet their WPCO. In analyzing the potential impacts of this WAIRE Points incentive, the EA assumes that these new trucks will be replacing older trucks because the WAIRE Program itself does not generate an increase in the national or even international demand for trucks used in the goods movement sector.

¹⁰ Southern California Association of Governments (SCAG). 2018, April. Final Industrial Warehousing in the SCAG Region. https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf

¹¹ Port of Long Beach and Port of Los Angeles. 2020, February. Economic Study for the Clean Truck Fund Rate. <https://cleanairactionplan.org/documents/economic-study-for-clean-truck-fund-rate.pdf/>

¹² This differs from that identified in the PDSR in order to provide a conservative analysis of potential indirect environmental effect in this EA.

The EA further assumes that some of the older trucks that are replaced by NZE and ZE trucks will be retired (i.e., scrapped) and some will be sold to other operators (either within the South Coast AQMD's jurisdiction or outside of it) to replace even older, higher emissions trucks in that operator's truck fleet. Again, this assumption is based on the fact that the proposed project does not generate an increase in the national or even international demand for trucks used in the goods movement sector, and that truck operators generally do not replace newer, cleaner trucks with older, dirtier ones. In general, the average age of a truck in the United States is 12 to 15 years old.¹³ When forecasting the demand for new trucks, truck manufactures must consider existing and pending rules and regulations since this affects the future demand. Thus truck manufactures must consider an increase in demand for NZE and ZE trucks, resulting in a nationwide trend for these new emerging technologies. Moreover, South Coast AQMD has an existing voucher ~~incentive~~ incentive program to replace fleets that have older trucks with newer trucks. Rules and regulations being adopted and incentive programs offered are creating an increased demand for NZE and ZE technologies, resulting in turnover of older, diesel-fueled trucks. Thus, operators that purchase the trucks replaced by NZE and ZE trucks pursuant to the proposed rule would either be replacing an existing truck that has aged out of or is nearing the end of its useful life or creating an increase in demand for NZE and ZE technology, resulting in greater turnover from diesel trucks to NZE and ZE trucks.

These assumptions are used in the analysis of the proposed project's environmental impacts and support the conclusion that the proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without its implementation.

4.0.1.5 Indirect Impacts Associated with New Facility Construction

The proposed project would ~~also~~ encourage and incentivize the purchase and use of NZE and ZE vehicles. As a result, it could indirectly result in the construction and operation of new manufacturing and recycling facilities as well as infrastructure improvements necessary to meet this increased demand for NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final Environmental Analysis for the ACT Regulation, and this EA incorporates that analysis by reference here. Because these potential impacts are indirect, and because the circumstances surrounding any such future development are unknown, the analysis of the potential indirect impacts associated with this development is discussed separately from the analysis of the proposed project's direct impacts in this EA.

4.0.2 Cumulative Analysis

CEQA Guidelines Section 15130(a) requires a discussion of cumulative impacts if a project may have an effect that is potentially cumulatively considerable, as defined in CEQA Guidelines Section 15065(a)(3). The proposed project applies to qualifying-sized warehouses located within the South Coast AQMD's jurisdiction, which currently extends to 2,902 warehouses that would be required to earn WAIRE Points (see Table 2-1). Due to the programmatic nature of the project, the analysis in Chapter 4 is inherently a cumulative analysis of potential impacts.

¹³ Brusseau, Dawn. NTEA News. 2019, November. "Aging Trucks Create More Service Opportunities." https://www.ntea.com/NTEA/Member_benefits/Industry_leading_news/NTEANewsarticles/Aging_trucks_create_more_service_opportunities.aspx?fbclid=IwAR3mkimdcKilEbdqvwYYSwODX5Hop5g6odQWuQdlt9cJ37I30kwxgv209PU (Accessed December 28, 2020).

Per CEQA Guidelines Section 15130(e), previously approved land use documents, including, but not limited to, general plans, specific plans, regional transportation plans, plans for the reduction of greenhouse gas emissions, and local coastal plans may be used in a cumulative impact analysis. A pertinent discussion of cumulative impacts contained in one or more previously certified EIRs may be incorporated by reference pursuant to the provisions for tiering and program EIRs. No further cumulative impacts analysis is required when a project is consistent with a general, specific, master, or comparable programmatic plan where the lead agency determines that the regional or areawide cumulative impacts of the proposed project have already been adequately addressed, as defined in CEQA Guidelines Section 15152(f), in a certified EIR for that plan. Further, if a cumulative impact was adequately addressed in a prior EIR for a community plan, zoning action, or general plan, and the project is consistent with that plan or action, then an EIR for such a project should not further analyze that cumulative impact, as provided in CEQA Guidelines Section 15183(j).

2016 AQMP Final Program EIR (State Clearinghouse No. 2016071006). The proposed project would implement the Facility-Based Mobile Source Measures (FBMSMs) included in the 2016 AQMP. The Final Program EIR for the 2016 AQMP analyzed the environmental impacts of all closely related projects, including regulatory and incentive measures that would result in greater use of ZE and NZE vehicles. The FBMSMs are concentrated on the four sectors of the goods movement industry: commercial marine ports, rail yards, warehouse distribution centers, and commercial airports. Of these FBMSMs, Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, committed to exploring how to achieve emission reductions from this sector. As discussed in Chapter 1 – Introduction, this EA tiers off of the 2016 AQMP Final Program EIR (State Clearinghouse No. 2016071006), pursuant to Public Resources Code Section 21094 and CEQA Guidelines Section 15152. In addition, consistent with CEQA Guidelines Section 15130(e), the cumulative impact analysis included in the 2016 AQMP Final Program Environmental Impact Report (EIR) (State Clearinghouse No. 2016071006) is incorporated by reference in this EA. The 2016 AQMP includes control measures to reduce emissions from sources that are primarily under state and federal jurisdiction, including on-road and off-road mobile sources that are proposed by and the responsibility of CARB (i.e., CARB’s Mobile Source Strategy). These emission reductions, along with the emission reductions from South Coast AQMD and SCAG’s Regional Transportation Strategy and Control Measures, are needed to achieve the remaining emission reductions necessary for ozone and PM2.5 attainment.

State SIP Strategy Final Environmental Analysis (EA). Statewide emission reduction control measures proposed by CARB are included in the *2016 State Strategy for the State Implementation Plan for Federal Ozone and PM2.5 Standards* (State SIP Strategy), which was adopted in March 2017. Therefore, consistent with CEQA Guidelines Section 15130(e), the cumulative impact analysis included in the State SIP Strategy Final Environmental Analysis (EA) is incorporated by reference in this EA.¹⁴ CARB is implementing the statewide emissions control strategies in the State SIP Strategy, which include the ACT Regulation and the Heavy-Duty Omnibus Regulation (Omnibus Regulation). This ~~Draft~~ EA considered the cumulative effect of CARB’s proposed rules on potential reductions and relocations associated with the proposed project.

¹⁴ California Air Resources Board. (CARB). 2017, March 10. Final Environmental Analysis for the Revised Proposed State Strategy for the State Implementation Plan. https://ww3.arb.ca.gov/planning/sip/2016sip/rev2016statesip_ceqa.pdf

ACT Regulation Final EA. CARB prepared and certified an Final EA for the ACT Regulation in accordance with the requirements of CEQA and CARB’s certified regulatory program in July 2020. Therefore, consistent with CEQA Guidelines Section 15130(e), the cumulative impact analysis included in the ACT Regulation Final EA is incorporated by reference in this EA.

4.1 AIR QUALITY AND GREENHOUSE GAS EMISSIONS

The overall purpose of the proposed project is to reduce NO_x and fine PM emissions associated with warehouse operations within South Coast AQMD's jurisdiction. To accomplish this purpose, the proposed project incentivizes transition to NZE and ZE trucks. By requiring warehouse operators to earn WAIRE Points that count towards a warehouse operator's WPCO, implementation of the proposed project would accelerate use of cleaner technologies for mobile sources associated with warehouse operations.

Compliance with the proposed project may, in some cases, require construction of new ZE infrastructure. For example, if a warehouse chooses to meet its WPCO by constructing with a new ZE charging station, that activity will require construction. As a result, compliance with the WAIRE Program could have potentially significant air quality impacts associated with that construction. These construction-related impacts are analyzed below.

Similarly, while the IEc Study determined that the WAIRE Program would not lead operators to locate a new warehouse outside of the South Coast AQMD's jurisdiction with a proposed project stringency of 0.0025 or less, this analysis nonetheless assumes the potential for up to three warehouse relocations in order to provide a conservative analysis of the proposed project's potential impacts. Similarly, while it is unlikely that cargo shipping companies may choose to divert their cargo to another port to avoid the compliance costs of the proposed project, this EA assumes that some diversion may occur. The air quality impacts associated with these market responses are considered 'operational' impacts of the proposed project and are analyzed below.

The proposed project would also encourage and incentivize the purchase and use of NZE and ZE vehicles instead of conventional gasoline and diesel vehicles. As a result, it could indirectly result in the construction and operation of new manufacturing and recycling facilities, as well as grid improvements, necessary to meet this increased demand for NZE and ZE vehicles and provide the energy and infrastructure to power them. These potential impacts were analyzed in CARB's Final Environmental Analysis for the Advanced Clean Trucks (ACT) Regulation, and this EA incorporates that analysis by reference here. Because these potential impacts are indirect, and because the circumstances surrounding any such future development are unknown, the analysis of the proposed project's potential indirect impacts on air quality and greenhouse gas (GHG) emissions associated with this development is discussed separately from the analysis of the proposed project's direct impacts.

In general, because the WAIRE Program allows warehouse operators to comply in a number of ways, it is not possible to determine the exact air quality impacts of the proposed project. Nonetheless, the following analysis provides a conservative estimate of potential air quality and GHG emissions impacts and benefits of the proposed project. A summary of the impact scenarios considered in this analysis is provided in Table 4.1-1.

Table 4.1-1
WAIRE Program Scenarios Considered for the Air Quality and GHG Emissions Impact Analysis

Scenario #	Scenario	Construction	Operational Phase		
			Warehouse Relocations	Electricity (GHG only)	AQ/GHG Benefits
Scenario 1	NZE Class 8 truck acquisitions and subsequent visits from those trucks	No	Yes	No	Yes
Scenario 2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase)	No	Yes	No	Yes
Scenario 3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks	No	Yes	No	Yes
Scenario 4	NZE Class 8 truck visits from non-owned fleets	No	Yes	No	Yes
Scenario 5	ZE Class 8 truck visits from non-owned fleets	No	Yes	No ^b	Yes
Scenario 6	Level 3 charger installations Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers	Yes	Yes	Yes	Yes
Scenario 7	Pay Mitigation Fee	No	Yes	No	Yes
<u>Scenario 7a</u>	<u>Pay Mitigation Fee and account for NZE trucks visiting the facility incentivized from the WAIRE Mitigation Program</u>	<u>No</u>	<u>Yes</u>	<u>No</u>	<u>Yes</u>
Scenario 8	NZE Class 6 truck acquisitions and subsequent visits from those trucks	No	Yes	No	Yes
Scenario 9	NZE Class 6 truck visits from non-owned fleets	No	Yes	No	Yes

Table 4.1-1
WAIRE Program Scenarios Considered for the Air Quality and GHG Emissions Impact Analysis

Scenario #	Scenario	Construction	Operational Phase		
			Warehouse Relocations	Electricity (GHG only)	AQ/GHG Benefits
Scenario 10	ZE Class 6 truck visits from non-owned fleets	No	Yes	No	Yes
Scenario 11	Rooftop solar panel installations and usage	Yes ^a	Yes	Yes	Yes
Scenario 12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station	Yes	Yes	No	Yes
Scenario 13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks	No	Yes	No ^b	Yes
Scenario 14	ZE Class 2b-3 truck visits from non-owned fleets	No	Yes	No ^b	Yes
Scenario 15	Filter System Installations	Yes ^a	Yes	Yes	Yes
Scenario 16	Filter Purchases	No	Yes	No	Yes
Scenario 17	TRU plug installations and usage in cold storage facilities	No	Yes	Yes ^c	Yes
Scenario 18	ZE Hostler Acquisitions and Usage	Yes ^a	Yes	Yes	Yes

Notes:

^a This scenario would generate construction emissions from worker and/or vendor deliveries but would not generate emissions from off-road equipment. As a result, construction emissions from this scenario are considered nominal and are not modeled.

^b Energy from use and/or purchase of ZE trucks is considered under Scenario 6.

^c Although ZE TRUs plugged in at docks would generate an increased demand for electricity, the WAIRE Points scenario modeling shows that the proposed project would not result in an incremental increase in demand for ZE TRUs above the baseline. Therefore, this scenario is not modeled.

4.1.1 Significance Criteria

The proposed project's air quality and GHG emissions impacts will be considered significant if the proposed project would:

- a. Conflict with or obstruct implementation of the applicable air quality plan.

- b. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
- c. Expose sensitive receptors to substantial pollutant concentrations.
- d. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.
- e. Diminish an existing air quality rule or future compliance requirement resulting in a significant increase in air pollutant(s).
- f. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
- g. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The Initial Study for the proposed project, under Chapter 2, Section II, *Air Quality and GHG Emissions*, Impact (a), identified that the proposed project would not conflict with the AQMP; under Impact (d), identified that the proposed project would not result odors adversely affecting a substantial number of people; and under Impact (e), identified that the proposed project would not ~~diminish~~ diminish an existing air quality rule or future compliance requirement resulting in a significant increase in air pollutants. Therefore, these significance criteria will not be discussed further in this EA.

4.1.1.1 Criteria Air Pollutants

To determine whether air quality impacts from implementing the proposed project are significant, emissions from criteria air pollutants will be quantified and compared to the South Coast AQMD's air quality significance criteria in Table 4.1-2. If emissions equal or exceed any of the air quality significance thresholds in Table 4.1-2, impacts will be considered potentially significant. All feasible mitigation measures must be identified and implemented to minimize significant impacts to the maximum extent feasible.

Table 4.1-2
South Coast AQMD Air Quality Significance Thresholds

Mass Daily Thresholds ^a		
Pollutant	Construction ^b	Operation ^c
NOx	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM10	150 lbs/day	150 lbs/day
PM2.5	55 lbs/day	55 lbs/day
SOx	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day
Toxic Air Contaminants (TACs), Odor, and GHG Thresholds		
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 10 in 1 million Cancer Burden > 0.5 excess cancer cases (in areas ≥ 1 in 1 million) Chronic- & Acute Hazard Index ≥ 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to South Coast AQMD Rule 402	
GHG	10,000 MT/yr CO ₂ eq for industrial facilities	
Ambient Air Quality Standards for Criteria Pollutants ^d		
NO2 1-hour average annual arithmetic mean	South Coast AQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.03 ppm (state) and 0.0534 ppm (federal)	
PM10 24-hour average annual average	10.4 µg/m ³ (construction) ^e and 2.5 µg/m ³ (operation) 1.0 µg/m ³	
PM2.5 24-hour average	10.4 µg/m ³ (construction) ^e and 2.5 µg/m ³ (operation)	
SO2 1-hour average 24-hour average	0.25 ppm (state) and 0.075 ppm (federal – 99th percentile) 0.04 ppm (state)	
Sulfate 24-hour average	25 µg/m ³ (state)	
CO 1-hour average 8-hour average	South Coast AQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)	
Lead 30-day Average Rolling 3-month average	1.5 µg/m ³ (state) 0.15 µg/m ³ (federal)	
^a Source: South Coast AQMD CEQA Handbook (South Coast AQMD, 1993) ^b Construction thresholds apply to both the South Coast Air Basin and Coachella Valley (Salton Sea and Mojave Desert Air Basins). ^c For Coachella Valley, the mass daily thresholds for operation are the same as the construction thresholds. ^d Ambient air quality thresholds for criteria pollutants based on South Coast AQMD Rule 1303, Table A-2 unless otherwise stated. ^e Ambient air quality threshold based on South Coast AQMD Rule 403. KEY: lbs/day = pounds per day ppm = parts per million µg/m ³ = microgram per cubic meter ≥ = greater than or equal to MT/yr CO ₂ eq = metric tons per year of CO ₂ equivalents > = greater than		
Revision: April 2019		

South Coast AQMD has developed CEQA significance thresholds for air quality for both construction and operation based on the maximum or peak emissions day.¹ Therefore, when analyzing the impacts of a permit or rule, the South Coast AQMD, as CEQA lead agency, makes significance determinations for construction and operational impacts based on the maximum or peak daily emissions during the construction of the project or project operation period, which provides a comprehensive analysis of the construction and operational emissions. Additionally, if there is an overlap between a project's construction and operational emissions, South Coast AQMD recommends that the overlapping emissions be summed and compared to the operational thresholds. Here, the proposed project is the WAIRE Program that requires warehouse operators to choose from a menu of options to reduce emissions associated with their operations. Thus, the air quality impacts attributable to the project are the impacts from reasonably foreseeable actions taken by warehouse operators to comply with the proposed project. As discussed below, the 'construction' activities associated with the proposed project include installation of ZE charging or fueling infrastructure (i.e., ZE chargers and hydrogen fueling stations), installation of solar panels, installation of additional 'plugs' to accommodate ZE transport refrigeration units (TRUs) or ZE cargo handling equipment, and installation of air conditioning (HVAC) systems. The 'operational' activities associated with the proposed project include potential warehouse relocations and cargo growth diversions and the use of cleaner technologies at warehouses with South Coast AQMD's jurisdiction including NZE and ZE trucks visiting the warehouse, ZE cargo handling equipment, ZE TRUs, operation of HVAC systems with Minimum Efficiency Reporting Value (MERV) of 16 (MERV-16), and operation of solar panels.

4.1.1.2 GHG Emissions

As noted in Table 4-3, the GHG emissions threshold for projects where South Coast AQMD is the Lead Agency is set at 10,000 metric tons of carbon dioxide (CO₂)-equivalent emissions (MTCO₂eq) per year. The South Coast AQMD convened a Greenhouse Gas CEQA Significance Threshold Working Group to consider a variety of benchmarks and potential significance thresholds to evaluate GHG impacts. On December 5, 2008, the South Coast AQMD adopted an interim CEQA GHG Significance Threshold for projects where South Coast AQMD is the lead agency.² South Coast AQMD prepared a "Draft Guidance Document – Interim CEQA GHG Significance Thresholds" that outlined the approved tiered approach to determine GHG significance of projects.³ The first two tiers involve: 1) exempting the project because of potential reductions of GHG emissions allowed under CEQA; and, 2) demonstrating that the project's GHG emissions are consistent with a local general plan. Tier 3 proposes a limit of 10,000 MTCO₂eq per year as the incremental increase representing a significance threshold for projects where South Coast AQMD is the lead agency.⁴ Tier 4 (performance standards) is yet to be developed. Tier 5

¹ Construction activities are "short-term" activities that may occur as warehouse operators comply with the proposed project. Operational activities are the "long-term" effects associated with the proposed project implementation.

² South Coast AQMD. 2008, December 5. Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans. <http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds>

³ South Coast AQMD. 2008, December 5. Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans. <http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds>, pg. 3-10

⁴ South Coast AQMD. 2008, December 5. Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans. <http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds>, pg. 3-11

allows offsets that would reduce the GHG impacts to below the Tier 3 bright line threshold. Projects with incremental increases below this threshold will not be cumulatively considerable.

4.1.1.3 Lifecycle Analysis

CEQA does not require a full lifecycle analysis of potential environmental effects. This is because the impact analysis in CEQA is subject to the rule of reason. Moreover, CEQA only requires analysis of impacts that are directly or indirectly attributable to the project under consideration (CEQA Guidelines Section 15064(d)). Lifecycle analysis in general may not be consistent with CEQA because the term ‘lifecycle’ could refer to emissions beyond those that could be considered ‘indirect effects’ of a project under CEQA Guidelines Section 15358.⁵

The Natural Resources Agency has indicated that a lifecycle analysis is not necessary to adequately analyze a project’s energy or GHG impacts. Pursuant to the Natural Resources Agency’s *Final Statement of Reasons for the Regulatory Action Amendments to the State CEQA Guidelines*, the energy impact analysis in CEQA is subject to the ‘rule of reason.’

“This [energy] analysis is subject to the rule of reason and shall focus on energy use that is caused by the project.” (CEQA Guidelines Section 15126.2(b))

This was added to the CEQA Guidelines to place a reasonable limit on the analysis and signal that a full lifecycle analysis will generally not be required.⁶

Similarly, according to the *Final Statement of Reasons for the Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*:

In some instances, materials may be manufactured for many different projects as a result of general market demand, regardless of whether one particular project proceeds. Thus, such emissions may not be "caused by" the project under consideration. Similarly, in this scenario, a lead agency may not be able to require mitigation for emissions that result from the manufacturing process. Mitigation can only be required for emissions that are actually caused by the project. (State CEQA Guidelines Section 15126.4(a)(4).) Conversely, other projects may spur the manufacture of certain materials, and in such cases, consideration of the indirect effects of a project resulting from the manufacture of its components may be appropriate. A lead agency must determine whether certain effects are indirect effects of a project, and where substantial evidence supports a fair argument that such effects are attributable to a project, that evidence must be considered. However, to avoid potential confusion regarding the scope of indirect effects that must be analyzed, the term "lifecycle" has been removed from Appendix F.⁷

⁵ California Natural Resources Agency. 2009, December. *Final Statement of Reasons for the Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*. https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/Final_Statement_of_Reasons.pdf

⁶ California Natural Resources Agency. 2018, November. *Final Statement of Reasons for the Regulatory Action Amendments to the State CEQA Guidelines*. OAL Notice File No. Z-2018-0116-12. https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/2018_CEQA_Final_Statement_of%20Reasons_111218.pdf

⁷ California Natural Resources Agency. 2009, December. *Final Statement of Reasons for the Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*. https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/Final_Statement_of_Reasons.pdf, pg. 72

Preparing a “lifecycle” analysis for the proposed project—i.e., an analysis of all of the potential energy, air quality, and GHG impacts associated with the proposed project’s role in incentivizing the transition from diesel vehicles to NZE ZE vehicles—would also be speculative given that the proposed project allows regulated warehouses to comply through a number of different means. For all of these reasons, this EA does not attempt to provide such a lifecycle analysis.

4.1.2 Air Quality Impacts During Construction (Significance Criteria b and c)

Construction-related emissions can be distinguished as either onsite or offsite. Onsite emissions generated during construction principally consist of exhaust emissions (VOC, NO_x, CO, SO_x, PM₁₀ and PM_{2.5}) from heavy duty construction equipment operation, fugitive dust (primarily as PM₁₀) from disturbed soil, and VOC emissions from asphaltic paving and painting. Offsite emissions during the construction phase normally consist of exhaust emissions and entrained paved road dust (primarily as PM₁₀) from worker commute trips, material delivery trips, and haul truck material trips to and from the construction site.

Here, ‘construction’ activities associated with the proposed project include: the installation of ZE charging, installation of hydrogen fueling station, installation of solar panels, installation of additional ‘plugs’ to accommodate ZE transport refrigeration units (TRUs) or ZE cargo handling equipment, and installation of high-efficiency HVAC systems. This is because warehouse operators may choose to comply with the proposed project by undertaking the following activities, all of which involve construction:

- **ZE Charger Installation (Scenario 6).** Construction of ZE charging stations at existing warehouses would warrant use of heavy, off-road construction equipment, worker trips, and vendor deliveries. Based on information compiled for ZE charging station projects by South Coast AQMD, installation of ZE truck charging infrastructure at a warehouse is assumed to have a construction duration of two days, an estimated ZE charging pad size of 5,000 square feet, and the following construction equipment: one industrial concrete saw, one backhoe, one skid steer loader with auger attachment (bore/drill), one crane, and one cement mixer. Modeling for this scenario was conducted using CalEEMod, version 2016.3.2.
- **Hydrogen Fuel Stations (Scenario 12).** Construction of hydrogen fueling stations at existing warehouses would warrant use of heavy, off-road construction equipment, worker trips, and vendor deliveries. Based on information compiled for similar fuel station projects at existing gas stations, installation of a hydrogen fueling station at a warehouse is assumed to have an ‘active’ construction duration of 2.5 months, on a 0.3-acre site, and the following construction equipment: one backhoe, one crane, and concrete and delivery trucks. Modeling for this scenario was conducted using CalEEMod, version 2016.3.2.
- **Solar Panel Installation (Scenario 11).** Installation of solar panels on warehouse rooftops would generate emissions from worker vehicle trips and vendor deliveries. It is not anticipated to require use of heavy, off-road construction equipment. Additionally, construction activities would occur over a short period (1-5 days). As a result, installation of solar panels is anticipated to have nominal construction emissions; ~~and~~ therefore, construction emissions were not modeled for this scenario.
- **‘Plug’ Installation for ZE TRUs (Scenario 17) or ZE Cargo Handling Equipment (Scenario 18).** Installation of additional electric outlets to accommodate ZE equipment such as ZE TRUs and ZE cargo handling equipment at docks and building exterior/interior is

anticipated to result in emissions from construction worker trips. It is not anticipated to require substantial building modifications that would warrant use of heavy, off-road construction equipment. Additionally, construction activities would occur over a short period (1-5 days). As a result, installation of plugs/outlets at warehouses is anticipated to have nominal construction emissions; and therefore, construction emissions were not modeled for this scenario.

- **High Efficiency HVAC Filter System Installation (Scenario 15).** Installation of HVAC equipment at sensitive land uses is anticipated to result in emissions from construction worker trips. It is not anticipated to require substantial building modifications that would warrant require use of heavy, off-road construction equipment. Additionally, construction activities would occur over a short period (1-5 days). As a result, installation of high efficiency HVACs filter systems is anticipated to have nominal construction emissions; ~~and~~ therefore, construction emissions were not modeled for this scenario.

Scenarios 1 through 5, 8 through 10, and 13 and 14 would allow WAIRE Points for purchase and use of NZE and ZE trucks, and would not warrant short-term construction activities to implement. Likewise, Scenario 7 (mitigation fee), Scenario 7a (mitigation fee and NZE truck visits), Scenario 16 (high efficiency filter purchases), and Scenario 18 (ZE cargo handling equipment purchase and use) would not warrant short-term construction activities to implement.

As discussed elsewhere in this EA, it is not possible to predict which WAIRE Points menu options each of the warehouse operators subject to the proposed project will choose. Moreover, the proposed project allows warehouse operators to propose a custom plan and/or pay a mitigation fee. Given that a warehouse operator has many factors to consider when choosing how to meet their WPCO, it is not possible to predict warehouse operator choices. Instead, this EA assessed the construction impacts associated with the scenarios listed above and conducted construction modeling for Scenarios 6 and 12, the scenarios with the greatest potential construction air quality impacts.

For these two scenarios (Scenario 6 and Scenario 12), the model assumed that all warehouse operators subject to the WAIRE Program would select the same compliance option. Thus, for example, in Scenario 6, the model assumed all warehouse operators would comply with the WAIRE Program by installing ZE charges. Assumptions were then made to estimate combustion emissions for Scenario 6 and Scenario 12 from construction activities necessary to carry out the compliance option, including construction activities occurring onsite; offsite on-road emissions from worker trips, deliveries, and haul trips; and onsite fugitive dust emissions.

Construction emissions were calculated for Scenarios 6 (ZE truck charger installation) and Scenario 12 (hydrogen fuel station installation) because these scenarios would warrant construction activities that are more intensive than the other WAIRE Points scenarios. The following WAIRE Points scenarios are not anticipated to require use of substantial off-road construction equipment: Scenario 11 (rooftop solar installation), Scenario 15 (high efficiency filters or filter systems installation), and Scenario 17 (TRU plug installations at cold storage facilities). As a result, WAIRE Points Scenario 6 and Scenario 12 represent the highest potential construction emissions scenarios associated with the proposed project and are used to conservatively estimate the ‘worst case’ emissions associated with the proposed project.

As identified previously, each of these WAIRE Point scenarios assumes that all warehouse operators selected that compliance option as the single, sole compliance option to meet their

WPCO. As a result, the highest emissions scenario represents the worst-case potential construction emissions associated with the proposed project. For Scenario 6, if 100 percent of warehouse facilities chose to install ZE chargers in the first year to meet their WPCO, then there would be up to ~~1,863~~ 1,857 ZE charger installations. For Scenario 12, if 100 percent of warehouse facilities chose to meet their WPCO by installing hydrogen fueling infrastructure, then there would be 1,160 hydrogen fueling station installations in year 2024 (compliance year 3 is the worst-case year) that would install this equipment onsite.

The construction emissions associated with Scenario 6 and Scenario 12 are the result of construction worker and vendor trips as well as emissions from construction equipment. Construction worker and vendor trips for these two scenarios were calculated using CalEEMod, version 2016.3.2, computer model based on data compiled by South Coast AQMD for ZE charger and for fueling infrastructure projects on developed sites. In general, limited construction emissions from site preparation activities, which may include earth moving and/or grading, are anticipated because each affected warehouse facility typically has already been graded and paved. Air quality emissions were based on the year 2021 in order to capture the ‘worst-case’ emissions rates for the most intensive construction scenarios, because this is the year projects would first start to be implemented following adoption of the WAIRE Program, and year 2021 would represent the most conservative emissions rates for off-road construction equipment. Detailed CalEEMod output files are included in Appendix D of this EA. The results are shown in Table 4-4 for Scenario 6 and Table 4-5 for Scenario 12.

4.1.2.1 Potential Construction Impacts from Scenario 6: ZE Truck Charger Installation

Scenario 6 assumes that all warehouse operators selected the purchase and use of ZE trucks and ZE charger installations as the single, sole compliance option to meet their WPCO. This scenario considers installation of ‘level 3’ chargers that deliver an electric charge between 19.2 and 50 kW in the first year a warehouse is subject to the proposed project followed by purchase of battery-electric Class 6 ZE trucks in the next year. In the following years, facilities would earn points by using the charging infrastructure and visits from acquired ZE fleet in the prior years. A limit of 25 purchases of Class 6 ZE trucks per facility is assumed in this scenario, and after that, facilities would purchase Class 8 ZE trucks to meet their WPCO requirement if needed. As identified previously, this scenario and all scenarios in the EA result in a conservative estimate of impacts because it is highly unlikely that all operators would choose to fulfill their WPCO with a single compliance option, every compliance year, for 10 years. As a result, the emissions identified in the table provides a conservative estimate of the potential greatest possible potential increase in construction emissions associated with the proposed project. Based on information compiled by South Coast AQMD for similar charging infrastructure projects, installation of ZE truck charging infrastructure at a warehouse is assumed to have a construction duration of two days, an estimated ZE charging pad size of 5,000 square feet, and the following construction equipment: one industrial concrete saw, one backhoe, one skid steer loader with augur attachment (bore/drill), one crane, and one cement mixer. The emissions from installation of ZE chargers are shown in Table 4.1-3.

Table 4.1-3

Source: CalEEMod Version 2016.3.2.25

^a To estimate emissions associated with overlapping projects, annual emissions from CalEEMod are multiplied by the number of projects under this scenario and converted to daily emissions by dividing by 365.

4.1.2.2 Potential Construction Impacts from Scenario 12: Hydrogen Fueling Station Infrastructure

Scenario 12 assumes that all warehouse operators selected purchase and use of hydrogen fueling station infrastructure as the single, sole compliance option to meet their WPCO. In this scenario, one hydrogen fueling station with capacity of 700 kilograms per day is installed in the first year a warehouse is subjected to the rule followed by a purchase of a hydrogen fuel cell Class 8 ZE truck in the next year. Warehouse operator would make more truck purchases as required by their WPCO considering points earned from the usage of the fueling infrastructure and visits from Class 8 ZE trucks already acquired in prior years. As identified previously, this scenario and all scenarios in the EA result in a conservative estimate of impacts because it is highly unlikely that all operators would choose to fulfill their WPCO through this single compliance option, every compliance year, for 10 years. As a result, the emissions identified in the table provides a very conservative estimate of the potential greatest possible increase in construction emissions associated with the proposed project. Based on information compiled for similar fuel station projects at existing gas stations, installation of a hydrogen fueling station at a warehouse is assumed to have an ‘active’ construction duration of 2.5 months on a 0.3-acre site, and the following construction equipment: one backhoe, one crane, and concrete and delivery trucks. The emissions from installation of hydrogen fueling station at a warehouse are shown in Table 4.1-4.

Table 4.1-4
Construction Emissions Associated with Hydrogen Fueling Infrastructure Station – Scenario 12

Activity	Scenario 12 Construction Emissions (lbs/day)

^a To estimate emissions associated with overlapping projects, annual emissions from CalEEMod are multiplied by the number of projects under this scenario and converted to daily emissions by dividing by 365.

4.1.2.3 Construction Summary

Tables 4.1-3 and 4.1-4 represent the potential second highest and highest construction emissions scenarios, respectively, if all warehouse operators selected these options as the single, sole compliance option to meet their WPCO in a compliance year. Because this EA cannot predict how each of the operators will comply with the proposed project, it is not possible to forecast a particular, regionwide compliance approach for the initial 2,902 warehouses that would likely need to earn WAIRE Points in any given compliance year. Thus, the analysis in this EA has taken a conservative scenario approach to estimating the maximum potential impacts associated with the proposed project. The peak daily emissions in Table 4.1-4 represent the highest potential emissions that could occur with implementation of the proposed project. As identified in this table, construction activities associated with the proposed project have the potential to exceed South Coast AQMD significance thresholds for NOx and CO during the construction phase in the peak year.

4.1.2.4 Indirect Impacts Associated with Construction of New Manufacturing Facilities, Recycling Facilities, and Grid Improvements

Because the proposed project incentivizes the purchase and use of NZE and ZE vehicles, it could also indirectly result in the construction and operation of new manufacturing and recycling facilities as well as infrastructure improvements to support NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final EA for the ACT Regulation, and this EA incorporates that analysis by reference here. In summary, the ACT Final EA identifies that construction activities would result in an increase in emissions; however, such facilities would be required to seek local land use approvals prior to their implementation. Part of the land use entitlement process requires that each of these projects undergo environmental review consistent with California environmental review requirements (e.g., CEQA) and other applicable local requirements (e.g., local air district rules and regulations), and that the land use authority impose feasible mitigation. Nonetheless, because CARB does not have land use approval authority, it could not guarantee that any mitigation measures will be imposed, and therefore CARB concluded these indirect construction-related effects are significant.

Similarly, the 2016 AQMP Final Program EIR also analyzed the potential construction and operational air quality impacts of that program, which included Control Measure MOB-03, an indirect source rule for warehouses. In particular, the EIR noted that MOB-03, together with other measures, could “have the potential to generate construction emission impacts from constructing infrastructure to provide support for new cleaner equipment or vehicles.”⁸ This EA incorporates this analysis by reference, including the listed mitigation measures, as a supplement to the analysis provided above.

4.1.3 Air Quality Impacts During Operation (Significance Criteria b and c)

As discussed in the introduction to Chapter 4, the IEc Study concluded the proposed project, at a rule stringency of 0.0025, would not cause new warehouses ~~would~~ to be located outside South Coast AQMD’s jurisdiction. However, in order to provide a conservative analysis of potential environmental impacts, this assessment assumes that up to three new warehouses may choose to locate outside the South Coast AQMD’s jurisdiction, rather than within it, to avoid having to comply with the proposed project. Additionally, it is not reasonably foreseeable that cargo shippers would divert cargo to other ports to avoid the increased cost of compliance with the proposed project, because of the uncertainty of the market response, and the EA assumes some shipping diversion, which is discussed qualitatively. Under this conservative assumption, the proposed project could result in an increase in air quality emissions as a result of additional truck VMT from facility relocations as well as from the methods used to earn WAIRE Points used for the warehouse operators WPCO. Similarly, as discussed above, this EA assumes that there may be some cargo owners who decide to ship their cargo to a different port to avoid the cost of compliance. Again, this is a conservative assumption because it is an unlikely market response. These additional ‘operational’ impacts are analyzed below, under “Potential Operational Impacts from Facility Relocations and Cargo Growth Diversion.”

At the same time, under several compliance options, the proposed project would result in greater turnover of diesel trucks to NZE and ZE trucks (Scenarios 1 through 6, 8 through 10, and 13 and 14). NZE and ZE trucks have lower NO_x and PM emissions than diesel trucks. Thus, the proposed project also has the potential to shift the type of energy sources utilized for the transportation sector in the South Coast AQMD region, and result in a reduction in NO_x and PM emissions. Currently, the goods movement sector relies on diesel fuel as the primary energy source for trucks. By providing a mechanism for warehouse operators that would incentivize early transition to NZE and ZE technology as a means to comply with the WPCO, the proposed project is expected to result in a decrease in air pollutant and GHG emissions in the South Coast AQMD region for several of the compliance option scenarios. These air quality benefits are discussed below, under “Range of Criteria Air Pollutant Benefits from the Proposed Project.”

The analysis in this EA provides ‘book-ends’ of the range of potential environmental consequences associated with the proposed project to provide a framework for understanding the greatest potential impacts in each topic area. The analysis in this EA has taken the scenario approach outlined above in order to provide a conservative analysis of potential greatest impacts of the proposed project.

⁸ South Coast Air Quality Management District, January 2017, Final Program Environmental Impact Report for the 2016 Air Quality Plan, <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfeir.pdf>, pg. 4.1-17

4.1.3.1 Potential Operational Impacts from Warehouse Relocations and Cargo Growth Diversion

Based on the currently proposed rule stringency of 0.0025, the proposed project would not result in warehouse relocations out of South Coast AQMD's jurisdiction. Under the highest rule stringency considered, that would result in \$2.00 per square foot of additional cost to warehouse operators, the proposed project would result in a maximum of six warehouse relocations (see Chapter 5, Alternatives). This EA conservatively considers the potential for up to three warehouse relocations from the proposed project, even though no such relocations are expected based on the IEc Study, in order to provide a conservative analysis of the operational air quality and GHG emissions, energy, and transportation impacts. Table 4.1-5 shows the potential increase in criteria air pollutant emissions associated with an increase in truck VMT for up to three potential warehouse relocations that are assumed for the purpose of this EA. As identified in this table, the increase in emissions from up to three relocations would exceed the South Coast AQMD threshold for NO_x and would be potentially significant in the absence of potential emissions reductions from the proposed project. However, the proposed project would result in regional emissions benefits that needed to be weighed with the potential impacts.

Table 4.1-5
Criteria Air Pollutant Emissions from Worst Case Up to Three Warehouse Relocations

Activity	Worst Case Up to Three Warehouse Relocations (lbs/day)	
	NO _x	PM ₁₀
Total	62.3 73.6	0.5 0.6
Significance Threshold	55	55 150
Exceeds Threshold?	Yes	No
Notes: For potential warehouse relocations in the IEc Study, it is assumed to be Pathway 15 for national distribution. So, there would be very minimal Class 2b-7 truck trips as they are typically used for last mile type trips.		

Although it is not reasonably foreseeable that cargo shippers would divert cargo to other ports to avoid the increased cost of compliance with the proposed project, because of the uncertainty of the market response, the EA assumes some shipping diversion. However, it is not possible to determine the amount of cargo diverted, where the cargo would be diverted to, or the existing air quality at the alternative port. As a result, it would be speculative to attempt to quantify such impacts.

Considered qualitatively, any impacts of such cargo diversion would likely be *de minimis*. This is because the amount of diverted cargo would likely be small—much smaller than the 1.4 percent estimated in the Port Study, for the reasons discussed above. Moreover, this small amount of cargo would likely be carried on ships that are already headed to other ports and would not result in additional shipping trips. As a result, any air quality impacts would be limited to increased emissions resulting from the small increase in weight. These impacts would thus likely be *de minimis*.

Moreover, the severity of a project's air quality impacts is typically judged by whether the project would cause an exceedance of local air quality standards. Given that the South Coast AQMD has some of the poorest air quality in the nation, it is likely that the minimal emissions associated with diverted cargo would ~~behave~~ have less impact ~~ful~~ at other ports than at the Ports of Los Angeles and Long Beach.

For all of these reasons, any operational air quality impacts associated with potential cargo diversion would be less than significant.

4.1.3.2 Range of Criteria Air Pollutant Benefits from the Proposed Project

The WAIRE Program is designed to have significant air quality benefits, especially for the communities located near warehouses in South Coast AQMD's jurisdiction. In general, the WAIRE Program achieves these benefits by requiring warehouse operators to implement air quality improvement measures. Operators can comply with WAIRE Program requirements in a number of ways, including by using NZE or ZE trucks in place of higher-polluting diesel trucks; building infrastructure to support expanded use of ZE trucks; increasing use of solar energy; and installing new filtration systems for sensitive receptors that are currently exposed to poor air quality.

Since it is speculative to determine how individual warehouse operators will choose to comply with the proposed project, it is not possible to quantify the exact emissions benefits that will result from the proposed project. Instead, this EA considers the range of emissions benefits that would result from each of the compliance options modeled as Scenarios 1 through 18 as a way to identify the environmental consequences of the WAIRE Points isolated for each individual compliance option. Table 4.1-6 shows the potential range of emissions reductions as a result of implementation of the proposed project under each of the different WAIRE Points scenarios modeled at compliance year 10 (year 2031) (see also Section 4.0.1.2, WAIRE Points Scenario Modeling, for a description of how benefits were modeled). It should be noted that NZE trucks have lower emissions than the diesel-fueled trucks they would replace. Once again, the WAIRE Point scenarios listed below assume that all warehouse operators selected that compliance option as the single, sole compliance option to meet their WPCO.

In Table 4.1-6, only Scenarios 15 (high efficiency filtration systems) and 16 (filter purchases) would not result in NO_x emissions reductions because they are aimed at providing exposure reduction benefits in disadvantaged communities proximate to warehouses. It is unlikely that all warehouse operators would select installation of high efficiency filtration systems and filter purchases as the primary means of fulfilling their WPCO since installation of filtration systems in private properties is the second most expensive compliance option and is harder to implement since this option has the higher long-term costs for private properties owners, which would make it less likely to occur. Given that all other scenarios would result in substantial NO_x reductions and given the proposed project would include tracking and monitoring to ensure that the NO_x emissions reductions benefits from the WPCO Points are realized over time, this EA assumes that the emissions benefits from the proposed project (as shown in Table 4.1-6) far outweigh any potential increase from up to three warehouse relocations. Therefore, no long-term air quality impacts would occur.

Table 4.1-6
Potential Emissions Reductions in the South Coast AQMD Region from the Proposed Project in
Year 2031 (Compliance Year 10)

Min. Potential Emissions Reduction		<u>0</u>	<u>0</u>

4.1.3.4 Transition to NZE and ZE Trucks (Scenarios 1-6, 8-10, and 12-14)

The proposed project would allow for purchase of new NZE and ZE trucks as a way for warehouse operators to meet their WPCO. Because NZE and ZE trucks have lower NO_x and PM₁₀ emissions than diesel trucks, the proposed project would likely result in significant emissions reductions. Table 4.1-6 shows the potential criteria air pollutant emissions reductions benefits associated with the modeled WAIRE Points scenarios (see Scenarios 1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 13, and 14). It is anticipated that when warehouse operators replace trucks with NZE and ZE trucks, some of the older trucks will be retired (i.e., scrapped), and some of these trucks would be transitioned to other uses or warehouses outside of South Coast AQMD's jurisdiction for trucks that are no longer eligible to access the San Pedro Bay Ports. However, even in this instance where the trucks are transitioned to other uses, it can be presumed that they would replace even older, higher emissions trucks in an operator's truck fleet. This assumption is based on the fact that the proposed project does not generate an increase in the national or even international demand for trucks used in the goods movement sector. Thus, operators that purchase the trucks replaced by NZE and ZE trucks pursuant to the proposed project would be replacing an existing truck that has aged out of or is nearing the end of its useful life. These assumptions support the conclusion that the proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without implementation of the proposed project, and that there would be an emissions benefit from the proposed project due to its incentives for replacing older trucks with newer ones. Regardless of whether or not trucks are retired or transferred, there would be a reduction in emissions from replacement of an older truck. These potential reductions as a direct result of the proposed project are captured in the scenario modeling shown in Table 4.1-6.

4.1.3.5 Efficiency of Goods Movement in Southern California

Because warehouse operators may earn WAIRE Points and comply with the WAIRE Program in many different ways, it's the effect on goods movement in Southern California is speculative. On the one hand, the WAIRE Program could decrease the overall VMT efficiency of goods movement in the South Coast AQMD region by creating WAIRE Points incentives to reroute NZE and ZE trucks to warehouses in the South Coast AQMD. For example, operators with multiple warehouses in the South Coast AQMD may choose to satisfy the WPCO through acquiring NZE and ZE trucks and rerouting so that the usage points are accumulated at multiple warehouses, since each operator must report annual truck trips that serve the warehouse. Similarly, warehouse operators may contract with trucking companies that already own NZE and ZE trucks to route those trucks to warehouses in the South Coast AQMD. Purchasers of the trucks would be replacing an existing truck that has aged out of or is nearing the end of its useful life. In either situation, the rerouting could lead to greater overall VMT to accomplish the same level of goods movement.

On the other hand, the WAIRE Program could increase the efficiency of goods movement. If it is assumed current travel patterns are optimized for efficiency, warehouse operators would be incentivized to reduce the number of truck visits at their facilities each year since that is a metric used to determine the WPCO for a warehouse. Under the WAIRE Program, the number of annual truck trips for applicable warehouses must be reported to be converted into each operator's WPCO; the fewer truck trips generated by a facility, the lower that facility's WPCO will be. Because the WPCO is based on the annual truck trips that are reported to South Coast AQMD, there is an incentive to increase efficiency of truck movements to reduce the number of truck trips generated at an operator's facility. Reducing diesel truck trip movements would be a beneficial effect of the WAIRE Program as it may reduce air pollutant emissions from fewer trips generated beyond those

emissions identified in Table 4.1-6. It is important to note that the South Coast AQMD staff intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These ‘check-ins’ will provide useful information on implementation details and help identify effects of the WAIRE Program on warehouses in the region.

Given this uncertainty, the EA cannot determine the effect of the proposed project on the efficiency of goods movement in Southern California. Pursuant to the CEQA Guidelines Section 15145, “If, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact.”

4.1.3.6 Air Quality Impacts During Overlap of Construction and Operation

Given the number of warehouse facilities that will be subject to the proposed project and the varying modifications expected to occur at each affected facility in order to comply with the proposed project, construction impacts associated with some WAIRE compliance options at warehouses could potentially overlap with operational impacts associated with facility relocation. According to South Coast AQMD’s policy for analyzing a project’s air quality impacts in CEQA documents, in the event that there is an overlap of construction and operation periods, the peak daily emissions from the construction and operation overlap period should be summed and compared to the South Coast AQMD’s air quality significance thresholds for operation, which is more stringent, and thus, more conservative ~~that~~ than using the construction thresholds.

The construction impacts are specific to the compliance options Scenario 6 (ZE truck charger installation) and Scenario 12 (hydrogen fueling station infrastructure installation). The overlap of emissions for these two compliance options Scenarios are provided in Table 4.1-7 for the ‘worst-case’ year and at compliance year 10 of proposed project implementation. The construction emissions for the worst-case year are identified above in Tables 4.1-3 and 4.2-4, that is compliance year 1 (year 2022) for Scenario 6 and compliance year 3 (year 2024) for Scenario 12. NO_x and PM₁₀ emissions from Scenario 6 and Scenario 12 are added to the additional emissions that would occur as a result of up to three warehouse relocations assumed in this EA for disclosing and understanding the greatest potential relocation impacts even though no such relocations are expected to occur. As such, total emissions from both scenarios of overlapping construction and operational activities have been compared to the South Coast AQMD’s air quality significance thresholds for operation in Table 4.1-7.

Table 4.1-7
Peak Daily Overlapping Construction and Operational Emissions

Scenario / Activity	Overlapping Construction and Operational Emissions (lbs/day) – Worst Case Year		Overlapping Construction and Operational Emissions (lbs/day) – Year 2031	
	NOx	PM10	NOx	PM10
Scenario 6				
Construction Scenario 6	140 <u>139</u>	7	15 <u>6</u>	<u>≤1</u>
Benefits Scenario 6	0	0	-3,554 <u>-2,853</u>	-18 <u>-17</u>
Worst Case Relocations	74	0.6	74	0.6
Total Scenario 6	214 <u>213</u>	7.6	-3,465 <u>-2,773</u>	-16.4 <u>-16.1</u>
Significance Threshold	55	55 <u>150</u>	55	55 <u>150</u>
Exceed Threshold?	Yes	No	No	No
Scenario 12				
Construction Scenario 12	1,061	52	49	2
Benefits Scenario 12	-702	-5.1	-5,695 <u>-3,992</u>	-40 <u>-28</u>
Worst Case Relocations	74	0.6	74	0.6
Total Scenario 12	433	47.5	-5,572 <u>-3,869</u>	-37.4 <u>-25.0</u>
Significance Threshold	55	55 <u>150</u>	55	55 <u>150</u>
Exceeds Threshold?	Yes	No	No	No
Notes: 'Worst-case' year is compliance year 1 (year 2022) for Scenario 6 and compliance year 3 (year 2024) for Scenario 12.				

As indicated in Table 4.1-7, the peak daily emissions during the construction and operational overlap period would exceed the South Coast AQMD's air quality significance thresholds for NOx for operation in the worst-case year for Scenario 6 (i.e., year 2021) and for NOx for operation in the worst-case year for Scenario 12 (i.e., year 2024). Therefore, the air quality impacts during the construction and operation overlap period are considered to be significant. By year 2031 the initial upfront emissions from installation would be offset by the potential emissions benefits from Scenario 6 and Scenario 12. However, because emissions modeling considers the worst-case scenario in the year where there are higher construction emissions than emissions benefits, the proposed project would temporarily result in significant adverse air quality impacts for NOx during the 'worst-case' construction and operation overlap period under the most conservative scenario where all warehouse operators would select Scenario 6 or Scenario 12 as the sole compliance option to meet their WPCO.

4.1.4 Greenhouse Gas Emissions Impacts (Significance Criteria f)

The analysis of GHGs is a different analysis than the analysis of criteria pollutants. For criteria pollutants, the significance thresholds are based on daily emissions because attainment or non-attainment is primarily based on daily exceedances of applicable ambient air quality standards. Further, several ambient air quality standards are based on relatively short-term exposure effects on human health (e.g., one-hour and eight-hour standards). Since the half-life of CO₂ is approximately 100 years, the effects of GHGs occur over a longer term, which means they affect the global climate over a relatively long-time frame. As a result, the South Coast AQMD's current policy is to evaluate the effects of GHGs over a longer time frame than a single day (i.e., annual emissions). GHG emissions are typically considered to be cumulative impacts because they

contribute to global climate effects. Annual GHG emission impacts from implementing the proposed project were calculated by considering first the ‘construction’ GHG impacts, i.e., GHG emissions associated with construction activities that may occur as warehouse operators comply with the proposed project; and ‘operational’ GHG impacts—i.e., GHG emissions associated with potential warehouse relocations and cargo growth diversion resulting from the proposed project implementation, increased electricity consumption, and GHG emissions benefits from purchase and use of NZE and ZE vehicles.

4.1.4.1 GHGs Emissions from Construction Activities

As discussed above, WAIRE Points Scenarios 6 (ZE charger installation) and Scenario 12 (hydrogen fueling station infrastructure installation) represent the highest potential construction emissions scenarios associated with the proposed project and are used to conservatively estimate the maximum potential ‘worst-case’ construction GHG emissions associated with the proposed project (see “Air Quality Impacts During Construction”). Again, the WAIRE Point scenarios assume that all warehouse operators selected that compliance option as the single, sole compliance option to meet their WPCO. As a result, the highest emissions scenario represents the worst-case potential construction GHG emissions associated with the proposed project. For Scenario 6 and Scenario 12, construction emissions over the 10 compliance years (year 2021 through year 2031) of proposed project implementation were amortized over a 30-year project life in accordance with the guidance provided in the *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans*⁹ that was adopted by the South Coast AQMD Governing Board in December 2008, and included in the operational analysis to reflect one-time emissions from these short-term construction activities.¹⁰ As identified previously, WAIRE Points scenarios modeled for solar installation, filtration system installation, and plugs at warehouse docking bays for electric TRUs would not use substantial off-road construction equipment, and thus any GHG emissions from those compliance options would be less than the GHG emissions from Scenario 6 and Scenario 12.

4.1.4.1.1 Potential Construction Impacts from ZE Truck Charger Installation (Scenario 6)

Scenario 6 assumes that all warehouse operators selected purchase and use of ZE trucks and ZE charger installations as the single, sole compliance option to meet their WPCO. As identified previously, this scenario and all scenarios in the EA result in a conservative estimate of impacts because it is highly unlikely that all operators would choose to fulfill their WPCO through this compliance option. As a result, the emissions identified in the table provides a conservative estimate of the potential greatest possible increase in construction emissions associated with the proposed project. Based on information compiled by South Coast AQMD for similar charging infrastructure projects, installation of ZE truck charging infrastructure at a warehouse is assumed to have a construction duration of two days, an estimated ZE charging pad size of 5,000 square feet, and the following construction equipment: one industrial concrete saw, one backhoe, one skid steer loader with augur attachment (bore/drill), one crane, and one cement mixer. The annual

4.1.4.1.2 Potential Construction Impacts from Hydrogen Fueling Infrastructure (Scenario 12)

Scenario 12 assumes that all warehouse operators selected the purchase and use of hydrogen fueling infrastructure as the single, sole compliance option to meet their WPCO. As identified previously, this scenario and all scenarios in the EA result in a conservative estimate of impacts because it is highly unlikely that all operators would choose to fulfill their WPCO through this compliance option. As a result, the emissions identified in the table provides a very conservative estimate of the potential greatest possible increase in construction emissions associated with the proposed project. Based on information compiled for similar fuel station projects at existing gas stations, installation of a hydrogen fueling station at a warehouse is assumed to have an ‘active’ construction duration of 2.5 months, on a 0.3-acre site, and the following construction equipment: one backhoe, one crane, and concrete and delivery trucks. The annual GHG emissions from installation of hydrogen fueling stations and amortized over a 30-year project lifetime are shown in Table 4.1-9.

4.1.4.2 Potential GHGs Emissions from Operations (Warehouse Relocations and Cargo Growth Diversion)

Based on the currently proposed rule stringency, the proposed project would not result in warehouse relocations out of South Coast AQMD's jurisdiction. Under the highest rule stringency considered, that would result in \$2.00 per square foot of additional cost to warehouses, the proposed project would result in a maximum of six warehouse relocations (see Chapter 5, Alternatives). This EA nonetheless considers the potential for up to three warehouse relocations from the proposed project, even though no such relocations are expected based on the IEc Study in order to provide a conservative analysis for the operational impacts. Table 4.1-10 shows the maximum potential increase in GHG emissions associated with an increase in truck VMT from up to three potential warehouse relocations assumed in this EA, even though no such relocations are expected to occur.

Table 4.1-10
GHG Emissions from Worst Case Up to Three Warehouse Relocations

Activity	Worst Case Up to Three Warehouse Relocations
	MTCO ₂ eq
Truck VMT Emissions	5,902
Significance Threshold	10,000
Exceed Significance?	No

Although it is not reasonably foreseeable that cargo shippers would divert to other ports to avoid the increased cost of compliance with the proposed project, because of the uncertainty of the market response, the EA assumes some shipping diversion. However, it is not possible to determine the amount of cargo diverted, where the cargo would be diverted to, or the existing air

quality at the alternative port. As a result, it would be speculative to attempt to quantify such impacts.

Considered qualitatively, any impacts of such cargo diversion would likely be *de minimis*. This is because the amount of diverted cargo would likely be small—much smaller than the 1.4 percent estimated in the Port Study, for the reasons discussed above. Moreover, this small amount of cargo would likely be carried on ships that are already headed to other ports and would not result in additional shipping trips. As a result, any impacts would be limited to increased GHG emissions resulting from the small increase in weight. Because the cumulative area of impact for GHG emissions is global emissions, this EA considers emissions outside of the South Coast AQMD’s jurisdiction from the increase in weight.

4.1.4.3 Potential GHGs Emissions from Operations (Increased Electricity)

Implementation of the proposed project would result in an increase in electricity demand, as many of the compliance options would support or involve a transition from diesel-fueled vehicles to electric vehicles. The WAIRE Points scenarios with the greatest GHG emissions associated with this transition are:

- **ZE Truck Charger Installation and ZE Truck Use (Scenario 6).** Electric trucks operate via battery power instead of fuels. As a result, transition of diesel trucks to electric trucks would result in an increase in electricity demand.
- **Installation of High Efficiency Filter Systems (Scenario 15)** High-efficiency HVAC systems with MERV-16 filters and filtration systems take more electricity to operate than standard HVAC systems. The increased energy demand from high efficiency HVAC systems is considered under this scenario.
- **ZE Cargo Handling Equipment Purchase and Use (Scenario 18).** ZE cargo handling equipment would operate on electricity rather than diesel fuel. As a result, use of this ZE cargo handling equipment in lieu of diesel cargo handling equipment would result in an increase in electricity demand.
- **TRUs Plug Installation and Usage in Cold Storage Facilities (Scenario 17).** Electric TRUs would utilize electricity rather than diesel fuel for their auxiliary engine while docked at the warehouse. However, WAIRE Points scenario modeling for this scenario did not show an increase over existing regulations, and therefore, no additional energy use is assumed with this scenario.
- **Solar Panel Installation (Scenario 11).** Operation of rooftop solar panels would offset the existing warehouse’s electricity demand. As a result, the proposed project would result in a GHG emissions benefit with this WAIRE Points compliance obligation.

The electricity ~~from~~ use/generation from implementation of the proposed project Scenarios 6, 15, 18, and 11 is multiplied by the carbon intensity for the Southern California Edison (SCE) utility—since SCE represents the vast majority (75 percent) of the service area¹¹—based on the carbon intensity from SCE’s latest Sustainability Report.¹² The carbon intensity is adjusted to reflect a

¹¹ Other electricity service providers include the City of Industry (6 percent of service area), City of Vernon (3 percent), City of Anaheim (2 percent), and Moreno Valley (1 percent).

¹² Southern California Edison. 2020. 2019 Sustainability Report.
<https://www.edison.com/content/dam/eix/documents/sustainability/eix-2019-sustainability-report.pdf>

reduction in carbon intensity as a result of implementation of Senate Bill 100, which established a renewable portfolio standard (RPS) target of 60 percent renewables. As identified previously, this scenario and all scenarios in the EA result in a conservative estimate of impacts because it is highly unlikely that all operators would choose to fulfill their WPCO through this single compliance option. As a result, the GHG emissions identified in the table provides a conservative estimate of the maximum potential increase in GHG emissions use (Scenarios 6, 15, and 18) and GHG benefits (Scenario 11) associated with the proposed project at compliance year 10 (year 2031).

4.1.4.3.1 Increased Electricity Consumption from ZE Truck Charger Installation and ZE Truck Use (Scenario 6)

ZE trucks would generate an increase in demand for electricity. This EA identifies the maximum potential anticipated increase in electricity use from ZE trucks purchased and used as a result of the proposed project. Scenario 6 assumes all warehouse operators selected the purchase and use of ZE trucks as the single, sole compliance option to meet their WPCO. Table 4.1-11 shows the maximum potential increase in GHG emissions from electricity from the proposed project at compliance year 10 (year 2031).

Table 4.1-11

^a Based on the Carbon Intensity for SCE identified in the 2019 Sustainability Report and adjusted to reflect Senate Bill 100 (i.e., 329 lbs/MWH).			

4.1.4.3.2 Increase in Electricity Consumption from Installation of High-Efficiency Filter Systems (Scenario 15)

Implementation of the proposed project could increase energy demand and associated GHG emissions under Scenario 15, which assumes that all warehouses operators would install high-efficiency filter systems or replace filters in residences, schools, daycares, hospitals, or community centers proximate to the warehouse location as the single, sole compliance option to meet their WPCO. This is because high efficiency air filtration systems take slightly more electricity to operate than traditional heating, ventilation, and air conditioning (HVAC) systems. As identified in Table 4.1-12, installation of high efficiency HVAC systems with MERV-16 filters would result in 2,870,569 2,307,547 systems installed by year 2031, resulting in an increase of 746 600 gigawatt-hours (GWH) by year 2031 (compliance year 10).

4.1.4.3.3 Increase in Electricity Consumption from Purchase and Use of ZE Cargo Handling Equipment (Scenario 18)

Scenario 18 assumes all warehouse operators selected the purchase and use of ZE cargo handling equipment as the single, sole compliance option to meet their WPCO. Use of ZE cargo handling equipment would replace diesel cargo handling equipment and result in both localized and regional air quality emissions benefits. However, ZE cargo handling equipment would result in an increased demand for electricity and associated GHG emissions. Table 4.1-13 shows the total increase in electricity use and GHG emissions at compliance year 10 (year 2031) associated with Scenario 18.

Table 4.1-13
Maximum Potential Increase in Electricity and GHG Emissions from ZE Cargo Handling Equipment Purchase and Use in the South Coast AQMD Region – Scenario 18

4.1.4.3.4 Potential GHG Benefits from Purchase and Use of Solar Panels (Scenario 11)

Scenario 11 assumes all warehouse operators selected installation of solar panels as the single, sole compliance option to meet their WPCO as a result of the proposed project. Under Scenario 11 the proposed project could offset electricity demand through installation of solar panels, which would reduce the need for additional energy resources from local utilities and offset the potential increase in electricity demand and GHG emissions from other compliance options, as shown in Table 4.1-14.

4.1.4.4 Scenario Modeling GHG Emissions Reduction Benefits

The proposed project is designed to have substantial long-term air quality benefits, which result in GHG emissions co-benefits. In general, the proposed project achieves these benefits by requiring warehouse operators to implement air quality improvement measures. Operators can comply with the WAIRE Program in a number of ways, including by using NZE or ZE trucks in place of higher-polluting diesel trucks; building infrastructure to support expanded use of ZE trucks; increasing use of solar energy; and installing new filtration systems for sensitive receptors that are currently exposed to poor air quality.

Since it is speculative to determine how individual warehouse operators will choose to comply with the proposed project, it is not possible to quantify the exact GHG emissions benefits that will result from the proposed project. Instead, this EA considers the range of GHG emissions benefits from each of the compliance options modeled as Scenarios 1 through 18 as a way to identify the environmental benefits on GHG emissions of the WAIRE Points isolated for each individual compliance option. Table 4.1-15 shows the potential range of GHG emissions reductions as a result of implementation of the proposed project under the different WAIRE Points Scenarios modeled at year 10 (year 2031). NZE trucks have a lower carbon intensity than the diesel trucks they would replace (i.e., GHG emissions per mile traveled are lower). The WAIRE Point scenarios assume all warehouse operators selected that compliance option as the single, sole compliance option to meet their WPCO.

Table 4.1-15
Potential GHG Emissions Reductions from the Proposed Project

4.1.4.5 Indirect Impacts Associated with Construction of New Manufacturing Facilities, Recycling Facilities, and Grid Improvements

Because the proposed project encourages and incentivizes the purchase and use of NZE and ZE vehicles, it could also indirectly result in the construction and operation of new manufacturing and

recycling facilities as well as infrastructure improvements to support NZE and ZE vehicles. These potential impacts were analyzed in CARB’s Final EA for the ACT Regulations, and this EA incorporates that analysis by reference here. In summary, the ACT Final EA identifies that construction activities would result in an increase in emissions; however, such facilities would be required to seek local land use approvals prior to their implementation. Part of the land use entitlement process requires that each of these projects undergo environmental review consistent with California environmental review requirements (e.g., CEQA) and other applicable local requirements (e.g., local air district rules and regulations). Additionally, this temporary increase in emissions of GHGs is meant to, in the long-term, allow for a transition to vehicles that reduce overall emissions of GHGs. Therefore, when these short-term construction-related-GHG emissions associated with construction activities under the proposed project are considered in relation to the overall long-term operational GHG emissions benefits associated with the WAIRE Point scenarios for NZE and ZE trucks discussed below, they are not considered substantial.

4.1.4.6 Summary of GHG Impacts (Construction and Operation)

Table 4.1-16 shows a summary of the GHG emissions impacts for the scenarios analyzed. These scenarios were selected based on the greatest potential to result in GHG emissions impacts in order to show the range of potential environmental consequences associated with the proposed project to provide a framework for understanding the greatest potential impacts on GHG emissions. The analysis in this EA has taken the scenario approach outlined above in order to provide a conservative analysis of potential impacts of the proposed project.

EMFAC2017 was used to calculate the class-specific CO ₂ eq emission rates for truck categories considered to be likely to visit warehouses (as discussed in WAIRE Program Technical Document). For Scenario 17, CARB's Draft 2019 TRU Emissions Inventory Output for Single Body Truck TRU Under Regulation Concept Scenario was used. In Scenario 18 CO ₂ emission rates were derived from Orion off-road Emissions Inventory for Port Cargo Handling Equipment Type, Yard Trucks. Electricity sector emission are based on the Carbon Intensity for SCE identified in the 2019 Sustainability Report and adjusted to reflect Senate Bill 100 (i.e., 329 lbs/MWH).	

The proposed project would have GHG emissions co-benefits from several of the WAIRE Points scenarios despite the indirect increase in GHG emissions from potential worst-case up to three warehouse relocations, electricity use, and construction-related emissions. It should be noted that although it is not possible to forecast a specific reasonable worst-case scenario that would occur with implementation of the proposed project, the actual impacts that would occur with implementation of the proposed project would be within the range of that identified in Table 4.1-16.

As shown in this Table 4.1-16, GHG emissions would not exceed South Coast AQMD's GHG significance threshold for all the scenarios except Scenario 15. In this scenario, the increase in electricity use from installation of higher efficiency filter systems and emissions from potential worst-case up to three warehouse relocations assumed in this EA would result in an indirect increase in GHG emissions associated with the proposed project; however, for this scenario there is not a regional GHG emissions benefit since this compliance option aims to reduce exposure to diesel particulate matter emissions. As a result, under Scenario 15, where all warehouse facilities,

landowners, or warehouse facility operators would select installation of high efficiency filter systems at sensitive receptors proximate to a warehouse as the single, sole compliance option to meet WPCO, the proposed project's GHG would exceed the South Coast AQMD's significance criteria. Additional GHG emissions could also result from cargo shippers diverting their cargo to other ports, though this EA has concluded that outcome is not reasonably foreseeable, it is not possible to quantify any such increase, and any increase would likely be small. For these reasons, implementing the proposed project is conservatively expected to potentially generate a significant adverse cumulative GHG impact. Therefore, the proposed project could generate GHG emissions, either directly or indirectly, that may have a significant adverse impact on the environment. However, as noted previously, South Coast AQMD staff intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These 'check-ins' will provide useful information on implementation details and help identify effects of the WAIRE Program on warehouses in the region.

4.1.5 Consistency with Greenhouse Gas Reduction Plans (Significance Criteria g)

The primary plan that governs GHG emission reductions in California is CARB's 2017 Scoping Plan Update. The Scoping Plan Update incorporates freight and mobile source strategies to reduce emissions from the goods-movement sector.¹⁵ On May 16, 2016, CARB released the 2016 Mobile Source Strategy that demonstrates how the State can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years.¹⁶ Under Senate Bill 44, CARB is required to update the Mobile Source Strategy every five years. CARB recently prepared a Draft 2020 Mobile Source Strategy.¹⁷ The Update to the Mobile Source Strategy considers the recent Executive Order N-79-20, which established a goal that 100 percent of California sales of new passenger cars and trucks will be ZE by 2035 and a goal transitioning existing trucks to ZE medium- and heavy-duty vehicles, where feasible, by 2045. The Mobile Source Strategy identifies the following strategies for on-road medium- and heavy-duty vehicles:

- Manufacturer requirements to foster clean technology production and sales;
- In-use requirements to accelerate penetration of newer technology;
- Incentive programs to promote and accelerate the use of advanced clean technologies;
- Enhanced enforcement strategies to ensure programs are achieving their anticipated benefits;
- Outreach and education to increase consumer awareness and acceptance of advanced vehicle and equipment technologies; and
- Infrastructure planning and development to support the transition to cleaner technologies.

The proposed project would accelerate the integration and use of NZE and ZE trucks and supporting infrastructure within South Coast AQMD's jurisdiction by providing WAIRE Points

¹⁵ California Air Resources Board, 2017, California's 2017 Climate Change Scoping Plan: The Strategy for Achieving California's 2030 Greenhouse Gas Target, https://www.arb.ca.gov/cc/scopingplan/2030sp_pp_final.pdf, accessed on March 18, 2019.

¹⁶ California Air Resources Board. 2016, May 16. 2016 Mobile Source Strategy. <https://ww2.arb.ca.gov/resources/documents/2016-mobile-source-strategy>

¹⁷ California Air Resources Board. 2020, November 24. Draft 2020 Mobile Source Strategy https://ww2.arb.ca.gov/sites/default/files/2020-11/Draft_2020_Mobile_Source_Strategy.pdf

incentives for warehouse operators to buy and use NZE and ZE trucks as well as install supporting infrastructure. Thus, the proposed project facilitates the implementation of the most recent statewide strategies for goods movement as outlined in the Draft 2020 Mobile Source Strategy and Executive Order N-79-20; therefore, the proposed project is consistent with statewide strategies for goods movement to reduce GHG emissions.

The proposed project is also consistent with the Mobile Source Control Measures in the 2016 AQMP and statewide strategies to reduce GHG emissions from the goods movement sector. The 2016 AQMP includes measures that examine and assess control of air pollutant emissions as they pertain to the following: emissions growth management, facility based mobile source, on-road and off-road mobile sources, incentive programs, on-road heavy-duty and off-road federal and international sources, and off-road equipment. Because the proposed project would promote the transition from diesel and gasoline trucks to NZE and ZE trucks and ZE cargo handling equipment to be operated on the warehouse sites, it would reduce GHG emissions as these trucks are retired. In addition, the proposed project would also aim to reduce emissions by introducing ZE charging stations and hydrogen fueling stations. While the proposed project could increase electricity consumption by promoting the transition from diesel to electric vehicles and allowing warehouse operators to comply by installing filter systems at sensitive receptors, the proposed project also allows warehouse operators to comply by installing solar panels, which would help to offset some of the increased electricity use. Finally, while the proposed project may have an effect on NZE and ZE truck VMT in the South Coast AQMD, it is also possible that operators consolidate the number of truck visits at a facility. Because there is an incentive to increase efficiency of truck movements to reduce the number of truck trips generated at an operator's facility, which in turn reduces the warehouse operator's WPCO, and may reduce air pollutant emissions from fewer truck trips generated.

Thus, the proposed project would be consistent with the Mobile Source Control Measures in the 2016 AQMP and statewide strategies in the Scoping Plan Update to reduce GHG emissions from the goods movement sector and would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

PROJECT IMPACTS – CONCLUSION: Based on the preceding analysis, construction-related air quality impacts (Scenario 6 and Scenario 12), air quality impacts during overlap of construction and operational activities (near-term impacts for Scenario 6 and Scenario 12), and GHG emissions impacts (Scenario 15) could be significant. Indirect construction-related air quality emissions associated with the construction of new manufacturing and recycling facilities, as well as infrastructure for NZE and ZE vehicles could also be significant. For these reasons, implementing the proposed project could generate a-potentially significant adverse short-term construction-related air quality impacts and long-term GHG emissions impacts from Scenario 15 (MERV 16 or greater filters and filtration systems) and cargo growth diversion. However, long-term air quality impacts and consistency of the proposed project with GHG reduction plans are less than significant impacts of the proposed project.

PROJECT MITIGATION MEASURES: The analysis indicates that long-term air quality impacts are less than significant. To reduce short-term significant adverse air quality impacts during construction, individual construction projects under Scenario 6 or Scenario 12 could utilize newer construction equipment that has lower NOx emissions. South Coast AQMD's Mitigation Monitoring and Reporting Plan for the 2016 Air Quality Management Plan is an additional resource to assist lead agencies with identifying other potential mitigation measures. When South

Coast AQMD is not the Lead Agency for undertaking actions to comply with the proposed project, the following mitigation measures can be used as a reference for other lead agencies, where applicable and feasible:

- All off road diesel-powered construction equipment greater than 50 hp shall meet U.S. Environmental Protection Agency (U.S. EPA) Tier 4 Final off-road emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. This requirement shall be included in applicable bid documents, purchase orders, and contracts.
- A copy of each unit's certified tier specification, BACT documentation, and CARB or South Coast AQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.
- All construction equipment must be tuned and maintained in compliance with the manufacturer's recommended maintenance schedule and specifications that optimize emissions without nullifying engine warranties. All maintenance records for each equipment and their construction contractor(s) should be made available for inspection and remain onsite for a period of at least two years from completion of construction.
- Encourage construction contractors to apply for South Coast AQMD "SOON" funds. The "SOON" program provides funds to applicable fleets for the purchase of commercially-available low-emission heavy-duty engines to achieve near-term reduction of NOx emissions from in-use off-road diesel vehicles. More information on this program can be found at South Coast AQMD's website: <http://www.aqmd.gov/home/programs/business/business-detail?title=off-road-diesel-engines>.
- Prohibit vehicles and construction equipment from idling longer than five minutes at the construction site by including these restrictions in the construction company contract(s) and by posting signs onsite, unless the exceptions in the CARB regulations which pertain to idling requirements are applicable.
- During construction, require the use of ZE) or NZE trucks (e.g., material delivery trucks and soil import/export), such as trucks with natural gas engines that meet the CARB's adopted optional NOx emission standard of 0.02 grams per brake horsepower-hour (g/bhp-hr). At a minimum, require that truck operator(s)/construction contractor(s) commit to using 2010 model year or newer engines that meet CARB's 2010 engine emission standards of 0.01 g/bhp-hr for particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks.
- Require construction equipment such as concrete/industrial saws, pumps, aerial lifts, material hoist, air compressors, forklifts, excavator, wheel loader, and soil compactors be electric or alternative-fueled (i.e., non-diesel).
- Survey and document the proposed project's construction areas and identify all construction areas that are served by electricity. Onsite electricity, rather than temporary power generators, shall be used in all construction areas that are demonstrated to be served by electricity.

Similarly, the mitigation measures described in CARB’s Final EA for the ACT Regulation could reduce air quality impacts from construction of new manufacturing facilities, battery facilities, and infrastructure project to support the transition to NZE and ZE vehicles.

While these measures could reduce the indirect air quality impacts associated with potential construction projects, South Coast AQMD does not have land use authority over those projects. To the extent future discretionary review is required for these types of improvements (i.e., ZE charging station installation and hydrogen fueling infrastructure installation), the lead agencies for those projects may consider the specific impacts and mitigation measures required. While South Coast AQMD is a commenting agency for CEQA projects within the South Coast AQMD region, it is up to the lead agencies for these particular construction projects to impose additional mitigation requirements under CEQA. As a result, while there are potential measures that could reduce and/or eliminate temporary construction-related impacts, these mitigation measures are within the responsibility and jurisdiction of another public agency. Additionally, construction emissions impacts under Scenario 6 and Scenario 12 are short term in nature and are based on an extremely conservative modeling scenario that assumes that all warehouse operators would select one compliance option as the sole compliance option to achieve their WPCO. At full implementation of the proposed project (year 10), there would be an overall reduction in NO_x and PM₁₀ emissions during the operational phase of the proposed project that would offset the increase in emissions from construction activities and emissions under the worst-case relocation under both Scenario 6 and Scenario 12. For GHG emissions, there are no additional mitigation measures that would reduce or eliminate the increase in GHG emissions from the additional energy use caused by installation of MERV 16 or greater filters and filtration systems (Scenario 15) and from cargo growth diversion.

REMAINING IMPACTS: No feasible mitigation measures were identified that are within South Coast AQMD’s jurisdictional authority to impose; thus, construction-related air quality impacts (Scenario 6 and Scenario 12); impacts during overlap of construction and operational activities (near-term impacts for Scenario 6 and Scenario 12); indirect construction-related air quality impacts from potential development of manufacturing facilities, battery facilities, and infrastructure projects to support transition to NZE and ZE vehicles; and GHG impacts (Scenario 15 and from cargo growth diversion) would remain significant and unavoidable.

CUMULATIVE IMPACTS: The short-term construction-related air quality impacts and the long-term GHG emissions impacts are the project’s cumulative contribution to air quality and GHG emissions impacts. Thus, construction-related air quality impacts (Scenario 6 and Scenario 12); impacts during overlap of construction and operational activities (near-term impacts for Scenario 6 and Scenario 12); indirect construction-related air quality impacts from potential development of manufacturing facilities, battery facilities, and infrastructure projects to support transition to NZE and ZE vehicles; and GHG impacts (Scenario 15 and from cargo growth diversion) are considered ~~to be~~ cumulatively considerable pursuant to CEQA Guidelines Section 15064(h)(1); and therefore, this EA identifies significant adverse cumulative air quality and GHG impacts associated with the proposed project.

It should be noted that the impact analysis is a conservative analysis and the actual construction and operational impacts are not expected to be as great as estimated in this EA. Additionally, the construction activities are temporary when compared to the permanent project’s long-term emission reductions of NO_x as a result of the proposed project (see Table 4.1-7 at year 2031). Even though the proposed project will cause a temporary, less than significant increase in air emissions

during the construction and operation phase, the temporary net increase in construction emissions combined with the total permanent emission reductions projected overall during operation would not interfere with the expected overall NO_x reductions as part of the proposed project. Therefore, cumulative long-term operational air quality impacts from the proposed project ~~is~~ are not expected to be significant because implementation of the proposed project is expected to result in net emission reductions and overall air quality improvement. Therefore, there will be no significant long-term cumulative adverse operational air quality (criteria air pollutant) impacts from implementing the proposed project.

4.2 ENERGY

The overall purpose of the proposed project is to reduce NO_x and PM emissions, including DPM, ~~emissions~~ associated with warehouse operations in the South Coast AQMD region. To accomplish this purpose, the proposed project allows warehouse operators to comply with PR 2305 by, among other things, acquiring and using NZE and ZE trucks. As a result, the proposed project incentivizes transition to NZE and ZE trucks.

Compliance with the rule may, in some cases, require construction of new facilities. For example, if a warehouse chooses to comply with its WPCO by constructing a new electric vehicle (EV) charging station, that activity will require construction. As a result, compliance with the rule could have potentially significant energy impacts associated with that construction. These construction-related impacts are analyzed below.

Similarly, the proposed project could affect market decisions related to goods movement more generally. For example, depending on how stringent the rule is (and thus how expensive it is for warehouse operators to comply), warehouse operators may consider locating new warehouses outside of the South Coast AQMD jurisdiction to avoid having new warehouses subject to the rule. These potential impacts are considered ‘operational’ impacts of the proposed project, and are analyzed below.

Because the proposed project would encourage and incentivize the purchase and use of NZE and ZE vehicles, it could indirectly result in the construction and operation of new manufacturing and recycling facilities as well as infrastructure improvements necessary to meet this increased demand for NZE and ZE vehicles. These potential impacts were analyzed in CARB’s Final EA for the ACT Regulation, and this EA incorporates that analysis by reference here. Because these potential impacts are indirect, and because the circumstances surrounding any such future development are unknown, the analysis of the proposed project’s potential indirect impacts on energy associated with this development is discussed separately from the analysis of the proposed project’s direct impacts.

The 2016 AQMP Final Program EIR also analyzed the potential construction and operational energy impacts of Control Measure MOB-03, an indirect source rule for warehouses. The EIR stated that mobile source control measures, including MOB-03, “are expected to increase the electricity demand in the Basin due to the electrification of mobile sources” (2016 AQMP Final Program EIR at 4.2-11). The EIR concluded: “The 2016 AQMP will result in less than significant impacts to the increased demand of alternative fuels, alternative energy, renewable energy, petroleum fuels, and natural gas. However, the electricity consumption impacts are significant because the potential 2024 electricity usage increase would exceed baseline electricity consumption by 7.8 to 12.7 percent. Even with implementation of the above mitigation measures, electricity consumption impacts would remain significant.” This EA incorporates this analysis by reference, including the listed mitigation measures, as a supplement to the analysis provided below.

In general, because the proposed project allows warehouse operators to comply in a number of ways, it is not possible to determine the exact energy impacts of the proposed rule. Nonetheless, the following analysis provides a conservative estimate of potential impacts and benefits of the proposed rule. A summary of the impact scenarios considered in this analysis is provided in Table 4.2-1.

Table 4.2-1
WAIRE Program Scenarios Considered for the Energy Impact Analysis

Scenario #	Scenario	Construction	Operational Phase			
			Diesel Fuel Increase From Up to Three Warehouse Relocations	Diesel Fuel Reduction Benefits from NZE and ZE Trucks	Alternative Fuel Used (Hydrogen or Natural Gas)	Electricity
Scenario 1	NZE Class 8 Truck Acquisitions and Visits (No Incentives)	No	Yes	Yes	Natural Gas	No
Scenario 2	NZE Class 8 Truck Acquisitions with Early Purchase (of one truck more than the required by WPCO) and Visits	No	Yes	Yes	Natural Gas	No
Scenario 3	NZE Class 8 Truck Acquisitions Funded by Carl Moyer and Visits	No	Yes	Yes	Natural Gas	No
Scenario 4	NZE Class 8 Truck Visits (Use from Non-Owned Fleet)	No	Yes	Yes	Natural Gas	No
Scenario 5	ZE Class 8 Truck Visits (Use from Non-Owned Fleet)	No	Yes	Yes	No ^d	No ^b
Scenario 6	Level 3 Charger Installations in the First Year and ZE Class 6 and 8 Truck Acquisitions followed by ZE Class 6 & 8 Truck Acquisitions	Yes	Yes	Yes	No	Yes
Scenario 7	Pay Mitigation Fee	No	Yes	No	No	No
<u>Scenario 7a</u>	<u>Mitigation Fee Funding NZE Class 8 and 4-7</u>	<u>No</u>	<u>Yes</u>	<u>No</u>	<u>No</u>	<u>No</u>
Scenario 8	NZE Class 6 Truck Acquisitions and Visits (No Incentives)	No	Yes	Yes	Natural Gas	No
Scenario 9	NZE Class 6 Truck Visits (Use from Non-Owned Fleet)	No	Yes	Yes	Natural Gas	No

Table 4.2-1
WAIRE Program Scenarios Considered for the Energy Impact Analysis

Scenario #	Scenario	Construction	Operational Phase			
			Diesel Fuel Increase From Up to Three Warehouse Relocations	Diesel Fuel Reduction Benefits from NZE and ZE Trucks	Alternative Fuel Used (Hydrogen or Natural Gas)	Electricity
Scenario 10	ZE Class 6 Truck Visits (Use from Non-Owned Fleet)	No	Yes	Yes	No ^d	No
Scenario 11	Rooftop Solar Panel Installations and Usage	Yes ^a	Yes	No	No	Yes
Scenario 12	Hydrogen Fueling Station Installations in the First Year and ZE Class 8 Truck Acquisitions and Visits (No Incentives)	Yes	Yes	Yes	Hydrogen	No
Scenario 13	ZE Class 2b-3 Truck Acquisitions and Visits (No Incentives)	No	Yes	Yes	No ^d	No ^b
Scenario 14	ZE Class 2b-3 Truck Visits (Use from Non-Owned Fleet)	No	Yes	Yes	No ^d	No ^b
Scenario 15	MERV-16 or Greater Filter and Filtration System Installations	Yes ^a	Yes	No	No	Yes
Scenario 16	MERV-16 or Greater Filter and Filtration System Purchases	No	Yes	No	No	No
Scenario 17	TRU Plug Installations and Usage in Cold Storage Facilities	No	Yes	No	No	Yes ^c
Scenario 18	ZE Cargo Handling Equipment Acquisitions and Usage	Yes ^a	Yes	No	No	Yes

Notes:

^a This scenario would generate fuel from worker and/or vendor deliveries but would not generate fuel from off-road equipment. As a result, construction fuel use from this scenario are considered nominal and are not modeled.

^b Energy from use and/or purchase of ZE trucks is considered under Scenario 6.

^c Although ZE TRUs plugged in at docks would generate an increase demand for electricity, the proposed rule shows that the proposed project would not result in an incremental increase in demand for EV TRUs above the baseline. Therefore, this scenario is not modeled.

^d Hydrogen fuel associated with ZE trucks is modeled under Scenario 12 since it is the scenario that assumes 100 percent hydrogen fueled ZE trucks rather than 100 percent electric or a blend of electric and hydrogen trucks.

4.2.1 Significance Criteria

Impacts to energy resources will be considered significant if any of the following criteria are met:

- a. Conflict with or obstruct adopted energy conservation plans, a state or local plan for renewable energy, or energy efficiency.
- b. Result in the need for new or substantially altered power or natural gas utility systems.
- c. Create any significant effects on local or regional energy supplies and on requirements for additional energy.
- d. Create any significant effects on peak and base period demands for electricity and other forms of energy.
- e. Comply with existing energy standards.
- f. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
- g. Require or result in the relocation or construction of new or expanded electric power, natural gas or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.

The Initial Study for the proposed project, under Chapter 2, Section VI, Energy, Impacts (a), (e), and (f), showed that the proposed project does not require any action which would result in any conflict with an adopted energy conservation or efficiency plan or result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation. Any existing or future facilities that are built to satisfy the requirements of the proposed project would be expected to continue implementing any existing energy conservation plans that are currently in place. Therefore, these significance criteria (a, e, and f) will not be discussed further in this Draft EA.

4.2.1.1 Lifecycle Analysis

CEQA does not require a full lifecycle analysis of potential environmental effects. This is because the impact analysis in CEQA is subject to the rule of reason. Moreover, CEQA only requires analysis of impacts that are directly or indirectly attributable to the project under consideration (CEQA Guidelines Section 15064(d)). Lifecycle analysis in general may not be consistent with CEQA because the term ‘lifecycle’ could refer to emissions beyond those that could be considered ‘indirect effects’ of a project under CEQA Guidelines 15358.¹

The Natural Resources Agency has indicated that a lifecycle analysis is not necessary to adequately analyze a project’s energy or GHG impacts. Pursuant to the Natural Resources Agency’s *Final Statement of Reasons for the Regulatory Action Amendments to the State CEQA Guidelines*, the energy impact analysis in CEQA is subject to the ‘rule of reason.’

¹ California Natural Resources Agency. 2009, December. Final Statement of Reasons for the Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97. https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/Final_Statement_of_Reasons.pdf

This [energy] analysis is subject to the rule of reason and shall focus on energy use that is caused by the project. (CEQA Guidelines Section 15126.2(b))

This was added to the CEQA Guidelines to place a reasonable limit on the analysis and signal that a full lifecycle analysis will generally not be required.²

Similarly, according to the *Final Statement of Reasons for the Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*:

In some instances, materials may be manufactured for many different projects as a result of general market demand, regardless of whether one particular project proceeds. Thus, such emissions may not be “caused by” the project under consideration. Similarly, in this scenario, a lead agency may not be able to require mitigation for emissions that result from the manufacturing process. Mitigation can only be required for emissions that are actually caused by the project. (State CEQA Guidelines, § 15126.4(a)(4).) Conversely, other projects may spur the manufacture of certain materials, and in such cases, consideration of the indirect effects of a project resulting from the manufacture of its components may be appropriate. A lead agency must determine whether certain effects are indirect effects of a project, and where substantial evidence supports a fair argument that such effects are attributable to a project, that evidence must be considered. However, to avoid potential confusion regarding the scope of indirect effects that must be analyzed, the term “lifecycle” has been removed from Appendix F.

Preparing a “lifecycle” analysis for the proposed project—i.e., an analysis of all of the potential energy, air quality, and GHG impacts associated with the proposed project’s role in incentivizing the transition from diesel vehicles to NZE/ZE vehicles—would also be speculative given that the proposed project allows regulated warehouses to comply through a number of different means. For all of these reasons, this EA does not attempt to provide such a lifecycle analysis.

4.2.2 Energy Impacts During Construction (Significance Criteria b, c, d, and g)

Construction activities undertaken to comply with the proposed project would consume energy in the short term due to gasoline and/or diesel fuel and electricity consumed by construction equipment and vehicles. Construction equipment-related energy use impacts were concluded to be less than significant in the IS under Chapter 2, Section VI, Energy, Impacts (b), (c), (d), and (g), and will not be discussed further in this Draft EA. Therefore, this analysis focuses on potential transportation energy use from delivery vehicles and construction employee vehicles. However, since information was available on off-road vehicle fuel use, this information is also included below.

Here, ‘construction’ activities associated with the proposed project include: the installation of ZE charging, installation of hydrogen fueling station, installation of solar panels, installation of additional ‘plugs’ to accommodate ZE transport refrigeration units (TRUs) or ZE cargo handling equipment, and installation of high-efficiency HVAC systems. This is because warehouse

² California Natural Resources Agency. 2018, November. Final Statement of Reasons for the Regulatory Action Amendments to the State CEQA Guidelines. OAL Notice File No. Z-2018-0116-12.

https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/2018_CEQA_Final_Statement_of%20Reasons_111218.pdf

operators may choose to comply with the proposed project by undertaking the following activities, all of which involve construction:

- **ZE Charger Installation (Scenario 6).** Construction of ZE charging stations at existing warehouses would warrant use of heavy, off-road construction equipment, worker trips, and vendor deliveries. Based on information compiled for ZE charging station projects by South Coast AQMD, installation of ZE truck charging infrastructure at a warehouse is assumed to have a construction duration of two days, an estimated ZE charging pad size of 5,000 square feet, and the following construction equipment: one industrial concrete saw, one backhoe, one skid steer loader with auger attachment (bore/drill), one crane, and one cement mixer. Modeling for this scenario was conducted using CalEEMod Version 2016.3.2.
- **Hydrogen Fuel Stations (Scenario 12).** Construction of hydrogen fueling stations at existing warehouses would warrant use of heavy, off-road construction equipment, worker trips, and vendor deliveries. Based on information compiled for similar fuel station projects at existing gas stations, installation of a hydrogen fueling station at a warehouse is assumed to have an ‘active’ construction duration of 2.5 months, on a 0.3-acre site, and the following construction equipment: one backhoe, one crane, and concrete and delivery trucks. Modeling for this scenario was conducted using CalEEMod Version 2016.3.2.
- **Solar Panel Installation (Scenario 11).** Installation of solar panels on warehouse rooftops would use fuel from worker vehicle trips and vendor deliveries. It is not anticipated to require use of heavy, off-road construction equipment. Additionally, construction activities would occur over a short period (1-to 5 days). As a result, installation of solar panels is anticipated to have nominal construction fuel use, and therefore construction fuel use was not modeled for this scenario.
- **‘Plug’ Installation for ZE TRUs (Scenario 17) or ZE Cargo Handling Equipment (Scenario 18).** Installation of additional electric outlets to accommodate ZE equipment such as ZE TRUs and ZE cargo handling equipment at docks and building exterior/interior is anticipated to result in fuel use from construction worker trips. It is not anticipated to require substantial building modifications that would warrant use of heavy, off-road construction equipment. Additionally, construction activities would occur over a short period (1-5 days). As a result, installation of plugs/outlets at warehouses is anticipated to have nominal construction fuel use, and therefore construction fuel use was not modeled for this scenario.
- **High Efficiency HVAC Filter System Installation (Scenario 15).** Installation of HVAC equipment at sensitive land uses is anticipated to result in fuel use from construction worker trips. It is not anticipated to require substantial building modifications that would warrant ~~require~~ use of heavy, off-road construction equipment. Additionally, construction activities would occur over a short period (1-5 days). As a result, installation of high-efficiency HVACs filter systems is anticipated to have nominal construction fuel use, and therefore construction fuel use was not modeled for this scenario.

Scenarios 1 through 5, 8 through 10, and 13 and 14 would allow WAIRE Points for purchase and use of NZE and ZE trucks and would not require short-term construction activities to implement. Likewise, Scenario 7 (mitigation fee), Scenario 7a (mitigation fee and NZE truck visits), Scenario 16 (high efficiency filter purchases), and Scenario 18 (ZE cargo handling equipment purchase and use) would not require short-term construction activities to implement.

As discussed elsewhere in this EA, it is not possible to predict which WAIRE Points menu options each of the warehouse operators subject to the proposed project would choose. Moreover, the proposed project allows warehouse operators to propose a custom plan and/or pay a mitigation fee. Given that a warehouse operator has many factors to consider when choosing how to meet their WPCO, it is not possible to predict warehouse operator choices; and therefore, this EA assessed the construction impacts associated with the scenarios listed above and conducted construction modeling for Scenarios 6 and 12.

For these two scenarios (Scenario 6 and Scenario 12), the model assumed that all warehouse operators subject to the WAIRE Program would select the same compliance option. Thus, for example, in Scenario 6, the model assumed all warehouse operators would comply with the WAIRE Program by installing ZE chargers. Assumptions were then made to estimate combustion emissions (and associated diesel fuel use) for Scenario 6 and Scenario 12 from construction activities necessary to carry out the compliance option, including construction on-road emissions from worker trips, deliveries, and haul trips.

Transportation fuel use was calculated for Scenario 6 (ZE truck charger installation) and Scenario 12 (hydrogen station) because these scenarios would warrant construction activities that are more intensive than the other WAIRE points scenarios. As identified previously, the WAIRE Points scenarios assume that all warehouse operators selected that compliance option as the sole compliance option to meet their WPCO. As a result, the highest emissions scenario represents the worst-case potential construction fuel associated with the proposed project. For Scenario 6, if 100 percent of warehouse facilities that are expected to be required to earn WAIRE Points (2,902 facilities) chose to install ZE chargers in the first year to meet their WPCO, then there would be up to ~~1,863~~ 1,857 ZE chargers that would be installed. For Scenario 12, if 100 percent of the 2,902 facilities chose to meet their WPCO by installing hydrogen stations, then there would be 1,160 hydrogen fueling stations installed in year 2024 (compliance year three is the worst-case year).

Construction worker and vendor trips for these two scenarios were calculated using CalEEMod, Version 2016.3.2.25, computer model based on data compiled by the South Coast AQMD for Scenario 6 (ZE charger) and Scenario 12 (hydrogen fueling station infrastructure) projects on developed sites. Vehicle miles traveled (VMT) from construction worker and vehicle trips during construction was converted to fuel use using EMFAC2017, Version 1.0.3. Modeling is included in Appendix D of this EA. The results are shown in Table 4.2-2 for Scenario 6 and Table 4.2-3 for Scenario 12.

Table 4.2-2
Construction Fuel Use Associated with ZE Truck Charger Installations – Scenario 6

Notes: kWh = kilowatt-hour ^a Based on CalEEMod default assumptions, which assumes worker trips consist of 50 percent light-duty auto (LDA), 25 percent light-duty truck type 1 (LDT1), and 25 percent light-duty truck type 2 (LDT2). ^b Based on CalEEMod default assumptions, which assumes that all vendors' vehicles are heavy heavy-duty trucks (HHDT). For purposes of this analysis, fuel usage associated with vendor trips is based on the fuels data for the EMFAC2011 T7 vehicle category.						

The use of energy resources by off-road construction equipment, delivery vehicles, and construction employee vehicles would fluctuate according to the phase of construction and would

be temporary, and all construction activities would cease upon completion of project construction. Furthermore, to limit wasteful and unnecessary energy consumption, the construction contractors are required to minimize nonessential idling of construction equipment during construction, in accordance with Section 2449 of the California Code of Regulations, Title 13, Article 4.8, Chapter 9. In addition, as shown in Table 4.2-2, construction activities associated with Scenario 6 could result in construction-related transportation fuel demands of ~~107,713~~ 144,061 gallons of gasoline, ~~334,094~~ 333,018 gallons of diesel, and ~~352~~ 350 kWh of electricity. This would represent approximately 0.002 percent of gasoline usage and 0.02 percent of diesel fuel usage within counties of Los Angeles, Orange, Riverside, and San Bernardino. As for electricity demand, the estimated ~~352~~ 351 kWh of electricity demand would be nominal when compared to the overall electricity demand in the region. Based on the annual electricity consumption stated in Section 3.3.1 of this EA, the combined total electricity consumption in the Southern California Edison (SCE) and Los Angeles Department of Water and Power (LADWP) service areas totaled 128,564 gigawatt hours for year 2019. For Scenario 12, as shown in Table 4.2-3, construction activities could result in construction-related transportation fuel demands of 31,812 gallons of gasoline, 2,393,936 gallons of diesel, and 2,795 kWh of electricity. This would represent 0.0005 percent of gasoline usage and 0.18 percent of diesel usage within the four aforementioned counties. Similar to Scenario 6, the estimated electricity demand of 2,795 kWh of electricity would also be nominal when compared to the overall existing electricity demand in the region. Therefore, in consideration of these factors, impacts from onsite construction equipment use and transportation energy associated with construction activities would not result in substantial depletion of existing energy resource supplies or impact the current capacities of the electric utilities and petroleum gas supplies. Therefore, impacts are less than significant.

4.2.3 Energy Impacts During Operations (Significance Criteria b, c, d, and g)

The proposed project could impact energy consumption associated with trucking operations in the South Coast AQMD's jurisdiction in several ways. First, as discussed in the Transportation section, implementation of the proposed project could increase truck VMT due to potential warehouse facility relocations, resulting in an increase in energy consumption as a result of additional diesel fuel use to relocated warehouses as well as project diesel fuel use to earn WAIRE Points. However, this increase in diesel consumption associated with warehouse relocation would be offset by a reduction in diesel consumption associated with the increased use of NZE and ZE trucks, which is also incentivized under the proposed project. Under several compliance options, the proposed project would result in greater turnover of diesel fueled trucks to NZE and ZE trucks.

This transition from diesel fueled trucks to NZE and ZE trucks also has the potential to shift the type of energy sources utilized for the transportation sector in the South Coast AQMD region (fuel switching). Currently, the goods movement sector relies primarily ~~on~~ on diesel fuel as the primary energy source for trucks. By providing a mechanism for warehouse operators that would incentivize early transition to NZE and ZE technology as a means to comply with the WPCO, the proposed project would create additional demands for electricity, hydrogen, and natural gas fuels, but less demand for diesel fuel compared to existing conditions (without the proposed project).

To determine the proposed project's energy impacts, the EA assessed the impacts (or benefits) of each of the WAIRE Point scenarios. The WAIRE Point scenarios assume that all warehouse operators selected that compliance option as the sole compliance option to meet their WPCO. Scenario 11, solar panels installation, resulted in the 'best case' energy benefit, as that Scenario

assumes that all operators would choose to comply with the rule by installing solar panels on their facilities, thus generating additional energy. Scenario modeling for Scenario 17 (TRUs plug installation and usage in cold storage facilities) did not show an increase over existing regulations; therefore, no additional energy use is assumed with this scenario. Diesel, electricity, natural gas, and hydrogen fuel impacts associated with potentially up to three warehouse relocations assumed for the purpose of the EA, and from the WPCOs that would affect energy use are described below.

4.2.3.1 Diesel Fuel

4.2.3.1.1 Increase in Diesel Fuel Use from Warehouse Relocations

According to the IEc Study,³ the proposed project would not result in warehouse relocations out of the South Coast AQMD's jurisdiction with a WPCO of 0.0025. If the rule stringency were increased such that it resulted in an annual \$2.00 per square foot of additional cost to warehouses, the rule could result in a maximum of six warehouse relocations (see Chapter 5, Alternatives). This EA conservatively considers the potential for up to three warehouse relocations from the proposed project in order to provide a conservative analysis for the operational air quality and greenhouse gas emissions, energy, and transportation impacts. Table 4.2-4 shows the diesel fuel consumption associated with an increase in truck VMT from the relocations of three warehouses.

**Table 4.2-4
Diesel Fuel from Potential Three Warehouse Relocations**

Truck Classifications	Worst-Case Relocations (Up to Three Warehouses)	
	Diesel Truck Annual VMT	Diesel Fuel Gallons/Year ^a
Truck VMT Total	4,341,988	735,930
Note:		
^a VMT converted to diesel fuel using mpg of 5.9 from WAIRE Technical Document for Class 8 Trucks.		

4.2.3.1.2 Range of Decrease in Diesel Fuel Consumption from NZE and ZE Trucks

Use of NZE and ZE trucks in the South Coast AQMD region would result in a reduction in diesel VMT and associated fuel use. The WAIRE Program would allow for purchase of new NZE and ZE trucks as a way for warehouse operators to meet their WPCO. It is anticipated that these operators replace their trucks with new NZE and ZE trucks, some of these trucks may be retired (i.e., scrapped) and some of these trucks would be transitioned to other uses or warehouses outside of the South Coast AQMD's jurisdiction for trucks that are no longer eligible to access the San Pedro Bay Ports. However, even in this instance where the trucks are transitioned to other uses, it can be presumed that they would replace even older, higher emissions trucks in an operator's truck fleet. This assumption is based on the fact that the proposed project does not generate an increase in the national or even international demand for trucks used in the goods movement sector. Thus, operators that purchase the trucks replaced by NZE and ZE trucks pursuant to the proposed project would be replacing an existing truck that has aged out of or is nearing the end of its useful life. These assumptions support the conclusion that the proposed project would result in a greater

³ Ec. 2020, December 23. Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule.

turnover of diesel trucks to NZE and ZE trucks than would have occurred without implementation of the proposed project.

Replacing diesel trucks with NZE and ZE trucks would reduce diesel fuel consumption. Table 4.2-5 shows the potential reduction in diesel fuel consumed as a result of implementation of the proposed project under the different WAIRE Points Scenarios modeled. Since it is speculative to determine individual market actions operators will choose to comply with the proposed project, this EA considers the range of emissions benefits from each of the compliance options, modeled as Scenarios 1 through 18, as a way to identify the potential environmental consequences of the WAIRE Points isolated for each individual compliance option.

Table 4.2-5
Potential Diesel Fuel Reductions in the South Coast AQMD Region from the Proposed Project

Scenario	Annual Diesel Truck VMT Reduced by Year 2031	Diesel Fuel Reduced Gallons/Year^a
Scenario 1	<u>634,183,368</u> <u>498,885,660</u>	<u>107,488,706</u> <u>84,556,892</u>

Min. Potential Reduction	<u>0</u> <u>3,839,680</u>	<u>0</u> <u>518,876</u>
Notes: Reduction in diesel-VMT above the cumulative baseline, accounting for other approved and pending regulations that affect diesel trucks in California. Under Scenario 6, should all warehouse operators choose to purchase NZE and ZE trucks to meet their WPCO, by year 2031 ISR would have no incremental effect above existing California Air Resources Board (CARB) rules.		
^a VMT converted to diesel fuel using mpg of 5.9, 7.4, and 23.2 from WAIRE Technical Document for Class 8, 6, and 26-3 Trucks, respectively.		

4.2.3.1.3 Impacts to Diesel Fuel Supplies

As stated, in 2019, California consumed 3.7 billion gallons of diesel fuel, with 1.3 billion gallons of diesel fuel sales occurring in the counties of Los Angeles, Orange, Riverside, and San

Bernardino.^{4,5} As shown in Table 4.2-5 and discussed in Section 4.2.3.1.1, above, the ‘worst-case’ analysis assumed for warehouse relocations due to implementation of the WAIRE Program would result in increased diesel fuel consumption of ~~454,373~~ 735,930 gallons per year. This estimated amount of demand would represent ~~0.03~~ 0.05 percent of the ~~3.7~~ 1.3 billion gallons of total diesel fuel sales within the four aforementioned counties, which would be a nominal amount. In addition, as shown in Table 4.2-5, potential diesel fuel reductions, when considering only the additional benefits of the WAIRE Program, could range from ~~12,770,331~~ 518,876 gallons up to ~~48,010,946~~ 94,491,315 gallons per year.⁶ This range in potential diesel fuel reductions is based on WAIRE Points scenarios modeling, where each scenario assumes full implementation of only one single compliance option by 2,902 warehouses. Thus, the likely range in diesel fuel reduction would likely fall within this estimated range. However, it is anticipated that any increase in diesel fuel demand resulting from up to three warehouse relocations would be either partially or fully offset from the overall diesel fuel demand reductions resulting from implementation of the WAIRE Program. Overall, it is anticipated that impacts of the proposed project to the regional diesel fuel supplies would be less than significant.

4.2.3.2 Electricity

4.2.3.2.1 Increase in Electricity from ZE Trucks

ZE trucks would generate an increase in demand for electricity. This EA identifies the anticipated increase in electricity use from ZE trucks purchased and used as a result of the proposed project. Scenario 6 is the scenario in which all warehouse operators selected the installation of Level 3 ZE chargers and purchase and use of ZE trucks as the sole compliance option to meet their WPCO. Table 4.2-6 shows the potential increase in electricity from the proposed project for years 1 through 10. As identified previously, it is unlikely that all 2,902 warehouse operators would choose to fulfill their WPCO through this compliance option as their single, sole compliance option in every compliance year for 10 years. As a result, the electricity use identified in the table provides a conservative estimate of the greatest potential increase in electricity use associated with the proposed project.

⁴ California Energy Commission. 2020, September 22. 2019 California Annual Retail Fuel Outlet Report Results (CEC-A15). <https://www.energy.ca.gov/sites/default/files/2020-10/2010-2019%20CEC-A15%20Results%20and%20Analysis.xlsx>.

⁵ Diesel is adjusted to account for retail (47.2 percent) and non-retail (52.8 percent) diesel sales.

⁶ Under Scenario 6, should all warehouse operators choose to purchase NZE and ZE trucks to meet their WPCO, by year 2031 ISR would have no incremental effect above existing and proposed CARB rules.

Table 4.2-6
Electricity Use from Purchase and Use of ZE Trucks – Scenario 6

Year	Electric Truck Electricity Usage		
	Class 4-7 GWH/Year	Class 8 GWH/Year	Total GWH/Year
Year 1 – 2022	0	0	0
Year 2 – 2023	0	0	0
Year 3 – 2024	434 185	0 3	434 188
Year 4 – 2025	330 332	8 10	338 342
Year 5 – 2026	461 461	23 20	484 480
Year 6 – 2027	572 563	31 26	603 589
Year 7 – 2028	634 620	36 28	670 647
Year 8 – 2029	695 648	38 28	733 676
Year 9 – 2030	750 663	40 28	790 690
Year 10 – 2031	805 670	42 28	847 697

Notes: GWH: Gigawatt hours

The proposed project would require installation of ZE chargers to charge electric trucks. If all warehouse operators selected installation of Level 3 ZE and purchase and use of ZE trucks as the sole compliance option to meet their WPCO (Scenario 6), at year 10 there would be ~~5,501~~ 4,863 additional Level 3 ZE chargers within South Coast AQMD's jurisdiction (see Table 4.2-7).

Table 4.2-7
Level 3 ZE Charger Installation in the South Coast AQMD Region – Scenario 6

Year	Number of ZE Chargers Installed
Year 1 – 2022	1,863 <u>1,857</u>
Year 2 – 2023	1,045 <u>1,023</u>
Year 3 – 2024	1,254 <u>1,192</u>
Year 4 – 2025	169 <u>119</u>
Year 5 – 2026	195 <u>132</u>
Year 6 – 2027	195 <u>127</u>
Year 7 – 2028	195 <u>119</u>
Year 8 – 2029	195 <u>110</u>
Year 9 – 2030	195 <u>99</u>
Year 10 – 2031	195 <u>85</u>
Total ZE Chargers Installed	5,501 <u>4,863</u>

The installation of Level 3 ZE chargers will require coordination with the local utility provider to ensure sufficient energy requirements (e.g., peak load, circuit capacity, etc.). While this EA identifies impacts associated with each individual compliance option identified in the WAIRE menu, the analysis in this EA cannot predict how each of the warehouse operators will comply with the proposed project. As a result, it is not possible to forecast a particular, regionwide compliance approach for the initial 2,902 warehouses that would likely need to earn WAIRE points in any given year. Thus, the analysis in this EA has taken the WAIRE Points scenarios approach outlined above in order to provide a conservative analysis of potential impacts of the proposed project.

4.2.3.2.2 Increase in Electricity from Installation of High-Efficiency Filtration Systems

Implementation of the proposed project could increase energy demand under Scenario 15 since high efficiency filter systems take slightly more electricity to operate than traditional heating, ventilation, and air conditioning (HVAC) systems. Scenario 15 assumes that all warehouse operators would install high-efficiency filters or filter systems in residences, schools, daycares, hospitals, or community centers proximate to the warehouse location as the sole compliance option to meet their WPCO. An air filter's minimum efficiency reporting value (MERV) rating measures the effectiveness of filters. As identified in Table 4.2-8, installation of high efficiency filtration systems with MERV-16 filters would result in a total of ~~2,870,569~~ 2,307,547 systems installed by end of year 2031, resulting in a total increase of ~~746~~ 600 GWH a year.

Table 4.2-8
High Efficiency Filtration Systems Installed in the South Coast AQMD Region – Scenario 15

Compliance Year	High Efficiency Filtration Systems Installed Total	Increase in GWH/Year ^a
Year 1 – 2022	62,279 <u>61,961</u>	16
Year 2 – 2023	148,858 <u>145,375</u>	39 <u>38</u>
Year 3 – 2024	255,667 <u>243,716</u>	66 <u>63</u>
Year 4 – 2025	303,258 <u>282,032</u>	79 <u>73</u>
Year 5 – 2026	329,467 <u>295,025</u>	86 <u>77</u>
Year 6 – 2027	337,714 <u>317,102</u>	88 <u>82</u>
Year 7 – 2028	345,961 <u>274,959</u>	90 <u>71</u>

Year 9 – 2030	362,455 <u>231,702</u>	94 <u>60</u>
Year 10 – 2031	370,702 <u>199,457</u>	96 <u>52</u>
Total	2,870,569 <u>2,307,547</u>	746 <u>600</u>
Notes: GWH: Gigawatt Hours. Based on installations in each compliance year.		
^a Based on an energy consumption of 260 kWh/yr per system. ⁷		

4.2.3.2.3 Increase in Electricity from Purchase and Use of ZE Yard Trucks

Scenario 18 assumes that all 2,902 warehouse operators selected purchase and use of ZE yard trucks as the sole compliance option to meet their WPCO. Use of ZE yard trucks would replace diesel yard trucks and result in both localized and regional emissions benefits. However, electric yard trucks would result in an increased demand for electricity. Table 4.2-9 shows the projected number of ZE yard trucks that would be purchased per year in addition to the associated electricity use under Scenario 18.

⁷ Peters, Christine. IQ Air. 2019, October 11. Personal Communication “School Filtration Costs – Installation, Maintenance”.

Table 4.2-9

Electricity from ZE Yard Truck Purchase and Use in the South Coast AQMD Region – Scenario 18

Year	ZE Yard Trucks Purchased	Greatest Possible GWH/Year^a
Year 1 – 2022	<u>1,183 974</u>	<u>36 30</u>
Year 2 – 2023	<u>1,082 1,101</u>	<u>33 34</u>

Total	<u>4,864 4,076</u>	<u>149 125</u>
Notes: GWH: Gigawatt hours. Based on installations in each compliance year.		
^a Based on 365 days of operation per year and each yard truck would consume 84 kWh/day. ⁸		

4.2.3.2.4 Purchase and Use of Solar Panels

Scenario 11 assumes that all warehouse operators selected installation of solar panels as the sole compliance option to meet their WPCO as a result of the proposed project. As shown in Table 4.2-10, under Scenario 11, the proposed project would provide net energy benefits through installation of solar panels, which would reduce the need for electrical grid capacity and additional energy resources from local utilities.

Table 4.2-10

Maximum Electricity Offset from Solar Panel Installation in the South Coast AQMD Region – Scenario 11

Year	Greatest Possible GWH/Year Generated
Year 1 – 2022	<u>0</u>
Year 2 – 2023	<u>977 1,490</u>
Year 3 – 2024	<u>2,938 4,382</u>
Year 4 – 2025	<u>6,729 7,190</u>
Year 5 – 2026	<u>8,421 9,095</u>
Year 6 – 2027	<u>9,762 10,259</u>

Year 10 – 2031	<u>11,044 11,022</u>
Total	<u>NA</u>
Notes: GWH: Gigawatt Hours. GWH generated is cumulative based on installations in the compliance year and prior compliance years.	

⁸ Orange EV. 2018, April 17. Making Electrification Work: How to Successfully Deploy HDEVs A Yard Truck Case Study. <https://www.gtsummitexpo.socialenterprises.net/program/2018presentations/MikeSaxton.pdf> Accessed December 2020.

4.2.3.2.5 Impacts to Electricity Providers

As stated, the total electricity consumption in SCE's service area in ~~GWH gigawatt-hours (GWh)~~ was 105,162 GWH in 2019.⁹ The total mid-electricity consumption in SCE's service area is forecasted to increase by approximately 10,000 GWH between 2018 and 2030.¹⁰ The LADWP service area spans much of the urban areas of Los Angeles County with a total electricity consumption of 23,402 GWH in 2019.¹¹ Based on LADWP's 2017 Power Strategic Long-Term Resource Plan, LADWP forecasts that its total retail sales in the 2021–2022 fiscal year will be 22,613 GWH of electricity.¹²

While the proposed project could result in an increase in electricity demand, it is speculative to identify, for this EA, how the investor-owned utilities (IOUs) or publicly owned utilities (POUs) would accommodate the increased electricity demand as a result of implementation of the proposed project (see also Section 6.3, Significant Environmental Effects Which Cannot Be Avoided). Furthermore, it would be speculative to analyze potential impacts resulting from the development of any supporting infrastructure, including new solar/wind, energy storage, and other utility infrastructure conducted by the utility providers and is outside the scope of this EA. Nonetheless, this EA incorporates by reference analysis of other, similar indirect impacts in Chapter 4.5, "Other Impact Areas." SCE and other IOUs forecast improvements to the electric grid to accommodate the forecast energy demand as part of the California Energy Commission's (CEC's) biennial Integrated Energy Policy Report (IEPR). Such utility-scale projects outlined in the IEPR would be subject to project-level review, including review of energy impacts under CEQA, if needed to address increase in supply and transmission of electricity resources, depending on the energy forecasts anticipated by the individual utility provider.

This EA evaluates the direct and indirect effect of an overall increase in electricity use in the South Coast AQMD region, as shown in Table 4.2-11. As identified in the compliance scenarios above, the proposed project would result in a direct increase in electricity in the South Coast AQMD region energy grid. In addition, there is also opportunity to offset grid energy impacts through installation of solar panel systems (Scenario 11). To ensure that the utility providers are able to anticipate and meet an increase in demand for electricity in the southern California region associated with the transition to ZE trucks, South Coast AQMD has been coordinating with SCE (see Chapter 1) to ensure that the potential increase in electricity from transition to ZE trucks is planned for in future IEPR updates.

Table 4.2-11
Range of Potential Electricity Impacts/Benefits Associated with the Proposed Project

Scenario at Year 2031	GWH/Year
Scenario 6 – ZE Electric Trucks	847 697
Scenario 15 – High Efficiency Filtration Systems	746 600
Scenario 18 – ZE Yard Trucks	149 125
Scenario 11 – Solar Panel Installation	-11,044 11,022 ^a
Notes: GWH: Gigawatt hours ^a This represents a potential beneficial impact as the renewable electricity generated would offset demand of electricity from a utility provider.	

The 2019 IEPR¹³ addresses the sweeping changes to the energy system needed to address the state's GHG reduction goals and improve air quality, including SB 100 and SB 350, and acknowledges that ZE vehicles are critical to the state's clean air goals. The IEPR includes a 10-year forecast for electricity, natural gas use, and transportation fuels that inform planning for resource procurement and transmission investments in the California Public Utility Commission's (CPUC) Integrated Resource Planning process and the California Independent System Operator's (California ISO's) Transmission Planning Process, respectively. In addition, the CEC provides monthly peak demand forecasts in coordination with California ISO and the CPUC for evaluating resource adequacy. It is through these planning efforts that the local utility providers and the state ensure reliable electricity transmission and delivery. As such, utility providers are anticipating an increase in demand for electricity that aligns with the state's carbon neutrality goals. This increase in electricity from ZE truck use would directly replace the need for diesel fuel from a truck.

As part of its analysis of total statewide energy planning needs, the CEC has begun assessing the potential impacts to the electric grid from widespread deployment of battery-electric vehicles. As part of the development of the 2020 IEPR, CEC staff has included a scenario that explicitly evaluates the electric power needed if greater than 100,000 ZE trucks are deployed to assist in meeting the 2031 ozone standards.¹⁴ This analysis showed that the projected electricity demand from charging these trucks would be about 1,684 GWH in 2031, with a peak summer hourly load of about 164 MW for SCE, the region's largest utility.¹⁵ For context, this is only an approximately one percent increase in overall SCE electric load, but about a three time increase from what SCE is currently planning for electric vehicles in the 2020 IEPR. Based on a presentations conducted by the CEC in December 2020, CEC identified that the energy forecast in the 2019 IEPR assumed that EV energy charging results in about a one to two percent increase in electricity demand overall in the SCE region compared to the 'mid' case analysis. However, this is still within the range of expected demand because the additional load from ZE charging does not exceed CEC's modeled

¹³ California Energy Commission. 2020, May 6. Adopted 2019 Integrated Energy Policy Report, <https://www.energy.ca.gov/data-reports/reports/integrated-energy-policy-report/2019-integrated-energy-policy-report>, accessed December 15, 2020.

¹⁴ McBride, Bob. California Energy Commission. 2019, December 3. Electricity and Natural Gas Demand Forecast. "Exploratory Scenario: Energy Impacts of MD-HD ZEV Populations to Meet Federal Ozone Standard in South Coast Air Basin in 2031" Docket Number 20-IEPR-03. <https://efiling.energy.ca.gov/getdocument.aspx?tn=235836>

¹⁵ Based on 100,000 Class 3 to Class 8 trucks, assuming pretty flat charging throughout the day.

‘high’ case. Because the proposed project would only result in a smaller subset of these 100,000+ trucks, the potential impacts to the electrical grid are expected to be even lower.^{16, 17}

The 2019 IEPR also states that to address the growing EV population, the state will need to drastically increase the availability of charging infrastructure. Per the CEC Assembly Bill 2127 Electric Vehicle Charging Infrastructure Assessment Staff Report, preliminary modeling shows large areas of the grid within and throughout the state (e.g., Central Valley) has little to no excess capacity.¹⁸ According the Staff Report, 157,000 (141,000 50 kW and 16,000 350 kW) DC fast chargers are needed to support the 180,000 battery-electric medium-duty and heavy-duty vehicles in year 2030 as projected under CARB’s Draft Mobile Source Strategy.¹⁹ The CEC is currently updating the state’s Vehicle Grid Integration Roadmap to outline key steps in the implementation of technologies that can lower the costs for plug-in vehicles, recharging station owners, and utility customers in general.²⁰

While the IEPR is considering the cumulative effect of N-79-20, which would ultimately shift California’s transportation economy to carbon-neutral energy sources, the proposed project would expedite this timeline for heavy duty trucks. South Coast AQMD is actively coordinating with SCE to ensure that they consider the potential cumulative effect of the proposed project. However, because the proposed project could expedite the need for infrastructure to support an increase in ZE sources, impacts associated with the ~~with the~~ need for new or substantially altered power utility systems, new and expanded infrastructure, and effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure by compliance year 2031 is conservatively considered a significant environmental effect of the proposed project.

4.2.3.3 Natural Gas

4.2.3.3.1 Purchase and Use of Natural Gas NZE Trucks

Scenarios 1, 2, 3, 4, 8, and 9 assume all 2,902 warehouse operators selected purchase and use of NZE trucks as the sole compliance option or part of their compliance option to meet their WPCO. Table 4.2-12 shows the increase in VMT and natural gas consumption associated with use and purchase of NZE trucks in compliance year 2031.

Scenario 9	701,925,624 376,571,845	111,416,766 59,773,309
Notes: Unit: Rep		
^a Based on 5.1 and 6.3 miles per diesel gallon equivalent for Class 8 and Class 4-7, respectively. ²¹		

In 2017, a total of approximately 167.6 million diesel gallon equivalent (DGE) of natural gas was used in state for transportation.²² This total includes the sum of liquefied natural gas (LNG) and compressed natural gas (CNG). Under the most conservative scenario, assuming all warehouse operators would select purchase and use of natural gas NZE trucks, the increase in natural gas consumption due to the proposed project over the course of the next ten years would amount to an increase of ~~65-35~~ to ~~74-65~~ percent over the 2017 demand. Use of natural gas would be offset by a decrease in diesel fuel. In addition, as it is an alternative fuel, its use would advance the goals of the State Alternative Fuels Plan.²³ However, because the proposed project could expedite the need for infrastructure to support an increase in demand for natural gas for transportation fuel, impacts associated with new or substantially altered natural gas utility systems and the expanded infrastructure needed to accommodate the increase in demand from NZE vehicles and refueling infrastructure by compliance year 2031 is conservatively considered a significant environmental effect of the proposed project.

4.2.3.4 Hydrogen Fuel

4.2.3.4.1 Hydrogen Fueling Station Installation and ZE (Hydrogen) Truck Purchase

Scenario 12 assumes all 2,902 warehouse operators selected installation of hydrogen fueling infrastructure and ZE truck acquisitions as the sole compliance option to meet their WPCO. Table 4.2-13 shows the greatest potential total increase in hydrogen fuel use associated with Scenario 12.

²¹ South Coast Air Quality Management District, 2020, March 3, Draft WAIRE Menu Technical Report, Version 3/3/2020.

Table 4.2-13
Hydrogen Fuel Use from Purchase and Use of ZE Trucks – Scenario 12

Year	Hydrogen Fuel Kilogram of H₂/Year
Year 1 – 2022	0
Year 2 – 2023	0 1,165,549
Year 3 – 2024	2,330,200 3,555,231
Year 4 – 2025	4,777,520 6,195,109
Year 5 – 2026	7,607,920 10,398,409
Year 6 – 2027	15,233,160 14,422,301
Year 7 – 2028	17,946,200 16,425,093
Year 8 – 2029	20,478,920 17,385,604
Year 9 – 2030	21,098,680 17,722,453
Year 10 – 2031	22,365,040 17,976,311
Notes: Unit: Rep ^a Highest natural gas consumption Scenarios 8 and 9. ^b Highest natural gas consumption Scenarios 1 through 4.	

As shown in Table 4.2-13, by year 2031, the proposed project would result in an increase of 22.4 million kilograms in hydrogen fuel consumption. In 2018, a total of 890,000 kilograms of hydrogen fuel was supplied in state for light-duty vehicles.²⁴ Under the most conservative scenario where all warehouse operators would install hydrogen fueling infrastructure to achieve their WPCO, the proposed project would represent a substantial increase over 2018 state levels. While the proposed project would result in an increase in hydrogen fuel, it is speculative to identify the lifecycle impacts associated with the production of hydrogen fuel manufacturing and other infrastructure necessary for this EA (see Section 4.2.1.1, Lifecycle Analysis; see also Chapter 4 Section 6.3, Significant Environmental Effects Which Cannot Be Avoided). However, Section 4.2.4 and Chapter 4.5 provide an analysis of potential indirect impacts associated with alternative fuel infrastructure development. As that analysis makes clear, any utility-scale projects would be subject to project-level review, including review of energy impacts under CEQA, if needed to address increase in supply and production of hydrogen fuel resources.

Overall, while the proposed project would result in an increase in hydrogen demand, it would advance the state's goal of increasing the use of alternative fuels. However, the proposed project could expedite the need for infrastructure on an overall statewide basis to support an increase in hydrogen vehicles. According to CARB's 2020 Annual Evaluation of Fuel Cell Electric Vehicle Deployment & Hydrogen Fuel Station Network Development, significant effort would be required to meet the 200 fuel stations by year 2025 target set under EO B-48-18.²⁵ Thus, impacts associated with the expanded hydrogen fuel infrastructure needed to accommodate the increase in demand from hydrogen vehicles and refueling infrastructure by compliance year 2031 is conservatively considered a significant environmental effect of the proposed project.

²⁴ California Energy Commission, May 6, 2020, Adopted 2019 Integrated Energy Policy Report, <https://www.energy.ca.gov/data-reports/reports/integrated-energy-policy-report/2019-integrated-energy-policy-report>, accessed December 15, 2020.

²⁵ California Air Resources Board, September 2020, 2020 Annual Evaluation of Fuel Cell Electric Vehicle Deployment & Hydrogen Fuel Station Network Development. https://ww2.arb.ca.gov/sites/default/files/2020-09/ab8_report_2020.pdf.

4.2.4 Indirect Energy Impacts Associated with Construction of New Manufacturing Facilities, Recycling Facilities, and Infrastructure Improvements (Significance Criteria b, c, d, and g)

Because the proposed project encourages and incentivizes the purchase and use of NZE and ZE vehicles, it could also indirectly result in the construction and operation of new manufacturing and recycling facilities, as well as infrastructure improvements to support the transition to NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final EA for the ACT Regulation, and this EA incorporates that analysis by reference here.

The CARB's Final EA for the ACT Regulation identified that temporary increases in energy demand associated with construction and modification of facilities would include fuel consumption from use of heavy equipment, vehicles, and generators. Typical equipment that may be necessary for construction includes: graders, scrapers, backhoes, jackhammers, front-end loaders, water trucks, and dump trucks. While energy would be required to complete construction for any new or modified facilities or infrastructure projects, it would be temporary and limited in magnitude such that a reasonable amount of energy would be expended. Additionally, this temporary expenditure of energy is meant to, in the long term, allow for a transition to vehicles that use less fossil fuels. Therefore, energy use during construction would not be wasteful, inefficient, or unnecessary. Short-term construction-related impacts on energy demand associated with these indirect impacts are less than significant.

However, the CARB's Final EA for the ACT Regulation identified that this transition to NZE and ZE vehicles would warrant expansion of the energy infrastructure. Public utility companies would continue to improve infrastructure and implement strategies to diversify the grid to accommodate additional electricity demand from use of NZE and ZE vehicles. Any new or modified facilities, no matter their size and location, would be required to seek local or State land use approvals prior to their development. In addition, part of the land use entitlement process for facilities proposed in California requires that each of these projects undergo environmental review consistent with the requirements of CEQA and the CEQA Guidelines. At this time, the specific location and type of construction needed is are not known and would be dependent upon a variety of market factors that are not within the control of CARB or South Coast AQMD, including: economic costs, product demands, environmental constraints, and other market constraints. Thus, the specific impacts to energy service providers cannot be identified with any certainty, and individual compliance responses could potentially result in significant environmental impacts for which it is unknown whether mitigation would be available to reduce the impacts.

PROJECT IMPACTS – CONCLUSION: Based on the preceding analysis, the overall conclusion is that energy impacts for the proposed project are less than significant during construction. However, the proposed project could expedite the need for expanded electricity, natural gas, and hydrogen fuel infrastructure, impacts of which are conservatively considered significant. The proposed project is part of a larger transition from diesel and petroleum to alternative energy for the transportation sector. This transition itself provides energy benefits. Further, it should be noted that the energy analysis is a conservative, 'worst case' analysis based on the WPCO scenarios if all warehouse operators selected the scenario as the sole compliance option. As a result, the actual energy use would range depending on the WPCO selected, and the actual construction and operational impacts are not expected to be as great as estimated in this EA.

PROJECT MITIGATION MEASURES: The analysis indicates that energy impacts during the construction phase are less than significant. However, the proposed project expedites the need for expanded electricity infrastructure in addition to increasing, on a statewide basis, the number of natural gas and hydrogen fuel stations. For electricity, SCE plans for and accommodates the need for electrical grid infrastructure expansions and improvements through the IEPR and is forecasting an increase in energy demand from ZE. While the IEPR is considering the cumulative effect of N-79-20, which would ultimately shift California's transportation economy to carbon-neutral energy sources, the proposed project would expedite this timeline for heavy duty trucks. South Coast AQMD is actively coordinating with SCE to ensure that they consider the potential cumulative effect of the proposed project. However, the authority to determine project-level impacts and require project-level mitigation lies with land use and/or permitting agencies for individual projects, and the programmatic level of analysis associated with this EA does not attempt to address project-specific details of mitigation. As such, there is inherent uncertainty in the degree of mitigation that may ultimately ~~by~~ be implemented to reduce potentially significant impacts. As for hydrogen fueling infrastructure, expansion of fueling stations statewide is supported through AB 8 and EO B-48-18 and state programs such as CARB's LCFS Hydrogen Refueling Infrastructure credit provision and the CEC's Grand Funding Opportunity 19-602 grant solicitation. Expansion of natural gas fueling infrastructure is supported through CEC's Clean Transportation Program. While impacts could be reduced to a less-than-significant level by land use and/or permitting agency conditions of approval, South Coast AQMD does not have the authority to implement mitigation related to new or modified energy infrastructure. No additional mitigation measures are feasible that would prevent the expedited need for electricity infrastructure and natural gas and hydrogen fueling stations to accommodate the demand of these alternative energy sources created by the proposed project.

REMAINING IMPACTS: Energy impacts during the construction phase are less than significant. The proposed project's long-term impacts on energy infrastructure is significant and unavoidable.

CUMULATIVE IMPACTS: The preceding analysis concluded that energy impacts from construction activities would be less than significant as a result of implementing the proposed project. However, as stated above, while there are ongoing planning efforts and programs in place to expand hydrogen and natural gas fueling infrastructure in addition to electricity infrastructure, the proposed project would contribute to expediting the need for expansion of the various infrastructure for these energy sources. Therefore, the proposed project's cumulative contribution to impacts on energy infrastructure is cumulatively considerable pursuant to CEQA Guidelines Section 15064(h)(1) and considered significant and unavoidable. However, it should be noted that the proposed project is part of a larger transition from diesel and petroleum to alternative energy for the transportation sector. This transition itself provides energy benefits. Furthermore, the energy analysis is a conservative, 'worst case' analysis based on the WPCO scenarios if all warehouse operators selected the scenario as the sole compliance option. As a result, the actual energy use would range depending on the WPCO selected, and the actual construction and operational impacts are not expected to be as great as estimated in this EA.

4.3 HAZARDOUS MATERIALS AND SOLID AND HAZARDOUS WASTE

Under the proposed project, warehouse operators may earn WAIRE Points by acquiring and/or using ZE trucks and ZE yard trucks, which will be referred to collectively as electric vehicles (EV) for this EA. WAIRE Points may also be earned by installing and using solar panel systems. All of these compliance actions could increase the use of batteries and fuel cells during the operational phase of the proposed project, and these batteries and fuel cells would need to be disposed of or recycled. Battery and fuel cell replacement could therefore have impacts associated with hazardous waste and recycling capacity for used batteries. The Initial Study for the proposed project concluded that impacts associated with spent batteries and fuel cells would be less than significant and would not be discussed further in the EA. However, during the public review period for the Notice of Preparation and Initial Study, several public comments were received that related to the increased rates of disposal of batteries and hydrogen fuel cells, the potential increase in hazards to the public or the environment, and the increased need for facilities capable of receiving these batteries and fuel cells. As such, the topic of spent batteries and fuel cells generated during the operational phase is being carried forward to the EA for further discussion.

Furthermore, the 2016 AQMP Final Program EIR concluded that the accidental release of liquefied natural gas (LNG) during transport could cause significant adverse hazards impacts even after implementation of the mitigation measures in the EIR. Since the proposed project could result in the increased use of NZE trucks, the use and transport of LNG could also increase. The 2016 AQMP Final Program EIR also concluded that due to the high volume of vehicles and equipment that need to be retired in a short time frame and due to the uncertainty of their outcome, a potentially significant impact would result due to implementation of the 2016 AQMP. Furthermore, since the extent and timing of construction needed to implement the 2016 AQMP is not known, the potential to exceed landfill capacities in the short term was found to be significant. This discussion is incorporated by reference here, and impacts associated with LNG, scrapped vehicles and equipment, and construction waste are included in this EA for further discussion.

In addition, the proposed project could indirectly result in the construction and operation of new manufacturing and recycling facilities, as well as grid improvements, necessary to meet the increased demand for NZE and ZE vehicles and provide the energy and infrastructure to power them. These potential impacts were analyzed in CARB's Final EA for the ACT Regulations, and this EA incorporates that analysis by reference here. Because these potential impacts are indirect, and because the circumstances surrounding any such future development are unknown, the potential hazardous materials and solid and hazardous waste impacts associated with this development are discussed separately from the analysis of the proposed projects' direct impacts.

It should be noted that hazards to the public or the environment due to the disposal of spent batteries was discussed under the Hazards and Hazardous Materials section of the Initial Study. Impacts to the capacity of local waste infrastructure was discussed in the Solid and Hazardous Waste Section of the Initial Study. These two impact topics are being analyzed jointly in this section of the EA.

4.3.1 Significance Criteria

The proposed project's impacts from battery and fuel cell disposal and recycling will be considered significant if the proposed project:

- a) Creates a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.
- b) Creates a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
- c) Generates solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impairs the attainment of solid waste reduction goals.

4.3.2 Hazards Associated with Routine Transport, Use, or Disposal of Batteries and Fuel Cells (Significance Criteria)

Some batteries contain toxic materials. As a result, the increased use of batteries may result in an incremental increase in hazardous waste impacts. Environmental impacts could occur if batteries were disposed of in an unsafe manner, such as illegal dumping or by disposal in an unlined landfill. The EA provides 'book-ends' of the range of potential environmental consequences associated with the proposed project to provide a framework for understanding the greatest potential impacts. Some of the compliance actions taken pursuant to the proposed project could increase the generation of spent batteries and fuel cells in South Coast AQMD's jurisdiction and subsequently the demand for specialized disposal facilities and landfills under Scenario 6 (ZE trucks), Scenario 11 (solar panel systems), Scenario 12 (hydrogen trucks), and Scenario 18 (ZE yard trucks). The analysis in this EA has taken the WAIRE Points scenarios approach outlined in Section 4.1 to provide a conservative analysis of potential impacts of the proposed project.

The most common battery currently used in gasoline- and diesel-fueled vehicles is the lead-acid battery found in conventional automobiles and trucks. These batteries are disposed of and processed by the lead recycling industry. ZE vehicles operate with different battery types than the lead-acid battery. The most common battery types available for zero emission vehicles are lithium ion (Li-ion) batteries. EVs use nickel metal hydride (NiMH) and nickel cadmium (NiCad) batteries to a lesser extent. The most common type of fuel cell for vehicle applications is the polymer electrolyte membrane (PEM) fuel cell. For solar panels, lead-acid based batteries and Li-ion batteries are the most commonly used for the type of applications associated with the proposed project. Implementation of the proposed project would lower the demand for gasoline- and diesel-fueled trucks and therefore decrease the use of lead-acid batteries.

Lead-acid batteries have a three- to five-year lifespan and need to be periodically replaced. Electric and hybrid vehicle batteries last longer than lead-acid batteries. For example, most of the batteries in electric vehicles have warranties for 10 years or 150,000 miles. Therefore, the shift from conventional to ZE vehicles would result in a decrease in the number of spent batteries that require disposal or recycling. However, it is speculative to estimate the number of lead acid, NiMH, NiCad, Li-ion, or PEM fuel cell batteries that would occur as a result of implementation of the proposed project since it is uncertain how many new ZE vehicles will be purchased to comply with the proposed project.

Furthermore, components of NiMH batteries are typically not disposed of at landfills, and whatever cannot be recycled is typically consumed as the fuel for the furnaces in the recycling process. The primary metals recovered during recycling are nickel, copper, and iron. Most industrial nickel is recycled due to the relatively easy retrieval of the magnetic element from scrap using electromagnets, and its high monetary value. Some principal rare earth metals, like neodymium and lanthanum, are also recovered.¹ Additionally, improper disposal of NiMH batteries poses less of an environmental hazard than of lead-acid or NiCad batteries because NiMH batteries do not contain lead and cadmium, which are toxic.

Because Li-ion batteries have the potential to collect and discharge electricity for another seven to 10 years after being taken off the roads and stripped from vehicles, destructive recycling can be postponed.² Battery manufacturers have projected that Li-ion battery packs will still be able to operate at about 80 percent of capacity at the time they must be retired from automotive use. For example, several major power utilities are working with companies such as General Motors, Ford, Toyota, and Nissan to explore the use of Li-ion batteries for the stationary storage of power produced during off peak periods by wind turbines and solar generation stations. The Li-ion battery packs are also being tested as backup power storage systems for retail centers, restaurants, and hospitals as well as residential solar panel systems. Automobile companies are partnering with battery, recycling, and electronics firms to figure out and develop post-automotive markets and applications for Li-ion battery packs.³ With the opportunity for other, non-automotive aftermarket uses, Li-ion battery recycling may not be immediately necessary when compared to recycling of lead-acid batteries.

Additionally, Li-ion batteries are between 70 and 100 percent recyclable, depending on the particular chemistry of the batteries. There are a number of different types of Li-ion batteries in use, and more are being developed. The components of Li-ion batteries that cannot be recycled are mostly consumed as fuel in the furnaces that are used to melt down the metals, which include cobalt, copper, iron, nickel, manganese, and lithium.⁴

There are only a few key companies serving the North America market with the established technology and capacity to process NiMH, Ni-Cad, and Li-ion batteries. Umicore, Glencore, Retrie Technologies (previously known as Toxco), and Battery Solutions recycle both NiMH and Li-ion batteries. Inmetco recycles NiMH batteries while LiCycle recycles Li-ion batteries. Retrie Technologies also recycles NiCad batteries.

Umicore, while based in Belgium as the leading metals recycling company in Europe, is expanding their operations in the United States. Retrie Technologies is the only commercial company in

³ Edmunds, August 25, 2014, What Happens to EV and Hybrid Batteries? Going Green with Battery Recycling, <https://www.edmunds.com/fuel-economy/what-happens-to-ev-and-hybrid-batteries.html>, accessed December 21, 2020.

⁴ State of California, California Code, Health and Safety Code - § 25507, January 1, 2019, Section 4.6.4.1, Spent Batteries from Electric Vehicles, pages 4.6-8 through 4.6-12 and Section 4.4.4.2.4, Electric Vehicles, pages 4.4-13 through 4.4-17 http://leginfo.ca.gov/faces/codes_displaySection.xhtml?lawCode=HSC§ionNum=25507

North America with the capacity to recycle Li-ion batteries.⁵ Retrieval Technologies was awarded a federal grant to build and operate an advanced lithium battery recycling facility at their existing Lancaster, Ohio site.⁶ The Retrieval Technologies facility appears to be the recycler that is most widely used by companies that sell hybrid vehicles and ZE vehicles in North America when batteries reach their end of useful life. The facility uses a proprietary system to primarily recycle Ni-MH batteries. Retrieval Technologies also currently handles small volumes of Li-ion battery packs as it works with automakers to develop the best recycling processes.⁷ Sudbury Integrated Nickel Operations (INO), a subsidiary company of global mining company Glencore, operates a large nickel and copper smelter in Sudbury, Ontario, Canada. Sudbury INO has historically processed mostly small portable batteries but is now handling large format EV batteries as well. Battery Solutions separates Li-ion battery components into three end products—cobalt and lithium salt concentrate; stainless steel; and copper, aluminum, and plastic. All of these products are sold to manufacturers to be reused in new products. For NiMH batteries, Battery Solutions removes the plastics from the cell portion prior to the recycling process. The cells go through a drying process to remove moisture from the cell, once the cells are dried, they become a valuable feedstock for the stainless steel and/or alloy manufacturing industries. The metals and plastic are then returned to manufacturers to be reused in new products. Inmetco, located in Ellwood City, Pennsylvania, recycles nickel, chrome, and iron from NiMH batteries.⁸ Li-Cycle recovers 95% or more of all materials found in Li-ion batteries and can process all types of lithium-ion batteries used in electronic devices, e-mobility, electric vehicles, and other energy storage applications. The company has two hubs, one in Ontario, Canada, and a second in Rochester, New York.⁹

If spent EV batteries exceed the capacity of recycling facilities, the batteries could be illegally dumped or disposed of in an unlined landfill, leading to environmental impacts. However, many manufacturers offer incentives to prevent the illegal disposal of NiMH, NiCad and Li-ion batteries. For example, most car manufacturers offer a program to take back used or damaged battery packs, including Toyota and Nissan.¹⁰ Additionally, federal and state laws have created incentives and requirements for the recycling and safe transport, use, or disposal of batteries, as follows:

- The federal Resource Conservation and Recovery Act (RCRA) gave the U.S. EPA the authority to control hazardous waste from the ‘cradle-to-grave.’ Under Subtitle C of RCRA, hazardous waste must be properly identified, stored, transported, treated, and disposed.

¹⁰ Edmunds, August 25, 2014, What Happens to EV and Hybrid Batteries? Going Green with Battery Recycling, <https://www.edmunds.com/fuel-economy/what-happens-to-ev-and-hybrid-batteries.html>, accessed December 21, 2020.

- California’s Hazardous Waste Control Act created the state’s Hazardous Waste Management Program. The act is implemented by regulations contained in Title 26 of the California Code of Regulations (CCR), which describes the following required aspects for the proper management of hazardous waste: identification and classification; generation and transportation; design and permitting of recycling, treatment, storage, and disposal facilities; treatment standards; operation of facilities and staff training; and closure of facilities and liability requirements.¹¹
- The federal Battery Act promulgated in 1996 requires that each regulated battery be labeled with a recycling symbol. NiCad batteries must be labeled with the words “NiCad” and the phrase “Battery must be recycled or disposed of properly.”
- The Universal Waste Rule requires that spent batteries exhibiting hazardous waste characteristics that are not recycled need to be managed as hazardous waste. This includes Li-ion, NiMH, and NiCad batteries.

In addition, the batteries that would power EVs and solar panels are packaged in battery packs and cannot be as easily disposed of as a single 12-volt conventional vehicle battery, which some electric cars also have. Since NiMH and Li-ion in batteries have a larger size and heavier weight (over 100 pounds) it makes them more difficult to handle and transport for unauthorized disposal.

EVs do not require the various oil and gasoline filters that are required by vehicles using internal combustion engines. Furthermore, EVs do not require the same type or amount of engine fluids (oil, antifreeze, etc.) that are required by vehicles using internal combustion engines. Because of the widespread use and volume of waste oil, a portion of waste oil is illegally disposed of via sewers, in waterways, on land, and disposed in landfills. Waste oil that is illegally disposed can contaminate the environment (via water, land, or air). Since electric motors do not require motor oil as a lubricant, replacing internal combustion engines with electric engines will eliminate the impacts of motor oil use and disposal. Release of contaminants due to engine oil that burns up in or leaks from engines, or due to the burning of recovered engine oil for energy generation, will also be reduced. Additional use of EVs is expected to have a beneficial environmental impact by reducing the amount of motor oil used, recycled, potentially illegally disposed, or washed into storm drains and ending up in the ocean.¹²

PEM fuel cells contain no poisonous or hazardous materials that may impact the environment upon disposal. Platinum group metals (PGMs) are the main electrocatalysts used in PEM stacks. Given their economic relevance, PGMs such as platinum, iridium, and ruthenium are typically recycled.

Therefore, for the reasons described above and consistent with the analysis in the ~~March 2017 Final Program EIR for the 2016 AQMP~~ Final Program EIR, impacts from the generation of hazardous solid waste associated with the use of EVs and solar panel systems that occur as a result of compliance with the proposed project would be less than significant.

¹² South Coast Air Quality Management District, January 2017, Final Program Environmental Impact Report for the 2016 Air Quality Plan, <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfpeir.pdf>, accessed December 21, 2020.

4.3.3 Hazards Associated with the Rupture of Liquefied Natural Gas Tanks During Storage Transportation (Significance Criteria b)

LNG is non-toxic, flammable, disperses more readily in air than conventional fuels, and has more rigorous standards for transportation. It is expected that the increased use of NZE vehicles due to the implementation of the proposed project could increase facilities that receive LNG from local suppliers located in the Basin. Deliveries of LNG would be made by tanker truck via public roads. LNG trucks are double-walled aluminum and are designed to withstand accidents during the transport of LNG. However, accidental releases may still occur. Four accidental release scenarios were identified in the 2016 AQMP Final Program EIR as having major consequences, and the adverse impacts from the four scenarios were determined (refer to section 4.3.4.7.1 of the 2016 AQMP Final Program EIR pp. 4.3-37). During transportation of LNG, it was estimated that the adverse impacts from these release scenarios would extend 0.3 mile. Because sensitive receptors may be within this distance, the accidental release of LNG during transport could cause significant adverse hazards and the increased storage and transport of LNG may substantially alter existing transportation hazards associated with mobile source fuels. Consequently, increased usage of LNG due to implementation of the proposed project could generate significant adverse hazard impacts during routing storage and transport.

4.3.4 Operational Impacts in Excess of the Capacity of Local Recycling Infrastructure (Significance Criteria c)

The increased spent battery and fuel cell waste stream could trigger the need for additional recyclers. As described previously, it not possible to identify the incremental increase in the number of EV batteries caused by the proposed project. Batteries used by EVs would either be reused in a secondary market (e.g., battery storage) or recycled when batteries reach their end of life.¹³ As identified above, Umicore, Glencore, Inmetco, Li-Cycle, and Retrieval Technologies (previously known as Toxco) have the technology to recycle NiMH, NiCad, and Li-ion batteries in the nation.¹⁴ The limited number of existing Li-ion battery recyclers and the fact that these existing recyclers have plans to expand battery recycling highlights that the recycling industry is only now beginning to expand operations to accommodate EV batteries reaching their end-of-life. The cumulative burden of EV waste is substantial given the growth trajectory of the EV market.¹⁵ Unlike the solid waste sector, which is required to plan for or adequate safe disposal capacity for a minimum of 15 years or plan for new and/or expanded facilities pursuant to Assembly Bill 939, no such requirement currently exists for the recycling industry.

To meet the increased demand of refurbishing or reusing batteries and fuel cells, new facilities or modifications to existing facilities would need to be constructed to accommodate recycling

activities. In the long term, implementation of the proposed project along with State standards such as the Sustainable Communities and Climate Protection Act (SB 375) and CARB's Advanced Clean Cars program and Truck and Bus Regulation would result in a shift away from petroleum-based fuels toward hydrogen or electric. California is moving in the direction of electrifying its transportation and energy systems, and it is anticipated that this would result in a corresponding increase in the market demand for recycling facilities. As more EVs and solar panel systems are introduced to the transportation and energy sector, increased economic incentives are anticipated to drive modifications to existing infrastructure.

However, there are no federal, state, or local regulations that require the recycling industry to forecast the capacity of infrastructure needed to meet the demand. While CalEPA formed the Lithium-Ion Car Battery Recycling Advisory Group in 2019 to advise the legislature on policies pertaining to the recovery and recycling of lithium-ion vehicle batteries, recommendations are still forthcoming. The group is required to submit policy recommendations on or before April 1, 2022. The policy recommendations are intended to address the end-of-life issues with a goal of ensuring that "as close to 100 percent as possible of lithium-ion vehicle batteries in the state are reused or recycled."¹⁶ Therefore, while it is expected that efforts are underway to ensure adequate infrastructure for the reuse, recycling, or disposal of lithium-ion batteries, implementation of the proposed project could result in the generation of spent batteries and fuel cells that exceed the current capacity of local recycling infrastructure, and impacts are potentially significant.

4.3.5 Operational Impacts in Excess of the Capacity of Local Landfills (Significance Criteria c)

Implementation of the proposed project could result in the early retirement of equipment such as on-road trucks and vehicles, off-road vehicles, gasoline-fueled engines, and diesel-fueled engines. Impacts could occur since the older equipment or vehicle parts would be taken out of service in the Basin and scrapped and disposed of in landfills. Approximately 80 percent of a vehicle can be recycled and reused in another capacity. During the scrapping process, batteries, catalytic converters, tires, and other recoverable materials (e.g., metal components) are removed and the metal components of the vehicle are shredded. The shredded material is then sent for recovery of metal content. Therefore, the amount of solid waste landfilled as a result of the proposed project would be relatively small, since most of the parts being replaced have commercial value as scrap metal. Currently, there are a limited number of vehicles and parts that can be scrapped per year because of the limited number of scrapping and recycling facilities in South Coast AQMD's jurisdiction. It is expected that gasoline and diesel engines could also be recycled for metal content or rebuilt and sold to other areas. It is expected that parts and equipment would be scrapped in the near future, regardless of the proposed project, as they are older vehicles or have older components. The primary solid waste impact is expected to be the accelerated replacement and disposal of equipment and parts before the end of their useful life.

Further, the proposed project does not mandate that older vehicle, engines, or other equipment be scrapped. WAIRE Menu items that would require new equipment will generally require that retirement occur when the life of the old equipment is exhausted, and the new equipment is put into service. Alternatively, some measures can encourage advanced deployment of cleaner

¹⁶ CalEPA, 2021, Lithium-ion Car Battery Recycling Advisory Group, AB 2832 Advisory Group: Draft Work Plan, <https://calepa.ca.gov/climate/lithium-ion-car-battery-recycling-advisory-group/draft-workplan-for-discussion-on-12-14-20-by-the-lithium-ion-car-battery-recycling-advisory-group/>, accessed January 17, 2021.

technologies ahead of natural retirement for the benefit of air quality. Based on the above, scrap metals from vehicle and engine replacements are expected to be recycled and not disposed of in landfills. Any small increase that may occur from miscellaneous parts is expected to be within the permitted capacity of landfills within the Basin so that no significant impacts would be expected.

The California Integrated Waste Management Act of 1989 (AB 939) requires cities and counties in California to reduce the amount of solid waste disposed in landfills and transformed by 25 percent by 1995 and by 50 percent by 2000, through source reduction, recycling, and composting activities. Subsequent legislation has been adopted that mandates a 50 percent diversion requirement to be achieved every year. SB 1016 (Wiggins) – Diversion: Alternative Compliance System (effective January 1, 2009) moves CalRecycle from the previously existing solid waste diversion accounting system to a per capita disposal based system. SB 1016 did not change the 50 percent requirement in AB 939, but measures it differently. Compliance is the same under the new system as it was under the old system. To evaluate compliance, CalRecycle looks at a jurisdiction's per capita disposal rate as an indicator of how well its programs are doing to keep disposal at or below a jurisdiction's unique 50 percent equivalent per capita disposal target. The 50 percent equivalent per capita disposal target is the amount of disposal a jurisdiction would have had during the base period had it been at exactly a 50 percent diversion rate. Compliance is based on CalRecycle evaluating whether a jurisdiction is continuing to implement the programs it chooses and is making progress in meeting its target. In 2014, California's statewide disposal was 31.2 million tons and population was 38.4 million residents. This resulted in a per resident disposal rate of 4.5 pounds/resident/day. The diversion rate equivalent was 65 percent. Almost all (99 percent) of California's solid waste was disposed of in landfills in California, while approximately one percent was exported to landfills out of state. An additional 0.82 million tons were transformed at three permitted waste-to-energy plants in California, but not included in the disposal rate estimate because of provisions in the law that allow limited diversion credit for transformation. Many cities and counties have met the 20 and 50 percent waste reduction goals of AB 939 prior to the adoption of the 50 percent equivalent per capita disposal target associated with SB 1016. For the counties within the Basin as well as statewide, the targets are still slightly short of meeting the diversion standards.¹⁷ The generation of additional waste associated with implementation of the proposed project could impact the abilities of cities and counties to further reduce wastes. However, as discussed above, the increase in solid waste that is expected to be diverted to a landfill is small, and many of the waste streams are recyclable.

The U.S. EPA has a policy to ensure that emission reductions programs seeking credit in the SIP are quantifiable, surplus (*not already required*), permanent, and enforceable. Thus, it is expected that when older vehicles are scrapped, they are put out of service permanently, and there are mechanisms in place to ensure that this requirement is enforced. Even with the ability to recycle metals from vehicles, there are no guarantees that vehicles will continue to be scrapped in the future, especially if the market is saturated with a high number of vehicles being sought for turnover. So, in an abundance of caution, the potential solid and hazardous waste impacts from the retirement of equipment is concluded to be significant.

¹⁷ South Coast Air Quality Management District, January 2017, Final Program Environmental Impact Report for the 2016 Air Quality Plan, <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfeir.pdf>, accessed December 21, 2020.

4.3.6 Indirect Hazardous Materials and Solid and Hazardous Waste Impacts Associated with Construction of New Manufacturing Facilities, Recycling Facilities, and Infrastructure Improvements

Because the proposed project encourages and incentivizes the purchase and use of NZE and ZE vehicles, it could also indirectly result in the construction and operation of new manufacturing and recycling facilities as well as infrastructure improvements to support the transition to NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final EA for the ACT Regulations, and this EA incorporates that analysis by reference here. In summary, CARB's analysis found that short-term construction and long-term operational effects associated with the need for new manufacturing and recycling facilities as well as infrastructure improvements to support the transition to NZE and ZE vehicles, would create significant impacts regarding hazards and hazardous materials through the routine transport, use, or disposal of hazardous materials.

PROJECT IMPACTS – CONCLUSION: Based on the preceding analysis, the overall conclusion is that hazardous waste impacts associated with routine transport, use, or disposal of batteries are less than significant during operation. However, the proposed project could result in a substantial increase in the batteries that would exceed the capacity of the existing recycling infrastructure. Furthermore, hazards associated with the accidental release of LNG during transportation is are potentially significant, and waste related to construction and scrapped vehicles and equipment could exceed the capacity of local landfills. In addition, the proposed project could indirectly result in the construction of new manufacturing facilities, recycling facilities, and infrastructure improvements to support the transition to NZE and ZE vehicles, which would create significant impacts regarding hazards and hazardous materials through the routine transport, use, or disposal of hazardous materials.

PROJECT MITIGATION MEASURES: To ensure that the recycling industry is able to accommodate the substantial cumulative increase in the number of EV batteries disposed of as a result of the transition to a carbon-neutral economy, battery recyclers would need to forecast the increased demand for EV battery recycling in relation to the capacity of recyclers. However, no such requirement is in place for the recycling industry. The requirement to mandate that the solid waste sector, and the recycling industry in particular, identify and plan for the potential increase in this waste stream is outside of the jurisdiction of South Coast AQMD. Thus, there are no available mitigation measures that could reduce the impacts from the increase in battery recycling to the capacity of the existing recycling infrastructure to less than significant.

The transportation of LNG fuel is concluded to create a significant hazardous material impact from exposure to overpressure and destruction of the LNG storage tank. The 2016 AQMP Final Program EIR identified the following measures that would reduce impacts from storage and use of LNG fuel that would be required by local fire departments.

- Install secondary containment (e.g., berms).
- Install valves that fail shut.
- Install emergency release valves and barriers around LNG storage tanks to prevent the physical damage to storage tanks or limit the release of LNG from storage tanks.
- Perform integrity testing of LNG storage tanks to assist in preventing failure from structural problems. Construct a containment system to be used for deliveries during off-loading operations

However, these measures are outside of the South Coast AQMD's jurisdiction to impose, and there are no feasible mitigation measures to reduce this significant impact. Additionally, no mitigation measures were included in the 2016 AQMP Final Program EIR for the impacts of construction waste and scrapped vehicles and equipment to the capacity of local landfills.

Furthermore, CARB's Final EA for the ACT Regulation noted that indirect impacts could be reduced to a less-than-significant level by mitigation measures that can and should be implemented by federal, state, and local lead agencies, including land use and/or permitting agency conditions of approval. However, these mitigation measures are beyond the authority of South Coast AQMD and not within its purview.

REMAINING IMPACTS: There are no available mitigation measures that could reduce the impacts from the increase in battery recycling on the existing recycling infrastructure capacity to less than significant. Therefore, impacts to the battery recycling infrastructure are significant and unavoidable. In addition, there are no available mitigation measures that could reduce the impacts associated with the accidental release of LNG during transport, the impact of construction waste and scrapped vehicles and equipment on landfill capacity, and the construction of new manufacturing facilities, recycling facilities, and infrastructure improvements to support the transition to NZE and ZE vehicles.

CUMULATIVE IMPACTS: The proposed project would increase the number of non-lead-acid batteries such as NiCad, NiMH, and Li-ion types and fuel cells in the South Coast AQMD region. At the end of their useful life, these batteries and fuel cells would need to be recycled or disposed, resulting in an increase in hazardous waste disposal. The Mercury Containing and Rechargeable Battery Management Act of 1996 (Battery Act) facilitates the increased collection and recycling of NiCad batteries, and the disposal of batteries would be conducted in compliance with the Resource Conservation and Recovery Act (RCRA). Under the RCRA batteries can be disposed of as universal waste and need to follow the regulations of the Universal Waste Rule (see Chapter 3.3, Hazards and Hazardous Materials, of this EA). Spent lead-acid batteries that are destined for reclamation would be regulated by 40 CFR Part 266, Subpart G. In California, consumers must recycle all single-use batteries or take them to a household hazardous waste disposal facility, a universal waste handler (e.g. storage facility or broker), or an authorized recycling facility. Additionally, consumers have to follow battery disposal requirements for lithium batteries.¹⁸ Existing battery recovery and recycling programs have limited the disposal of batteries in landfills. For example, the recycling of lead-acid and NiCad batteries is already a well-established activity. Further penetration of ZE trucks and ZE yard trucks is expected to result in a reduction in the use of lead-acid and NiCad batteries. Implementation of the proposed project would be expected to result in an increased use of electric vehicles which use NiMH batteries, Li-ion batteries, and PEM fuel cells instead of lead-acid and NiCad batteries. NiMH, Li-ion batteries, and PEM fuel cells generally contain materials that have high economic value and, therefore, there is high demand for the recyclable materials. The preceding analysis concluded that impacts associated with routine transport, use, or disposal of batteries would be less than significant as a result of implementing the proposed project. Thus, there are no significant adverse cumulative impacts.

However, the proposed project could result in a substantial increase in the number of batteries that would need to be recycled and exceed the capacity of the existing recycling infrastructure. This

¹⁸ Call2Recycle. 2020, Accessed December 15. Recycling Laws by State, California, <https://www.call2recycle.org/recycling-laws-by-state/#California>

increase in demand would cumulatively contribute to the increase in demand for battery recycling as a result of transition to a carbon-neutral economy, in accordance with the State's GHG reduction goals. Currently, there are no federal, state, or local regulations that require the recycling industry to forecast the capacity of infrastructure needed to meet the demand. There are no mitigation measures that would ensure that battery recyclers can accommodate the proposed project's and cumulative increase in volume of EV batteries. Therefore, the proposed project's cumulative impact associated with the capacity of battery recycling infrastructure to accommodate the additional demand is considered significant and unavoidable.

Furthermore, the 2016 AQMP Final Program EIR concluded that the impacts from LNG tank rupture during transport, construction waste, and scrapped vehicles and equipment is expected to remain significant. In addition, the proposed project could indirectly result in the construction of new manufacturing facilities, recycling facilities, and infrastructure improvements to support the transition to NZE and ZE vehicles. As CARB concluded in its EA, the hazardous waste impacts and impacts to recycling facility capacity associated with that development could be significant. Therefore, the project and cumulative impacts of the proposed project associated with this development is significant and unavoidable.

4.4 TRANSPORTATION

The overall purpose of the proposed project is to reduce NO_x and PM emissions associated with warehouse operations within South Coast AQMD's jurisdiction. To accomplish this purpose, the proposed project requires warehouse operators to reduce or otherwise mitigate emissions associated with their operations by choosing from a menu of emission-reducing measures, proposing a custom menu option, or paying a mitigation fee.

The proposed project will not increase the demand for goods or otherwise facilitate growth in shipping or goods movement. However, several of the compliance options require some construction (see Air Quality and Greenhouse Gas Impacts). The increased VMT associated with those construction projects is discussed below as "Transportation Impacts During Construction."

It is also possible that the proposed project will have the indirect effect of encouraging warehouse operators to relocate new warehouses outside of the South Coast AQMD region to avoid having their warehouse be subject to the proposed project. While the IEc Study "Assessment of Warehouse Relocations Associated with the South Coast AQMD Warehouse ISR" ~~the IEc Study~~ concluded that there would be no such relocations at the proposed rule stringency, this EA conservatively estimates that there would be up to three warehouse relocations. Thus, this section of the EA assesses the potential transportation impacts associated with those relocations as "Transportation Impacts During Operations."

The proposed project would also encourage and incentivize the purchase and use of NZE and ZE vehicles. As a result, it could indirectly result in the construction and operation of new manufacturing and recycling facilities as well as infrastructure improvements necessary to meet this increased demand for NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final EA for the ACT Regulation, and this EA incorporates that analysis by reference here. Because these potential impacts are indirect, and because the circumstances surrounding any such future development are unknown, the analysis of the potential transportation impacts associated with this development is discussed separately from the analysis of the proposed project's direct impacts.

4.4.1 Significance Criteria

The proposed project's transportation impacts will be considered significant if the proposed project would:

- a. Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.
- b. Conflict with or be inconsistent with CEQA Guidelines Section 15064.3(b).
- c. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
- d. Result in inadequate emergency access.

The Initial Study for the proposed project, under Chapter 2, Section XVII, *Transportation*, Impact (c) identified that the proposed project would not increase hazards or (d) result in inadequate emergency access. Therefore, these significance criteria will not be discussed further in this EA.

4.4.1.1 CEQA Guidelines

On September 27, 2013, Governor Jerry Brown signed Senate Bill 743 (SB 743) into law. SB 743 tasked the Office of Planning and Research (OPR) with developing alternative methods of measuring transportation impacts pursuant to CEQA, other than the current practice of using traffic congestion-based measures, which tend to promote increased vehicle use. OPR proposed to replace roadway capacity and vehicle delay measures, often displayed as levels of service (LOS), with VMT, which estimates the total distance people drive by vehicle. This shift in CEQA transportation metrics promotes outcomes that reduce reliance on automobile travel, and thus aligns with state goals for reducing greenhouse gas emissions and traffic-related air pollution, investing in multimodal transportation networks, encouraging higher density infill development, and providing clean, efficient access to destinations. The California Natural Resources Agency (Agency) certified and adopted the CEQA Guidelines update package, including the guidelines for implementing SB 743. The new CEQA Guidelines Section 15064.3, Determining the Significance of Transportation Impacts, generally requires that VMT-based metrics be used to evaluate transportation impacts.

4.4.1.2 OPR Technical Advisory

The South Coast AQMD has not yet adopted a VMT significance threshold for evaluating transportation impacts in CEQA under SB 743. Therefore, this EA utilizes the thresholds developed by OPR in December 2018 entitled, “Technical Advisory on Evaluating Transportation Impacts in CEQA” (Technical Advisory) for automobile VMT (i.e., light-duty vehicles).¹ The Technical Advisory provides non-binding technical advice and is not a formal administrative regulation, like the CEQA Guidelines. However, it does provide a reasonable framework for lead agencies as they implement the CEQA Guidelines.

4.4.1.2.1 Screening Thresholds for Land Use Projects

The Technical Advisory suggests that lead agencies may screen out VMT impacts under CEQA based on project size, VMT generation characteristics, transit availability, and provision of affordable housing. The following project types are ‘screened out’ as having less than significant transportation impacts in the Technical Advisory:

- **Small Projects Generating Less Than 110 Daily Trips:** OPR suggests a small project that would generate 110 trips per day or less generally may be assumed to cause a less-than-significant transportation impact and thus not warrant further VMT analysis.
- **Redevelopment Projects with a Net Decrease in VMT:** Where a project replaces existing VMT-generating land uses, if the replacement leads to a net overall decrease in VMT, the project would lead to a less-than-significant transportation impact. If the project leads to a net overall increase in VMT, then the thresholds developed by the jurisdiction should apply.
- **Projects in Low VMT Areas:** Residential and office (or other land use) projects that are located in areas with low VMT and that incorporate similar features (i.e., density, mix of uses, transit accessibility), will tend to exhibit similarly low VMT and thus not warrant further VMT analysis.

¹ Governor’s Office of Planning and Research. 2018, December. Technical Advisory on Evaluating Transportation Impacts in CEQA. https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf

- **Projects in Transit Priority Areas (TPAs):** A TPA is an area within a half a mile of a major transit stop or a bus transit corridor with service intervals of no longer than 15 minutes during peak commute hours. A ‘major transit stop’ means “a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods,” as defined by Public Resources Code Section 21064.3. OPR suggests that a project in TPA should generally be presumed to have less than significant impacts, but the presumption might not be appropriate if the project:
 - Has a Floor Area Ratio (FAR) of less than 0.75.
 - Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking).
 - Is inconsistent with the applicable Sustainable Communities Strategy (SCS) (as determined by the lead agency, with input from the Metropolitan Planning Organization).
 - Replaces affordable residential units with a smaller number of moderate- or high-income residential units.
- **Local-Serving Retail Projects under 50,000 Square Feet:** Because new retail development typically redistributes shopping trips rather than creates new trips, estimating the total change in VMT (i.e., the difference in total VMT in the area affected with and without the project) is the best way to analyze a retail project’s transportation impacts. By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT. Thus, lead agencies generally may presume such development creates a less-than-significant transportation impact. Regional-serving retail development, on the other hand, which can lead to substitution of longer trips for shorter ones, may tend to have a significant impact. Where such development decreases VMT, lead agencies should consider the impact to be less than significant. The Technical Advisory suggests that retail uses of less than 50,000 square feet might be considered local serving.
- **Affordable Housing Projects:** OPR guidance indicates that adding affordable housing to infill locations generally improves jobs-housing match, in turn shortening commutes and reducing VMT. Further, “... low-wage workers in particular would be more likely to choose a residential location close to their workplace, if one is available.” In areas where existing jobs-housing match is closer to optimal, low income housing nevertheless generates less VMT than market-rate housing; therefore, a project consisting of a high percentage of affordable housing may be a basis for the lead agency to find a less-than-significant impact on VMT. Evidence supports a presumption of a less-than-significant impact for a 100 percent affordable residential development (or the residential component of a mixed-use development) in infill locations.

4.4.1.2.2 VMT Numeric Thresholds

OPR identified the following recommended VMT thresholds for projects that are not screened out under the criteria above.

- **Residential Projects:** A proposed residential project exceeding a level of 15 percent below existing VMT per capita may indicate a significant transportation impact. OPR states these

thresholds can be applied to either household (i.e., tour-based) VMT or home-based (i.e., trip-based) VMT assessments.²

- **Office (Employment) Projects:** OPR recommends that office (employment) projects that would generate vehicle travel exceeding 15 percent below existing VMT per employee for the region may indicate a significant transportation impact. OPR uses the term ‘office’; however, the likely intent of the advisory is as ‘employment.’
- **Retail Projects:** Because new retail development typically redistributes shopping trips rather than creating new trips, OPR recommends a threshold based on the total change in VMT (i.e., the difference in total VMT in the area affected with and without the project) as the best way to analyze a retail project’s transportation impacts. A net increase in total VMT may indicate a significant transportation impact.

The thresholds identified by OPR were derived from the California Air Resources Board’s (CARB) “2017 Scoping Plan–Identified VMT Reductions and Relationship to State Climate Goals” (CARB Report) on the VMT reductions needed over current conditions (2015–2018) to meet the state’s 2030 and 2050 climate goals.³ The CARB Report includes non-binding technical information on what level of statewide VMT reduction would promote achievement of statewide GHG emission reduction targets. CARB asserts that the currently adopted SCSs throughout the state “would achieve in aggregate, a nearly 18 percent reduction in statewide per capita on-road light-duty transportation-related GHG emissions relative to 2005 by 2035, if those SCSs were successfully implemented.” However, in order to meet the state climate goals, the full reduction needed is a 25 percent reduction in statewide per capita on-road light-duty transportation-related GHG emissions, however, CARB has “determined that those targets would be infeasible for metropolitan planning organizations (MPOs) to achieve with currently available resources.” CARB concluded (using assumptions of a cleaner fuels and technologies scenario) that a 14.3 percent reduction in total daily VMT per capita below existing conditions and a 16.8 percent reduction in light-duty VMT per capita below existing conditions were needed to meet these goals.⁴ The CARB Report is based on modeling that incorporates cleaner technologies and fuels assumptions consistent with the 2017 Scoping Plan Update and the 2016 Mobile Source Strategy.

4.4.1.3 Thresholds for Impacts to Goods Movement

Neither the Technical Advisory nor CEQA Guidelines Section 15064.3(a) directly address how to analyze transportation impacts associated with changes to goods movement, which is largely carried out by heavy-duty trucks. CEQA Guidelines Section 15064.3(a) specifies that VMT to be analyzed is defined as the amount and distance of *automobile* travel (emphasis added) attributable to a project. The term ‘automobile’ refers to on-road *passenger vehicles, specifically cars and light*

² OPR states that lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included. In the analysis of each use, a project should take credit for internal capture. Alternatively, a lead agency may consider only the project’s dominant use.

³ California Air Resources Board (CARB). January 19. 2017 Scoping Plan–Identified VMT Reductions and Relationship to State Climate Goals. <https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate>

⁴ California Air Resources Board (CARB). January 19. 2017 Scoping Plan–Identified VMT Reductions and Relationship to State Climate Goals. <https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate>

trucks (emphasis added).⁵ SB 743 is not intended to require the inclusion of heavy-duty truck trips, utility vehicles, or other types of vehicles in the VMT analysis.⁶ In the case of trucks (other than light trucks), based on CARB’s 2017 Scoping Plan, the state’s strategy for the goods movement sector is not in VMT reduction, but in advances in technology [zero-emissions (ZE) and near-zero-emissions (NZE) control strategies)].⁷

4.4.1.4 Effect of COVID-19 on VMT

The measures put into place to slow the spread of COVID-19 resulted in significant changes in human activity and VMT. Most notable are the temporary reductions in both heavy-duty and light-duty VMT across the state’s highways and local roads, and the resulting temporary emission reductions. In California, VMT fell to its lowest point in early- to mid-April, with an approximately 25 percent reduction in heavy-duty VMT and 50 to 60 percent reduction in light-duty VMT. Since that time, both heavy-duty and light-duty VMT have steadily increased, with heavy-duty VMT returning to pre-COVID-19 levels in early June.⁸ COVID-19 stay-at-home orders and related closures are temporary measures. While there is potential for changes made during this time to have far-reaching implications for transportation mode choice, shared mobility, vehicle choice, and VMT into the future, the medium- or long-term effects of the COVID-19 on VMT are uncertain at this point in time, and it would be speculative to estimate any potential long-term or permanent changes. Predicting the proposed project’s physical impacts on the environment without firm evidence based on facts to support the analysis would require an engagement in speculation or conjecture that is inappropriate for an EA. Accordingly, the transportation impact analysis presented in this EA is generally based on the assumption that general behavior would be similar to conditions prior to the start of COVID-19 stay-at-home orders.

4.4.2 Transportation Impacts During Construction (Significance Criteria b)

CEQA Guidelines Section 15064.3(b)(3) provides that a qualitative analysis of construction traffic may be appropriate for many projects. The proposed project contains several compliance options that would result in construction of new facilities. Here, ‘construction’ activities associated with the proposed project include: the installation of ZE charging, installation of hydrogen fueling station, installation of solar panels, installation of additional ‘plugs’ to accommodate ZE transport refrigeration units (TRUs) or ZE cargo handling equipment, and installation of high-efficiency HVAC systems. As a result, implementation of the proposed project could trigger the need to implement capital improvements at affected warehouses in the South Coast AQMD’s jurisdiction. These construction activities would generate construction worker trips and vendor trips for material deliveries, which would generate VMT. Because of the nature of construction activities,

⁵ Governor’s Office of Planning and Research, December 2018, Technical Advisory on Evaluating Transportation Impacts Under CEQA, https://www.opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf, accessed January 10, 2021.

⁶ South Coast AQMD coordinated with staff at OPR on January 12, 2021 to confirm how to address heavy-duty freight VMT in CEQA documents. OPR staff identified that the intent of SB 743 was to address passenger vehicle VMT impact and not freight VMT, as cited under CEQA Guidelines Section 15064.3(a). Therefore, lead agencies could exclude freight VMT from transportation VMT impact analyses under CEQA.

⁷ California Air Resources Board, 2017, California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target, https://www.arb.ca.gov/cc/scopingplan/2030sp_pp_final.pdf, accessed on March 18, 2019.

⁸ California Air Resources Board. 2020, November 24. Draft 2020 Mobile Source Strategy https://ww2.arb.ca.gov/sites/default/files/2020-11/Draft_2020_Mobile_Source_Strategy.pdf

any increase in VMT would occur on a short-term basis at each warehouse. In general, temporary construction-related increases in VMT are not considered to be a transportation impact or be inconsistent with CEQA Guidelines Section 15064.3. These construction projects would not have a substantial, permanent effect on regional VMT, including commute VMT, in the SCAG region. Additionally, discretionary projects at affected warehouses that would result in construction at existing warehouses could be subject to project level review under CEQA. As a result, construction projects would not have a permanent effect of regional VMT. Therefore, temporary effects of construction-related vehicles would not conflict with the state's GHG reduction and associated VMT goals for the transportation sector.

4.4.3 Transportation Impacts During Operations (Significance Criteria a and b)

4.4.3.1 Automobile VMT

CEQA Guidelines 15064.3(a) clarifies that the primary consideration in evaluating a project's transportation impacts for CEQA purposes is the amount and distance that a project might cause people to drive. This captures two measures of transportation impacts: number of automobile trips generated and VMT.

The proposed project would not indirectly or directly result in an increase in warehousing activities, and therefore would not result in an increase in employee commute trips by automobile (passenger vehicles and light trucks). Moreover, even if the proposed project resulted in new warehouses being located outside South Coast AQMD's jurisdiction, which the IEc Study concluded would not occur under the proposed project, relocated warehouses factor in the availability of employees and are expected to utilize employees within the local areas. Therefore, the proposed project is not anticipated to result in an increase in employee trips associated with warehouse relocations, even under the worst-case warehouse relocation scenario assumed in this EA. Consequently, for the purpose of automobile VMT, the proposed project is expected to generate 110 trips per day or less for employee commute trips and can be screened out from the need of further VMT analysis for employee commute trips in accordance with OPR's guidance for small projects. Thus, the proposed project would result in less-than-significant transportation impacts under SB 743 from employee trips and associated automobile VMT.

4.4.3.2 Truck VMT

As noted above, CEQA Guidelines Section 15064.3(a) specifies that VMT to be analyzed is defined as the amount and distance of *automobile travel* attributable to a project.⁹ It does not require any analysis of increased VMT from heavy-duty truck trips. In fact, in CARB's 2017 Scoping Plan, the state's strategy for the goods-movement sector is not in VMT reduction, but in advances in technology [zero-emissions (ZE) and near-zero-emissions (NZE) control strategies].¹⁰

⁹ South Coast AQMD staff conducted extensive research on the state's guidance for how to analyze truck VMT under SB 743 in CEQA documents. Searches included reviews of OPR's December 2018 Technical Advisory, CARB's 2017 Scoping Plan Update, the California Natural Resources Agency's rulemaking documents for the Updates to the 2019 CEQA Guidelines, which includes the incorporation of SB 743 requirements, and consultation with SCAG staff.

¹⁰ California Air Resources Board, 2017, California's 2017 Climate Change Scoping Plan: The Strategy for Achieving California's 2030 Greenhouse Gas Target, https://www.arb.ca.gov/cc/scopingplan/2030sp_pp_final.pdf, accessed on March 18, 2019.

Nonetheless, to provide a conservative estimate of the potential impacts of the proposed project, the transportation analysis in this EA considers potential impacts from truck VMT.

The proposed project has the potential to affect regional VMT associated with potential warehouse relocations out of the South Coast AQMD's jurisdiction, potential cargo diversion to other ports, or as a result of a potential decrease in efficiency of goods movement in the South Coast AQMD's jurisdiction, as described below.

4.4.3.2.1 VMT from Potential Warehouse Relocation and Cargo Growth Diversion

Based on the IEc Study, under the currently proposed rule stringency of a 0.0025, the proposed project would not result in warehouse relocations out of South Coast AQMD's jurisdiction above the baseline scenario. Under the rule stringency scenario that would result in costs of \$2.00 per square foot of warehouse space, the proposed project would result in a maximum of six warehouse relocations (see Chapter 5, Alternatives). This EA conservatively considers the potential for up to three warehouse relocations in order to provide a conservative relocation impact analysis for truck VMT. Table 4.4-1 identifies the daily truck trips generated by up to three warehouse relocations in order to determine whether the proposed project screens out from having to do a full VMT analysis under the OPR Technical Advisory screening criteria of 110 daily trips.

Table 4.4-1
Daily Truck Trips from Potential Warehouse Relocations – Screening Analysis

Truck Classification	Trips/ TSF	Trips/ Warehouse	Worst-Case Relocations (Up to Three Warehouses)
Class 4-7 Trucks	0.12	31	92
Class 8 Trucks	0.33	38 84	114 252
Truck Trips Total		68 114	205 343
Exceeds Screening Threshold of 110 Trips			Yes
Notes: TSF: Thousand Square Feet; Based on an average warehouse size of 254,409 square feet. Source: IEc, 2020, December 23. Results of ISR Warehouse Relocation Analysis			

It should be noted that truck trips from warehouse relocations are not 'new' truck trips, and the proposed project would not directly or indirectly result in an increase in the number of truck trips since the proposed project would not cause a new warehouse to be built or result in an increase in warehouse space in terms of square footage. To the contrary, a warehouse subject to the WAIRE Program might consider improving operational efficiency and reducing the number of annual truck trips as an option to reduce their WPCO since the number of annual truck trips is one of the multipliers for calculating WPCO. However, in order to provide a conservative analysis that considers the potential increase in truck VMT, this EA considers the relocated warehouse truck VMT under OPR's guidance for small projects as a screening tool to determine if a full analysis of truck VMT is warranted. As shown in Table 4.4-1, under the worst-case relocation impact analysis, the proposed project would not be screened out under OPR's screening criteria of 110 daily trips for small projects; and therefore, a further VMT analysis associated with warehouse relocations was conducted.

Goods movement generally refers to the movement of raw, semi-finished, and finished materials and products used by businesses and residents across the transportation system. These goods move

in myriad ways and through complex systems, often using multiple modes of transportation (e.g. ships, trucks, trains, planes, etc.). Products can be produced within the U.S. or another country and make their way to a business, retail store, or directly to consumers versus traditional purchases by consumers at physical retail outlets. The efficient movement of these goods are critical to maintain a strong economy and ensure improvements in the quality of life of regional residents.

Under this definition, goods movement in Southern California closely resembles the transportation patterns of retail uses described in the OPR Technical Advisory. Warehouses move retail products through distribution channels along business-to-business and business-to-consumer pathways. The IEc Study identifies that warehoused goods in Southern California have the following pathways: 43 percent local, 41 percent national, 11 percent regional, and 5 percent destined to northern California. In the Technical Advisory, the recommended significance threshold for retail projects is a net increase in total VMT.¹¹

Since OPR has not identified guidance for heavy-duty trucks, for the purpose of this EA, changes in truck VMT associated with the proposed project would be considered significant if implementation of the proposed project would result in a net increase in total truck VMT since operational characteristics of the goods movement sector resemble retail projects. Truck VMT associated with the reasonable ‘worst-case’ relocation impact scenario of up to three warehouse relocations is identified in Table 4.4-2. While the proposed project is not anticipated to result in warehouse relocations out of South Coast AQMD’s jurisdiction, under the reasonable ‘worst-case’ warehouse relocation scenario (i.e., three warehouse relocations), the proposed project could result in a net increase in truck VMT associated with the additional distances these trucks would need to travel in the Southern California region to move goods. Therefore, this increase in truck VMT is conservatively considered a significant and unavoidable impact.

Table 4.4-2
Daily and Annual Truck VMT from Potential Warehouse Relocations

Truck Classification	Annual Truck VMT		Daily Truck VMT	
	Per Warehouse	Worst-Case Relocations (Up to Three Warehouses)	Per Warehouse	Worst-Case Relocations (Up to Three Warehouses)
Truck VMT Total	1,447,329	4,341,988	3,965	11,896

Source: IEc, 2020, December 23. Results of ISR Warehouse Relocation Analysis.

As discussed in Chapter 4.0, it is not reasonably foreseeable that implementation of the proposed project would result in cargo being shipped ~~ing~~ to other ports to avoid incurring any increased cost associated with the proposed project. Nonetheless, because of the uncertainty of market responses, this EA has conservatively assumed that there could be some diversions. However, any associated increase or decrease in truck VMT associated with such diversions would be speculative, given that it is unknown where the cargo would be diverted to and how that would affect truck VMT.

¹¹ IEc. 2020, December 23. Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule.

Efficiency of Goods Movement in Southern California

The WAIRE Program would have an indirect effect on goods movement within South Coast AQMD's jurisdiction. As described in Chapter 2 of this EA, the WAIRE Program would require warehouse operators to satisfy an annual WPCO, which is based on the reported number of annual truck trips serving the warehouse. To meet the WPCO, WAIRE Points must be earned by completing actions and investments, which include acquiring and/or using NZE and ZE trucks. Warehouse operators with multiple warehouses in the South Coast AQMD's jurisdiction may satisfy the WPCO through acquiring NZE and ZE trucks and rerouting those trucks so that the usage points are accumulated by multiple warehouses, since each warehouse operator must report annual truck trips that serve the warehouse. Similarly, warehouse operators may contract with trucking companies that already own NZE and ZE trucks to route those trucks to warehouses in the South Coast AQMD. Purchasers of the trucks would be replacing an existing truck that has aged out of or is nearing the end of its useful life. As a result, there is a potential for trucks to be diverted by operators of warehouse to meet their WPCO, thus decreasing the efficiency of goods movement in the South Coast AQMD region, assuming truck routes are currently optimized for efficiency, which may not be true. Additionally, since the WAIRE Program applies to warehouses of certain sizes within South Coast AQMD's jurisdiction, and its implementation is expected to cause no warehouse relocation, it is not anticipated that the WAIRE Program would result in potential changes to the global supply chain and ocean shipping routes in emergency or non-emergency situations. The details and precise effect of how each warehouse may divert truck trips to earn WAIRE Points is not known and not reasonably foreseeable at this time. To make assumptions for the unknown would be speculative and not appropriate for the EA. It is also important to note that the South Coast AQMD intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These 'check-ins' will provide useful information on implementation details and help identify effects on warehouses subject to the WAIRE Program.

While the proposed project may have an effect on NZE, ZE, and diesel truck VMT in the South Coast AQMD region, it is also possible that warehouse operators will consolidate the number of truck visits at a warehouse facility. As stated above, WPCO are based on the annual truck trips that are reported to South Coast AQMD. Therefore, there is an incentive to increase efficiency of truck movements to reduce the number of truck trips generated by a warehouse facility. Reducing truck trips and enhancing efficiency of truck movements would be beneficial effects of the proposed project.

4.4.3.3 Consistency with Goods Movement Plans

On May 16, 2016, CARB released the 2016 Mobile Source Strategy that demonstrated how the state can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years.¹² Under Senate Bill 44, CARB is required to update the Mobile Source Strategy every five years. CARB recently prepared a Draft 2020 Mobile Source Strategy.¹³ The Update to the Mobile Source Strategy considers the recent Executive Order N-79-20, which established a

¹² California Air Resources Board. 2016, May 16. 2016 Mobile Source Strategy.
<https://ww2.arb.ca.gov/resources/documents/2016-mobile-source-strategy>

¹³ California Air Resources Board. 2020, November 24. Draft 2020 Mobile Source Strategy
https://ww2.arb.ca.gov/sites/default/files/2020-11/Draft_2020_Mobile_Source_Strategy.pdf

goal that 100 percent of in-state sales of new passenger cars and trucks will be ZE by 2035 and a goal transitioning existing trucks to ZE medium- and heavy-duty vehicles, where feasible, by 2045. The Mobile Source Strategy identifies the following strategies for on-road medium- and heavy-duty vehicles:

- Manufacturer requirements to foster clean technology production and sales;
- In-use requirements to accelerate penetration of newer technology;
- Incentive programs to promote and accelerate the use of advanced clean technologies;
- Enhanced enforcement strategies to ensure programs are achieving their anticipated benefits;
- Outreach and education to increase consumer awareness and acceptance of advanced vehicle and equipment technologies; and
- Infrastructure planning and development to support the transition to cleaner technologies.

The proposed project would accelerate the integration and use of NZE and ZE trucks and supporting infrastructure within South Coast AQMD's jurisdiction. Thus, the proposed project facilitates the implementation of the most recent statewide strategies for good movement as outlined in the Draft 2020 Mobile Source Strategy and Executive Order N-79-20; therefore, the proposed project is consistent with statewide strategies for goods movement. Similarly, local goods movement strategies, such as the Los Angeles County Goods Movement Plan, are an extension of the 2020 Mobile Source Strategy, and the proposed project would not conflict with local goods movement strategies.

Additionally, the proposed project would result in a decrease in VMT associated with diesel-fueled trucks, with a commensurate increase in VMT associated with NZE and ZE trucks. Table 4.4-3 identifies the potential decrease in VMT by compliance year 2031 associated with diesel-fueled trucks in South Coast AQMD's jurisdiction as a result of the proposed project above the cumulative baseline. The proposed project would allow for purchase of new NZE and ZE trucks as a way for warehouse operators to meet their WPCO. It is anticipated that while some of these trucks may be transitioned to other uses or warehouses to replace even older, higher emissions trucks in an operator's truck fleet outside of South Coast AQMD's jurisdiction, some of these trucks may be retired (i.e., scrapped). At this time, the percentage of diesel-fueled trucks retired ~~verses~~ versus replaced outside of South Coast AQMD's jurisdiction as a result of the proposed project cannot be predicted. However, the proposed project would result in greater and earlier turnover of diesel-fueled trucks to NZE and ZE trucks with supporting infrastructure than ~~would have occurred~~ without implementation of the proposed project. Additionally, Executive Order N-79-20 established a goal of 100 percent of California sales of new passenger cars and trucks be ZE by 2035 and a goal transitioning existing trucks to ZE medium- and heavy-duty vehicles, where feasible, by 2045. Therefore, the proposed project would lower the demand for diesel-fueled trucks in the state and have beneficial effects on reductions of air pollution and greenhouse gas emissions that are consistent with the goals and policies outlined in the CARB's Mobile Source Strategy and 2017 Scoping Plan Update.

Table 4.4-3
Reduction in Diesel Truck VMT in the South Coast AQMD Region by 2031

Scenario		Annual Diesel Truck VMT Reduced by Compliance Year 2031	Daily Diesel Truck VMT Reduced by Compliance Year 2031
Scenario 1	NZE Class 8 truck acquisitions and subsequent visits from those trucks	<u>634,183,368</u> <u>498,885,660</u>	<u>1,737,489</u> <u>1,366,810</u>

Max. Potential VMT Reduction		<u>968,116,129</u> <u>832,738,608</u>	<u>2,652,373</u> <u>2,281,476</u>
Min. Potential VMT Reduction		0	0
Notes: Reduction in diesel-VMT above the cumulative baseline, accounting for other approved and pending regulations that affect diesel trucks in California. Scenarios 15 through 18 do not affect diesel truck VM; and therefore, are not shown in this Table.			
^a Under Scenario 6, should all warehouse operators choose to purchase NZE and ZE trucks to meet their WPCO, by compliance year 2031 ISR would have no incremental effect above existing CARB rules.			

Despite the net increase in truck VMT from the reasonable ‘worst-case’ warehouse relocations and potential loss of efficiency of goods movement in Southern California, the increase in truck VMT would be offset by the potential emissions benefits associated with a decrease in diesel-fueled

truck VMT in the South Coast AQMD region for all scenarios except Scenario 6. CARB estimates that about 70 percent of total known cancer risk related to air toxics in California is attributable to diesel particulate matter (DPM).¹⁴ Therefore, reducing VMT from diesel-fueled trucks is consistent with CARB's Mobile Source Strategy, the 2017 Scoping Plan Update, and thus the intent of SB 743 to reduce greenhouse gas emissions and traffic-related air pollution (see discussion under Sections 4.2.2 through 4.2.5 of this EA). Additionally, warehouses often operate near highly populated and disadvantaged communities. Mobile sources accounted for 45 percent of exposure disparity for the African American population, and 37 percent of exposure disparity for people in disadvantaged communities.¹⁵ Reductions in DPM from a transition from diesel-fueled trucks to NZE and ZE trucks have local air quality and public health benefits to disadvantaged communities in the South Coast AQMD region.

4.4.3.4 Indirect Transportation Impacts Associated with Construction of New Manufacturing Facilities, Recycling Facilities, and Infrastructure Improvement NZE and ZE Vehicles

Because the proposed project encourages and incentivizes the purchase and use of NZE and ZE vehicles, it could also indirectly result in the construction and operation of new manufacturing and recycling facilities as well as infrastructure improvements to support the transition to NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final EA for the ACT Regulations, and this EA incorporates that analysis by reference here.

In summary, CARB's analysis found that short-term construction activities would result in short-term construction traffic (primarily motorized) in the form of worker commutes and material delivery related trips. Depending on the amount of trip generation and the location of new facilities, implementation could result in potentially significant transportation impacts. Additionally, new manufacturing and recycling facilities may affect local roadways during the operational phase, potentially increasing VMT levels on nearby roadways. Local roadways may also experience additional egress/ingress points or increased traffic that would result in hazardous conditions on local roadways. Inadequate access may impede emergency vehicle access to new facilities. Therefore, long-term operational-related impacts were also found to be potentially significant.

PROJECT IMPACTS – CONCLUSION: Based on the preceding analysis, the overall conclusion is that direct transportation impacts from construction activities VMT and employee commute VMT for the proposed project would be less than significant. However, in the reasonable 'worst-case' analysis for up to three warehouse relocations, the proposed project would result in a net increase in truck VMT during operations. In addition, potential indirect transportation impacts resulting from the construction of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles would also be significant.

PROJECT MITIGATION MEASURES: South Coast AQMD will conduct ongoing monitoring, review, and reporting on the performance of the proposed project to provide useful information on implementation details. This information will help identify effects of the rule on warehouses subject to the WAIRE Program.

¹⁴ California Air Resources Board. 2020, November 24. Draft 2020 Mobile Source Strategy
https://ww2.arb.ca.gov/sites/default/files/2020-11/Draft_2020_Mobile_Source_Strategy.pdf

¹⁵ California Air Resources Board. 2020, November 24. Draft 2020 Mobile Source Strategy
https://ww2.arb.ca.gov/sites/default/files/2020-11/Draft_2020_Mobile_Source_Strategy.pdf

Furthermore, CARB’s EA noted that indirect impacts could be reduced to a less-than-significant level by mitigation measures that can and should be implemented by local lead agencies, including land use and/or permitting agency conditions of approval. New or modified facilities in California would qualify as a “project” under CEQA. The jurisdiction with primary permitting authority over a proposed action is the Lead Agency, which is required to review the proposed action for compliance with CEQA statutes. However, these mitigation measures are beyond the authority of CARB and South Coast AQMD and not within its purview.

REMAINING IMPACTS: Even with ongoing monitoring, review, and reporting, the proposed project’s transportation impacts from truck VMT caused by relocation of up to three warehouses and potential cargo shipping diversion would be significant and unavoidable. In addition, potential indirect transportation impacts resulting from the construction of new manufacturing facilities, recycling facilities, and grid improvements would also be significant and unavoidable.

CUMULATIVE IMPACTS: The preceding analysis concluded that transportation impacts from construction and employee commute trips would be less than significant as a result of implementing the proposed project. However, truck VMT would increase compared to the baseline under the ‘worst-case’ relocations analysis and potential decreases in goods movement efficiency if warehouse operators divert truck trips. Thus, the transportation impacts from operation (only with regards to truck VMT) are considered to be cumulatively considerable pursuant to CEQA Guidelines Section 15064(h)(1). In addition, potential indirect transportation impacts resulting from the construction of new manufacturing facilities, recycling facilities, and grid improvements would also be significant. Therefore, truck VMT is considered a significant adverse cumulative transportation impact. It should be noted that the transportation analysis is a conservative, ‘worst case’ analysis. The IEc Study indicates that no relocations would occur due to the proposed project, and analysis in this EA concluded that cargo shipping diversions are not reasonably foreseeable. Additionally, while the proposed project could result in a potential net increase in truck VMT, there would be a substantial reduction in the amount of VMT from diesel-fueled trucks and commensurate increase in VMT from NZE and ZE trucks for all scenarios except Scenario 6. The overall effect of the proposed project for these scenarios is therefore beneficial and would be consistent with SB 743’s intent to reduce greenhouse gas emissions and traffic-related air pollution. Nonetheless, increased truck VMT is considered a significant adverse cumulative transportation impact.

4.5 OTHER IMPACT AREAS

4.5.1 Indirect Impacts

The impact analysis for other impact areas, including Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services, Recreation, and Utilities and Service Systems, is incorporated by reference from the CARB Advanced Clean Truck Regulation (ACT) Final Environmental Analysis. These impact areas are only relevant to this EA to the extent they may be impacted by potential future construction of new manufacturing and recycling facilities, and improvements to the electrical grid. Because these impacts are indirect impacts of the proposed project, and because it would be speculative to analyze the specific impacts caused by future construction projects at this time, these impacts are evaluated at a more general level of detail than the proposed project's direct impacts. While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144). As a result, the following indirect effects of the project were subject to the rule of reason and are evaluated in this section:

- **Construction of New Truck Manufacturing Facilities.** The proposed project would encourage and incentivize the purchase and use of NZE and ZE vehicles. While it remains uncertain how many warehouse operators subject to the proposed project would choose to comply by purchasing or operating NZE and ZE vehicles, the potential increase in demand could lead to the construction of new manufacturing facilities for these vehicles.
- **Construction of New Battery / Fuel Cell Manufacturing Facilities.** The proposed project would encourage and incentivize the purchase and use of ZE vehicles. While it remains uncertain how many warehouse operators subject to the proposed project would choose to comply by purchasing or operating ZE vehicles, the potential increase in demand could lead to the construction of new manufacturing facilities for ZE batteries and hydrogen fuel cells.
- **Mineral Resource Extraction/Production.** The proposed project would encourage and incentivize the purchase and use of ZE vehicles. While it remains uncertain how many warehouse operators subject to the proposed project would choose to comply by purchasing or operating ZE vehicles, the potential increase in demand could lead to the mineral resource extraction (e.g., lithium) and/or production (e.g., hydrogen).
- **Construction of New Recycling Facilities.** The proposed project would encourage and incentivize the purchase and use of ZE vehicles. While it remains uncertain how many warehouse operators subject to the proposed project would choose to comply by purchasing or operating ZE vehicles, the potential increase in demand could lead to the construction of new recycling facilities for batteries.
- **Energy Infrastructure Improvements.** The proposed project would encourage and incentivize the purchase and use of ZE vehicles. While it remains uncertain how many warehouse operators subject to the proposed project would choose to comply by purchasing or

operating ZE vehicles, the potential increase in energy demand could lead to the construction of new energy infrastructure.¹

It is uncertain how many new facilities/infrastructure improvements would be built, where they would be built, and whether the local land use permitting authority would require mitigation. Therefore, it is not possible to analyze any specific potential impacts of this new development. Nonetheless, CARB provided a general analysis of these impacts in its Final Environmental Analysis for the Advanced Clean Truck (ACT) Regulation. The regulation requires truck manufacturers to sell medium-and heavy-duty ZE vehicles as an increasing percentage of California sales. The Final EA described the potential for the regulation to result in the construction of new manufacturing, recycling, and other facilities in this way:

Reasonably foreseeable compliance responses under this measure would include an increase in manufacturing and associated facilities to increase the supply of ZEVs, along with construction of new hydrogen fueling stations and battery electric vehicle (BEV) charging stations to support ZEV operations. Increased deployment of ZEVs could increase production of electricity and hydrogen fuel, reduce rates of oil and gas extraction, and result in associated increases in lithium and platinum mining and exports from source countries or other states. Increased demand for lithium-ion batteries could increase production and manufacture, which could result in the expansion of or construction of new facilities along with associated increases in lithium mining and exports from source countries or other states. Disposal of any portion of vehicles, including batteries, would be subject to and have to comply with existing laws and regulations governing solid and hazardous waste, such as California's Hazardous Waste Control law, and implementing regulations, such as the Universal Waste Rule (22 California Code of Regulations (CCR) Chapter 23). That is, disposal of used batteries into solid waste landfills is prohibited; however, they could be refurbished, reused or disposed of as hazardous waste. To meet an increased demand of refurbishing or reusing batteries, new facilities or modifications to existing facilities are anticipated to accommodate battery recycling activities. Fleet turnover would be largely unaffected because the proposed sales requirement applies at time of new vehicle sales. (CARB ACT Regulation Final EA, pp. 19–20.)

The Final EA for the ACT Regulation further noted that “CARB does not have the ability to determine specific projects or locations, facility size and character, or site-specific environmental characteristics affected by any potential future facilities” (CARB ACT Regulation Final EA, pp. 19–20). Nonetheless:

This Final EA takes a conservative approach and considers some environmental impacts as potentially significant because of the inherent uncertainties in the relationship between physical actions that are reasonably foreseeable under the Proposed Project and environmentally sensitive resources or conditions that may be affected. This approach tends to overstate environmental impacts considering these uncertainties and is intended to satisfy the good-faith, full-disclosure intention of CEQA. If specific projects are proposed and subjected to project-level

¹ The CARB EA did not specifically discuss these potential improvement projects, but they would have similar impacts to the other development projects discussed in that EA, and thus the same impacts analysis would apply.

environmental review, it is expected that many of the impacts recognized as potentially significant in the Final EA that are not already mitigated or avoided with this proposed project, can later be avoided or reduced to a less-than-significant level. If a potentially significant environmental effect cannot be feasibly mitigated with certainty, this Final EA identifies the impact as significant and unavoidable. (CARB ACT Regulation Final EA, pp. 19–20).

With respect to mitigation for any potential impacts resulting from development of new facilities, CARB’s Final EA stated:

The Final Draft EA contains a degree of uncertainty regarding implementation of mitigation for potentially significant impacts. While CARB is responsible for adopting the Proposed Project, it does not have authority over all the potential infrastructure and development projects that could be carried out in response to the Proposed Project. Other agencies are responsible for the review and approval, including any required environmental analysis, of any facilities and infrastructure that are reasonably foreseeable, including any definition and adoption of feasible project-specific mitigation measures, and any monitoring of mitigation implementation. For example, local cities or counties must approve proposals to construct new facilities. Additionally, State and/or federal permits may be needed for specific environmental resource impacts, such as take of endangered species, filling of wetlands, and streambed alteration.

Because CARB cannot predict the location, design, or setting of specific projects that may result and does not have authority over implementation of specific infrastructure projects that may occur, the programmatic analysis in the Final Draft EA does not allow for identification of the precise details of project-specific mitigation. As a result, there is inherent uncertainty in the degree of mitigation that would ultimately need to be implemented to reduce any potentially significant impacts identified in the Final Draft EA. Consequently, this Final Draft EA takes the conservative approach in its post-mitigation significance conclusions (i.e., tending to overstate the risk that feasible mitigation may not be sufficient to mitigate an impact to less than significant) and discloses, for CEQA compliance purposes, that potentially significant environmental impacts may be unavoidable, where appropriate. It is also possible that the amount of mitigation necessary to reduce environmental impacts to below a significant level may be far less than disclosed in this Final Draft EA on a case-by-case basis. It is expected that many potentially significant impacts of facility and infrastructure projects would be avoidable or mitigable to a less-than-significant level as an outcome of their project-specific environmental review processes. (CARB ACT Regulation Final EA, pp. 20).

This EA incorporates by reference CARB’s analysis of the potential impacts of this potential development, including its discussion of potential mitigation measures, for each of the impact areas in Table 4.5-1. The proposed project would likely result in even fewer new facilities than CARB’s ACT Regulation, given the more limited geographic scope of the proposed project (only within South Coast AQMD’s jurisdiction), its more limited application (just to subject warehouses), and the alternative methods of compliance available to warehouses (e.g., installing filtration systems at nearby sensitive receptors). Nonetheless, this EA adopts CARB’s conservative approach and

concludes these potential impacts, while uncertain, are significant and unavoidable. Table 4.5-1 identified the potential indirect effects of the proposed project associated with the upstream and downstream manufacturing and resources extraction that may occur as a result of the project.²

Table 4.5-1
Indirect Impacts of the Proposed Project

Indirect Impact Area	Discussion	Significance Conclusion
Aesthetics	Increased use of NZE and ZE vehicles and technology could increase the demand for lithium mining, ³ new and modified manufacturing facilities, improvements to the electric grid, and expanded/modified recycling facilities. There is uncertainty as to the exact locations of new and modified facilities and infrastructure. Operation and construction of these facilities, though likely to occur in areas with appropriate zoning where other similar facilities may already exist, could introduce or increase the presence of non-natural appearing elements (e.g., buildings, parking lots, mining equipment) in areas with national-, State-, or county-designated scenic vistas and/or scenic resources visible from State scenic highways. The visual impact of such development would depend on several variables, including sensitivity of viewers, size of facilities, viewer distance, angle of view, visual absorption capacities, and the structure placement in the landscape. Introduction of new facilities in a highly sensitive and natural area, for example, could substantially degrade the area's visual quality. In addition, operation and construction may introduce substantial sources of nighttime lighting for safety and security purposes. In areas with minimal existing lighting, lighting may be a substantial new source of light or glare. While impacts could be reduced to a less-than-significant level by mitigation measures prescribed by local, State, federal, or other land use or permitting agencies (either in the U.S. or abroad) with approval authority over the development projects, South Coast AQMD does not have the authority to require implementation of mitigation related to new or modified facilities that would be approved by local jurisdictions. Therefore, impacts from the construction and operational phases of the proposed project are significant and unavoidable.	Construction: Significant and unavoidable Operations: Significant and unavoidable
Agriculture and Forestry Resources	There is uncertainty as to the exact locations of new and modified manufacturing and recycling facilities, improvements to the electrical grid, and lithium mining; therefore, their location in relation to agricultural land, including farmland, land zoned for agricultural use, and land under Williamson Act (Government Code Section 51200 et seq.) contract is unknown. Similarly, it is uncertain where new and modified facilities would be in relation to forest land and timberland. Construction and modification of these facilities, though likely to occur in areas with appropriate zoning that would not have	Construction: Significant and unavoidable Operations: Significant and unavoidable

² Indirect impacts from air quality, GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation are identified in Chapter 4.1 through 4.4, respectively.

³ Hard rock mining of lithium ore would not be expected to occur within the state or the U.S

**Table 4.5-1
Indirect Impacts of the Proposed Project**

Indirect Impact Area	Discussion	Significance Conclusion
	<p>agricultural or forestry uses, could result in conversion of agricultural land or forest land if they are sited in areas of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, Williamson Act conservation contracts, forest land or timberland. Some of the conversion would be permanent where facilities are constructed, while temporary conversion may be needed to facilitate temporary construction activities. Potential agricultural and forest resource impacts could be reduced to a less-than-significant level by mitigation measures prescribed by local, State, federal, or other land use or permitting agencies (either in the U.S. or abroad) with approval authority over the development projects. However, South Coast AQMD does not have the authority to require implementation of mitigation related to new or modified facilities that would be approved by local jurisdictions. Therefore, impacts from the construction and operational phases of the proposed project are significant and unavoidable.</p>	
Biological Resources	<p>Construction of new recycling and manufacturing facilities and improvements to the electrical grid could require disturbance of undeveloped area, such as clearing of vegetation, earth movement and grading, trenching for utility lines, erection of new buildings, and paving of parking lots, delivery areas, and roadways. These activities would have the potential to adversely affect biological resources (e.g., species, habitat) because there could be biological species that occur, or even thrive, in developed settings. Additionally, resources could also be adversely affected by the installation of hydrogen fuel dispensing units at existing gasoline service stations and modifications to existing hydrogen production plants within existing footprints, or at other sites in areas with consistent zoning.</p> <p>Operation of a new facility could deter wildlife from the surrounding habitat or could impede wildlife movement through the area. This impact would be substantial if there is not adequate habitat nearby. Vegetation management may be necessary to comply with fire codes and defensible space requirements, which may require tree trimming and other habitat modification that could, for example, result in species mortality or nest failure.</p> <p>Lithium may also be collected from lake brines and clays.⁴ Such activities could result in substantial disturbances to biological resources and could cause a reduction in sensitive habitat, interference with a wildlife corridor, loss of special-status species, or conflict with a habitat conservation plan or natural community conservation plan. Water contamination associated with lithium ore</p>	<p>Construction: Significant and unavoidable</p> <p>Operations: Significant and unavoidable</p>

⁴ Hard rock mining of lithium ore and its related effects to biological resources would not be expected to occur within the state or the U.S.

**Table 4.5-1
Indirect Impacts of the Proposed Project**

Indirect Impact Area	Discussion	Significance Conclusion
	<p>extraction could have acute and adverse effects to sensitive habitat and sensitive species.</p> <p>Impacts to biological resources could be reduced to a less-than-significant level by mitigation that can and should be implemented by local lead agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, impacts from the construction and operational phases of the proposed project are significant and unavoidable.</p>	
Cultural Resources	<p>The cultural resources that could potentially be affected by ground disturbance activities associated with new manufacturing and recycling facilities and infrastructure associated with the transition to NZE and ZE vehicles could include, but are not limited to, prehistoric and historical archaeological sites; paleontological resources; historic buildings, structures, or archaeological sites associated with agriculture and mining; and heritage landscapes. Properties important to Native American communities and other ethnic groups, including tangible properties possessing intangible traditional cultural values, also may exist. Historic buildings and structures may also be adversely affected by demolition-related activities.</p> <p>Most operational activities would not have the potential to affect archaeological, paleontological, or historical resources. Operation of new facilities may, however, change the visual setting of the surrounding area, which could adversely affect historic resources and districts with a visual component.</p> <p>Potential construction-related and operational-related cultural resources impacts could be reduced to a less-than-significant level by mitigation that can and should be implemented by local lead agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, impacts from the construction and operational phases of the proposed project are significant and unavoidable.</p>	<p>Construction: Significant and unavoidable</p> <p>Operations: Significant and unavoidable</p>
Geology and Soils	<p>Although it is reasonably foreseeable that construction activities could occur as a result of new or modified manufacturing and recycling facilities and improvements to the electrical grid, there is uncertainty as to the exact location of new facilities/infrastructure and, as a result, there is uncertainty as to geologic conditions at project sites. Furthermore, characteristics of any new facilities and what kinds of modifications to existing facilities would occur is unknown.</p> <p>Construction activities would have the potential to adversely affect soil and geologic resources in construction areas. New and modified facilities and infrastructure associated with compliance responses</p>	<p>Construction: Significant and unavoidable</p> <p>Operations: Significant and unavoidable</p>

**Table 4.5-1
Indirect Impacts of the Proposed Project**

Indirect Impact Area	Discussion	Significance Conclusion
	<p>under the proposed project could be located in a variety of geologic, soil, and slope conditions with varying amounts of vegetation that would be susceptible to soil compaction, soil erosion, and loss of topsoil during construction.</p> <p>Implementation of the proposed project would not be expected to result in effects to seismicity. The level of susceptibility to geologic effects, such as erosion and landslides, varies by location and geologic conditions. However, the specific design details, siting locations, and soil compaction and erosion hazards for manufacturing and recycling facilities are not known at this time and would be analyzed on a site-specific basis at the project level.</p> <p>Hard rock lithium ion extraction, which would be expected to occur outside of the state and U.S., would have adverse effects to erosion from potential loss of forests and soil disturbance. The impacts to geology and soil resources could be reduced to a less-than-significant level by mitigation that can and should be implemented by federal, State, and local lead agencies, but is beyond the authority of South Coast AQMD and not within its purview. Therefore, impacts from the construction and operational phases of the proposed project are significant and unavoidable.</p>	
Hydrology and Water Quality	<p>New and modified manufacturing and recycling facilities and improvements to the electrical grid could be in locations with a range of hydrologic conditions. Construction of buildings may exacerbate hydrologic hazards. Precise impacts cannot be determined because specific construction details, siting locations, and associated hydrology and water quality conditions are not known at this time. Construction projects would be required to comply with applicable erosion, water quality standards, and waste discharge requirements (e.g., National Pollution Discharge Elimination System [NPDES], Stormwater Pollution Prevention Plan [SWPPP]). The operation of new plants, stations, and modifications would be required to comply with applicable erosion, water quality standards, and waste discharge requirements (e.g., NPDES, SWPPP). With respect to depleting groundwater supplies, new facilities are not being anticipated to result in substantial demands due to the nature of associated activities.</p> <p>Lithium mining and extraction could result in over drafting of groundwater. Extraction of lithium has substantial effects on water quality. Mineral extraction and mining activities within the U.S. would be required to comply with the provisions of the Clean Water Act and the natural resource protection and land reclamation requirements of the appropriate State and federal land managers. For instance, the Bureau of Land Management (BLM) and U.S. Forest</p>	<p>Construction: Significant and unavoidable</p> <p>Operations: Significant and unavoidable</p>

Table 4.5-1
Indirect Impacts of the Proposed Project

Indirect Impact Area	Discussion	Significance Conclusion
	<p>Service (USFS) mining permit conditions contain protections for hydrologic resources and require mining reclamation standards. However, lithium is obtained from areas outside of the U.S., where State and U.S laws and regulation are not enforced. Thus, water quality impacts related to mining could occur because of implementation of the reasonably foreseeable compliance responses associated with the proposed project.</p> <p>This impact could be reduced to a less-than-significant level by mitigation that can and should be implemented by local lead agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, impacts from the construction and operational phases of the proposed project are significant and unavoidable.</p>	
Land Use and Planning	<p>New and modified manufacturing and recycling facilities would likely occur within existing footprints or in areas with consistent zoning or would undergo the appropriate process for a variance or conditional use. Additionally, constructed facilities would not be linear and are unlikely to be constructed in an area that would require displacing existing dissimilar uses (e.g., housing). Thus, implementation of the proposed project would not be anticipated to divide an established community or conflict with a land use policy.</p>	<p>Construction: Less than significant</p> <p>Operations: Less Than Significant</p>
Mineral Resources	<p>While manufacturing and recycling facilities would likely be constructed within areas zoned for industrial uses, there is a possibility that buildings could be sited in locations identified as having viable mineral resources that are locally important or are of regional or state value. However, buildings would be limited in size and would not wholly preclude resource recovery from adjacent areas. As result, this impact would be less than significant.</p> <p>Long-term operational compliance responses associated with the proposed project include increased mining and processing of rare materials (e.g., lithium) used in fuel cells and ZE vehicle batteries. Depending on the magnitude of required materials, implementation of the proposed project could affect the availability of known minerals. The demand for additional mining to meet increased use of batteries could result in the development of new mines and mining of lithium. For the purposes of this document it would be too speculative to determine if, when, and where a new mine may be located. In the case that new mines are required, they would go through independent environmental review at the appropriate federal, state, or local level. It is assumed, for the purposes of this analysis, that any new mines located within the U.S. or the state would be in areas with appropriate zoning, and subject to Federal, State, and/or local requirements.</p>	<p>Construction: Less than significant</p> <p>Operations: Significant and unavoidable</p>

**Table 4.5-1
Indirect Impacts of the Proposed Project**

Indirect Impact Area	Discussion	Significance Conclusion
	<p>Batteries used in ZE vehicles are primarily lithium based. Thus, it is assumed that mineral resource requirements associated with implementation of recommended measures associated with the proposed project would be tied to lithium resources and other lithium-ion battery-related metals. The only domestic lithium mine in operation in the U.S. is a brine operation in Nevada; however, in recent years, 6.9 million tons of new lithium resources have been identified in the U.S. in the form of continental brines, geothermal brines, hectorite, oilfield brines, and pegmatites. Worldwide reserves total approximately 14 million metric tons. The magnitude of reserves is necessarily limited by many considerations, including cost of drilling, taxes, price of the mineral commodity being mined and the associated demand. In addition, deposits of mineral resources are also important to consider in assessing future supplies. Furthermore, owing to continuing exploration, identified lithium resources have increased substantially worldwide. Worldwide, identified lithium resources are currently estimated to be approximately 62 million tons.</p> <p>Increased use of fuel cell electric vehicles could increase the demand for platinum. With the phasing out of conventional internal combustion engines for trucks that will use platinum for catalysts, the potential demand on platinum-group metals (PGMs) should not be substantial. One U.S. domestic company produced about 18,000 kilograms of PGMs with an estimated value of about \$570 million from its two mines located in Montana. Worldwide palladium reserves are about 67 million metric tons.</p> <p>Implementation of the proposed project and associated compliance responses could result in an increased development where mining for lithium and platinum is feasible, which could conceivably affect the availability of these mineral resources if access to resources becomes impeded.</p> <p>This impact could be reduced to a less-than-significant level by mitigation that can and should be implemented by local lead agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, long-term operational impacts of the proposed project are significant and unavoidable.</p>	
Noise	<p>Construction and modification of manufacturing and recycling facilities and improvements to the electrical grid would result in construction-related noise and vibration in excess of applicable standards or that result in a substantial increase in ambient levels at nearby sensitive receptors.</p> <p>Operational-related activities associated with lithium mining could produce substantial stationary sources of noise. New sources of noise</p>	<p>Construction: Significant and unavoidable</p> <p>Operations: Significant</p>

**Table 4.5-1
Indirect Impacts of the Proposed Project**

Indirect Impact Area	Discussion	Significance Conclusion
	associated with the implementation of the proposed project could include operation of manufacturing plants and recycling facilities. Depending on the proximity to existing noise-sensitive receptors, stationary source noise levels could exceed applicable noise standards and result in a substantial increase in ambient noise levels. This impact could be reduced to a less-than-significant level by mitigation that can and should be implemented by local lead agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, impacts from the construction and operational phases of the proposed project are significant and unavoidable.	and unavoidable
Population and Housing	Construction and modification activities would be anticipated to require minimal if any crew relocation because manufacturing facilities are frequently constructed and the demand for crews would be temporary (e.g., 6 to 12 months per project). Furthermore, it would not be anticipated that a substantial amount of new personnel would be needed to operate the facilities and that enough employment base would likely be available from the local population. If manufacturers build new truck assembly plants in California, it is reasonable to anticipate that (potential) workers would be local and are not likely to migrate from other places. Therefore, impacts from the construction and operational phases of the proposed project are less than significant.	Construction: Less than significant Operations: Less than significant
Public Services	As discussed for Population and Housing, minimal or no relocation of employees would occur during construction or operation. Increased operation of manufacturing facilities may increase the need for emergency services in the case of accidents. Compliance with Occupational Safety and Health Administration safety regulations and local fire departments would minimize the risk of accidents. Therefore, impacts from the construction and operational phases of the proposed project are less than significant.	Construction: Less than significant Operations: Less than significant
Recreation	As discussed for the topic of population and housing, minimal or no relocation of employees would occur during construction or operation of new facilities built in response to the proposed project. Therefore, only minimal increases in the use of parks and other recreational facilities may occur, and impacts from the construction and operational phases of the proposed project are less than significant.	Construction: Less than significant Operations: Less than significant
Utilities and Service Systems ^a	Utilities and Service Systems impacts are inherently long term and related to the operational facilities; thus, there would be no short-term construction-related impacts associated with the proposed project. New manufacturing plants and recycling facilities could generate substantial increases in the demand for water supply, wastewater treatment, storm water drainage, energy, and solid waste services in their local areas. Additionally, depending on the location, new	Construction: No impact Operations: Significant and unavoidable

**Table 4.5-1
Indirect Impacts of the Proposed Project**

Indirect Impact Area	Discussion	Significance Conclusion
	<p>facilities may require new utility service lines and connections. At this time, the specific location, type, and number of new manufacturing and recycling facilities developed is not known and would be dependent upon a variety of market factors including economic costs, product demands, and environmental constraints. Therefore, the ultimate magnitude and location of demand for utilities such as water and wastewater cannot be known. Thus, the specific impacts from new manufacturing plants and recycling facilities on utility and service systems cannot be identified with any certainty, and individual plants could potentially result in significant environmental impacts related to procurement and delivery of utilities and public services.</p> <p>Any new or modified facilities, no matter their size and location, would be required to seek local or State land use approvals prior to their development. In addition, part of the land use entitlement process for facilities proposed in California requires that each of these projects undergo environmental review consistent with the requirements of CEQA and the CEQA Guidelines. It is assumed that facilities proposed in other states would be subject to comparable federal, State, and/or local environmental review requirements (e.g., CEQA) and that the environmental review process would assess whether adequate utilities and services (i.e., wastewater services, water supply services, solid waste facilities) would be available and whether the project would result in the need to expand or construct new facilities to serve the project. Through the environmental review process, utility and service demands would be calculated, and agencies would provide input on available service capacity and the potential need for service-related infrastructure, including expansions to wastewater treatment plants, new water supply entitlements and infrastructure, stormwater infrastructure, and solid waste handling capacity (e.g., landfills). Resulting environmental impacts would also be determined through this process.</p> <p>Potential long-term operational-related utilities and service systems impacts could be reduced to a less-than-significant level by mitigation that can and should be implemented by local lead agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, operational impacts of the proposed project are significant and unavoidable.</p>	
<p>Notes:</p> <p>^a Indirect impacts to energy are evaluated in Chapter 4.2 of this Draft EA</p> <p>Source: California Air Resources Board. 2020, June 23. Final Environmental Analysis for the Proposed Advanced Clean Trucks Rule Regulation. https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf</p>		

PROJECT IMPACTS – CONCLUSION: Based on the preceding analysis, indirect impacts to Mineral Resources, Population and Housing, Land Use and Planning, Public Services, and Recreation due to the construction of new manufacturing and recycling facilities and improvements to the electrical grid are found to be less than significant. There would be no construction-related indirect impacts to Utilities and Service Systems. Indirect impacts to Population and Housing, Land Use and Planning, Public Services, and Recreation due to the operational phase are less than significant. However, potential impacts to Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, and Noise resulting from the construction and operational phases of new manufacturing facilities, recycling facilities, and infrastructure improvements would be potentially significant. Indirect impacts to Mineral Resources and Utilities and Service Systems during the operational phase will also be potentially significant.

PROJECT MITIGATION MEASURES: South Coast AQMD does not have land use authority over indirect impacts associated with upstream and downstream effects of the proposed project. However, future discretionary review may be required for these types of improvements. While South Coast AQMD is a commenting agency for CEQA projects within the South Coast AQMD region, it is up to the lead agencies for these particular construction projects to impose additional mitigation requirements under CEQA. As a result, while there are potential measures that could reduce and/or eliminate these impacts, these mitigation measures are not included in this EA because it is outside of South Coast AQMD's jurisdiction to impose.

REMAINING IMPACTS: Potential indirect impacts to Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, and Noise resulting from the construction and operational phases of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles would be significant and unavoidable. Impacts to Mineral Resources and Utilities and Service Systems during the operational phase will phase-also be significant and unavoidable.

CUMULATIVE IMPACTS: The proposed project could indirectly result in the construction of new manufacturing facilities, recycling facilities, and infrastructure improvements to support the transition to NZE and ZE vehicles. As CARB concluded in its Final EA, the proposed project could result in a cumulatively considerable contribution to a significant cumulative impact on Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources, Noise, and Utilities and Service Systems. The proposed project would not result in significant cumulative impacts related to Land Use and Planning, Population and Housing, Public Services, and Recreation.

CHAPTER 5 ALTERNATIVES

5.1 INTRODUCTION

This section provides a discussion of alternatives to the proposed project as required by CEQA (CEQA Guidelines Section 15126.6). Alternatives include measures that would feasibly attain most of the basic objectives of the proposed project and provide a means for evaluating the comparative merits of each alternative. The discussion of alternatives shall focus on alternatives to the project including alternative locations that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly (CEQA Guidelines Section 15126.6(b)). A ‘no project’ alternative must also be evaluated (CEQA Guidelines Section 15126.6(e)). The range of reasonable alternatives must be sufficient to permit a reasoned choice but need not include every conceivable project alternative. CEQA Guidelines Section 15126.6(c) specifically notes that the range of reasonable alternatives required in a CEQA document is governed by a ‘rule of reason’ and only necessitates that the CEQA document set forth those alternatives necessary to permit a reasoned choice. The key issue is whether the selection and discussion of alternatives foster informed decision making and meaningful public participation. A CEQA document need not consider an alternative whose effect cannot be reasonably ascertained and whose implementation is remote and speculative. South Coast AQMD Rule 110 (the rule which implements the South Coast AQMD’s certified regulatory program) does not impose any greater requirements for a discussion of project alternatives in an EA than is required for an environmental impact report (EIR) under CEQA.

5.2 METHODOLOGY FOR DEVELOPING PROJECT ALTERNATIVES

The alternatives typically included in CEQA documents for proposed South Coast AQMD rules, regulations, or plans are developed by breaking down the project into distinct components (e.g., emission limits, compliance dates, applicability, exemptions, pollutant control strategies, etc.) and varying the specifics of one or more of the components.

Of the requirements in the proposed project, only the components that pertain to PR 2305 – Warehouse Indirect Source Rule could involve physical or operational modifications to warehouses that are subject to the Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, and these physical or operational modifications could potentially have an effect on the physical environment. The WAIRE Program is being developed so warehouse operators subject to the proposed project can implement changes to reduce emissions from mobile sources associated with their operations. Alternatives to the proposed project were developed by modifying components of the WAIRE Program. The rationale for selecting and modifying specific components of the WAIRE Program to generate a reasonable range of feasible alternatives for the alternatives analysis is based on CEQA’s requirement to present “realistic” alternatives; that is, alternatives that can actually be implemented. These alternatives are also designed to meet most ~~and~~ or all of the basic objectives of the proposed project as well as to reduce the proposed project’s potentially significant adverse environmental impacts. The alternatives were developed by varying the proposed rule applicability in terms of warehouse size in square feet, the proposed rule stringency, the proposed initial compliance period, and the availability of actions on the WAIRE

Menu that warehouse operators can select and implement to meet the WAIRE Points Compliance Obligation (WPCO).

5.3 DESCRIPTION OF ALTERNATIVES

The evaluation of the components that compose the WAIRE Program is based on construction and operational activities from the modeled WAIRE Points scenarios if all warehouse operators selected one scenario as the single, sole compliance option to meet their WPCO. In the context of the proposed project, which is a rule, “construction” impacts are those ~~impacts~~ that would result if warehouse operators selected a compliance option requiring new construction, while “operational” impacts are those ~~impacts~~ that would be ongoing (e.g., impacts resulting from warehouse relocations, cargo growth diversion, increased demand for electricity and need for charging infrastructure, increased disposal of batteries and hydrogen fuel cells, or operation of new Minimum Efficiency Reporting Value (MERV) 16 or greater filters and filtration systems installed to comply with the rule).

The environmental impacts analysis in Chapter 4 of the EA analyzes the proposed project’s direct adverse environmental impacts. The analysis indicates that the proposed project could result in the following potentially significant adverse impacts: air quality impacts during construction from the installation of electric vehicle (EV) chargers (Scenario 6) and hydrogen fueling stations (Scenario 12) and during overlapping construction and operational activities; greenhouse gas (GHG) emissions impacts during operations from the use of MERV 16 or greater filters and filtration systems (Scenario 15) and cargo growth diversion; energy impacts during operations due to increased demand for electricity and increased need for EV charging infrastructure; hazardous materials and solid and hazardous waste impacts for construction waste that could be characterized as hazardous waste and during operations with regards to impact on recycling capacity at the existing recycling infrastructure from the increased disposal of batteries and hydrogen fuel cells and impact from routine transport, use, or disposal of liquefied natural gas (LNG) fuel; and transportation impacts during operations with regards to truck vehicle miles travel (VMT) from relocation of up to three warehouses, which are assumed for the environmental impact analysis purposes even though no such relocations are expected to occur based on the currently proposed rule stringency. It is important to note that this EA assumes some cargo growth shipping diversion. Because of the uncertainty of the market result, and because it is not possible to quantify, the impacts from cargo growth diversion are discussed qualitatively.

The proposed project’s direct environmental impacts analysis in Chapter 4 of the EA also indicates that implementation of the WAIRE Program based on the modeled WAIRE Points scenarios if all warehouse operators selected one scenario as the single, sole compliance option to meet their WPCO, will result in the following less than significant adverse impacts: air quality impacts during operations; GHG construction emissions impacts that could directly result from the installation of EV charger (Scenario 6) and hydrogen fueling station (Scenario 12) after subtracting a 30-year amortization; energy impacts during construction; and transportation impacts from construction activities as well as during operations with regards to automobile VMT from employee commute trips associated with up to three warehouse relocations that are assumed for the environmental impact analysis in this EA.

The environmental impact analysis in Chapter 4 of the EA also analyzes the proposed project’s indirect adverse environmental impacts, including impacts to air quality and GHG emissions,

energy, hazardous materials and solid and hazardous waste, and transportation associated with construction of new manufacturing facilities, recycling facilities, and grid improvements that could result if warehouse operators choose to comply with the WAIRE Program by purchasing or using zero-emissions (ZE) trucks. These indirect impacts of the proposed project were comprehensively analyzed by the California Air Resources Board (CARB) in its Final Environmental Analysis for the Advanced Clean Trucks Regulation (State Clearinghouse No.: 2018052041),¹ which found that the development of new facilities, including manufacturing, recycling, and grid infrastructure facilities, which is an indirect impact of the proposed project, could also have potentially significant impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term, operational-related impacts from increased demand for new mines and mining activities to meet increased use of lithium-based batteries for ZE vehicles), Noise, and Utilities and Service Systems (during operations).

Five alternatives to the proposed project have been developed and summarized in Table 5-1, as follows: Alternative A – No Project, Alternative B – Decreased Emission Reductions, Alternative C – Increased Emission Reductions, Alternative D – All Natural Gas Options Only, Alternative E – All Electric Options Only. The primary components of the alternatives that have been modified are the WAIRE Program applicability in terms of warehouse size in square feet, the proposed rule stringency, the proposed initial compliance period, and the actions that are available on the WAIRE menu, which could make the WAIRE Program more prescriptive by including a limited number of actions that warehouse operators can select and implement. Unless otherwise specifically noted, all other components of the project alternatives are identical to the components of the proposed project.

The South Coast AQMD's Governing Board may choose to adopt any portion or all of any alternative presented in the Final EA with appropriate findings as required by CEQA. The Governing Board is able to adopt any portion or all of any of the alternatives presented because the impacts of each alternative will be fully disclosed to the public, and the public will have the opportunity to comment on the alternatives and impacts generated by each alternative. Written suggestions on potential project alternatives received during the public review and comment period for the Draft EA as provided in Appendix E – Letters Received on the Draft EA and Responses to Comments will be considered when preparing the Final EA and will be included as an appendix (Appendix E) of the Final EA.

The following subsections provide a brief summary of the proposed project along with a description of the alternatives.

5.3.1 Proposed Project

The proposed project (also referred to as the WAIRE Program) consists of PR 2305 and the associated mitigation program, and PR 316. It facilitates NO_x and PM, including DPM, emissions reductions from the vehicles and other sources of emissions associated with existing and new warehouses located in the South Coast AQMD's jurisdiction in order to assist in meeting state and federal air quality standards for ozone and PM_{2.5}.

¹ California Air Resources Board. 2019. The Advanced Clean Trucks Regulations Final Environmental Analysis. Accessed at: <https://ww3.arb.ca.gov/regact/2019/act2019/finalea.pdf>.

The project objectives of the WAIRE Program are to: 1) reduce NO_x emissions and PM, including DPM, and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617; and 4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse. PR 316 is a fee rule for Rule 2305 and serves as a mechanism for the collection of administrative fees to be paid by a warehouse operator subject to PR 2305 to recover administrative costs. As a result, PR 316 does not itself have the potential to physically impact the environment.

The proposed project implements Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, which is one of four Facility-Based Mobile Source Measures identified in the 2016 Air Quality Management Plan (AQMP) for the warehouse and distribution sector. The WAIRE Program applies to owners and operators of warehouses located in the South Coast AQMD's jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building that may be used for warehousing activities by one or more warehouse operators.

The initial compliance period encompasses three years from January 1, 2022~~July 1, 2021~~, to December 31~~June 30~~, 2024, in three phases. The phasing is based on warehouse size in square feet. Larger warehouses, ~~which are~~ equal to or greater than 250,000 square feet, will be subject to the first compliance period from January 1, 2022~~July 1, 2021~~, to December 31~~June 30~~, 2022. Warehouses ~~which are~~ equal to or greater than 150,000 square feet will be subject to the second compliance period from January 1, 2023~~July 1, 2022~~, to December 31~~June 30~~, 2023. Warehouses ~~which are~~ equal to or greater than 100,000 square feet will be subject to the third compliance period from January 1, 2024~~July 1, 2023~~, to December 31~~June 30~~, 2024. The proposed project has a sunset date. It will sunset upon final action by the U.S. EPA finding that all air basins within the South Coast AQMD have attained the 2015 NAAQS for ozone (e.g., 70 parts per billion) and when CARB has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion).

Warehouse operators that are subject to the WAIRE Program must earn a certain number of WAIRE Points each compliance year. The required number of points depends on the number of weighted annual truck trips (WATTs), a stringency factor, and an annual variable, and is calculated by multiplying them together. WATTs include the number of all actual truck trips from Class 2b to Class 8 vehicles that occurred at a warehouse (e.g., the number of trips to and from the warehouse) while the warehouse operator was responsible for operations during the previous 12-month compliance period. If a warehouse is occupied by more than one warehouse operator, the WATTs are only the truck trips attributed to that operator. Warehouse operators would be required to count and report all of their trucks entering the warehouse's truck entrance to determine the WATTs in every compliance year.

A stringency factor is based on the following considerations: the air quality and public health need for emissions reductions from the WAIRE Program (e.g., worst air quality in the nation, exceedance of federal air quality standards, high pollution burdens for communities near warehouses) and impacts to industry (e.g., increased costs of warehouse operations, potential imposition of competitive disadvantages relative to other regions, and potential ancillary effects such as impacts to the electric grid from switching fuels to ZE trucks). The proposed project was analyzed for different stringency factors in a range from 0.0001 WAIRE Points per WATT to

0.0050 WAIRE Points per WATT. The currently proposed stringency factor for the proposed project is set at 0.0025 WAIRE Points per WATT.

The annual variable provides a phase-in of the proposed project's stringency and increases each compliance year, beginning at an annual variable of 0.33 in a warehouse's initial compliance year. Full stringency would be achieved in a warehouse's third compliance year with an annual variable of 1.0. However, the annual variable is established relative to the proposed project's adoption and will not "reset" for new warehouses. For example, this means that a new warehouse built in year 2026 submitting its first Annual WAIRE Plan after July 1, 2027, would be subject to an annual variable of 1.0, or full stringency. The steady increase in the annual variable associated with the proposed project's phase-in schedule allows for a gradual increase in WPCO in the initial years following the adoption of the proposed project.

WAIRE Points can be earned by completing actions and investments from the following menu of implementation measures: 1) acquiring and/or using near-zero emissions (NZE) and ZE trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or transport refrigerated units (TRUs); 4) installing and/or using onsite energy systems (e.g., solar panels); and 5) implementing community benefits (e.g., MERV 16 or greater filters or filter systems). Warehouse operators may also earn WAIRE Points through a Custom WAIRE Plan specific to their operation that satisfy prescribed performance metrics. In lieu of earning WAIRE Points through WAIRE Menu options or a Custom WAIRE Plan, or to supplement earned WAIRE Points to meet the WPCO, within each compliance year, a warehouse operator may choose to pay a mitigation fee to the South Coast AQMD that would be used in a mitigation program implemented by the South Coast AQMD to achieve the emissions reductions. It is estimated that 2,902 warehouses are likely required to earn WAIRE Points at the time of rule adoption. It is not possible to predict how individual warehouses subject to the WAIRE Program will comply, i.e., which specific compliance strategy (in the form of WAIRE Menu actions, a Custom WAIRE Plan, and/or the payment of a mitigation fee) they will undertake. Individual warehouse operators' compliance choices will likely depend on warehouse-specific factors, for example, the physical configuration of a warehouse, whether the operator owns a truck fleet, what their business needs are, etc.

As stated above, the proposed project has a phase-in compliance schedule, and the annual variable, which is used to gradually increase the WPCO, is tied to the phases.

5.3.2 Alternative A: No Project

Alternative A is the no project alternative. The no project alternative is required by CEQA Guidelines Section 15126.6(e)(2). The no project alternative consists of what would occur if the proposed project was not approved. The no project alternative allows decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project. The no project alternative evaluates "what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services" (CEQA Guidelines Section 15126(e)(2)).

For purposes of this document, the no project alternative assumes that the WAIRE Program would not be implemented. This means that the existing and new warehouses located in the South Coast AQMD's jurisdiction with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building that may be used for warehousing activities by one or more warehouse

operators, or use more than 50,000 square feet for warehousing activities in a building with multiple tenants, would not be required to meet their WPCO. The WPCO compliance strategies in the form of WAIRE Menu actions, a Custom WAIRE Plan, and/or the payment of the optional mitigation fee would not be implemented.

5.3.3 Alternative B: Decreased Emission Reductions

Alternative B consists of a version of the proposed project that would result in fewer emission reductions of NO_x and PM_{2.5}. Although it is possible for this to be achieved in a number of ways, for the purpose of this analysis, three ways have been identified and are discussed as follows. First, the applicability of the WAIRE Program is narrowed to reduce the number of affected warehouses. Specifically, the warehouse size requirement is increased from “greater than or equal to 100,000 square feet” to “greater than or equal to 200,000 square feet,” such that the number of affected warehouses under Alternative B would decrease. Second, the beginning of the initial compliance and reporting dates are delayed by one year, such that the regulated warehouses would have a longer time period to plan for and phase in any actions that they would need to undertake to meet their WPCO. Third, the rule stringency is relaxed, such that the rule stringency factor for the proposed project is below 0.0025 WAIRE Points per WATT and could be as low as 0.0001 WAIRE Points per WATT. The WPCO compliance strategies such as the WAIRE Menu (all of the actions), a Custom WAIRE Plan, and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD would not change. For the purpose of comparing alternatives to the proposed project as discussed in Section 5.4, Alternative B is considered to encompass all three elements (i.e., an increase in the size requirement, a delay in the initial compliance date, and a decrease in the rule stringency factor) to provide “book-ends” of the range of potential environmental impacts associated with Alternative B and a framework for understanding the greatest potential impacts when compared to the proposed project.

5.3.4 Alternative C: Increased Emission Reductions

Alternative C consists of a version of the proposed project that would result in greater emission reductions of NO_x and PM_{2.5}. Although it is possible for this to be achieved in a number of ways, for the purpose of this analysis, two ways have been identified and are discussed as follows. First, the applicability of WAIRE Program is broadened to increase the number of affected warehouses. Specifically, the warehouse size requirement of “greater than or equal to 100,000 square feet” is removed, and all warehouses, regardless of their size, will be subject to the WAIRE Program. Second, the rule stringency is increased, such that the rule stringency factor for the proposed project is above 0.0025 WAIRE Points per WATT and could be as high as 0.0050 WAIRE Points per WATT. The three-year initial compliance period and WPCO compliance strategies such as the WAIRE Menu (all of the actions), a Custom WAIRE Plan, and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD would not change. For the purpose of comparing alternatives to the proposed project as discussed in Section 5.4, Alternative C is considered to encompass both of elements (i.e., a decrease in the size requirement and an increase in the rule stringency factor) to provide “book-ends” of the range of potential environmental impacts associated with Alternative C and a framework for understanding the greatest potential impacts when compared to the proposed project.

5.3.5 Alternative D: All Natural Gas Options Only

Alternative D is based on the currently proposed applicability and rule stringency factor for the proposed project of 0.0025 WAIRE Points per WATT. However, this alternative limits the number of actions on the WAIRE Menu that warehouse operators could select and implement to earn WAIRE Points. Specifically, the only actions allowed to earn WAIRE Points under Alternative D are related to the use of all natural gas equipment such as the acquisition and/or use of natural gas trucks such as renewable natural gas (RNG) and/or LNG and equipment, and installation and/or use of natural gas infrastructure. Alternative D limits the range of compliance actions on the WAIRE Menu as constraints. Other WPCO compliance strategies such as a Custom WAIRE Plan and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD would still be available to use by warehouse operators to comply with the proposed project. However, the number and types of actions on the Custom WAIRE Plans under Alternative D that warehouse operators could select and implement to earn WAIRE Points would also be limited to the use of all natural gas equipment, and/or installation and/or use of natural gas infrastructure and would not include non-natural gas options. Therefore, the number and types of actions on the WAIRE Menu and Custom WAIRE Plans under Alternative D would ~~not~~ change with respect to the proposed project.

5.3.6 Alternative E: All Electric Options Only

Alternative E is also based on the currently proposed applicability and rule stringency factor for the proposed project at 0.0025 WAIRE Points per WATT. However, this alternative limits the number of actions on the WAIRE Menu that warehouse operators could select and implement to earn WAIRE Points. Specifically, the only actions allowed to earn WAIRE Points under Alternative E are related to the use of all-electric equipment such as the acquisition and/or use of all-electric trucks and installation and/or use of ZE fueling or charging infrastructure. Alternative E limits the range of compliance actions on the WAIRE Menu as constraints. Other WPCO compliance strategies such as a Custom WAIRE Plan and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD would still be available to use by warehouse operators to comply with the proposed project. However, the number and types of actions on the Custom WAIRE Plans under Alternative E that warehouse operators could select and implement to earn WAIRE Points would also be limited to the use of all electric equipment and would not include non-electric options. Therefore, the number and types of actions on the WAIRE Menu and Custom WAIRE Plans under Alternative E would ~~not~~ change with respect to the proposed project.

Table 5-1 provides a summary of the elements of each of the alternatives and compares them to the proposed project.

Table 5-1
Summary of the Proposed Project and Alternatives

ELEMENT	PROPOSED PROJECT	ALT A No Project	ALT B Decreased Emission Reductions	ALT C Increased Emission Reductions	ALT D All Natural Gas Options Only	ALT E All Electric Options Only
Applicability	All warehouses with greater than or equal to 100,000 square feet of indoor floor space in a single building that may be used for warehousing activities by one or more warehouse operators, or more than 50,000 square feet for warehousing activities in a building with multiple tenants.	None.	Increased warehouse size requirement from “greater than or equal to 100,000 square feet” to “greater than or equal to 200,000 square feet.”	Remove warehouse size requirement; all existing and future new warehouses would be subject to rule.	Same as the proposed project.	Same as the proposed project.
Initial Compliance Period	Initial compliance period encompasses three years from January 1, 2022 July 1, 2024 , to December 31, June 30, 2024 , and is broken up into three phases based on warehouse size.	None.	Delaying the start of the initial compliance and reporting dates by one year later .	Same as the proposed project.	Same as the proposed project.	Same as the proposed project.
Rule Stringency Factor	0.0025 WAIRE Points per WATT.	None.	Decreased rule stringency factor.	Increased rule stringency factor.	Same as the proposed project.	Same as the proposed project.
Actions on the WAIRE Menu	Allows for the following: acquiring and/or using NZE and ZE trucks; acquiring and/or using ZE yard trucks; installing and/or using ZE charging/fueling infrastructure for cars, trucks, and/or TRUs; installing and/or using onsite solar panels; and installing high efficiency air filter systems in the community.	None.	Same as the proposed project.	Same as the proposed project.	Only allows for the acquisition and/or use of all natural gas trucks (e.g., RNG and/or LNG) <u>and equipment</u> , and installation and/or use of natural gas infrastructure.	Only allows for the acquisition and/or use of all electric trucks and installation and/or use of ZE fueling or charging infrastructure.
Custom WAIRE Plan	WAIRE Points may be earned through a Custom WAIRE Plan for the warehouse that meets specified requirements. Custom WAIRE Plans are only potentially approvable if they include actions that are not already included in the WAIRE Menu.	None.	Same as the proposed project.	Same as the proposed project.	WAIRE Points may be earned through a Custom WAIRE Plan. Only allows for the acquisition and/or use of all natural gas trucks (e.g., RNG and/or LNG) <u>and equipment</u> , and installation and/or use of natural gas infrastructure.	WAIRE Points may be earned through a Custom WAIRE Plan. Only allows for the acquisition and/or use of all electric trucks and installation and/or use of ZE fueling or charging infrastructure.
Optional Mitigation Fee	Payment of \$1,000 per WAIRE Point to South Coast AQMD that will be used to achieve emissions reductions in lieu of or to supplement WAIRE Points earned.	None.	Same as the proposed project.	Same as the proposed project.	Same as the proposed project.	Same as the proposed project.

NOTE: ALT stands for “Alternative.”

5.4 COMPARISON OF ALTERNATIVES

5.4.1 Meeting Project Objectives

As stated in Chapter 2 of this EA, the project objectives of the proposed project are to: 1) reduce NO_x and PM, including DPM, emissions and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617; and 4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse.

The extent to which each of the alternatives achieves the basic objectives of the proposed project as described in Chapter 2 of this EA has been evaluated below and summarized in Table 5-2. The proposed project would meet all of the project objectives. Although Alternative A, the no project alternative, is not capable of meeting any of the project objectives, it has been analyzed as required by CEQA. Alternatives B, C, D, and E are capable of meeting most of the project objectives.

- Alternative B is expected to result in fewer regional and local NO_x and PM, including DPM, emission reductions than the proposed project. It would take a longer period to achieve the emission reductions that are needed to meet attainment of federal and state air quality standards for ozone and PM_{2.5} than the proposed project. Alternative B would also provide less public health protection against exposure to emissions from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities, than the proposed project.
- Alternative C is expected to result in greater regional and local NO_x and PM, including DPM, emission reductions than the proposed project, which would help accelerate attainment of federal and state air quality standards for ozone and PM_{2.5}. Alternative C would also provide greater public health protection against exposure to emissions from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities, than the proposed project.
- Alternative D is more prescriptive than the proposed project by limiting the emission reduction choices for warehouse operators to all natural gas NZE technology (e.g., trucks and equipment) and infrastructure. However, since Alternative D does not include the acquisition and/or use of ZE trucks and yard trucks as allowable actions, it would likely result in fewer regional and local NO_x and PM emission reductions than the proposed project. Additionally, Alternative D would not provide reductions against exposure to emissions from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities, because it does not include MERV 16 or greater filters and filtration systems on the WAIRE Menu or Custom WAIRE Plan.
- Alternative E is more prescriptive and stringent than the proposed project by limiting the emission reduction choices for warehouse operators to all electric ZE technology and infrastructure. This alternative is expected to result in greater regional and local NO_x and PM_{2.5} emission reductions than the proposed project, which would help accelerate attainment of federal and state air quality standards for ozone and PM_{2.5}. However, due to the current market availability of electric trucks and yard trucks within the initial compliance period,

compliance with this alternative might be challenging for warehouse operators. Additionally, Alternative E would not provide reductions against exposure to emissions from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities, on the WAIRE Menu or Custom WAIRE Plan.

Table 5-2
Comparison of the Proposed Project and Alternatives in Meeting Project Objectives

PROJECT OBJECTIVE	PROPOSED PROJECT	ALT A No Project	ALT B Decreased Emission Reductions	ALT C Increased Emission Reductions	ALT D All Natural Gas Options Only	ALT E All Electric Options Only
Reduce NOx and PM, including DPM, emissions and reduce associated public health impacts from warehouse activities.	Yes	No	Yes (lesser extent)	Yes (greater extent)	Yes (lesser extent)	Yes (greater extent)
Facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM2.5.	Yes	No	Yes (lesser extent)	Yes (greater extent)	Yes (lesser extent)	Yes (greater extent)
Implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617.	Yes	No	Yes (lesser extent)	Yes (greater extent)	Yes (lesser extent)	Yes (greater extent)
Reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse.	Yes	No	Yes (equal)	Yes (equal)	No	No

5.4.2 Environmental Impacts of Alternatives

Pursuant to the requirements in CEQA Guidelines Section 15126.6(b), to avoid or substantially lessen one or more of the significant effects that a project may have on the environment, the environmental impacts that are analyzed and considered to be significant for the proposed project in Chapter 4 of this EA are evaluated for the project alternatives and compared with the proposed project. Additionally, as shown in Table 5-2, Alternative C and Alternative D are expected to achieve most of the project objectives to a greater extent than the proposed project. This could lead to warehouse operators undertaking more activities ~~undertake~~ to comply with the proposed project. Therefore, in addition to considering the significant effects, it is important to consider and evaluate if Alternative C and Alternative D would result in new significant effects that the proposed project does not have. This section identifies the proposed project's environmental impact areas that are found to be no impact or less than significant and analyzes them for Alternative C and Alternative D as compared with the proposed project.

As stated above, Chapter 4 of this EA indicates that the proposed project's direct adverse environmental impacts would be potentially significant on 1) air quality during construction and overlapping construction and operations from the installation of EV chargers and hydrogen fueling stations, 2) GHG emissions during operations from the use of MERV 16 or greater filters and filtration systems and cargo growth diversion, 3) energy during operations from increased demand for electricity and increased need for EV charging infrastructure, 4) hazardous materials and solid and hazardous waste from removal of soil and construction debris that could be characterized as hazardous waste, and during operations with regards to impacts on recycling capacity from the increased disposal of batteries and hydrogen fuel cells and routine transport, use, or disposal of LNG fuel, and 5) transportation during operations (only with regards to truck VMT from potential warehouse relocation). Chapter 4 of this EA also indicates that the proposed project's indirect adverse environmental impacts, associated with development of new manufacturing facilities, recycling facilities, and grid improvements, would also be significant to air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation. This development, which is an indirect impact of the proposed project, could also lead to the proposed project's significant indirect impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term, operational-related impacts from increased demand for new mines and mining activities to meet increased use of lithium-based batteries for ZE vehicles), Noise, and Utilities and Service Systems (during operations). When comparing the overall effects of alternatives to a project that is designed to benefit the environment such as the proposed project, it is important to consider both adverse and beneficial effects. As such, Table 5-3 includes information about these direct and indirect significant environmental adverse impacts and long-term beneficial effects on the environment for each of the project alternatives and compares them with those of the proposed project. The purpose of this comparison is to identify ways to mitigate or avoid the proposed project's potentially significant adverse effects on the environment and to increase beneficial effects.

Pursuant to CEQA Guidelines Section 15126.6(d), a CEQA document "shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. A matrix displaying the major characteristics and significant environmental effects of each alternative may be used to summarize the comparison. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative shall be discussed, but in less detail than the significant effects of the project as proposed." This section provides a discussion of the direct and indirect environmental impacts found to be significant for the proposed project and long-term beneficial effects of each alternative.

5.4.2.1 Alternative A: No Project

If Alternative A is implemented, the proposed project would not be adopted, and the proposed project's objectives would not be achieved. Although some emissions reductions could occur as a result of other regulations (e.g., the Advanced Clean Trucks Regulation and the Heavy-Duty Low NOx Omnibus Regulation) even without the proposed project, the acceleration of NOx and PM, including DPM, emissions reductions and the corresponding health benefits that would be achieved under the proposed project would not occur. The quantity of NOx and PM emissions currently generated from mobile sources and other sources of emissions associated with warehouses (the baseline) will continue to grow. Currently, the South Coast Air Basin is in non-

attainment for ozone and cannot achieve attainment unless NO_x emission reductions occur. The 2016 AQMP² stated that the most significant air quality challenge in the South Coast Air Basin is to achieve an additional 45 percent reduction in NO_x emissions in 2023 and an additional 55 percent NO_x reduction beyond 2031 levels for ozone attainment. In addition, actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617 would not occur if Alternative A is implemented.

When compared to the proposed project, Alternative A would result in no adverse direct impacts on air quality during construction and overlapping construction and operations because the installations of EV chargers (Scenario 6) and hydrogen fueling stations (Scenario 12) would not be needed. The no project alternative would also result in no impacts on GHG emissions during operations because the use of MERV 16 or greater filters and filtration systems (Scenario 15) would not be needed, and because cargo growth diversion that was assumed for the purpose of the environmental analysis would not occur. Additionally, because ZE trucks and yard trucks and supporting infrastructure would not be needed, implementation of Alternative A would not increase demand for electricity or expand infrastructure needs to support an increased use of ZE technology (e.g., electric trucks and yard trucks). It would also not increase construction waste attributable to the removal of soil or construction debris from demolition that could be characterized as hazardous waste; increase the need for routine transport, use, or disposal of LNG fuel; or increase disposal of batteries or hydrogen fuel cells, which could result in no impact to the existing recycling infrastructure. According to the Industrial Economics Inc. Study,³ it is estimated that up to 10 warehouse relocations could still occur even without the proposed project.⁴ As stated above, even though the proposed project is not expected to cause warehouse relocations, and because of the uncertainty of market responses, the environmental impact analysis in Chapter 4 conservatively assumes relocation of up to three warehouses, which would affect truck VMT. The no project alternative would result in less adverse impacts on transportation with regards to truck VMT than the proposed project because relocation of up to three warehouses and associated increases in truck VMT that were assumed for the proposed project would not result from this alternative.

When compared to the proposed project, Alternative A would result in no adverse indirect impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation because purchasing or using ZE trucks and yard trucks would not be required. Therefore, development of new manufacturing and recycling facilities to provide and fuel ZE trucks and yard trucks incentivized by the proposed project, as well as grid improvements, would not be needed. Furthermore, Alternative A's indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from increased demand for new mines and mining activities to meet increased use of lithium-based batteries for ZE vehicles), Noise, and Utilities and Service Systems

² South Coast AQMD. March 3, 2017. *2016 Air Quality Management Plan*. Accessed at: <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan>

³ Study will be included as an appendix to the socioeconomic analysis and is also located here: www.aqmd.gov/fbmsm

⁴ Preliminary Draft Staff Report. January 2021. Accessed at: <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf>

(during operations), which could be indirectly caused by the development of new facilities and grid improvement, would not occur.

When considering the overall effects of Alternative A to the proposed project, although Alternative A has no adverse significant environmental impacts (both directly and indirectly), it does not have emissions reductions or public health protection benefits that the proposed project has.

5.4.2.2 *Alternative B: Decreased Emission Reductions*

If Alternative B is implemented, the WAIRE Program would result in fewer emission reductions of NO_x and PM, including DPM. If the WAIRE Program applicability is narrowed and the currently proposed rule stringency factor is below 0.0025 WAIRE Points per WATT, Alternative B would result in less adverse direct impacts to air quality during construction than the proposed project because fewer EV chargers (Scenario 6) and hydrogen fueling stations (Scenario 12) would need to be constructed and fewer overlapping construction and operational activities. Construction activities are also temporary. Fewer MERV 16 or greater filters and filtration systems (Scenario 15) would also need to be installed and used, resulting in lower electricity demands and associated GHG emissions. Because Alternative B's rule stringency factor would be lower than the proposed project, this would likely lead to less cargo growth potentially being diverted to other ports and resulting in less GHG emissions from cargo growth diversion than the proposed project. Since fewer warehouses would likely select the ZE trucks and yard trucks and fueling stations to earn WAIRE Points, which would likely lead to a lower demand on utilities, Alternative B's demand for electricity and infrastructure needs would be reduced. Fewer warehouses subject to the WAIRE Program could mean fewer construction activities, which could lead to generation of less construction waste attributable to the removal of soil or construction debris from demolition that could be characterized as hazardous waste, and the number of batteries that need to be recycled would also be reduced, resulting in less adverse direct impact on the existing recycling infrastructure from exceeding their capacity. The amount, frequency, and duration of routine transport, use, or disposal of LNG fuel would be less than the proposed project. As a result, Alternative B would have less adverse direct impacts to energy and hazardous materials and solid and hazardous waste. Alternative B's potential impacts on transportation with regards to truck VMT from warehouse relocations would also be less adverse when compared to the proposed project since the lower rule stringency factor would likely lead to fewer than the three warehouse relocations that were assumed for analyzing the proposed project's transportation impacts.

If the compliance date is delayed, Alternative B is expected to result in similar direct impacts to air quality during construction, GHG emissions during operations, energy during operations with regards to demand and need for utilities and infrastructure to accommodate the use of ZE technology (e.g., electric trucks and yard trucks), hazardous materials and solid and hazardous waste from potentially hazardous construction waste and during operations with regards to impacts on landfill capacity from the increased disposal of batteries and hydrogen fuel cells, and transportation from truck VMT during operations with regards to warehouse relocations because a delayed compliance date merely gives warehouses more time to meet the WPCO without changes to the impacts from the proposed project. Having more time to comply is not expected to change how warehouses will need to meet the WPCO or change the compliance actions or activities.

Alternative B's indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation would likely be less than the proposed project. Since fewer warehouses would be subject to the WAIRE Program, this could

lead to a reduced use and demand of the ZE technology (e.g., electric trucks and yard trucks) and necessary supporting infrastructure that could indirectly lead to construction of fewer new manufacturing, battery recycling, and grid infrastructure facilities. The reduction in the number or intensity of development of new facilities and grid improvement would likely lead to less adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from reduced demand for new mines and mining activities because of the reduced use and demand of lithium-based batteries in ZE vehicles), Noise, and Utilities and Service Systems (during operations) than the proposed project. If the compliance date is delayed, Alternative B's indirect adverse environmental impacts would be similar to the proposed project because having more time to comply with the proposed project is not expected to change how warehouses will need to meet the WPCO or change the compliance actions or activities and the level of significance for indirect adverse environmental impacts that could result.

When considering the overall effects of Alternative B to the proposed project, it should be noted that even though Alternative B could have less adverse direct and indirect environmental impacts than the proposed project, as indicated in Table 5-2, it would also have less NO_x and PM, including DPM, emissions reductions and less reductions against exposure to emissions from mobile sources in the community in the vicinity of warehouse, such as AB 617 communities, than the proposed project. Therefore, Alternative B's ongoing, long-term, and permanent air quality and public health benefits would be less when compared to the proposed project.

5.4.2.3 *Alternative C: Increased Emission Reductions*

If Alternative C is implemented, the WAIRE Program would result in greater emission reductions of NO_x and PM, including DPM. If the WAIRE Program applicability is broadened and the rule stringency factor is increased to above 0.0025 WAIRE Points per WATT, Alternative C would result in greater adverse direct impacts to air quality during construction than the proposed project because more warehouses subject to the WAIRE Program would mean potentially more EV chargers (Scenario 6) and hydrogen fueling stations (Scenario 12) would be constructed, and more overlapping construction and operational activities would occur. There would likely be increases in the amount and duration of construction activities, construction equipment, and construction workers' trips that would take place under this alternative than the proposed project. However, it is important to note that the increases in construction emissions would be short term as construction activities are temporary.

Additionally, more warehouses subject to the WAIRE Program could mean potentially more MERV 16 or greater filters and filtration systems (Scenario 15) would be installed for use under Alternative C, resulting in higher electricity demands and generating higher GHG emissions during operations than the proposed project. Because Alternative C's rule stringency factor would be higher than the proposed project, and because it is not reasonably foreseeable to predict how cargo shippers would respond to the increased rule stringency factor, this analysis assumes that implementation of Alternative C would likely lead to more cargo growth being potentially diverted to other ports and generate greater GHG emissions than the proposed project.

With more electric trucks and yard trucks, EV chargers, and hydrogen fueling stations, Alternative C is expected to increase demand for electricity, expand the need for EV charging and hydrogen fueling infrastructure, and generate more batteries and hydrogen fuel cells that would need be

disposed of at the existing recycling facilities that could exceed their capacity. Moreover, more EV chargers and fueling stations that would need to be built to earn WAIRE Points could lead to an increase in the amount of construction waste that could be characterized as hazardous waste. Moreover, because a market-wide commercial deployment of NZE trucks such as LNG trucks are already commercially available at the time of this EA, it is reasonably foreseeable that more warehouses would select the use of LNG trucks to earn WAIRE Points, and this could lead to an increase in the amount, frequency, and duration of routine transport, use, or disposal of LNG fuel than the proposed project. Alternative C will likely have greater adverse direct impacts on energy and hazardous materials and solid and hazardous waste than the proposed project. Although it is uncertain if smaller warehouses, i.e., warehouses of less than 100,000 square feet in size, would relocate under Alternative C, it is expected that the impacts to transportation from truck VMT caused by warehouse relocations could be greater when compared to the proposed project.

Alternative C's indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation would likely be greater than the proposed project. Since more warehouses would be subject to the WAIRE Program, this could lead to an increased use and demand of the ZE technology (e.g., electric trucks and yard trucks) and necessary supporting infrastructure that could indirectly lead to construction of more manufacturing and battery recycling facilities, and more improvements to the electrical grid. The increase in the number or intensity of development of new facilities and grid improvement would likely lead to greater adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from increased demand for new mines and mining activities to meet increased use and demand of lithium-based batteries in ZE vehicles), Noise, and Utilities and Service Systems (during operations) than the proposed project.

CEQA requires that the focus of alternatives is on those that are capable of avoiding or substantially lessening any significant effects of the project (CEQA Guidelines Section 15126.6(b)). As analyzed above, Alternative C could lead to greater environmental adverse impacts than the proposed project. It is important to consider if Alternative C could also result in new significant adverse environmental impacts that the proposed project does not have. As stated in Chapter 4 of the EA, the proposed project would have no impact or less than significant adverse environmental impacts, both directly and indirectly, from development of new manufacturing, recycling, and grid improvement facilities, on the following five environmental topic areas: 1) Land Use and Planning; 2) Population and Housing; 3) Public Services; 4) Recreation; and 5) Wildfire. Therefore, this EA considers and analyzes whether Alternative C could result in new significant adverse environmental impacts that were found to be less than significant for the proposed project. As analyzed in detail below, Alternative C's direct and indirect environmental impacts would be similar and continue to be less than significant when compared to the proposed project in all five environmental topic areas.

5.4.2.3.1 Land Use and Planning

The increased number of warehouses under this alternative is expected to lead to installation of an increased number of ZE charging and fueling infrastructure, solar panels, and MERV 16 or greater filters and filtration systems. The additional construction, which is a direct impact, is expected to be sited in locations with appropriate land use and zoning designations established by local jurisdictions. Although more manufacturing, recycling, and ~~grid~~ grid improvement facilities could

be built under this alternative, this development, which is an indirect impact, is expected to go through independent environmental review at the appropriate federal, state, and/or local level and is assumed to be located in areas with appropriate land use and zoning designations. This development could require additional construction workers and associated housing for these workers. However, not only are construction activities temporary and short term, the development is expected to employ labor from the existing construction workforce. Additionally, activities that would result directly or could result indirectly from compliance with the WAIRE Program under this alternative would be subject to project-level review, including review of land use and planning impacts under CEQA, as applicable. Therefore, Alternative C's impact on land use and planning is similar to the proposed project and would be less than significant.

5.4.2.3.2 Mineral Resources (During Construction)

The increased number of warehouses under this alternative is expected to lead to installation of an increased number of ZE charging and fueling infrastructure, solar panels, and MERV 16 or greater filters and filtration systems. However, the additional construction, which is a direct impact, is expected to take place near existing warehouses and in areas with the appropriate land use and zoning designations (e.g., industrial uses) established by local jurisdictions. Although Alternative C could lead to construction of more manufacturing and battery recycling facilities, and more improvements to the electrical grid, the development, which is an indirect impact, is also expected to be constructed in areas with the appropriate land use and zoning designations. Additionally, construction activities are short-term and temporary. Therefore, additional construction activities that could result directly and indirectly from Alternative C are not expected to result in the loss of availability of known mineral resources that have value to the region and the residents of the state or of a locally important mineral resource recovery site or a location as having known mineral resources shown on a local general plan, specific plan, other land use plan. Alternative C's direct and indirect impact on mineral resources from short-term construction activities is similar to the proposed project and would be less than significant.

5.4.2.3.3 Population and Housing

Similar to the proposed project, Alternative C is also not expected to generate population growth or displacement of substantial numbers of existing people or housing necessitating the construction of replacement housing elsewhere because Alternative C does not include development or removal of housing. Additionally, the development of new manufacturing, recycling, and grid improvement facilities is expected to be located in appropriately zoned and planned areas for industrial and manufacturing uses. The development, which is an indirect impact, would be subject to project-level review and is expected to be consistent with local and regional growth forecasts and housing plans and policies. Therefore, Alternative C's impact on population and housing is similar to the proposed project and would be less than significant.

5.4.2.3.4 Public Services

The increased number of warehouses that would be subject to the WAIRE Program under this alternative is not expected to increase fire, police, or emergency medical services that have already been provided to and required by the warehouses. It is also expected that Alternative C would not create a need for new or expansion of existing schools, parks, or library services because this alternative is not expected to induce population growth. Although Alternative C could lead to the installation of more ZE charging and fueling infrastructure, which is a direct impact, and the development of more manufacturing, recycling, and ~~grid~~ grid improvement facilities, which is an indirect impact, these activities would be subject to project-level review and ~~is~~ are expected to

meet all necessary fire codes and safety requirements established by local agencies and jurisdictions. Therefore, Alternative C's impact on public services is similar to the proposed project and would be less than significant.

5.4.2.3.5 Recreation

The need for recreational facilities and parks is tied with land use, zoning designation, and population growth. As analyzed above, since Alternative C is expected to result in less adverse direct and indirect impacts on Land Use and Planning and Population and Housing, this alternative's impact on Recreation would likely be similar to the proposed project and would be less than significant.

5.4.2.3.6 Wildfire

The increased number of warehouses under this alternative is expected to lead to installation of more ZE charging and fueling infrastructure, solar panels, and MERV 16 or greater filters and filtration systems. This direct increase, coupled with the indirect increase in the development of manufacturing, recycling, and grid improvement facilities to support the increased use of ZE trucks and yard trucks, could add new equipment and structures (e.g., power lines and other utilities) facing wildfire risks. However, these new equipment, structures, and development would be expected to be required to comply with all applicable fire protection and safety regulations established by federal, state, or local government, and prevention measures established by electric utilities to reduce wildfire hazards. Additionally, activities that would result directly or could result indirectly from compliance with the WAIRE Program under this alternative would be subject to project-level review, including review of wildfire impacts under CEQA, as applicable. Therefore, Alternative C's impact on wildfire is similar to the proposed project and would be less than significant.

When considering the overall effects of Alternative C to the proposed project, it is important to note that even though Alternative C's adverse effects on the environment could be greater than the proposed project in some areas, some of the adverse effects are indirect (e.g., associated with the development of new manufacturing, battery recycling, and grid improvement facilities) and would result ~~but~~ from short-term, temporary construction activities. Moreover, Alternative C's beneficial effects on the environment would be long term and permanent. As indicated in Table 5-2, Alternative C would have greater NO_x and PM, including DPM, emissions reductions than the proposed project, and these reductions would be ongoing. Alternative C would also have greater reductions against exposure to emissions from mobile sources in the communities in the vicinity of warehouse, ~~as—such as~~ as AB 617 communities, than the proposed project. Therefore, Alternative C's ongoing, long-term, and permanent benefits on air quality and public health would outweigh its adverse environmental impacts.

5.4.2.4 Alternative D: All Natural Gas Options Only

Under Alternative D, warehouse operators would be limited to the acquisition and/or use of natural gas trucks (RNG and/or LNG) and equipment and installation and/or using natural gas infrastructure. None of the other items on the WAIRE Menu would ~~not~~ be allowed to earn points to meet the WPCO.

Alternative D is expected to result in less adverse direct impacts on air quality during construction and overlapping construction and operations. Since EV chargers (Scenario 6) and hydrogen fueling stations (Scenario 12) would not be included as actions available on the WAIRE Menu, they would

not be built or installed as a result of implementing Alternative D, resulting in less construction activities, construction equipment, materials deliveries, and construction workers' trips. Construction activities are also temporary.

Alternative D would not use ZE trucks and yard trucks or fueling infrastructure, the need for additional electricity demands and energy infrastructure would not exist. Alternative D would not generate batteries and hydrogen fuel cells, and the need to recycle them at the existing recycling infrastructure would not exist. Additionally, since natural gas fueling stations are already commercially available, the need for building new natural gas fueling stations and infrastructure would not be as great as for EV chargers and hydrogen fueling stations when compared to the proposed project, and the amount of construction waste that could be characterized as hazardous waste would not be as great as the proposed project. However, Alternative D would accelerate and increase the use of NZE trucks such as LNG trucks and equipment. This could lead to a substantial increase in the amount, frequency, and duration of routine transport, use, or disposal of LNG fuel than the proposed project and a potentially greater adverse impact on hazardous materials and solid and hazardous waste.

Alternative D could also have less adverse direct impacts on GHG emissions during operations than the proposed project because it would not result in increased use of MERV 16 or greater filters and filtration systems (Scenario 15), thereby reducing electricity uses and associated GHG emissions. The demands for renewable energy for RNG trucks and equipment could increase, but the use of RNG trucks and equipment, instead of diesel-fueled trucks and equipment, could potentially generate more GHG emissions reductions. When Alternative D does not include MERV 16 or greater filters and filtration systems on the WAIRE Menu or Custom WAIRE Plans, their installation would not be needed, and construction waste that could be characterized as hazardous waste from the installation would be further reduced than the proposed project.

Because natural gas trucks and equipment and infrastructure are more commercially available and currently being deployed in the market, it is expected that it could be less costly to comply with the WPCO under Alternative D than the proposed project. Therefore, Alternative D is expected to have less adverse transportation impacts from truck VMT than the proposed project because it would likely lead to fewer than three warehouse relocations and smaller increases in truck VMT that could result from warehouse relocations than the proposed project.

Alternative D's indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation could be less than the proposed project. Since warehouses subject to the WAIRE Program under this alternative would not need to use the ZE technology (e.g., electric trucks and yard trucks) or install EV chargers and hydrogen fueling stations, the development of new facilities, including manufacturing, recycling, and grid infrastructure facilities would not be needed. This would likely lead to less adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from increased demand for new mines and mining activities because the use and demand of lithium-based batteries in ZE vehicles would not be needed), Noise, and Utilities and Service Systems (during operations) than the proposed project.

When considering the overall effects of Alternative D to the proposed project, it should be noted that even though Alternative D could have less adverse direct and indirect environmental impacts

than the proposed project, as indicated in Table 5-2, it would also have less NO_x and PM, including DPM, emissions reductions than the proposed project. NZE trucks result in approximately 90 percent of reductions in NO_x emissions and some PM emissions reductions while electric trucks result in 100 percent of NO_x and PM emissions reductions. Additionally, all of the compliance options for Alternative D would require emission reductions, but Alternative D would not provide reductions against exposure to emissions from mobile sources in the community in the vicinity of warehouse, such as AB 617 communities, that the proposed project provides. Alternative D does not include MERV 16 or greater filters and filtration systems on the WAIRE Menu or Custom WAIRE Plans. Therefore, Alternative D's ongoing, long-term, and permanent air quality benefits as well as reductions against exposure to emissions from mobile sources could be less when compared to the proposed project.

5.4.2.5 *Alternative E: All Electric Options Only*

Under Alternative E, warehouse operators would be limited to the use of ZE technology (e.g., electric trucks and yard trucks) and supporting charging infrastructure. All other items on the WAIRE Menu would not be allowed to earn points to meet the WPCO.

Alternative E is expected to have similar air quality impacts directly resulted from construction and overlapping construction and operations to those for the proposed project because limiting the WAIRE Menu actions to installations of EV charger (Scenario 6) and hydrogen fueling station (Scenario 12) under this alternative would not increase the number or intensity of construction activities for these two modeled WAIRE Points scenarios. Construction activities are also temporary. Although electricity uses for electric trucks and yard trucks and associated GHG emissions could increase under Alternative E, this increase could be partially offset by the reductions of electricity uses and GHG emissions associated with the use of MERV 16 or greater filters and filtration systems (Scenario 15) because filters and filtration systems would no longer be on the WAIRE Menu or Custom WAIRE Plans. Therefore, Alternative E could have less adverse direct impacts on GHG emissions during operations than the proposed project. The magnitude of additional electricity demands and energy infrastructure and the amount of EV batteries and hydrogen fuel cells would be similar to the proposed project since some of the modeled WAIRE Points scenarios already accounted for the possibility of all ZE serving the warehouses subject to the WAIRE Program. Therefore, Alternative E would have similar direct impacts on energy during operations and hazardous materials and solid and hazardous waste with regards to exceeding the capacity of the existing recycling infrastructure to meet the recycling of batteries and hydrogen fuel cells. Additionally, Alternative E's direct impact on hazardous materials and solid and hazardous waste from construction waste that could be characterized as potentially hazardous would not be as great as the proposed project because of the similar amount of ZE serving the warehouses, and because construction debris from installing MERV 16 or greater filters and filtration systems would not exist. Since the use of NZE trucks such as LNG trucks and equipment would not be included on the WAIRE Menu or Custom WAIRE Plans under this alternative, Alternative E's direct impact on hazardous materials and solid and hazardous waste from routine transport, use, or disposal of LNG fuel would not exist. When the only available compliance option is the ZE technology, and a market-wide commercial deployment of ZE technology, particularly in trucks, is not currently available at the time of this EA, Alternative E is likely to cause more warehouses that are not able to use the ZE technology to relocate outside the South Coast AQMD's jurisdiction, thereby resulting in greater adverse transportation impacts on truck VMT from warehouse relocation than the proposed project.

Alternative E's indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation could be greater than the proposed project. Since the only available compliance option is the ZE technology, this could lead to an increased use and demand of the ZE technology (e.g., electric trucks and yard trucks) and necessary supporting infrastructure that could indirectly lead to construction of more manufacturing and battery recycling facilities, and more improvements to the electrical grid. The increase in the development of new facilities and grid improvement would likely lead to greater adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from increased demand for new mines and mining activities because of the increased use and demand of lithium-based batteries in ZE vehicles), Noise, and Utilities and Service Systems (during operations) than the proposed project.

As shown in Table 5-1, Alternative E is capable of meeting most of the project objectives to a greater extent. It is important to consider if this alternative could result in new significant adverse environmental impacts that the proposed project does not have. Chapter 4 of the EA indicates that the proposed project would have no impact or less than significant adverse environmental impacts, both directly and indirectly from development of new manufacturing, recycling, and grid improvement facilities on the following five environmental topic areas: 1) Land Use and Planning; 2) Population and Housing; 3) Public Services; 4) Recreation; and 5) Wildfire. Similar to the analysis for Alternative C in Section 5.4.2.3, Alternative E's direct and indirect environmental impacts would be similar and continue to be less than significant when compared to the proposed project in all five environmental topic areas.

Even though Alternative E's direct impacts on air quality and GHG emissions, and hazardous materials and solid and hazardous waste would be less than or similar to the proposed project, its transportation impacts with regards to truck VMT could be greater than the proposed project. Alternative E's indirect impacts from the development of new manufacturing, recycling, and grid improvement facilities could also be greater than the proposed project. All of the compliance options for Alternative E would require emission reductions. Alternative E could have greater NOx and PM, including DPM, emissions reductions than the proposed project; however, using only the ZE technology might be challenging for some warehouse operators at the beginning. When considering the overall effects of Alternative E to the proposed project, it is important to note that Alternative E is intended to further accelerate the use of ZE technology than the proposed project to make it more available and less costly. Alternative E's ongoing, long-term, and permanent air quality benefits could be greater over time than the proposed project. However, because Alternative E does not include MERV 16 or greater filters and filtration systems on the WAIRE Menu or Custom WAIRE Plans, it would not provide reductions against exposure to emissions from mobile sources in the community in the vicinity of warehouse, such as AB 617 communities, that the proposed project provides.

5.5 ALTERNATIVES REJECTED AS INFEASIBLE

In accordance with CEQA Guidelines Section 15126.6(c), a CEQA document should identify any alternatives that were considered by the lead agency, but were rejected as infeasible during the scoping process and briefly explain the reasons underlying the lead agency's determination. CEQA Guidelines Section 15126.6(c) also states that among the factors that may be used to eliminate

alternatives from detailed consideration in a CEQA document are: 1) failure to meet most of the basic project objectives; 2) infeasibility; or 3) inability to avoid significant environmental impacts.

As noted in the Introduction of this chapter, the range of feasible alternatives to the proposed project is limited by the nature of the proposed project and the scope of indirect source rule authority granted to local air districts (Health and Safety Code Sections 40716(a)(1), 40440). Similarly, the range of alternatives considered but rejected as infeasible is also relatively limited.

As discussed in Appendix C of the EA, South Coast AQMD received public comments on the NOP/IS for the proposed project. One public comment recommended that the EA evaluate and consider alternatives such as stricter engine emission standards to be adopted by the California Air Resources Board (CARB) and implementation of stricter truck emission standards at the ports of Los Angeles and Long Beach. The alternatives that the comment recommended are outside the scope of the South Coast AQMD's legal authority and ability to enforce as an air district; therefore, they have not been included in Chapter 5 of this EA. South Coast AQMD does not have the authority to require CARB to adopt stricter engine emission standards, nor is that in the scope of the analysis of this EA. South Coast AQMD does not have the authority over truck emission standards at the ports. U.S. Environmental Protection Agency and CARB have primary authority to regulate emissions from mobile sources (see Response to Comment 8-7 in Appendix C of this EA).

The following discussion identifies Alternative A as being rejected due to its failure to meet most of the basic project objectives.

CEQA documents typically assume that the adoption of the No Project alternative would result in no further action on the part of the project proponent or lead agency. For example, in the case of a proposed land use project such as a housing development, adopting the No Project alternative terminates further consideration of that housing development or any housing development alternative identified in the associated CEQA document. In that case, the existing setting would typically remain unchanged.

“The ‘no project’ analysis shall discuss the existing conditions at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, *as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services...*” (CEQA Guidelines Section 15126.6(e)(2)). It should be noted that, although the no project alternative may have fewer adverse environmental impacts than the proposed project, it also would have fewer environmental benefits, in particular air quality benefits, if no further action is taken. Additionally, although there are other existing rules that may have future compliance dates for NOx emission reductions, potential adverse impacts from these rules have already been evaluated in the ~~March 2017 Final Program EIR for the 2016 AQMP~~ Final Program EIR and their subsequent rule-specific CEQA documents. While air quality would continue to improve to a certain extent, it is unlikely that all state or federal ozone standards would be achieved as required by the federal and California CAAs. It is possible that the federal 24-hour PM2.5 standard may be achieved; however, it is unlikely that further progress would be made towards achieving the state PM2.5 standard as required by the California CAA.

5.6 LOWEST TOXIC ALTERNATIVE

In accordance with South Coast AQMD’s policy document Environmental Justice Program Enhancements for FY 2002-03, Enhancement II-1 recommends for all South Coast AQMD CEQA documents which are required to include an alternatives analysis, the alternatives analysis shall also include and identify a feasible project alternative with the lowest air toxics emissions and/or exposure. In other words, for any major equipment or process type under the scope of the proposed project that creates a significant environmental impact, at least one alternative, where feasible, shall be considered from a “least harmful” perspective with regard to hazardous or toxic air pollutants.

As explained in the existing setting for air quality and GHG emissions in Chapter 3, DPM, which is a toxic air contaminant and carcinogen, is the largest contributor to cancer risk within the South Coast Air Basin.⁵ Implementation of the proposed project would achieve emission reductions ~~not only~~ from NOx and PM, including DPM, emitted from mobile sources and other sources of emissions associated with a warehouse. Of the actions and investments available on the WAIRE Menu, the main technology that can be used to earn the highest WAIRE Points and provide the greatest potential emissions reductions in NOx and PM, including DPM, are related to acquiring and using ZE technology. The top three high-earning WAIRE Menu actions are installation of hydrogen station (1,680 WAIRE Points), use of ZE yard trucks (291 WAIRE Points), and acquiring ZE yard trucks (177 WAIRE Points).

To identify a lowest toxic alternative with respect to the proposed project, it would be the alternative that provides the highest DPM emission reductions or exposure reduction from warehousing activity emissions. Based on the available emission reduction options, the implementation of ZE technology would accomplish the greatest amount of PM and DPM emission reductions. For the proposed project and Alternatives B, C, and E, it is assumed that ZE trucks and fueling and/or charging infrastructure would be available compliance options. Alternatives A and D would not include ZE technology as available compliance options. For exposure reduction, the installation of high efficiency air filters and filter systems would provide the greatest level of benefit. For the proposed project, and Alternatives B and C, the installation of high efficiency air filters and filter systems are available compliance options while Alternatives D and E remove this compliance option.

Under Alternative C, all of the existing and new warehouses in the South Coast AQMD’s jurisdiction are subject to the WAIRE Program, which could result in a greater use of ZE technology when compared to the proposed project. Under Alternative E, all affected warehouses would be required to only use ZE technology, which would also result in a greater use of ZE technology when compared to the proposed project. However, Alternative C would allow for exposure reduction from the installation of high efficiency air filters and filter systems, while Alternative E would not. Therefore, Alternative C is the lowest toxic alternative.

5.7 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Pursuant to CEQA Guidelines Section 15126.6(e)(2), if the environmentally superior alternative is the “no project” alternative, the CEQA document shall also identify an alternate environmentally

⁵ Final Report, Multiple Air Toxics Exposure Study, MATES-IV, available at <https://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iv>.

superior alternative from among the other alternatives. Based on the analysis above in Section 5.4, Table 5-3 summarizes the comparison of the adverse environmental impacts and long-term beneficial effects of the proposed project with the alternatives for the environmental direct and indirect impact areas where the proposed project was concluded to have a significant adverse impact. When evaluating the environmentally superior alternative for a project that is designed to benefit the environment such as the proposed project, it is important to consider both adverse impacts and beneficial effects.

Table 5-3
Comparison of Significant Adverse Environmental Impacts and Long-term Beneficial Effects of the Proposed Project and Alternatives

PROPOSED PROJECT	ALTERNATIVE A No Project	ALTERNATIVE B Decreased Emission Reductions	ALTERNATIVE C Increased Emission Reductions	ALTERNATIVE D All Natural Gas Options Only	ALTERNATIVE E All Electric Options Only
Despite the significant adverse direct and indirect environmental impacts, it provides ongoing, long-term, and permanent NOx and PM, including DPM, emissions reductions benefits, reduces exposures, and protects public health.	Although Alternative A has no adverse significant environmental impacts (both directly and indirectly), it does not have emissions reductions or exposure reductions benefits that the proposed project has.	<p>Although Alternative B has less adverse significant environmental impacts (both directly and indirectly), its ongoing, long-term, and permanent NOx and PM, including DPM, emissions reductions would also be less.</p> <p>It also provides less exposure reductions and overall less public health protection.</p>	<p>Despite the greater significant adverse impacts (both directly and indirectly in some areas), Alternative C provides greater NOx and PM, including DPM, emissions reductions that are ongoing, long-term, and permanent.</p> <p>It also provides greater exposure reductions and overall greater public health protection.</p>	<p>Although Alternative D has less or sometimes no adverse significant environmental impacts (both directly and indirectly), its ongoing, long-term, and permanent NOx and PM, including DPM, emissions reductions would also be less.</p> <p>It does not provide exposure reductions and overall less public health protection.</p>	<p>Although Alternative E's direct environmental impact on transportation from truck VMT are greater, and its indirect environmental impacts are also greater, it provides greater NOx and PM, including DPM, emissions reductions that are ongoing, long-term, and permanent over time overtime.</p> <p>It does not provide exposure reductions and overall less public health protection.</p>

Of the five alternatives, Alternative A would generate the least severe and fewest number of adverse environmental impacts, both directly and indirectly. ~~However, Alternatives A is rejected as infeasible because it is not capable of meeting any of the project objectives.~~ Importantly, this alternative would not result in emissions reductions of NO_x or PM, including DPM. Alternative B and Alternative D are similar in that both have less adverse direct and indirect impacts and less environmental benefits. Alternative C and Alternative E are similar in that both have greater direct and indirect impacts in some environmental areas. However, Alternative E does not have the ability to provide exposure reductions to emissions that Alternative C has. Alternative C could have the greatest potential NO_x and PM, including DPM, emissions reductions among the five alternatives. It could also provide the greatest protections against exposures to these emissions when compared to the other alternatives. Despite Alternative C's significant adverse impacts, from the perspective of providing ongoing, long-term, and permanent air quality benefits and protection against exposures to mobile source emissions, Alternative C would be considered the environmentally superior alternative.

5.8 CONCLUSION

When comparing the environmental adverse impacts and evaluating the effectiveness of achieving the project objectives and providing long-term, permanent beneficial effects of the project alternatives, particularly Alternative C which would be considered as the lowest toxic alternative and environmentally superior alternative to the proposed project, the proposed project balances achieving the project objectives and the potential adverse impacts.

CHAPTER 6 OTHER CEQA CONSIDERATIONS

6.1 INTRODUCTION

This section of the EA includes a brief summary of the potential environmental impacts found to be less than significant, significant and unavoidable impacts of the project, significant irreversible environmental changes, potential growth-inducing impacts, and the relationship between short-term and long-term environmental goals associated with the proposed project.

6.2 POTENTIAL ENVIRONMENTAL IMPACTS FOUND NOT TO BE SIGNIFICANT

The November 2020 Notice of Preparation of a Draft EA and Initial Study (see Appendix B) concluded that the proposed project would have no impact or less than significant direct or indirect adverse effects on the following environmental topic areas¹:

- Air Quality and Greenhouse Gas Emissions (AQMP Consistency, Diminishing Air Quality Rules, and Odors)
- Energy (Consistency with Energy Plans, Compliance with Standards, and Wasteful/Inefficient Use of Energy)
- Solid and Hazardous Waste
- Transportation (Traffic Hazards and Emergency Access)
- Wildfire

In addition, the following environmental impacts were identified as less than significant in this EA:

- **Air Quality and Greenhouse Gas Emissions** – Long-term air quality impacts and consistency of the proposed project with GHG reduction plans are less than significant impacts of the proposed project.
- **Energy** – Energy impacts for the proposed project are less than significant during construction.
- **Hazardous Materials and Solid and Hazardous Waste** – Impacts from routine transport, use, or disposal of batteries would be less than significant as a result of implementing the proposed project.
- **Transportation** – Transportation impacts from construction and employee commute trips would be less than significant as a result of implementing the proposed project.

¹ Impacts of battery recycling are addressed in the Hazards and Hazardous Materials section of this EA as a result of public comments received during the public review and comment period on the Initial Study. Indirect impacts to Aesthetics, Agricultural and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Noise, Population and Housing, Public Services, Recreation, and Utilities and Service Systems are evaluated in Chapter 4.5 of this EA.

6.3 SIGNIFICANT ENVIRONMENTAL EFFECTS WHICH CANNOT BE AVOIDED

CEQA Guidelines Section 15126(b) requires an environmental analysis to consider “any significant environmental effects which cannot be avoided if the proposed project is implemented.” This EA identified the following environmental topic areas having potentially significant adverse environmental effects if the proposed project is implemented:

- **Air Quality and Greenhouse Gas Emissions** – Construction-related air quality impacts (Scenario 6 and Scenario 12); impacts during overlap of construction and operational activities (near-term impacts for Scenario 6 and Scenario 12); indirect construction-related air quality emissions associated with the construction of new manufacturing and recycling facilities, and energy infrastructure for NZE and ZE vehicles; and GHG impacts (Scenario 15 and from cargo growth diversion) are significant unavoidable impacts of the proposed project. The short-term construction-related air quality impacts and the long-term GHG emissions impacts are the project’s cumulative contribution to air quality and GHG emissions impacts.
- **Energy.** Impacts associated with the with the need for new or substantially altered utility systems, new and expanded infrastructure, and effects on peak and base period electricity demands are significant and unavoidable impacts of the proposed project. The proposed project expedites the need for expanded electricity infrastructure to accommodate electric vehicles. SCE plans for and accommodates the need for electrical grid infrastructure expansions and improves through the biennial Integrated Energy Policy Report (IEPR) and is forecasting an increase in energy demand from ZE vehicles. While the IEPR is considering the cumulative effect of N-79-20, which would ultimately shift California’s transportation economy to carbon-neutral energy sources, the proposed project would expedite this timeline for ZE heavy duty trucks. South Coast AQMD is actively coordinating with SCE to ensure that IEPR considers the potential cumulative effect of the proposed project. However, since the proposed project expedites need for electricity, natural gas fueling, and hydrogen fueling infrastructure to accommodate the electricity demand created by the proposed project, this is considered a significant impact. However, the proposed project is part of a larger transition from diesel and petroleum to alternative energy for the transportation sector. This transition itself provides energy benefits. Further, it should be noted that the energy analysis is a conservative, “worst case” analysis based on the WPCO scenarios if all warehouse operators selected the scenario as the sole compliance option. As a result, the actual energy use would range depending on the WPCO selected, and the actual construction and operational impacts are not expected to be as great as estimated in this EA.
- **Hazardous Materials and Solid and Hazardous Waste** – Impacts from storage and use of LNG fuel are significant and unavoidable impacts of the proposed project. The proposed project would result in a substantial increase in the batteries that would exceed the capacity of the existing recycling infrastructure. This increase in demand would cumulatively contribute to the increase in demand for battery recycling as a result of transition to a carbon-neutral economy, in accordance with the State’s GHG reduction goals. However, there are currently no federal, State, or local regulations that require the recycling industry to forecast the capacity of infrastructure needed to meet the demand. There are no mitigation measures that would ensure that battery recyclers can accommodate the proposed project’s and cumulative increase in volume of EV batteries. Therefore, project and cumulative impacts associated with the capacity of battery recycling infrastructure to accommodate the additional demand is

significant and unavoidable. The proposed project could also result in an increase of scrapped vehicles to landfills and construction waste, resulting in significant impacts to landfill facility capacity. In addition, the proposed project could indirectly result in the construction of new manufacturing facilities, recycling facilities, and infrastructure improvements to support the transition to NZE and ZE vehicles, which would create significant impacts regarding hazards and hazardous materials through the routine transport, use, or disposal of hazardous materials.

- **Transportation** – Truck VMT would increase compared to the baseline under the “worst-case” relocations analysis and potential decreases in goods movement efficiency if warehouse operators divert truck trips. Therefore, truck VMT is considered a significant unavoidable project and cumulative transportation impact. In addition, potential indirect transportation impacts resulting from the construction of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles would also be significant and unavoidable impacts of the proposed project. It should be noted that the transportation analysis is a conservative, “worst case” analysis, and the IEc Study indicates that under the current Rule Stringency ~~that~~ no relocations would occur. Additionally, while the proposed project could result in a potential increase in truck VMT, there could be a substantial reduction in the amount of VMT from diesel-fueled trucks and commensurate increase in VMT from NZE and ZE trucks, which is consistent with statewide efforts to reduce emissions and the intent of SB 743.

In addition, indirect impacts associated with the proposed project are identified in this EA as having potentially significant adverse environmental effects in the following topic areas.

- **Indirect Impacts:** Potential indirect impacts to Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, and Noise resulting from the construction and operational phases of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles would be significant and unavoidable. Impacts to Mineral Resources and Utilities and Service Systems during the operational phase will also be significant and unavoidable.

6.4 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

CEQA Guidelines Section 15126(c) requires an environmental analysis to consider “any significant irreversible environmental changes which would be involved if the proposed action should be implemented.” Specifically, the CEQA Guidelines Section 15126.2 states:

Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highways improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

The following are significant irreversible changes that would be caused by the proposed project:

6.4.1 Raw Materials Used in NZE/ZE Truck Manufacturing and Battery Production

The proposed project would expedite the demand for NZE and ZE technologies. As a result, the proposed project could increase demand for NZE and ZE trucks and associated batteries/fuel cells that power ZE trucks, resulting in an increased demand for raw materials.

The demand for this technology may result in increased production of batteries/fuel cells. For this EA it is not possible to identify the incremental increase in the number of EV truck batteries/fuel cells caused by the proposed project; whether existing battery manufacturing plants can accommodate the demand; or if new production facilities for batteries/fuel cells are needed, where such facilities would be located. While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144). A lifecycle analysis of battery/fuel cell production is outside the scope of this Draft EA. This EA focuses on the potential energy use associated with the WAIRE Program and is subject to the rule of reason. An analysis of the battery/fuel cell production impacts used to power ZE vehicles is speculative. However, the proposed project could result in a significant irreversible increased demand for batteries/fuel cells.

The proposed project would incentivize the acquisition of NZE and ZE trucks; however, the WAIRE Program would not impose any sales requirements on manufactures. Additionally, the WAIRE Program itself does not generate an increase in the national or even international demand for trucks used in the goods movement sector. As such, the proposed project would not result in an overall increase in truck production. Manufacturers would respond to an increase in demand for NZE and ZE truck technology by producing fewer traditional, diesel-fuel trucks. For this EA it is not possible to identify whether truck manufacturers would need to retrofit existing truck manufacturing plants or construct new plants for development of NZE and ZE truck fleets, and if new production facilities for NZE and ZE trucks are needed, where such facilities would be located. While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines section 15144). This EA focuses on the potential energy use associated with the WAIRE Program and is subject to the rule of reason. An analysis of the site-specific effects of NZE and ZE truck manufacturing from the increased demand for NZE and ZE trucks is speculative. However, the proposed project could result in a significant irreversible increased demand for raw materials associated with NZE and ZE trucks.

6.4.2 Mining Activities

ZE truck technology currently relies on the use of lithium batteries. Thus, the proposed project would result in an increased demand for lithium and other mineral resources used in the battery production, indirectly resulting in the need for additional extraction. However, for this EA it is not possible to identify the incremental increase in the number of EV truck batteries caused by the proposed project; the increase in amount of lithium or other mineral resources that would be used to power the batteries; and whether or not existing lithium resources (e.g., from lithium-ion battery recycling or from existing ore)² are sufficient to cover this increased demand or additional mineral resource extraction would occur and where it would occur. It would be speculative to determine

² Metals can be recovered from used batteries rather than from natural ore.

whether the increase demand for lithium batteries spurred as a result of use of ZE trucks associated with PR 2305 would trigger new mines. While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines section 15144). This EA focuses on the potential energy use associated with the WAIRE Program and is subject to the rule of reason. An analysis of the mineral resource extraction impacts from the increased demand for lithium and other mineral resources used to power ZE vehicles is speculative. However, PR 2305 could result in a significant irreversible increased demand for mineral resources associated with lithium batteries.

6.5 POTENTIAL GROWTH-INDUCING IMPACTS

CEQA Guidelines Section 15126(d) requires an environmental analysis to consider the “growth-inducing impact of the proposed action” to examine ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment.³ Also required is an assessment of other projects that would foster other activities which could affect the environment, individually or cumulatively. To address this issue, potential growth-inducing effects will be examined through analysis of the following questions:

- *Would this project remove obstacles to growth, e.g., through the construction or extension of major infrastructure facilities that do not presently exist in the project area, or through changes in existing regulations pertaining to land development?* Implementing the proposed project will not, by itself, have any direct or indirect growth-inducing impacts on businesses in the South Coast AQMD's jurisdiction because it is not expected to foster economic or population growth or the construction of additional housing and primarily affects existing facilities.
- *Would this project result in the need to expand one or more public services to maintain desired levels of service?* As analyzed in the Initial Study, the proposed project would not result in an increase in public services (e.g., schools, police, fire, library, and emergency services). However, as identified above, the proposed project would require coordination with the primary electricity utility provider (SCE) to ensure that they consider the proposed project in their next biennial IEPR.
- *Would this project encourage or facilitate economic effects that could result in other activities that could significantly affect the environment?* The proposed project could have an economic effect on warehouse owners and operators within the South Coast AQMD jurisdiction. This include economic effects associated with the warehouse operators WAIRE Points Compliance Obligation (WPCO), including reporting. As identified in this EA, under the current rule stringency, the proposed project is not anticipated to result in any relocations outside of the South Coast AQMD region. However, as a reasonable “worst-case” analysis, this EA

³ Please note that growth-inducing effects are not to be construed as necessarily beneficial, detrimental, or of little significance to the environment. This issue is presented to provide additional information on ways in which this project could contribute to significant changes in the environment, beyond the direct consequences of developing the land use concept examined in the preceding sections of this EA.

conservatively assumes that up to three warehouses would relocate above the baseline scenario and those impacts have been analyzed.

- *Would approval of this project involve some precedent-setting action that could encourage and facilitate other activities that could significantly affect the environment?* The proposed project implements the air pollution reduction goals of the 2016 AQMP. The 2016 AQMP contains a variety of control measures, which include Facility-Based Mobile Source Measures (FBMSMs), also known as indirect source rules (ISR). While the proposed project would be the first ISR in the South Coast AQMD region, except for the employee commute reduction Rule 2202, it is not the first ISR in the state.⁴ Additionally, because the proposed project is implementing the FBMSM of the 2016 AQMP, specifically Control Measure MOB-03, outlined in the 2016 AQMP, the proposed project would not involve a precedent-setting action.

6.6 RELATIONSHIP BETWEEN SHORT-TERM AND LONG-TERM ENVIRONMENTAL GOALS

CEQA documents are required to explain and make findings about the relationship between short-term uses and long-term productivity (CEQA Guidelines Section 15065(a)(2)). An important consideration when analyzing the effects of a proposed project is whether it will result in short-term environmental benefits to the detriment of achieving long-term goals or maximizing productivity of these resources.

Implementation of the proposed project is not expected to achieve short-term goals at the expense of long-term environmental productivity or goal achievement. The proposed project is part of the long-range emissions reduction strategy outlined in the 2016 AQMP. The proposed project implements the FBMSM of the 2016 AQMP, specifically Control Measure MOB-03. The proposed project will facilitate the reduction of NO_x and PM, including DPM, within South Coast AQMD's jurisdiction, and emission reductions associated with warehouses and the mobile sources attracted to applicable warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. Implementation of the proposed project is expected to result in NO_x and PM, including DPM, emissions reductions and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed. The proposed project would also implement PR 316, which would establish a mechanism for the collection of administrative fees to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with the review of various notifications, Custom WAIRE Plan evaluation, reports and mitigation fees, as well as compliance activities such as onsite inspections. Implementing the proposed project does not narrow the range of beneficial uses of the environment.

⁴ The San Joaquin Valley Unified Air Pollution Control District adopted Rule 9510 (Indirect Source Review) and Rule 3180 (Administrative Fees for Air Impact Assessment Applications) Source Review in December 2005. (State Clearinghouse No. 2005111027)

Proposed Rule 2305

In order to save space and avoid repetition, please refer to the latest version of PR 2305 located elsewhere in the Governing Board Package (meeting date May 7, 2021). The version of PR 2305 that was circulated with the Draft EA and released on January 26, 2021 for a 45-day public review and comment period ending on March 12, 2021 was identified as Proposed Rule 2305 (Version 1/15/2021) which is available from South Coast AQMD's website at: <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/proposed-rule-2305.pdf>.

Original hard copies of the Draft EA, which include the draft version of the proposed rule listed above can be obtained by contacting the Public Information Center by phone at (909) 396-2001 or by email at PICrequests@aqmd.gov.

APPENDIX A2

Proposed Rule 316

In order to save space and avoid repetition, please refer to the latest version of PR 316 located elsewhere in the Governing Board Package (meeting date May 7, 2021). The version of PR 316 that was circulated with the Draft EA and released on January 26, 2021 for a 45-day public review and comment period ending on March 12, 2021 was identified as Proposed Rule 316 (Version 1/15/2021) which is available from South Coast AQMD's website at: <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/proposed-rule-316.pdf>. Original hard copies of the Draft EA, which include the draft version of the proposed rule listed above can be obtained by contacting the Public Information Center by phone at (909) 396-2001 or by email at PICrequests@aqmd.gov.

APPENDIX B

Initial Study/ Notice of Preparation

South Coast Air Quality Management District

21865 Copley Drive, Diamond Bar, CA 91765-4178
(909) 396-2000 • www.aqmd.gov

SUBJECT: NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL ASSESSMENT, INITIAL STUDY, AND OPPORTUNITY FOR PUBLIC COMMENT

PROJECT TITLE: PROPOSED RULE 2305 – WAREHOUSE INDIRECT SOURCE RULE - WAREHOUSE ACTIONS AND INVESTMENTS TO REDUCE EMISSIONS (WAIRE) PROGRAM; AND PROPOSED RULE 316 – FEES FOR REGULATION XXIII

In accordance with the California Environmental Quality Act (CEQA), the South Coast Air Quality Management District (South Coast AQMD), as Lead Agency, has prepared a Notice of Preparation (NOP) of the Draft Environmental Assessment (EA) and Initial Study (IS) to analyze environmental impacts from the project identified above pursuant to its certified regulatory program (Public Resources Code Section 21080.5, CEQA Guidelines Section 15251(l), and South Coast AQMD Rule 110). The NOP/IS includes a project description and analysis of potential adverse environmental impacts that could be generated from the proposed project. The NOP/IS serves two purposes: 1) to solicit information on the scope of the environmental analysis for the proposed project, and 2) to notify public agencies and the public that the South Coast AQMD will prepare a Draft EA to further assess potential adverse environmental impacts that may result from implementing the proposed project.

This letter, the attached NOP and the attached IS are not South Coast AQMD applications or forms requiring a response from you. Their purpose is simply to provide information to you on the above project. If the proposed project has no bearing on you or your organization, no action on your part is necessary. The IS and other relevant documents may be obtained by calling the South Coast AQMD Public Information Center at (909) 396-2001 or accessing the South Coast AQMD's website at: <http://www.aqmd.gov/home/library/documents-support-material/lead-agency-scaqmd-projects>.

Comments focusing on your area of expertise, your agency's area of jurisdiction, if applicable, or issues relative to the environmental analysis for the proposed project will be accepted during a 32-day public review and comment period beginning Friday, November 13, 2020 and ending at 5:00 p.m. on Tuesday, December 15, 2020. **Please send any comments relative to the CEQA analysis in the IS to Ryan Bañuelos (c/o CEQA) at the address shown above. Comments can also be sent via email to rbanuelos@aqmd.gov, facsimile to (909) 396-3982.** Please include the name and phone number of the contact person for your organization. Questions regarding the proposed rule language should be directed to Victor Juan at (909) 396-2374 or by email to vjuan@aqmd.gov.

Because the proposed project may have statewide, regional, or areawide significance, a CEQA scoping meeting is required pursuant to Public Resources Code Section 21083.9(a)(2). The CEQA scoping meeting will be held via video conferencing and by telephone on December 2, 2020 at 1:30 PM. PR 2305 and PR 316 are scheduled to be considered for adoption at the Governing Board Meeting (Public Hearing) on March 5, 2021 at 9:00 a.m. This date is subject to change. Meeting agendas, which include details on how the public can participate electronically, are posted at least 72 hours prior to the meeting and are available from South Coast AQMD's website at: <http://www.aqmd.gov/home/newsevents/meeting-agendas-minutes>.

Date: November 12, 2020

NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL ASSESSMENT (EA), INITIAL STUDY (IS), AND OPPORTUNITY FOR PUBLIC COMMENT

Project Title: Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII

Project Location: The proposed project may affect existing and new warehouses located throughout the South Coast Air Quality Management District's (South Coast AQMD) jurisdiction, which includes the four-county South Coast Air Basin (all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties), and the Riverside County portion of the Salton Sea Air Basin and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin.

Description of Nature, Purpose, and Beneficiaries of Project: The proposed project is comprised of Proposed Rule (PR) 2305, including a mitigation program component, PR 316 to recover administrative costs, and the submittal of PR 2305 into the State Implementation Plan (SIP). PR 2305 has been developed to facilitate local and regional emission reductions associated with existing and new warehouses with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building and the mobile sources attracted to these warehouses. Under PR 2305, operators of applicable existing and new warehouses would be subject to an annual Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points Compliance Obligation (WPCO) intended to reduce regional and local emissions from warehouse indirect sources. To meet the WPCO, WAIRE Points can be earned by warehouse operators and/or owners by selecting from a menu of implementation measures: 1) acquiring and/or using near-zero emissions (NZE) and zero-emission (ZE) trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or transport refrigeration units; 4) installing and/or using onsite energy systems (e.g., solar panels); and 5) implementing community benefits (e.g., air filters for sensitive receptors). In addition, warehouse operators may apply to earn WAIRE Points through a custom WAIRE Plan specific to their operations that satisfy prescribed performance metrics. WAIRE Points may be earned only for "surplus" actions that go beyond existing state and federal regulations. In lieu of satisfying the WPCO via implementation measures, a warehouse operator may choose to pay an optional mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve the emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option. Therefore, the environmental impacts associated with the mitigation program are similar to implementation of measures to earn WAIRE Points and are analyzed in this NOP/IS. Implementation of the proposed project is expected to result in emission reductions of nitrogen oxides and particulate matter, including diesel particulate matter and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed. There may be additional industrial properties and warehouse operators and owners that will only be required to provide reports but will not be required to earn WAIRE Points. PR 2305 will be submitted into the State Implementation Plan. PR 316 has been developed to establish fees to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with submittal and review of various notifications and reports, custom WAIRE Plan evaluation, and implementing a program using mitigation fees from warehouse operators that chose to pay a mitigation fee, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records. While reducing emissions is an environmental benefit, the NOP/IS identifies potentially significant adverse impacts to the environmental topic areas of air quality and greenhouse gas emissions, energy, and transportation (traffic). Warehouses that will be subject to the proposed project may be identified on lists compiled by the California Department of Toxic Substances Control per Government Code Section 65962.5.

INTRODUCTION

The purpose of the Notice of Preparation (NOP) of a Draft Environmental Assessment (EA) and Initial Study (IS) is to evaluate the potential adverse environmental impacts associated with the proposed project, which includes Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Regulation XXIII. The proposed project may affect existing and new warehouses located throughout the South Coast Air Quality Management District (South Coast AQMD) jurisdiction, which includes the four-county South Coast Air Basin (SCAB) (all of Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties), and the Riverside County portion of the Salton Sea Air Basin (SSAB) and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin (MDAB). The proposed project is described in more detail under Project Description.

The California Legislature created the South Coast AQMD in 1977¹ as the agency responsible for developing and enforcing air pollution control rules and regulations in the SCAB and portions of the SSAB and MDAB. In 1977, amendments to the federal Clean Air Act (CAA) included requirements for submitting State Implementation Plans (SIPs) for nonattainment areas that failed to meet all federal ambient air quality standards (CAA Section 172), and similar requirements exist in state law (Health and Safety Code Section 40462). The federal CAA was amended in 1990 to specify attainment dates and SIP requirements for ozone, carbon monoxide (CO), nitrogen dioxide (NO₂), and particulate matter (PM) with an aerodynamic diameter of less than 10 microns (PM₁₀). In 1997, the United States Environmental Protection Agency (U.S. EPA) promulgated ambient air quality standards for particulate matter with an aerodynamic diameter less than 2.5 microns (PM_{2.5} or fine particulate matter). U.S. EPA is required to periodically update the national ambient air quality standards (NAAQS).

In addition, the California Clean Air Act (CCAA), adopted in 1988, requires the South Coast AQMD to achieve and maintain state ambient air quality standards for ozone, CO, sulfur dioxide (SO₂), and NO₂ by the earliest practicable date (Health and Safety Code Section 40910). The CCAA also requires a three-year plan review, and, if necessary, an update to the SIP. The CCAA requires air districts to achieve and maintain state standards by the earliest practicable date and for extreme non-attainment areas, to include all feasible measures pursuant to Health and Safety Code Sections 40913, 40914, and 40920.5. While not defined in this part of the Health and Safety Code, the term “feasible” is defined in the California Environmental Quality Act (CEQA) Guidelines² Section 15364, as a measure “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.”

By statute, the South Coast AQMD is required to adopt an air quality management plan (AQMP) demonstrating compliance with all federal and state ambient air quality standards for the areas under the jurisdiction of the South Coast AQMD³. Furthermore, the South Coast AQMD must adopt rules and regulations that carry out the AQMP⁴. The AQMP is a regional blueprint for how

¹ The Lewis-Presley Air Quality Management Act, 1976 Cal. Stats., Ch. 324 (codified at Health and Safety Code Section 40400-40540).

² The CEQA Guidelines are codified at Title 14 California Code of Regulations Section 15000 *et seq.*

³ Health and Safety Code Section 40460(a).

⁴ Health and Safety Code Section 40440(a).

the South Coast AQMD will achieve air quality standards and healthful air and the 2016 AQMP⁵ contains multiple goals promoting reductions of criteria air pollutants, greenhouse gases (GHGs), and toxic air contaminants (TACs). In particular, the 2016 AQMP states both oxides of nitrogen (NOx) and volatile organic compound (VOC) emissions need to be reduced to meet air quality standards, with emphasis that NOx emission reductions are more effective to reduce the formation of ozone and PM2.5. Ozone is a criteria pollutant shown to adversely affect human health and is formed when VOCs react with NOx in the atmosphere. NOx is a precursor to the formation of ozone and PM2.5.

To meet air pollution reduction goals, the 2016 AQMP contains a variety of control measures, which include Facility-Based Mobile Source Measures (FBMSMs), also known as indirect source measures or rules. An indirect source rule (ISR) is distinct from a traditional air pollution control regulation that focus on stationary equipment in that ISR focuses on reducing emissions from the vehicles associated with a facility rather than emissions from a facility itself.⁶ PR 2305 is an indirect source rule that South Coast AQMD can adopt under the authority of Health and Safety Code Sections 40716(a)(1) and 40440. The primary goal of the FBMSMs is to reduce NOx emissions as one of many local, state, and federal strategies to meet the 8-hour ozone NAAQS. NOx is locally and regionally important due to its involvement in the photochemical formation of ozone and fine particulate matter. Mobile sources associated with goods movement make up about 52% of all NOx emissions in the SCAB.⁷ PR 2305 will also reduce diesel particulate matter (DPM), which is a toxic air contaminant and a component of fine particulate matter. The emission reductions from PR 2305 will contribute to meeting commitments for reducing NOx and PM2.5 in the SIP.

The FBMSMs are concentrated on the four sectors of the goods movement industry: commercial marine ports, rail yards, warehouse distribution centers, and commercial airports. Of these FBMSMs, Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, committed to exploring how to achieve emission reductions from this sector. As such, South Coast AQMD staff has developed Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, to implement Control Measure MOB-03.

If adopted, PR 2305 would be applicable to any existing or new warehouse located in the South Coast AQMD jurisdiction with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building that may be used for warehousing activities by one or more warehouse operators. Under PR 2305, operators of applicable warehouses would be subject to an annual WAIRE Points Compliance Obligation (WPCO). WAIRE Points can be earned by warehouse operators and/or owners by selecting from the following implementation measures in the WAIRE Menu: 1) acquiring and/or using near-zero emissions (NZE) and zero-emission (ZE) trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or transport refrigeration units (TRUs); 4) installing and/or using onsite energy systems (e.g., solar panels); and 5) installing high-efficiency filters or filter systems in residences, schools, daycares, hospitals,

⁵ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

⁶ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

⁷ SCAG 2020 Regional Transportation Plan. Accessed Oct. 7, 2020. https://www.connectsocial.org/Documents/Adopted/fConnectSoCal_Goods-Movement.pdf#page=4

or community centers. In addition, warehouse operators may apply to earn WAIRE Points through a custom WAIRE Plan specific to their operations that satisfy prescribed performance metrics. Custom WAIRE Plans could include measures like installing offsite fueling/charging infrastructure or implementing new onsite practices to reduce air quality impacts from electricity consumption (such as installing and operating battery storage, or energy management systems to shift when electricity is used).

WAIRE Points may be earned only for “surplus” actions that go beyond existing state and federal regulations. In lieu of satisfying the WPCO via implementation measures, a warehouse operator may choose to pay an optional mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve the emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option. Therefore, the environmental impacts associated with the mitigation program are similar to implementation of measures to earn WAIRE Points and are analyzed in this NOP/IS.

In addition, South Coast AQMD staff has developed PR 316 – Fees for Regulation XXIII, to accompany PR 2305, to establish an annual fee to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with submittal and review of various notifications and reports, custom WAIRE Plan evaluation, implementing an incentive program using fees from warehouse operators that chose to pay a mitigation fee, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records. Although PR 316 is statutorily exempt from CEQA, to avoid confusion the CEQA analysis will consider any potential environmental impacts from this proposed rule as part of the project.

Implementation of the proposed project is expected to result in NO_x and PM, including DPM, emission reductions and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed. Estimated emission benefits from this project, including any that are creditable towards the SIP, will be included in the Environmental Assessment.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

The California Environmental Quality Act (CEQA), Public Resources Code Section 21000 *et seq.* and CEQA Guidelines which are codified at Title 14 California Code of Regulations, Section 15000 *et seq.*, requires all potential adverse environmental impacts of proposed projects be evaluated and methods to reduce or avoid identified significant adverse environmental impacts of these projects be implemented, if feasible. The purpose of the CEQA process is to inform decision makers, public agencies, and interested parties of potential adverse environmental impacts that could result from implementing a proposed project and to identify feasible mitigation measures or alternatives, when an impact is significant.

Public Resources Code Section 21080.5 allows public agencies with regulatory programs to prepare a plan or other written documents in lieu of a Negative Declaration or Environmental Impact Report once the secretary of the resources agency has certified the regulatory program. The South Coast AQMD's regulatory program was certified by the secretary of resources agency on March 1, 1989. [CEQA Guidelines Section 15251(l)]. In addition, the South Coast AQMD adopted Rule 110 – Rule Adoption Procedures to Assure Protection and Enhancement of the Environment, which implements the South Coast AQMD's certified regulatory program. Under the certified regulatory program, the South Coast AQMD typically prepares an Environmental Assessment (EA) to evaluate the environmental impacts for rule projects proposed for adoption or amendment. The EA is a substitute CEQA document (CEQA Guidelines Section 15252), prepared either in lieu of a Negative Declaration for a project with no significant impacts or in lieu of an Environmental Impact Report for a project with potentially significant adverse impacts, pursuant to the South Coast AQMD's Certified Regulatory Program. The EA is also a public disclosure document intended to: 1) provide the lead agency, responsible agencies, decision makers and general public with information on the environmental impacts of the proposed project; and, 2) be used as a tool by decision makers to facilitate decision making on the proposed project.

The proposed adoption of PR 2305, and PR 316 is a discretionary action subject to South Coast AQMD Governing Board consideration, which has the potential for resulting in direct or indirect change to the environment and, therefore, is considered a “project” as defined by CEQA. [CEQA Guidelines Section 15378]. While PR 316 would individually qualify for a statutory exemption under CEQA Guidelines Section 15273 – Rates, Tolls, Fares, and Charges, it is being included as part of the project description for clarity and to give a complete description of the proposed project. The lead agency is the “public agency that has the principal responsibility for carrying out or approving a project that may have a significant effect upon the environment.” [Public Resources Code Section 21067]. Since the South Coast AQMD Governing Board has the primary responsibility for approving the entire project as a whole, the South Coast AQMD is the most appropriate public agency to act as lead agency for the proposed project. [CEQA Guidelines Section 15051(b)].

The first step of the EA process is to prepare a Notice of Preparation (NOP) with an Initial Study (IS) that includes an Environmental Checklist and project description. The Environmental Checklist provides a standard evaluation tool to identify a project's adverse environmental impacts. The NOP/IS is also intended to provide information about the proposed project to other public agencies and interested parties prior to the release of the Draft EA for public review and comment.

PR 2305 is anticipated to result in NO_x and PM, including DPM, emissions reductions because its implementation would accelerate transition to near zero and zero emissions vehicles and equipment. However, it is not possible to quantify the magnitude of emissions benefits at this

preliminary state. While implementation is expected to result in NO_x and PM, including DPM, emission reductions in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter (an environmental benefit), the proposed project also has the potential to generate potentially significant adverse environmental impacts to the environmental topic areas of air quality and greenhouse gas emissions, energy, and transportation (traffic). Thus, in accordance with CEQA Guidelines Section 15063, this IS identifies these potential adverse effects.

This NOP/IS is being released and circulated for a 32-day public review and comment period from November 13, 2020 to December 15, 2020. Written comments received during the public comment period on the scope of the environmental analysis presented in the NOP/IS will be considered when preparing the Draft EA and included in an appendix of the Draft EA, along with responses to comments.

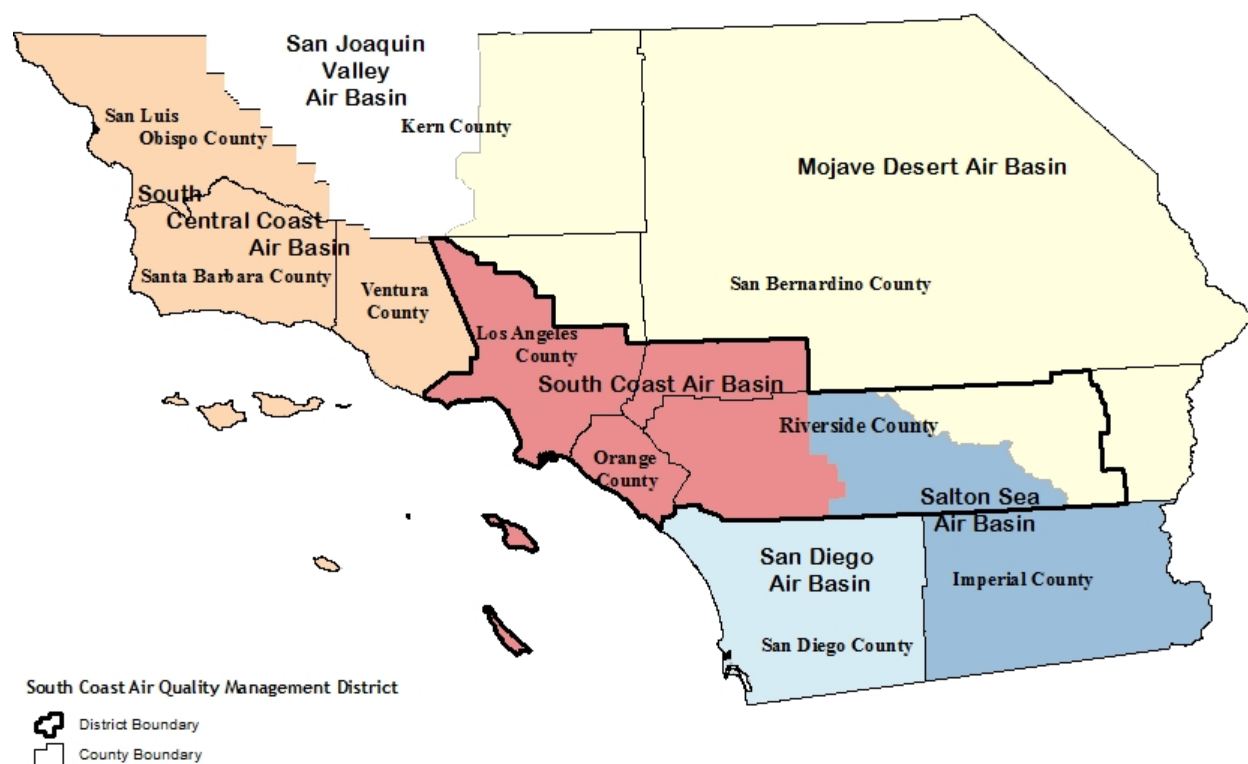

Because the proposed project may have statewide, regional, or areawide significance, a CEQA scoping meeting is required pursuant to Public Resources Code Section 21083.9(a)(2) and will be held on December 2, 2020 at 1:30 p.m. South Coast AQMD staff recognizes the challenges businesses and other stakeholders are experiencing due to COVID-19 and seeks to be consistent with Governor Newsom's Executive Order N-29-20 (March 18, 2020). To ensure South Coast AQMD is practicing safe social distancing, the CEQA scoping meeting will only be conducted remotely via video conference and teleconference (Zoom) which can be accessed via an internet-connected digital device or a telephone. Any comments made at the CEQA scoping meeting relative to the proposed project along with responses to the CEQA-related comments will be included in an appendix of the Draft EA. Further, pursuant to CEQA Guidelines Section 15252, since significant adverse impacts have been identified, an alternatives analysis along with mitigation measures are required and will be included in the Draft EA.

Prior to making a decision on the adoption of the proposed project, the South Coast AQMD Governing Board must review and certify the Final EA, including responses to comments, as providing adequate information on the potential adverse environmental impacts that may occur as a result of adopting the proposed project.

PROJECT LOCATION

The South Coast AQMD has jurisdiction over an area of approximately 10,743 square miles, consisting of the four-county SCAB (all of Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties), and the Riverside County portion of the SSAB and the non-Palo Verde, Riverside County portion of the MDAB. The SCAB is a subarea of South Coast AQMD's jurisdiction, it is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto mountains to the north and east. SCAB includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. The Riverside County portion of the SSAB is bounded by the San Jacinto Mountains in the west and spans eastward up to the Palo Verde Valley. A federal nonattainment area (known as the Coachella Valley Planning Area) is a subregion of Riverside County and the SSAB that is bounded by the San Jacinto Mountains to the west and the eastern boundary of the Coachella Valley to the east (see Figure 1-1).

Figure 1-1
Southern California Air Basins and South Coast AQMD's Jurisdiction

The proposed project applies to qualifying-sized warehouses located within the South Coast AQMD's jurisdiction (see Table 1-1). Some properties may only be required to satisfy reporting requirements in PR 2305 as the information contained within existing databases may not be sufficient to determine if the property is currently used for warehousing, or if warehousing activities are conducted in areas above rule thresholds. Because the warehousing industry is dynamic, the number of regulated entities is expected to change year to year as more warehouses are constructed, or as operations change at existing warehouses.

Table 1-1 Expected Number of Warehouses and Industrial Properties Subject to PR 2305

County	Total Number of Industrial Properties Anticipated to be Subject to PR 2305	Total Number of Warehouses Likely Required to Earn WAIRE Points	Total Number of Warehouses and Industrial Properties Likely Only Subject to PR 2305 Reporting Requirements
Los Angeles	1,635	1,392	243
Orange	398	325	73
Riverside	406	365	41
San Bernardino	881	820	61
Total	3,320	2,902	418

PROJECT BACKGROUND

In response to historical and ongoing exceedances of state and federal ambient air quality standards for PM₁₀, PM_{2.5}, and ozone, South Coast AQMD has adopted a series of AQMPs with the most recent 2016 AQMP adopted in March 2017. The 2016 AQMP evaluated new implementation strategies and control measures to achieve emission reductions to demonstrate how the region will meet federal air quality standards for ozone and fine particulate matter. The 2016 AQMP states both NO_x and VOC emissions need to be addressed, emphasizing NO_x emission reductions are more effective to reduce ozone and fine particulate matter formation. DPM is a component of fine particulate matter.

The 2016 AQMP includes potential regulatory control options to achieve multiple air quality goals. The primary goal of the 2016 AQMP is to reduce NO_x emissions as one of many local, state, and federal strategies to meet the 8-hour ozone NAAQS. If these standards are met, then all other federal ozone and PM standards should be achieved. In order to meet these air quality standards, total NO_x emissions in the SCAB must be reduced by approximately 45 percent beyond baseline 2023 levels, and 55 percent beyond baseline 2031 levels (see Figure 1-2).

Figure 1-2
NOx Emission Reductions Needed to Achieve Federal 8-Hour Ozone NAAQS

Source: South Coast AQMD, 2016 Air Quality Management Plan, Potential Strategies for Facility-Based Mobile Source Measures, May 4, 2018, Figure 1-1, page 1-1, <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2018/2018-may4-032.pdf>.

To meet air pollution reduction goals, the 2016 AQMP contains FBMSMs to reduce NOx emissions from mobile sources utilized as part of the goods movement industry as one of many local, state, and federal strategies to meet the 8-hour ozone NAAQS⁸. The FBMSMs were focused on four sectors of the goods movement industry: commercial marine ports, rail yards and intermodal facilities, warehouse distribution centers, and commercial airports.

To assist in identifying potential areas of opportunity for emission reductions, South Coast AQMD developed preliminary NOx emission inventories for each facility sector included that could be affected by FBMSMs. Figure 1-3 presents the estimated NOx emission baseline inventory by source for each FBMSM sector. Each bar in Figure 1-3 is not mutually exclusive from another bar. For example, trucks may travel from a port to a warehouse, or from a warehouse to a railway.

⁸ NOx is locally and regionally important due to its involvement in the photochemical formation of ozone and fine PM.

Figure 1-3
2023 NOx Baseline Inventory

Source: South Coast AQMD, 2016 Air Quality Management Plan, Potential Strategies for Facility-Based Mobile Source Measures, May 4, 2018, page 2-2, <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2018/2018-may4-032.pdf>.

Warehouse Distribution Centers

The 2016 AQMP included Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers which required the assessment and identification of potential actions to reduce emissions associated with mobile sources operating in and out of warehouse distribution centers.⁹

Distribution centers and/or warehouses are facilities that serve as a distribution point for the transfer of goods and have a variety of emission sources. In particular, depending on the size and type, a warehouse distribution center may attract hundreds of diesel trucks each day which deliver, load, and/or unload goods, often operating seven days a week. Further, if the warehouse distribution center needs to transport perishable goods which require refrigeration, the trucks are equipped with diesel-fueled TRUs. In addition, diesel-fueled cargo handling equipment (CHE) such as yard tractors are utilized to move goods throughout the warehouse and onto or off of the trucks. Lastly, warehouse employees commute trips via gasoline or diesel-fueled passenger vehicles also contribute to the overall emissions. Thus, emissions from trucks with or without

⁹ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

TRUs, CHEs and warehouse employees all contribute to the overall emissions profile associated with warehouse distribution centers.

The estimates presented in Figure 1-3 indicate the majority of NO_x emissions are primarily from heavy-duty diesel trucks. Over the past decade, the capacity and quantity of warehouse distribution centers have been increasing rapidly throughout the region (Figure 1-4), future growth of this sector is projected to continue, with the greatest growth occurring in the Inland Empire (e.g., an additional 15 million square feet per year to the regional building stock).¹⁰

Figure 1-4
Total Square Footage of Building Potentially Covered by PR 2305 by County in South Coast AQMD

Working Groups

In order to evaluate potential emission reduction strategies for the FBMSMs, including Control Measure MOB-03, South Coast AQMD staff convened FBMSM Working Groups with stakeholders to explore voluntary, collaborative approaches in addition to potential regulatory approaches to reduce emissions from facilities following adoption of the 2016 AQMP. A total of 17 working group meetings for all FBMSMs were held in the first year following the adoption of the 2016 AQMP in March 2017, with three meetings held on June 1, 2017, October 4, 2017, and January 17, 2018 which specifically focused on warehouses.

After considering the recommendations by South Coast AQMD staff on potential voluntary and regulatory strategies developed from the FBMSM Working Group Meetings, the South Coast AQMD Governing Board, at the May 4, 2018 Public Hearing, directed staff to initiate the development of an ISR for warehouses and distribution centers. The Warehouse ISR Working Group was formed to discuss warehouse air quality related issues and to provide feedback on a

¹⁰ South Coast AQMD, March 2, 2018 Board Meeting Agenda, Potential Strategies for Facility-Based Mobile Source Measures Adopted in 2016 AQMP. Accessed on August, 14, 2020. <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2018/2018-mar-2-032.pdf>.

potential ISR approach and ten meetings were held on the following dates: August 1, 2018, August 23, 2018, October 24, 2018, March 22, 2019, August 23, 2019, September 19, 2019, November 13, 2019, December 10, 2019, March 3, 2020, October 9, 2020, and October 30, 2020. Additional working group meetings continue to be held as part of the rule development process. Presentations for the FBMSM and the Warehouse ISR Working Group meetings are available on the South Coast AQMD's website at: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/fbmsm-mtngs>.

Warehouse ISR

Recognizing the importance of reducing criteria pollutant emissions from facilities that attract mobile emission sources, federal law allows states to adopt indirect source regulations. California law explicitly provides ISR authority to local air districts. [Health and Safety Code Sections 40716(a)(1), 40440]. An indirect source is defined in the Federal CAA as “a facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution.” [42 United States Code (USC) Section 7410(a)(5)(C)].

As such, the following potential options for reducing emissions from this source category were discussed in the Warehouse ISR Working Group:

- **Facility Caps:** Allow emissions at each warehouse distribution center to be capped so each warehouse distribution center would have the flexibility to individually determine how to reduce emissions.
- **Local Government Measures:** Local governments may decide to tailor emission reduction strategies to address local needs (e.g., through their land use authority).
- **Clean Fleets Crediting/Banking Program:** Allow clean fleets to generate credits that would be managed through a bank while requiring ISR facilities to regularly purchase and apply the credits to offset emissions from individual warehouse distribution centers.
- **Voluntary Fleet Certification Program:** Allow fleet owners to certify their fleets are cleaner than what would otherwise be required by CARB regulations while requiring facilities to use a prescribed amount of certified fleets.
- **Best Management Practices (BMPs):** Allow facilities to choose from an assortment of BMPs such as utilizing ZE or NZE equipment on site, and/or installing ZE/NZE fueling and charging infrastructure, or solar energy storage.
- **Mitigation Fees:** Allow facilities to pay mitigation fees if other options are not chosen and apply collected funds to subsidize the purchase and use of ZE/NZE equipment or the installation of fueling/charging infrastructure.

Of these options, only the Best Management Practices (now the WAIRE Menu and custom WAIRE Plan option) and the Mitigation Fee options have been carried forward to PR 2305.

The proposed WAIRE Program (PR 2305) includes a menu of actions and/or investments that facility owners or operators can implement, with each menu item having a defined number of WAIRE Points. Each operator of a warehouse with greater than or equal to 100,000 square feet of indoor floor space in a single building that may be used for warehousing activities by one or more warehouse operators would need to demonstrate that a requisite number of WAIRE Points have been earned each year from the WAIRE Menu. Alternatively, warehouse operators can apply to earn WAIRE Points from a custom WAIRE Plan that they develop and implement, if approved by

South Coast AQMD. Finally, warehouse operators could choose to pay a mitigation fee to earn WAIRE Points if they do not want to complete actions from the WAIRE Menu or develop and implement a custom WAIRE Plan.

For warehouses greater than or equal to 100,000 square feet in size, but with warehousing activities less than 100,000 square feet, operators would only have to comply with the reporting requirements in PR 2305. Operators in a multi-tenant warehouse whose total building includes greater than or equal to 100,000 square feet of warehousing activities would also be required to earn WAIRE Points if they use more than 50,000 square feet of floor space for warehousing activities. Some limited reporting requirements in PR 2305 would also apply to warehouse owners. If excess WAIRE Points are earned beyond the WAIRE Points Compliance Obligation (WPCO) for a given year, any accumulation of extra WAIRE Points would be banked for use in any of the following three years at that site. A warehouse operator could also transfer their excess WAIRE Points to a different warehouse that they operate, or to the warehouse owner for use at that site. The WAIRE Points obligation in PR 2305 would not apply to a warehouse owner or fleet owner, unless the warehouse owner or fleet owner is also a warehouse operator.

AIR QUALITY REGULATORY ENVIRONMENT

Overview of Current Regulatory Requirements

There are many existing and upcoming air quality regulations at the state and federal level that focus on emissions from the mobile sources associated with warehouses. These can broadly be placed into three categories. First are regulations that aim to reduce emissions at the tailpipe of a vehicle, commonly called engine standards. These regulations typically focus on requirements for new vehicles. Second are regulations that aim to replace older vehicles with newer vehicles with cleaner technologies, often called fleet rules. Third are regulations that focus on air quality impacts from facilities. These regulations look at the activities associated with a facility and aim to reduce air quality impacts beyond what is already required by engine standards or fleet rules. Key examples of these three types of regulations that address air quality impacts from warehouses are presented in Figures 1-5a and 1-5b as follows.

Figure 1-5a
Key Existing Regulations that Address Air Quality Impacts from Warehouses

The effect of all existing regulations in Figure 1-5a was considered in the 2016 AQMP. The emission reductions from these key regulations and all other existing regulations is reflected in the reduced emissions shown in Figure 1-2. In order to evaluate the potential effect of upcoming regulations shown in Figure 1-5b (as well as other potential future actions) CARB is developing an update to its Mobile Source Strategy (MSS). This draft document evaluates emissions from all mobile source sectors and identifies potential targets for future regulations in order to meet the various state goals for air pollution and climate impacts.¹¹ A summary of the emission reductions CARB is targeting in 2031 from all vehicle sectors is shown in Figure 1-6.

¹¹ Draft MSS available here: <https://ww2.arb.ca.gov/resources/documents/2020-mobile-source-strategy>

Figure 1-6
2031 Emission Reduction Targets in CARB Mobile Source Strategy

Source: South Coast AQMD, Warehouse ISR Working Group Presentation, October 9, 2020, page 8 <https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/draft-slides.pdf>.

There are three key conclusions that can be drawn from the MSS analysis:

1. Significant emissions reductions are required from all mobile source sectors in order to meet 2031 ozone standards.
2. The draft MSS analysis does not evaluate the 2023 ozone standard, and its proposed strategy will not meet this standard.
3. Some mobile source sectors with significant emissions and targeted emission reductions (e.g., ocean going vessels, locomotives, aircraft) may require regulations from either the federal government or from international bodies. Emission reductions from these sectors are therefore likely more difficult than sources that operate solely within the state. If shortfalls occur from these sectors, more emissions reductions from other sectors (e.g., trucks) may be required.

Other State And South Coast AQMD Requirements

Executive Order N-79-20¹²

On September 23, 2020, Governor Newsom signed an executive order directing state agencies to pursue aggressive goals towards zero emissions technologies. Key directives include:

- CARB shall develop and propose car and truck regulations with increasing zero emissions percentages such that by 2035 all in state sales are zero emissions.
- CARB shall also pursue regulations to achieve a 100 percent zero emissions medium duty and heavy duty fleet by 2045.
- CARB shall develop, in coordination with state agencies, U.S. EPA, and local air districts, strategies to achieve 100 percent zero emissions operations for off-road vehicles by 2035.

¹² <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-text.pdf>

AB 617 Community Air Protection Program

In 2017, Governor Edmund Brown signed Assembly Bill (AB) 617 to develop a new community-focused program to reduce local air pollution in environmental justice communities more effectively. The AB 617 program includes community air monitoring and community emissions reduction programs. In addition, the legislature appropriated funding to support early actions to address localized air pollution through targeted incentive funding to deploy cleaner technologies in these communities, and grants to support community participation in the AB 617 process. AB 617 includes new requirements for accelerated retrofit of air pollution controls on industrial sources, increased penalty fees, and greater transparency and availability of air quality and emissions data, which will help advance air pollution control efforts throughout the State.

In December 2018, CARB designated three AB 617 communities in the South Coast AQMD, including Wilmington, Carson, West Long Beach; San Bernardino, Muscoy; and East Los Angeles, Boyle Heights, West Commerce. A Community Steering Committee (CSC) was established for each community to gather input and develop Community Emission Reduction Plans (CERPs) and Community Air Monitoring Plans (CAMPs). The CSCs are comprised of residents, community organizations, local agencies, and businesses. Each CERP includes actions, strategies, and goals focused on emission and exposure reductions for air quality priorities identified by the CSCs. In September 2019, the South Coast AQMD Governing Board adopted the CERPs. Due to concerns expressed by the CSCs about local air quality impacts in their communities from trucks going to warehouses, all three 1st Year CERPs include as an action item that South Coast AQMD should continue developing an indirect source rule for warehouses (i.e. PR 2305).

In December 2019, CARB designated two new AB 617 communities in the South Coast AQMD, including Eastern Coachella Valley and Southeast Los Angeles. A CSC has been established for the communities, and they are working on developing CERPs and CAMPs. Finally, in October 2020, the South Coast AQMD Board voted to designate a sixth AB 617 community in the South Los Angeles area.

As demonstrated above, additional actions are needed to meet both the 2023 and the 2031 federal ozone standards as well as addressing concerns about local air quality. PR 2305 is designed to provide additional emission reductions on its own, and to facilitate emission reductions from other proposed regulations to assist in meeting these air quality standards. These actions will also assist in reducing local air quality impacts and will also facilitate the transition to zero emissions vehicles.

PROJECT DESCRIPTION

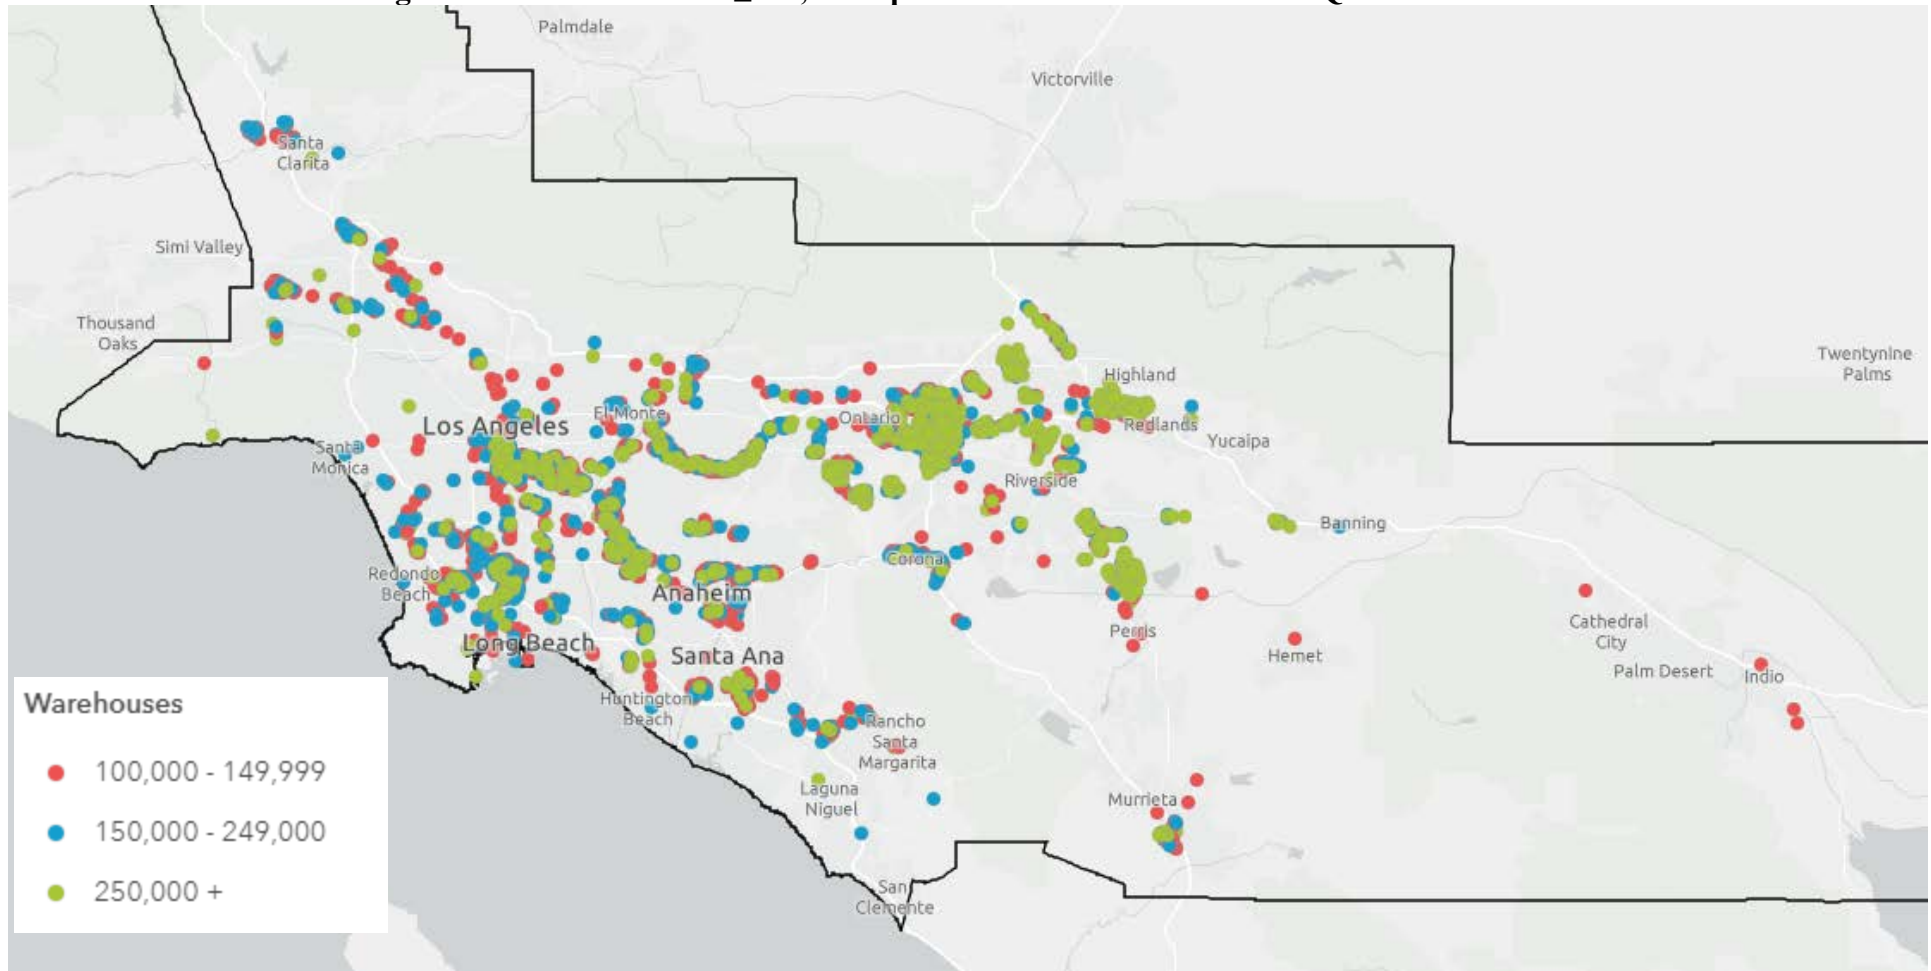

The proposed project is comprised of PR 2305 and the associated mitigation program, and PR 316. The purpose of PR 2305 is to facilitate NO_x and PM, including DPM, emission reductions associated with warehouses and the mobile sources attracted to applicable warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. Implementation of the proposed project is expected to result in NO_x and PM, including DPM, emission reductions and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed. Estimated emission benefits from this project, including any that are creditable towards the SIP, will be included in the Environmental Assessment.

The purpose of PR 316 is to establish a mechanism for the collection of administrative fees to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with review of various notifications, custom WAIRE Plan evaluation, reports and mitigation fees, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records.

Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program

The section provides a detailed summary of the key elements contained in PR 2305. A preliminary draft of PR 2305 can be found in Appendix A. PR 2305 is designed to apply to any new or existing warehouse located within South Coast AQMD’s jurisdiction with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building that may be used for warehousing activities by one or more warehouse operators. PR 2305 also applies to manufacturing or other facilities that have ancillary warehouses with equal to or greater than 100,000 square feet of indoor floor space in a single building.

Implementation of PR 2305 would initially affect about 3,320 warehouses. Some of these facilities have more than one tenant, so there are potentially a total of about 5,600 warehouse operators that may be subject to the rule. As new facilities are built, they would also become subject to the rule. It is expected that about 418 of these facilities and about 2,100 of these operators would only be subject to reporting requirements in PR 2305. Figure 1-7 shows the location of these existing facilities within South Coast AQMD’s jurisdiction.

Figure 1-7 Warehouses $\geq 100,000$ Square Feet in the South Coast AQMD Jurisdiction

The WAIRE program under PR 2305 is being developed so operators of applicable warehouses can implement changes to reduce emissions from mobile sources associated with their operations. Under this program, the number of annual truck trips for applicable warehouses must be reported. These truck trips in turn are converted into each operator's WPCO. The WPCO can be satisfied by earning WAIRE Points by completing actions and investments from the WAIRE Menu, completing actions from an approved custom WAIRE Plan, or paying the optional mitigation fee.

Calculating WPCO

A warehouse's WPCO is calculated by multiplying the number of weighted annual truck trips (WATTs) by a Stringency factor and an Annual Variable as shown in the following equation.

$$WPCO = WATTS \times Stringency \times (Annual Variable)$$

Where:

- WPCO is the number of WAIRE Points a warehouse operator must earn in a year.
- WATTs are the number of Weighted Annual Truck Trips
- Stringency factor is a dimensionless multiplier that determines how many Points an operator needs to earn
- The Annual Variable is a dimensionless multiplier which controls how the stringency will phase in through time

WATTs include the number of all actual truck trips from Class 2b to Class 8 vehicles that occurred at a warehouse (e.g., the number of trips to and from the warehouse) while the warehouse operator was responsible for operations during the previous 12-month compliance period. If a warehouse is occupied by more than one warehouse operator, the WATTs are only the truck trips attributed to that operator. Warehouse operators would be required to count and report all of the trucks entering their facility to determine the WATTs in every compliance year.

WATTs are calculated according to the following equation:

$$WATTS = [Class\ 2b\ to\ 7\ truck\ trips] + [2.5 \times Class\ 8\ truck\ trips]$$

In the rare event of a force majeure event such that the warehouse operator does not have truck trip information (e.g., records destroyed in a fire), then the WATTs are determined using default average truck trip rates.

$$WATTS_{alt} = Days\ per\ Year \times Warehouse\ Size \times WTTR$$

Earning WAIRE Points

WAIRE Points can be earned by completing actions and investments from the following menu of implementation measures: 1) acquiring and/or using NZE and ZE trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or TRUs; 4) installing and/or using onsite energy systems (e.g., solar panels); and 5) implementing community benefits (e.g., air filters for sensitive receptors). In addition, warehouse operators may apply to earn WAIRE Points through a custom WAIRE Plan specific to their operations that satisfy strict criteria.

The WAIRE point system considers the annualized cost of installing and/or operating vehicles/infrastructure; the amount of regional NOx emissions reductions; and the local DPM emissions reduction benefit, which are weighted equally using the following equation:

WAIRE Points may be earned only for actions that go beyond existing state and federal regulations. If adopted, PR 2305 will interact with other existing and upcoming regulations and incentive programs in varying ways. For example, some incentive programs like Carl Moyer prohibit using funds to comply with a regulation. A warehouse operator that owns a fleet may not use Carl Moyer funds to purchase a truck and also earn WAIRE Points for that truck purchase. However, visits to a warehouse from a truck that was funded through the Carl Moyer program can still earn WAIRE Points because Carl Moyer does not require localized emission reductions near warehouses, and because the Carl Moyer program applies to truck owners and not warehouse operators. Separately, if CARB's upcoming TRU rule is approved, warehouse operators that face requirements from that rule (e.g., installing ZE TRU charging infrastructure) will not be able to use those actions to comply with PR 2305. However, if they implement actions beyond CARB requirements, or earlier than required by CARB, then they would be able to earn WAIRE Points for those actions.

In lieu of satisfying the WPCO via the WAIRE Menu, a warehouse operator may choose two other options. The first is to prepare and then implement a custom WAIRE Plan tailored to their site that will achieve an equal number of WAIRE Points as would be obtained implementing actions from the WAIRE Menu. The types of projects that might fit within this approach that have been suggested by industry stakeholders include modifying a building's energy use throughout the day to draw more energy from renewable power sources (like solar) rather than natural gas fueled power plants, or installing ZE charging infrastructure for onroad trucks at an offsite location, perhaps in cooperation with other nearby warehouse operators.

The custom WAIRE Plan application shall follow the WAIRE Implementation Guidelines and the following criteria:

- Custom WAIRE Plan applications must demonstrate how the proposed action will earn WAIRE Points based on the incremental cost of the action, the NOx emission reductions from the action, and the DPM emission reductions from the action, relative to baseline conditions if the warehouse operator had not completed the action in that compliance year.
- Any WAIRE Points for emission reductions must be quantifiable, verifiable, and real as determined by the Executive Officer and consistent with the WAIRE Implementation Guidelines.
- Custom WAIRE Plan applications must include the following elements:
 - A description of how the proposed actions will achieve quantifiable, verifiable, and real NOx and DPM emission reductions as quickly as feasible, but no later than three years after plan approval; and
 - A quantification of expected NOx and/or DPM emission reductions from the proposed project within the South Coast AQMD and within three miles of the warehouse; and
 - A description of the method to be used to verify that the proposed project will achieve NOx and/or DPM emission reductions; and
 - A schedule of key milestones showing the increments of progress to complete the proposed project; and
 - A description of the location and a map of where the proposed project will occur; and
 - Any expected permits or approvals required by other private parties, or South Coast AQMD, or other federal, state, or local government agencies to implement the proposed plan.

Any proposed plan that relies on vehicle miles travelled (VMT) reduction must demonstrate that these reductions are surplus to what is included in the most recent approved Regional Transportation Plan (RTP) and AQMP.

The second option is that warehouse operators may elect to pay an optional mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve the emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option. Therefore, the environmental impacts associated with the mitigation program are similar to implementation of measures to earn WAIRE Points and are analyzed in this NOP/IS.

Transferring WAIRE Points

WAIRE Points accumulated by a warehouse owner or operator in a given compliance year can be transferred in one of three limited ways. First, an operator may transfer excess WAIRE Points from one of its warehouses to another of its warehouses. WAIRE Points transferred under this scenario are subject to a reduction via a locational discount to encourage emission reductions within the immediate vicinity of warehouses. The locational discount is intended to account for the reduced health benefits within the immediate vicinity of a warehouse that utilizes WAIRE Points earned at another warehouse. The net effect of applying a locational discount would result in the warehouse

needing to secure more WAIRE Points via transfer than if it had otherwise self-generated WAIRE Points.

Second, operators may bank WAIRE Points earned in excess of their WPCO for up to three years for use at the warehouse where the points were earned provided that the actions from the WAIRE Menu used to earn those points are not otherwise required by U.S. EPA, CARB or South Coast AQMD regulatory requirements in place at the time of surrender. For example, while points may be earned prior to the adoption of a pending regulatory requirement, once the regulatory requirement is in effect, the points may not be used for future years. Furthermore, owners or operators transferring WAIRE Points to a different compliance year shall demonstrate that any onsite improvements or equipment installations that were used to earn the WAIRE Points being transferred are still operational at that warehouse facility in the year that WAIRE Points are used. WAIRE Points that are banked from one year to another are not allowed to be transferred to a different site. Similarly, WAIRE Points transferred to another site are not allowed to be banked to a later year.

Third, a warehouse owner may earn points and transfer the points to an operator of the same warehouse, and vice-versa, subject to the three-year WAIRE Points banking limitation. Transfers of WAIRE Points are allowed within an individual warehouse (e.g., from owner to operator) or between warehouses controlled by the same operator. Transfers between different operators at different warehouses are prohibited.

Reporting, Notification, and Recordkeeping Requirements

There are three types of reports required by PR 2305. The first is a Warehouse Operations Notification. Warehouse owners will be required to notify the South Coast AQMD when any of the following conditions occur:

- Within 60 calendar days after adoption of PR 2305;
- Within 14 calendar days after a new warehouse operator has the ability to use at least 50,000 square feet of a warehouse that has greater than or equal to 100,000 square feet used for warehousing activities;
- Within 30 calendar days after a renovated warehouse has received a certificate of occupancy from the local land use agency such that the total warehouse space that may be used for warehousing activities has increased or decreased; or
- Within three calendar days of a request from the Executive Officer.

This notification will need to contain basic information about the site, such as building size and how much of the building is used for warehousing activities, and the name and contact information of any tenant leasing the property and the length of the lease term. Many of the 3,320 initially identified facilities may not ultimately be required to earn WAIRE Points based on data provided in these Warehouse Operations Notification reports. For example, a building that is 100,000 square feet in size that has only 80,000 square feet used for warehousing and 20,000 square feet used for offices would not be subject to the parts of PR 2305 that requires operators to earn WAIRE Points. Other reasons that operators may not be required to earn WAIRE Points could include that the facility is not currently used for warehousing activity at all (e.g., it is used only for manufacturing, or is used as a church), or that no operator uses more than 50,000 square feet for warehousing activity in a building with multiple tenants.

The second type of report is an Initial Site Information Report that warehouse operators must submit no later than January 15 of the year that they must submit their first Annual WAIRE Report (the third type of report). This Initial Site Information Report will include more detailed information pertaining to warehouse characteristics, truck trip data, fleet data if they own a fleet, and the anticipated implementation approach to satisfy the WPCO for the next compliance period. Finally, warehouse operators required to satisfy a WPCO must submit an Annual WAIRE Report that includes truck trip data (used to determine their site-specific WPCO), details on actions that were implemented to earn WAIRE Points, and how many WAIRE Points were earned for the prior 12-month compliance period.

Timing of WAIRE Program

Implementation of PR 2305 will be annually phased-in according to warehouse size. As summarized in Table 1-2, the first compliance period is applicable to warehouses with the largest footprint of floor space (e.g., greater than 250,000 square feet) with the Initial Site Information Report due by January 1, 2022 and the Annual WAIRE Report due by August 2, 2022.

Table 1-2 PR 2305 First Annual WAIRE Report Dates

Warehouse Size (square feet)	First Annual WAIRE Report Date
Greater than or equal to (\geq) 250,000 square feet	August 2, 2022
\geq to 150,000 square feet	August 1, 2023
\geq to 100,000 square feet	July 31, 2024

Proposed Rule 316 – Fees for Regulation XXIII

The proposed project also includes Proposed Rule 316 – Fees for Regulation XXIII. These administrative fees will be paid by facilities subject to PR 2305 every year to cover the costs associated with submittal and review of various notifications, reports and mitigation fees, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records. Specific administrative fees are proposed for submitting an Annual WAIRE Report, Initial Site Information Report, Warehouse Operations Notification, custom WAIRE Plan Evaluation, and/or Mitigation Fee. PR 316 also includes a fee schedule to address late fees and provides for a fee exemption for warehouses with less than 100,000 square feet of floor area within a single building used for warehousing activities for that year. A preliminary draft of PR 316 can be found in Appendix B.

PR 316 would individually qualify for a statutory exemption under CEQA Guidelines Section 15273 – Rates, Tolls, Fares, and Charges, however it is being included as part of the project description for clarity and to give a complete description of the proposed project.

ALTERNATIVES

The Draft EA will discuss and compare a range of reasonable alternatives to the proposed project as required by CEQA Guidelines Section 15126.6 and by South Coast AQMD Rule 110 for environmental topics areas with potentially significant adverse impacts. Alternatives must include realistic measures for attaining the basic objectives of the proposed project and provide a means for evaluating the comparative merits of each alternative. In addition, the range of alternatives must be sufficient to permit a reasoned choice and it need not include every conceivable project alternative. The key issue is whether the selection and discussion of alternatives fosters informed

decision making and public participation. A CEQA document need not consider an alternative whose effect cannot be reasonably ascertained and whose implementation is remote and speculative.

South Coast AQMD Rule 110 (the rule which implements the South Coast AQMD's certified regulatory program) does not impose any greater requirements for a discussion of project alternatives in an EA than are required for an Environmental Impact Report (EIR) under CEQA. Alternatives will be developed based in part on the major components of the proposed project which may result in physical modifications resulting in potential environmental impacts. The rationale for selecting alternatives rests on CEQA's requirement to present "realistic" alternatives; that is alternatives that can actually be implemented. CEQA also requires an evaluation of a "no project alternative." Pursuant to CEQA Guidelines Section 15126.6(e)(2), if the environmentally superior alternative is the "no project" alternative, the CEQA document shall also identify an alternate environmentally superior alternative from among the other alternatives.

In addition, South Coast AQMD's policy document Environmental Justice Program Enhancements for fiscal year (FY) 2002-03, Enhancement II-1 recommends all South Coast AQMD environmental analysis under CEQA include and identify a feasible project alternative with the lowest air toxics emissions. In other words, for any major equipment or process type under the scope of the proposed project that creates a significant environmental impact, at least one alternative, where feasible, shall be considered from a "least harmful" perspective with regard to hazardous or toxic air pollutants.

The South Coast AQMD Governing Board may choose to adopt any portion or the entirety of any alternative presented in the EA with appropriate findings as required by CEQA because the impacts of each alternative will be fully disclosed to the public and the public will have the opportunity to comment on the alternatives and impacts generated by each alternative. Written suggestions on potential project alternatives received during the comment period for the Initial Study will be considered when preparing the Draft EA.

CHAPTER 2

ENVIRONMENTAL CHECKLIST

Introduction

General Information

Environmental Factors Potentially Affected

Determination

Environmental Checklist and Discussion

INTRODUCTION

The environmental checklist provides a standard evaluation tool to identify a project's potential adverse environmental impacts. This checklist identifies and evaluates potential adverse environmental impacts that may be created by the proposed project.

GENERAL INFORMATION

Project Title:	Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII
Lead Agency Name:	South Coast Air Quality Management District
Lead Agency Address:	21865 Copley Drive Diamond Bar, CA 91765
CEQA Contact Person:	Ryan Bañuelos, (909) 396-3479, rbanuelos@aqmd.gov
Rules Contact Person:	Victor Juan, (909) 396-2374, vjuan@aqmd.gov
Project Sponsor's Name:	South Coast Air Quality Management District
Project Sponsor's Address:	21865 Copley Drive Diamond Bar, CA 91765
General Plan Designation:	Not applicable
Zoning:	Not applicable
Description of Project:	<p>The proposed project is comprised of Proposed Rule (PR) 2305 and an associated mitigation program, and PR 316. PR 2305 has been developed to facilitate local and regional emission reductions associated with existing warehouses with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building and the mobile sources attracted to these warehouses. PR 316 has been developed to establish administrative fees to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with submittal and review of various notifications, custom WAIRE Plan evaluation, reports and mitigation fees, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records.</p> <p>Under PR 2305, operators of applicable warehouses would be subject to a WAIRE Points Compliance Obligation (WPCO) by which WAIRE Points can be earned by selecting from a menu of implementation measures: 1) acquiring and/or using NZE and ZE trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger,</p>

hydrogen fuel station) for cars, trucks, and/or TRUs; 4) installing and/or using onsite energy systems (e.g., solar panels); and 5) implementing community benefits (e.g., air filters for sensitive receptors).

WAIRE Points may be earned only for “surplus” actions that go beyond existing state and federal regulations. In addition, warehouse operators may apply to earn WAIRE Points through a custom WAIRE Plan specific to their operations that satisfy prescribed performance metrics. In lieu of satisfying the WPCO via implementation measures, a warehouse operator may choose to pay an optional mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve the emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option. Therefore, the environmental impacts associated with the mitigation program are similar to implementation of measures to earn WAIRE Points and are analyzed in this NOP/IS.

Implementation of the proposed project is expected to result in emission reductions of NO_x and particulate matter, including diesel particulate matter, and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed. While reducing emissions is an environmental benefit, the NOP/IS identifies potentially significant adverse impacts to the environmental topic areas of air quality and greenhouse gas emissions, energy, and transportation (traffic). Some warehouses that will be subject to the proposed project may be identified on lists compiled by the California Department of Toxic Substances Control per Government Code Section 65962.5.

Surrounding Land Uses and Setting:

Industrial, commercial, and residential

Other Public Agencies Whose Approval is Required:

California Air Resources Board

United States Environmental Protection Agency

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The following environmental impact areas have been assessed to determine their potential to be affected by the proposed project. As indicated by the checklist on the following pages, environmental topics marked with a "✓" involve at least one impact that is a "Potentially Significant Impact". An explanation relative to the determination of impacts can be found following the checklist for each area.

<input type="checkbox"/> Aesthetics	<input type="checkbox"/> Geology and Soils	<input type="checkbox"/> Population and Housing
<input type="checkbox"/> Agriculture and Forestry Resources	<input type="checkbox"/> Hazards and Hazardous Materials	<input type="checkbox"/> Public Services
<input checked="" type="checkbox"/> Air Quality and Greenhouse Gas Emissions	<input type="checkbox"/> Hydrology and Water Quality	<input type="checkbox"/> Recreation
<input type="checkbox"/> Biological Resources	<input type="checkbox"/> Land Use and Planning	<input type="checkbox"/> Solid and Hazardous Waste
<input type="checkbox"/> Cultural and Tribal Cultural Resources	<input type="checkbox"/> Mineral Resources	<input checked="" type="checkbox"/> Transportation
<input checked="" type="checkbox"/> Energy	<input type="checkbox"/> Noise	<input type="checkbox"/> Wildfire
<input type="checkbox"/> Mandatory Findings of Significance		

DETERMINATION

On the basis of this initial evaluation:

- ☐ I find the proposed project, in accordance with those findings made pursuant to CEQA Guidelines Section 15252, COULD NOT have a significant effect on the environment, and that an ENVIRONMENTAL ASSESSMENT with no significant impacts has been prepared.
- ☐ I find that although the proposed project could have a significant effect on the environment, there will NOT be significant effects in this case because revisions in the project have been made by or agreed to by the project proponent. An ENVIRONMENTAL ASSESSMENT with no significant impacts will be prepared.
- ☒ I find that the proposed project MAY have a significant effect(s) on the environment, and an ENVIRONMENTAL ASSESSMENT will be prepared.
- ☐ I find that the proposed project MAY have a "potentially significant impact" on the environment, but at least one effect: 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards; and, 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL ASSESSMENT is required, but it must analyze only the effects that remain to be addressed.
- ☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects: 1) have been analyzed adequately in an earlier ENVIRONMENTAL ASSESSMENT pursuant to applicable standards; and, 2) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL ASSESSMENT, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

ENVIRONMENTAL CHECKLIST AND DISCUSSION

As explained in Chapter 1, the WAIRE program under PR 2305 provides a mechanism and accounting process by which warehouse operators can earn WAIRE Points in order to achieve emission reductions by implementing the following measures from a menu: 1) acquiring and/or using NZE and ZE trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or TRUs; 4) installing and/or using onsite solar panels; and 5) implementing community benefits (e.g., air filters for sensitive receptors). In lieu of earning WAIRE Points from the WAIRE Menu, warehouse operators would have the option of either implementing an approved site-specific custom WAIRE Plan, or instead paying a mitigation fee. The South Coast AQMD would apply the collected mitigation fees to subsidize the purchase of ZE and NZE trucks and installation of ZE charging/fueling infrastructure. Analysis of PR 2305 indicates that while reducing NO_x emissions from acquiring and using NZE and ZE trucks, and ZE yard trucks is an environmental benefit, secondary significant adverse environmental impacts may occur from the physical activities associated with installing or using charging/fueling infrastructure, solar panels, air filters, or carrying out activities from an approved custom plan. Some examples of potential custom WAIRE Plans include upgrades to a warehouse's energy system, installing offsite ZE charging/fueling infrastructure, demonstrating early or over-compliance with CARB rules (e.g., exceeding requirements for CARB's upcoming TRU regulation). Additional options may be proposed by warehouse operators in the future; however, it is speculative at this time to determine the full range of options that may be implemented in the future. If future custom WAIRE Plan applications propose actions that may have environmental impacts beyond the scope of the CEQA analysis conducted for PR 2305, then additional CEQA review will be conducted at that time.

PR 2305 also contains other proposed requirements which are administrative or procedural in nature (e.g., reporting, notification and recordkeeping requirements) and would not require any physical modifications to occur at any of the affected warehouses and thus, would not cause any environmental impacts.

In addition, South Coast AQMD staff has developed PR 316 which establishes an annual fee to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with submittal and review of various notifications, reports and mitigation fees, as well as compliance activities associated with conducting desktop audits, onsite inspections, and reviewing records. Since PR 316 is a fee rule meant to recover costs associated with the administration of PR 2305, it is administrative in nature and its implementation is not expected to cause any environmental impacts.

For these reasons, the focus of the analysis in this NOP/IS is limited to the potential secondary adverse environmental impacts associated with physical activities expected to occur at the affected warehouses in response to complying with PR 2305. While operators of warehouse facilities have the option to comply with PR 2305 by either selecting items from the WAIRE Menu, implementing an approved custom WAIRE Plan, or paying a mitigation fee to meet the WPCO, no particular approach to achieving compliance is prescribed. As such, Table 2-1 presents all options available to warehouse operators and identifies the type of corresponding physical activities that would be expected to result in potential secondary adverse impacts by environmental topic.

Table 2-1
PR 2305 Compliance Options with Potential Physical Activities and Environmental Impacts

PR 2305 Compliance Option with Potential Physical Effects	Construction Impacts?	Operational Impacts?	Environmental topic areas potentially affected
Acquiring and/or using on-road NZE and ZE trucks	Yes, if infrastructure needs to be built (e.g., electric chargers or hydrogen fueling stations for ZE trucks and natural gas fueling stations for NZE trucks)	Yes, from: - increased use of electricity or hydrogen for ZE trucks - increased use of natural gas for NZE trucks - battery replacement - increase in VMT	- Air Quality and GHG Emissions - Energy - Hazards and Hazardous Materials - Solid and Hazardous Waste - Transportation
Acquiring and/or using ZE yard trucks	Yes, if infrastructure needs to be built (e.g., electric chargers for ZE equipment)	Yes, from: - increased use of electricity for ZE yard trucks - battery replacement	- Air Quality and GHG Emissions - Energy - Solid and Hazardous Waste
Installing and/or using ZE charging/fueling infrastructure for cars, trucks and/or TRUs (e.g., electric chargers or hydrogen fueling stations for ZE vehicles)	Yes	Yes, from: - increased use of electricity for ZE vehicles - increased use of natural gas for NZE vehicles - increase in VMT	- Air Quality and GHG Emissions - Energy - Hazards and Hazardous Materials - Hydrology and Water Quality - Noise - Transportation
Installing and/or using Solar Panels	Yes	Yes, from: - increased use of renewable electricity - battery replacement - increase in VMT	- Air Quality and GHG Emissions - Energy - Hydrology and Water Quality - Noise - Solid and Hazardous Waste - Transportation
Installing high-efficiency filters or filter systems in residences, schools, daycares, hospitals, or community centers	Yes	Yes, from: - maintenance activities and filter replacement - energy penalty from using HEPA filters	- Air Quality and GHG Emissions - Energy - Solid and Hazardous Waste - Transportation

PR 2305 would result in an increase in construction related trips, the generation of noise, the use of construction equipment, soil disturbance, and the use of construction related hazardous materials. Increased construction related trips and the use of construction materials would temporarily generate air quality and GHG emissions and increase the demand for energy. The use of hazardous materials could impact the public or the environment through routine or accidental transport, use, or disposal. Furthermore, soil disturbance could affect water quality through erosion and siltation.

The installation of onsite ZE charging/fueling infrastructure and solar panels would require some diesel powered construction equipment (e.g., delivery trucks, trenchers, backhoes, etc.) however it is typically no larger or noisier than the diesel powered trucks already operating at a warehouse. At the same time, noise from the operation of ZE trucks or yard trucks is quieter than the equivalent diesel powered vehicles that are typically used. Any new equipment or infrastructure would be subject to project-level review, including review of noise levels based on the jurisdiction's noise standard, as applicable. Therefore, PR 2305 would not generate noise levels in excess of standards established in a local general plan, noise ordinance, or any other applicable noise standards.

PR 2305 is expected to result in operational impacts from an increased demand for and use of Class 2b through 8 ZE and NZE trucks and equipment which in turn, would also result in an increased use of electricity, hydrogen, and natural gas. Currently, there are no commercially available Class 8 ZE trucks; however, several Class 8 trucks are currently in the demonstration phase and their penetration into the market is imminent. Some truck manufacturers are beginning to release Class 2b through 7 ZE trucks, and more models are anticipated in the coming years. Furthermore, implementation of PR 2305 would result in an energy penalty from using HEPA filters and hazardous materials generated from the maintenance and replacement of air filters and batteries. PR 2305 could also increase distances trucks travel if warehouses relocate and/or vehicles seek out NZE/ZE charging/fueling stations.

In general, this CEQA document uses a “worst-case” approach so that whenever an assumption is made, those assumptions that result in the greatest potentially significant adverse impacts are typically chosen. This method ensures that environmental impacts from the proposed project are documented for decision-makers and the general public. Accordingly, the analysis in the following NOP/IS uses a conservative “worst-case” approach for analyzing the potentially significant adverse impacts.

Potential for Warehouse Relocation

The South Coast AQMD has funded a study to evaluate how different sectors within the warehousing industry (e.g., cold storage versus import facilities, etc.) may respond to the proposed project to determine the likelihood as to whether warehouse activities would relocate to areas outside of South Coast AQMD's jurisdiction. This study is under way and the results will be used together with the socioeconomic analysis to inform the rule development and the Draft EA. If it is considered possible that some warehouses will relocate because of the proposed project, then the potential environmental impacts, if any, of this activity will be included in the Draft EA to the extent that potential adverse environmental impacts are reasonably foreseeable and not speculative, in accordance with CEQA Guidelines Section 15145. Potential impacts may be difficult to forecast because: 1) existing business could relocate due to changes in market conditions rather than socio-economic effects of the rule; 2) existing warehouse operators could lease space in existing warehouses rather than construct new facilities; and 3) it is speculative to identify where the new warehouse site(s) could be (CEQA Guidelines Section 15144).

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
I. AESTHETICS. Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point(s).) If the project is in an urbanized area, would the project conflict with applicable zoning or other regulations governing scenic quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

The proposed project impacts on aesthetics will be considered significant if:

- The project will block public views from a scenic highway or corridor.
- The project will adversely affect the visual continuity of public views of the surrounding area.
- The impacts on light and glare will be considered significant if the project adds lighting which would add glare to residential areas or sensitive receptors.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing and using NZE and ZE charging and fueling infrastructure, and installing and using solar panels would be expected to have impacts to the topic of aesthetics. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

I. a), b) c) & d) No Impact. For the purpose of determining significance under CEQA, a scenic vista is generally considered a viewpoint that provides expansive views of a highly valued landscape for the benefit of the general public. Some scenic vistas are officially designated by public agencies, or informally designated by tourist guides. Vistas provide visual access or panoramic views to a large geographic area and are generally located at a point where surrounding views are greater than one mile away. Panoramic views are usually associated with vantage points

over a section of urban or natural areas that provide a geographic orientation not commonly available. Examples of panoramic views might include an urban skyline, valley, mountain range, a large open space area, the ocean, or other water bodies. A substantial adverse effect to a scenic vista is one that degrades the view from such a designated view spot.

A scenic highway is generally considered a stretch of public roadway that is designated as a scenic corridor by a federal, state, or local agency. Caltrans defines a scenic highway as any freeway, highway, road, or other public right of way, that traverses an area of exceptional scenic quality.

While construction of new warehouses is not required, under PR 2305, operators of existing warehouses and/or warehouse and fleet operators may replace trucks with ZE and NZE trucks in order to earn a sufficient number of WAIRE Points to meet the WPCO. However, the presence and appearance of the ZE and NZE trucks necessary to achieve the WPCO are not expected to be substantially different than existing diesel trucks.

Other options to achieve the WPCO include installing ZE charging/fueling infrastructure, and installation and use of solar panels at existing warehouses. Since the affected warehouses are located in existing industrial areas, any construction equipment needed to install infrastructure (e.g., installing ZE charging/fueling infrastructure, and installation and use of solar panels at existing warehouses) is not expected to be substantially discernable from other off-road equipment that exists onsite for routine operations and maintenance activities. Further, the construction activities are not expected to adversely impact views and aesthetics resources since most of the construction equipment and activities are expected to occur at existing warehouse facilities and are expected to introduce only minor visual changes, if at all, depending on the location of the construction activities at each affected warehouse. In addition, the construction activities are expected to be temporary in nature and will cease following the completion of infrastructure installation. Once construction is completed, all construction equipment will be removed from each warehouse.

Construction of the infrastructure, once built, may result in slight changes to the appearance of the affected warehouses post-construction. However, due to the nature of the infrastructure installations, any altered appearances will be minor and will not substantially alter the visual character of the existing warehouses. For example, the installation of solar panels on roofs are not expected to be substantially discernable from the ground and are expected to introduce only minor visual changes from outside each warehouse, if at all.

Furthermore, the appearance of ZE charging/fueling infrastructure and solar panels would result in slight changes to the appearance of the installation location and would not affect the aesthetic quality of the area. Such projects would also need to obtain city or county planning department approvals prior to commencement of any construction activities and would be subject to project-level review, including review of aesthetic impacts under CEQA, as applicable.

For facilities that are located within the views of a scenic vista or state scenic highway, the local city or county planning department would assess aesthetics impacts, if any, prior to commencement of any construction activities. Therefore, implementation of PR 2305 would have no substantial adverse effect on scenic vistas or other scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

Also, any changes to buildings or structures will require approvals from the local city or county planning departments to assess compliance with zoning requirements. For this reason, PR 2305 would not be expected to conflict with applicable zoning or other regulations governing scenic quality.

Therefore, the replacement vehicles, equipment, and/or infrastructure as part of implementing PR 2305 would not be expected to adversely affect a scenic vista, obstruct scenic resources within a state scenic highway, or degrade the existing visual character or quality of public views.

PR 2305 does not include any components that would require construction activities to occur at night. Further, cities often have their own limitations and prohibitions that restrict construction from occurring during evening hours and weekends. Therefore, no additional temporary construction lighting at the existing warehouses would be expected. However, if warehouse operators determine that the construction schedule requires nighttime activities, temporary lighting may be required but would be subject to approvals from the local city or county planning departments. Furthermore, during operation, additional light or glare would not be created which would adversely affect day or nighttime views in the area since no light generating equipment would be required to comply with PR 2305.

Solar panels may generate glare; however, the amount of glare depends on the angle of installation and on the specific product installed. Different types of solar panels absorb different amounts of light. Some solar panels include an anti-reflective layer to maximize absorption and minimize glare. Solar panel reflectivity is generally lower than that of other building materials (such as glass or steel). Furthermore, new solar panel systems would be required to abide by local county and city ordinances that require new sources of light and glare to be minimized. Therefore, installation of solar panels would not result in substantial glare.

Nonetheless, for construction activities that would be located within the boundaries of each affected warehouse, additional temporary lighting is not expected to be discernable from the existing permanent night lighting. For these reasons, the proposed project would not create a new source of substantial light or glare at any of the affected facilities in a manner that would adversely affect day or nighttime views in the surrounding areas. Any offsite activities near applicable warehouses would be subject to a project-level CEQA review.

Conclusion

Based upon these considerations, significant adverse aesthetics impacts are not expected from implementing the proposed project. Since no significant aesthetics impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
II. AGRICULTURE AND FORESTRY RESOURCES. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland mapping and Monitoring Program of the California Resources Agency, to non- agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Result in the loss of forest land or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Involve other changes in the existing environment which, due to their location or nature, could result in the conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Project-related impacts on agriculture and forest resources will be considered significant if any of the following conditions are met:

- The proposed project conflicts with existing zoning or agricultural use or Williamson Act contracts.
- The proposed project will convert prime farmland, unique farmland or farmland of statewide importance as shown on the maps prepared pursuant to the farmland mapping and monitoring program of the California Resources Agency, to non-agricultural use.
- The proposed project conflicts with existing zoning for, or causes rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined in Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g)).

- The proposed project would involve changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing NZE and ZE charging and fueling infrastructure and installing solar panels would be expected to have impacts to the topic of agriculture and forestry resources. As such, the following responses to the checklist questions limit the discussion to these activities.

II. a), b), c), d) & e) No Impact. Pursuant to the California Land Conservation Act of 1965, a Williamson Act Contract enables private landowners to voluntarily enter into contracts with local governments for the purpose of restricting specific parcels of land to agricultural or related open space use. In return, landowners receive lower property tax assessments based upon farming and open space uses as opposed to full market value.

Under PR 2305, existing warehouse operators and/or warehouse and fleet operators might replace (purchase and use) trucks with ZE and NZE trucks in order to earn a sufficient number of WAIRE Points to meet the WPCO. Other options to achieve the WPCO include installing ZE charging/fueling infrastructure, and installation of solar panels at existing warehouses. While construction of new warehouses is not required, the proposed project may involve the installation of ZE charging/refueling infrastructure near applicable warehouses. Improvements would continue to be subject to project-level review, including review of agricultural impacts under CEQA, as applicable. Therefore, implementation of the proposed project would not affect Prime Farmland, Unique Farmland, or Farmland of Statewide Importance or conflict with a Williamson Act contract if the proposed project is implemented.

Physical changes associated with PR 2305 will be at previously developed sites and would not warrant construction in undeveloped areas where agricultural and forest resources are more likely to occur. Therefore, PR 2305 would not conflict with existing zoning for, or cause rezoning of, forest land or timberland zoned Timberland Production. Additionally, the proposed project would not result in the loss of forest land or conversion of forest land to non-forest use.

Conclusion

Based upon these considerations, significant adverse agricultural and forest resources impacts are not expected from implementing the proposed project. Since no significant agriculture and forest resources impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
III. AIR QUALITY AND GREENHOUSE GAS EMISSIONS.				
Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Expose sensitive receptors to substantial pollutant concentrations?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Diminish an existing air quality rule or future compliance requirement resulting in a significant increase in air pollutant(s)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
f) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Significance Criteria

To determine whether or not air quality and greenhouse gas impacts from implementing the proposed project are significant, impacts will be evaluated and compared to the criteria in Table 2-2. The proposed project will be considered to have significant adverse impacts if any one of the thresholds in Table 2-2 are equaled or exceeded.

Table 2-2
South Coast AQMD Air Quality Significance Thresholds

Mass Daily Thresholds ^a		
Pollutant	Construction ^b	Operation ^c
NO _x	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM ₁₀	150 lbs/day	150 lbs/day
PM _{2.5}	55 lbs/day	55 lbs/day
SO _x	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day
Toxic Air Contaminants (TACs), Odor, and GHG Thresholds		
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 10 in 1 million Cancer Burden > 0.5 excess cancer cases (in areas ≥ 1 in 1 million) Chronic & Acute Hazard Index ≥ 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to South Coast AQMD Rule 402	
GHG	10,000 MT/yr CO ₂ eq for industrial facilities	
Ambient Air Quality Standards for Criteria Pollutants ^d		
NO ₂ 1-hour average annual arithmetic mean	South Coast AQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.03 ppm (state) and 0.0534 ppm (federal)	
PM ₁₀ 24-hour average annual average	10.4 µg/m ³ (construction) ^e & 2.5 µg/m ³ (operation) 1.0 µg/m ³	
PM _{2.5} 24-hour average	10.4 µg/m ³ (construction) ^e & 2.5 µg/m ³ (operation)	
SO ₂ 1-hour average 24-hour average	0.25 ppm (state) & 0.075 ppm (federal – 99 th percentile) 0.04 ppm (state)	
Sulfate 24-hour average	25 µg/m ³ (state)	
CO 1-hour average 8-hour average	South Coast AQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)	
Lead 30-day Average Rolling 3-month average	1.5 µg/m ³ (state) 0.15 µg/m ³ (federal)

^b Construction thresholds apply to both the South Coast Air Basin and Coachella Valley (Salton Sea and Mojave Desert Air Basins).

^c For Coachella Valley, the mass daily thresholds for operation are the same as the construction thresholds.

^d Ambient air quality thresholds for criteria pollutants based on South Coast AQMD Rule 1303, Table A-2 unless otherwise stated.

^e Ambient air quality threshold based on South Coast AQMD Rule 403.

KEY: lbs/day = pounds per day ppm = parts per million $\mu\text{g}/\text{m}^3$ = microgram per cubic meter \geq = greater than or equal to
 MT/yr CO₂eq = metric tons per year of CO₂ equivalents $>$ = greater than

Revision: April 2019

Discussion

All the activities identified in Table 2-1 would be expected to have impacts to the topic of air quality and greenhouse gas emissions. As such, the following responses to the checklist questions discuss these activities. Both construction and operational impacts are addressed as applicable.

III. a) No Impact. Warehouses subject to PR 2305 are located within the jurisdiction of South Coast AQMD. In March 2017, the South Coast AQMD approved the Final 2016 AQMP aimed at meeting the state and federal ambient air quality standards for ozone and PM_{2.5}. The key strategy set forward in the 2016 AQMP to meet air quality challenges in South Coast AQMD's jurisdiction is to reduce NO_x emissions sufficiently to meet the 8-hour ozone NAAQS deadlines. One of the critical control measures within the 2016 AQMP for reducing NO_x emissions included the development of a facility-based measure for warehouses (MOB-03). PR 2305 is the resulting proposed approach to satisfy that control measure. 2016 AQMP for reducing NO_x emissions included the development of a facility-based measure for warehouses (MOB-03). PR 2305 is the resulting proposed approach to satisfy that control measure.

Consistent with control measure MOB-03, PR 2305 is expected to reduce emissions associated with on- and off-road equipment operating at warehouses which in turn will contribute to attaining the state and federal ambient air quality standards. Thus, because PR 2305 implements control measure MOB-03 it is not expected to conflict or obstruct implementation of the 2016 AQMP. Therefore, implementing PR 2305 would not diminish an existing air quality rule or future compliance requirement, nor conflict with or obstruct implementation of the applicable air quality plan and this will not be discussed further in the Draft EA.

III. b), c) f), and g) Potentially Significant Impact. The following describes impacts from short-term construction activities and long-term operation of the proposed project.

Short-Term Construction-Related Air Quality Impact

Construction activities pursuant to PR 2305 would result in the generation of air pollutants from: 1) exhaust emissions from off-road diesel-powered construction equipment; 2) dust generated from site preparation, earthmoving, and other construction activities; 3) exhaust emissions from on-road vehicles and 4) off-gas emissions of volatile organic compounds (VOCs) from application of asphalt, paints, and coatings.

Construction activities related to new ZE charging/refueling infrastructure, solar panels, or community benefits projects (e.g., new HVAC systems to filter particulates) would occur at existing warehouses. Therefore, this impact is potentially significant and will be discussed in more detail in the Draft EA.

Long-Term Operation-Related Air Quality Impact

Additional analysis is required to identify the potential impacts associated with changes in truck fleet/type and associated emissions from implementation of PR 2305. Therefore, impacts associated with acquiring and using on-road NZE and ZE trucks, and acquiring and using ZE yard trucks is potentially significant and will be discussed in more detail in the Draft EA.

III. d) Less Than Significant. The threshold for an odor impact is if a project creates an odor nuisance pursuant to Rule 402 (Nuisance), which states:

“A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.”

The type of facilities that are considered to have objectionable odors include wastewater treatment plants, compost facilities, landfills, solid waste transfer stations, fiberglass manufacturing facilities, paint/coating operations (e.g., auto body shops), dairy farms, petroleum refineries, asphalt batch plants, chemical manufacturing, and food manufacturing facilities. The measures proposed by PR 2305 do not fall within the aforementioned land uses. Additionally, while PR 2305 may result in new infrastructure constructed to comply with some of the WAIRE Menu items at affected facilities, these facilities already operate diesel equipment and trucks. Regarding odors, currently, for all existing diesel-fueled equipment and vehicles, the diesel fuel is required to have a low sulfur content (e.g., 15 ppm by weight or less) in accordance with South Coast AQMD Rule 431.2 – Sulfur Content of Liquid Fuels¹³. Such fuel is expected to minimize odor. The proposed project has the potential to reduce use of diesel equipment and trucks onsite and reduce odors further. In the event that a facility elects to install EV chargers or solar energy systems to earn WAIRE points, operation of the new EV chargers or solar systems are not expected to generate any new odors because these devices are electric. Further, compliance with PR 2305 would mean that some odorous trucks and warehouse equipment would be electrified, such that the existing odor profiles at the affected facilities would be reduced. Thus, PR 2305 is not expected to create significant adverse objectionable odors during operation.

Additionally, emissions from construction equipment, such as diesel exhaust and volatile organic compounds from paving activities, might generate odors. However, these odors would be low in concentration, temporary, and are not expected to affect a substantial number of people. Any odors produced during the construction phase are not expected to be significant or highly objectionable and would be in compliance with Rule 402. Diesel fueled construction equipment would also comply with South Coast AQMD Rule 431.2 – Sulfur Content of Liquid Fuels, which is expected to minimize odor. The operation of construction equipment will occur within the confines of existing affected facilities. Dispersion of diesel emissions over distance generally occurs so that odors associated with diesel emissions may not be discernable to offsite receptors, depending on the location of the equipment and its distance relative to the nearest offsite receptor. Further, the diesel trucks that will be operated onsite will not be allowed to idle longer than five minutes per any one location in accordance with the CARB idling regulation, so odors from these vehicles would not be expected for a prolonged period of time. Therefore, the addition of several pieces of construction equipment and trucks that will operate intermittently, over a relatively short period of time, are not expected to generate diesel exhaust odor substantially greater than what is already typically present at the affected facilities.

Therefore, impacts would be less than significant, no mitigation measures are necessary, and this will not be discussed further in the Draft EA.

III. e) Less than Significant. The determination of whether a proposed project would diminish an existing air quality rule or future compliance requirement resulting in a significant increase in

¹³ South Coast AQMD, Rule 431.2 – Sulfur Content of Liquid Fuels, September 15, 2000.
<http://www.aqmd.gov/docs/defaultsource/rule-book/rule-iv/rule-431-2.pdf>

air pollutant(s) is dependent on construction and operational activities associated with the PR 2305. While PR 2305 does not contain any requirements for warehouses to build infrastructure to comply with the WAIRE program, some WAIRE Menu items may be expected to cause existing warehouses to make physical modifications that may require some construction activities as well as operational changes, once construction is completed. However, all construction activities would abide by local and regional regulations and PR 2305 is expected to reduce operational emissions associated with emission sources operating in and out of warehouse distribution centers. Therefore, development pursuant to PR 2305 is not expected to diminish an existing air quality rule or future compliance requirement or result in a significant increase in air pollutant(s). Impacts would be less than significant, and this will not be discussed further in the Draft EA.

Conclusion

Based upon these considerations, significant construction related air quality and GHG emissions impacts may occur from the installation of ZE charging/refueling infrastructure, solar panels, or community benefits projects (e.g., new HVAC systems to filter particulates). Significant operational impacts may also arise from using on-road NZE and ZE trucks and ZE yard trucks. These impacts will be further analyzed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES.				
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Impacts on biological resources will be considered significant if any of the following criteria apply:

- The project results in a loss of plant communities or animal habitat considered to be rare, threatened or endangered by federal, state or local agencies.
- The project interferes substantially with the movement of any resident or migratory wildlife species.
- The project adversely affects aquatic communities through construction or operation of the project.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing and using NZE and ZE charging and fueling infrastructure and installing and using solar panels would be expected to have impacts to the topic of biological resources. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

IV. a), b), c), d), e) & f) No Impact. PR 2305 would offer several compliance options that facilities could implement to reduce emissions from warehouses to achieve the WPCO. PR 2305 would not require or induce new warehouse development however; PR 2305 might result in the onsite installation of ZE charging/fueling infrastructure and solar panels. Warehouse sites have already been disturbed and typically do not contain open space, water features, or natural vegetation. Sites might contain landscaping that consist of ornamental trees and turf. The sites of the affected facilities that would be subject to PR 2305 currently do not support riparian habitat, federally protected wetlands, or migratory corridors because they are existing developed and established facilities currently used for industrial, manufacturing, or warehouse purposes. Additionally, special status plants, animals, or natural communities identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service are not expected to be found on or in close proximity to the affected facilities because the affected facilities are in existing industrial, commercial or mixed land use areas. Further, activities resulting from the compliance of the proposed project would be subject to project-level review, including review of biological impacts under CEQA, as applicable. Any offsite installation of ZE charging/refueling infrastructure near applicable warehouses would also be subject to a project-level CEQA review.

Additionally, PR 2305 would not conflict with any adopted Habitat Conservation Plan, Natural Community Conservation Plan, or any other relevant habitat conservation plan, and would not create divisions in any existing communities because onsite activities associated with complying with PR 2305 would occur at existing facilities in previously disturbed areas which are not typically subject to Habitat or Natural Community Conservation Plans. Any offsite installation of ZE charging/refueling infrastructure near applicable warehouses would also be subject to a project-level CEQA review.

Conclusion

Based upon these considerations, significant biological resource impacts are not expected from implementing the proposed project. Since no significant biological resource impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
V. CULTURAL AND TRIBAL CULTURAL RESOURCES.				
Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 21074, as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is either:				
• Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
• A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in Public Resources Code Section 5024.1(c)? (In applying the criteria set forth in Public Resources Code Section 5024.1(c), the lead agency shall consider the significance of the resource to a California Native American tribe.)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Impacts to cultural resources will be considered significant if:

- The project results in the disturbance of a significant prehistoric or historic archaeological site or a property of historic or cultural significance, or tribal cultural significance to a community or ethnic or social group or a California Native American tribe.
- Unique resources or objects with cultural value to a California Native American tribe are present that could be disturbed by construction of the proposed project.
- The project would disturb human remains.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing and using NZE and ZE charging and fueling infrastructure and installing and using solar panels would be expected to have impacts to the topic of cultural resources. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

V. a) No Impact. Existing laws are in place to protect and mitigate potential impacts to cultural resources. For example, CEQA Guidelines state that generally, a resource shall be considered “historically significant” if the resource meets the criteria for listing in the California Register of Historical Resources, which include the following:

- Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
- Is associated with the lives of persons important in our past;
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values;
- Has yielded or may be likely to yield information important in prehistory or history (CEQA Guidelines Section 15064.5).

Buildings, structures, and other potential culturally significant resources that are less than 50 years old are generally excluded from listing in the National Register of Historic Places, unless they are shown to be exceptionally important. Any of the buildings or structures that may be affected by PR 2305 that are older than 50 years are buildings that are currently utilized for manufacturing or warehousing purposes and would generally not be considered historically significant since they would not have any of the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values. Further, historic resources generally consist of buildings, structures, improvements, and remnants associated with a significant historic event or person(s) and/or have a historically significant style, design, or achievement. Damaging or demolition of historic resources is typically considered to be a significant impact. Impacts to historic resources can occur through direct impacts, such as destruction or removal, and indirect impacts, such as a change in the setting of a historic resource. Any projects pursuant to PR 2305 would occur at or near existing warehouses. Warehouses are generally not historic resources and are not located in historic districts. Additionally, the proposed project would not result in demolition of existing warehouses. Minor modifications to the existing structures to support EV charging equipment, solar panels, and/or natural gas fueling equipment. Construction pursuant to PR 2305 would need to obtain city or county planning department approvals prior to commencement of any construction activities and would be subject to project-level review, including review of historic impacts under CEQA, if

applicable. Therefore, PR 2305 is not expected to cause any impacts to significant historic cultural resources.

V. b) & c) Less Than Significant Impact. Archaeological sites are locations that contain resources associated with former human activities, and might contain such resources as human skeletal remains, waste from tool manufacture, tool concentrations, and/or discoloration or accumulation of soil or food remains. Construction activities associated with the proposed project, such as installation of EV charging stations and solar panels, would occur at warehouse sites that have been previously disturbed. The type of construction that could occur on applicable existing warehouses would not require excavation that goes beyond currently disturbed ground cover. However, for the installation of ZE charging/refueling infrastructure near warehouse sites, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface or to disturb human remains including those interred outside of dedicated cemeteries. Activities that result from compliance with the proposed project would be subject to project-level review, including review of cultural impacts under CEQA, as applicable.

Construction-related activities are expected to be confined within the existing footprint of the affected facilities that have already been fully developed and paved, PR 2305 is not expected to require physical changes to the environment which may disturb paleontological or archaeological resources. Furthermore, in the event that human remains are discovered during any future grading or other ground disturbing activities, the proposed activities would be required to comply with the applicable provisions of Health and Safety Code Section 7050.5 as well as Public Resources Code Section 5097 et. seq. Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin. Pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made by the Coroner.

If the Coroner determines the remains to be Native American, the California Native American Heritage Commission (NAHC) must be contacted and the NAHC must then immediately notify the “most likely descendant(s)” of receiving notification of the discovery. The most likely descendant(s) shall then make recommendations within 48 hours and engage in consultations concerning the treatment of the remains as provided in Public Resources Code Section 5097.98. PR 2305 would result in replacement of heavy-duty trucks and installation and/or replacement of structures, equipment, and infrastructure at or near warehouses. No physical changes to roadways will occur and the only new offsite structures might include ZE charging/refueling infrastructure near applicable warehouses. Offsite activities that result from compliance with the proposed project would be subject to project-level review, including review of agricultural impacts under CEQA, as applicable.

As such, the proposed project will not cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5 or disturb any human remains, including those interred outside of formal cemeteries. Impacts would be less than significant.

V. d) Less Than Significant Impact. Refer to section V.a above, since warehouses are not historic resources and are not located in historic districts changes made at or near warehouses would not cause a substantial adverse change in the significance of a historical resource. Furthermore, as part of releasing this CEQA document for public review and comment, the South Coast AQMD also provided a formal notice of the proposed project to all California Native American Tribes (Tribes)

that requested to be on the Native American Heritage Commission's (NAHC) notification list per Public Resources Code Section 21080.3.1(b)(1). The NAHC notification list provides a 30-day period during which a Tribe may respond to the formal notice, in writing, requesting consultation on the proposed project.

In the event that a Tribe submits a written request for consultation during this 30-day period, the South Coast AQMD will initiate a consultation with the Tribe within 30 days of receiving the request in accordance with Public Resources Code Section 21080.3.1(b). Consultation ends when either: 1) both parties agree to measures to avoid or mitigate a significant effect on a Tribal Cultural Resource and agreed upon mitigation measures shall be recommended for inclusion in the environmental document [see Public Resources Code Section 21082.3(a)]; or, 2) either party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. [Public Resources Code Section 21080.3.2(b)(1)-(2) and Section 21080.3.1(b)(1)].

Furthermore, the provisions of CEQA, Public Resources Code Sections 21080.3.1 et seq. (also known as AB 52), requires meaningful consultation with California Native American Tribes on potential impacts to tribal cultural resources, as defined in Public Resources Code Section 21074. Tribal cultural resources are sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either eligible or listed in the California Register of Historical Resources or local register of historical resources (CNRA 2018). As part of the AB 52 process, Native American tribes must submit a written request to the relevant lead agency if it wishes to be notified of projects that require CEQA public noticing and are within its traditionally and culturally affiliated geographical area.

Construction resulting from PR 2305 would need to obtain city or county planning department approvals prior to commencement of any construction activities and would be subject to project-level review, including separate tribal consultation under AB 52, as applicable, to address site-specific requests identified by the tribes. Therefore, impacts to tribal cultural resources are less than significant.

Conclusion

Based upon these considerations, significant adverse cultural resources impacts are not expected from implementing the proposed project. Since no significant cultural and tribal cultural resources impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
VI. ENERGY. Would the project:				
a) Conflict with or obstruct adopted energy conservation plans, a state or local plan for renewable energy, or energy efficiency?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Result in the need for new or substantially altered power or natural gas utility systems?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Create any significant effects on local or regional energy supplies and on requirements for additional energy?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Create any significant effects on peak and base period demands for electricity and other forms of energy?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Comply with existing energy standards?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
f) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
g) Require or result in the relocation or construction of new or expanded electric power, natural gas or telecommunication facilities, the construction or relocation of which could cause significant environmental effects?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Significance Criteria

Impacts to energy resources will be considered significant if any of the following criteria are met:

- The project conflicts with adopted energy conservation plans or standards.
- The project results in substantial depletion of existing energy resource supplies.
- An increase in demand for utilities impacts the current capacities of the electric and natural gas utilities.
- The project uses energy resources in a wasteful and/or inefficient manner.

Discussion

All the activities identified in Table 2-1 would be expected to have impacts to the topic of energy. As such, the following responses to the checklist questions discuss these activities. Both construction and operational impacts are addressed as applicable.

VI. a), e), & f) Less than Significant. PR 2305 does not require any action which would result in any conflict with an adopted energy conservation or efficiency plan or result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. Any existing or future facilities that implement the requirements of PR2305 would be expected to continue implementing any existing energy conservation plans that are currently in place regardless of whether the proposed project is implemented.

Additionally, PR 2305 does not require any measures which would conflict with a state or local plan for renewable energy. Renewable energy sources include wind, small hydropower, solar, geothermal, biomass, and biogas. The California Renewables Portfolio Standard (RPS) was established in 2002 under Senate Bill 1078 (SB 1078) and was amended in 2006 and 2011. The RPS program requires investor-owned utilities, electric service providers, and community choice aggregators to increase the use of eligible renewable energy resources to 33 percent of total procurement by 2020. Executive Order S-14-08, signed in November 2008, expanded the state's RPS to 33 percent renewable power by 2020. This standard was adopted by the legislature in 2011 (SB X1-2). SB 350, de Leon was signed into law September 2015 and establishes tiered increases to the RPS. SB 350 requires renewable energy resources of 40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. SB 350 also set a new goal to double the energy-efficiency savings in electricity and natural gas through energy efficiency and conservation measures. On September 10, 2018, Governor Brown signed SB 100, which raises California's RPS requirements to 60 percent by 2030, with interim targets, and 100 percent by 2045. The bill also establishes a state policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all state agencies by December 31, 2045. Under SB 100 the state cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target. Electricity production from renewable sources is generally considered carbon neutral. WAIRE Menu options include solar panels and storage. Therefore, the proposed project would not obstruct a state or local plan for renewable energy.

VI. b), c), d) & g) Potentially Significant Impact.

Construction

Construction activities pursuant to PR 2305 would consume energy, in the short term, due to gasoline and/or diesel fuel and electricity consumed by construction vehicles and equipment. Construction activities may require the use of energy-consuming construction equipment for grading, hauling, and building activity. Electricity use during construction activities is expected to vary depending on which phase of construction is occurring—with the majority of construction-related energy consumption resulting from fossil fuel use such as gasoline or diesel fuel occurring during activities such as grading and the majority of electricity use occurring during the later construction phases which may require more electric powered equipment. The use of electricity during construction would be temporary and would fluctuate according to the phase of construction. Furthermore, construction pursuant to PR 2305 would need to obtain city or county planning department approvals prior to commencement of any construction activities and would

be subject to project-level review, including review of energy impacts under CEQA, if applicable. Therefore, impacts from construction vehicles and equipment are assumed to be less than significant and will not be discussed further in the EA.

Construction transportation energy use depends on the type of vehicle, number of trips, vehicle miles traveled, fuel efficiency of vehicles, and travel mode. Transportation energy use during construction activities is derived from the use of gasoline and diesel fuel consumption required to operate vendor trucks that provide deliveries of equipment and building materials, as well as worker vehicles as they commute to construction sites. Construction transportation energy could be potentially significant and will be discussed further in the EA.

Operation

Once construction is completed, operation of projects implemented by owners and operators of warehouses pursuant to PR 2305 could create additional demands for electricity, hydrogen, and natural gas compared to existing conditions. In addition, warehouse operators and owners may comply with PR 2305 by installing solar panels which would reduce the need for additional energy resources from local utilities.

The proposed measures pursuant to PR 2305 would result in an increase in electricity, hydrogen, and/or natural gas consumption during the operational phase. Electricity, hydrogen, and natural gas would be used to charge and fuel trucks, TRUs, and cargo handling equipment (CHE). Implementation of PR 2305 would also result in an energy penalty from the use of HEPA filters. Existing warehouses would be expected to comply with existing energy regulations in accordance with existing standards and additional requirements in local zoning codes. During the local land use permit process, the project proponent might be required by the local jurisdiction or energy utility to undertake a site-specific CEQA analysis to determine the impacts, if any, associated with the siting and construction of new infrastructure to support the electricity, hydrogen, or natural gas demands of the WAIRE Menu options needed to achieve the WPCO.

Pursuant to PR 2305 warehouses may choose to switch to ZE or NZE trucks and ZE truck yards, or use NZE and ZE charging and fueling infrastructure and as such would require more electricity or natural gas and may warrant additional infrastructure to service warehouses that utilize solar energy systems for WAIRE Points to achieve their WPCO. Therefore, this impact is potentially significant and will be discussed in more details in the Draft EA.

Conclusion

Based upon these considerations, significant impacts from energy use for construction related trips may occur. Significant operational impacts may also arise from using on-road NZE and ZE trucks and ZE yard trucks and installing NZE and ZE charging and fueling stations. These impacts will be further analyzed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
VII. GEOLOGY AND SOILS. Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
• Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
• Strong seismic ground shaking?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
• Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
• Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Directly or indirectly destroy a unique paleontological resource or site or unique geological feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Significance Criteria

Impacts on the geological environment will be considered significant if any of the following criteria apply:

- Topographic alterations would result in significant changes, disruptions, displacement, excavation, compaction or over covering of large amounts of soil.
- Unique geological resources (paleontological resources or unique outcrops) are present that could be disturbed by the construction of the proposed project.
- Exposure of people or structures to major geologic hazards such as earthquake surface rupture, ground shaking, liquefaction or landslides.
- Secondary seismic effects could occur which could damage facility structures, e.g., liquefaction.
- Other geological hazards exist which could adversely affect the facility, e.g., landslides, mudslides.
- Unique paleontological resources or sites or unique geologic features are present that could be directly or indirectly destroyed by the proposed project.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing and using NZE and ZE charging and fueling infrastructure and installing and using solar panels would be expected to have impacts to the topic of geology and soils. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

VII. a) Less Than Significant Impact. The Alquist-Priolo Earthquake Fault Zoning Act was passed in 1972 to mitigate the hazard of surface faulting to structures for human occupancy. Surface rupture is the most easily avoided seismic hazard. Fault rupture generally occurs within 50 feet of an active fault line and is limited to the immediate area of the fault zone where the fault breaks along the surface. The main purpose of the Alquist-Priolo Earthquake Fault Zoning Act is to prevent construction of buildings used for human occupancy on the surface of active faults, in order to minimize the hazard of surface rupture of a fault to people and habitable buildings. Before cities and counties can permit development within Alquist-Priolo Earthquake Fault Zones, geologic investigations are required to show that a proposed development site is not threatened by surface rupture from future earthquakes. Therefore, any future project development near existing warehouses would not subject people or structures to hazards arising from surface rupture of a known active fault.

The most significant geologic hazard to the design life of any project associated with PR 2305 is the potential for moderate to strong ground shaking resulting from earthquakes generated on the faults in seismically active southern California. It is anticipated that future projects would likely be subject to strong ground shaking due to earthquakes on nearby faults. The intensity of ground shaking would depend on the magnitude of the earthquake, distance to the epicenter, and the geology of the area between the epicenter and the project sites. However, the warehouses affected by PR 2305 are not at a greater risk of seismic activity or impacts than other sites in southern California.

The California Building Code (CBC; California Code of Regulations, Title 24, Part 2) contains provisions to safeguard against major structural failures or loss of life caused by earthquakes or other geologic hazards. The CBC contains provisions for earthquake safety based on factors including the types of soil and rock onsite, and the strength of ground motion with specified

probability of occurring at the site. Additionally, Section 1803.2 of the 2019 CBC, requires a geotechnical investigation that must evaluate soil classification, slope stability, soil strength, position and adequacy of load-bearing soils, the effect of moisture variation on soil-bearing capacity, compressibility, liquefaction, and expansiveness, as necessary. The geotechnical investigation must be prepared by registered professionals (i.e., California Registered Civil Engineer or Certified Engineering Geologist). Recommendations of the report pertaining to structural design and construction recommendations for earthwork, grading, slopes, foundations, pavements, and other necessary geologic and seismic considerations must be incorporated into the design and construction of the proposed project. PR 2305 does not cause or require new warehouses to be constructed, however owners or operators of warehouses may choose WAIRE Menu items that would result in construction activities. These activities would be required to adhere to the provisions of the CBC. Compliance with the requirements of the CBC for structural safety during a seismic event would reduce hazards from strong seismic ground shaking to less than significant.

Liquefaction is a phenomenon that occurs when soil undergoes a transformation from a solid state to a liquified condition. It refers to loose, saturated sand or silt deposits that behave as a liquid and lose their load-supporting capability when strongly shaken. Loose granular soils and silts that are saturated by relatively shallow groundwater are susceptible to liquefaction. When subjected to seismic ground shaking, affected soils lose strength during liquefaction and foundation failure can occur. Landslides are the downslope movement of geologic materials. Slope failures in the form of landslides are common during strong seismic shaking in areas of steep hills.

Installation of ZE charging/fueling infrastructure and solar panels may require a geotechnical investigation, as required by the CBC, to evaluate geohazards, like liquefaction potential of underlying soils. For such facilities that would be installed onsite at existing warehouses, a geotechnical investigation would already be available. Grading, design, and construction work would conform with the recommended design parameters of the geotechnical investigation. Cities and counties would impose the recommended design parameters as a condition of any required planning approval, and compliance would be ensured through plan checks and development review processes. Compliance with the requirements of the CBC would reduce hazards from liquefaction and landslides to less than significant.

VII. b) Less Than Significant Impact. Erosion is the movement of rock and soil from place to place and is a natural process. Common agents of erosion include wind and flowing water. Significant erosion typically occurs on steep slopes where stormwater and high winds can carry topsoil down hillsides. Erosion can be increased greatly by earthmoving activities if erosion-control measures are not used.

Installation of ZE charging/refueling infrastructure and solar panels, subsequent to adoption of PR 2305 could involve excavation, grading, and construction activities that would disturb soil and leave exposed soil on the ground surface. Soil erosion at construction sites could be caused by water, wind, or vehicles tracking soil offsite. However, projects that occur as a result of PR 2305 would have a small construction footprint, and would be subject to local, regional, and state codes and requirements for erosion control and grading during construction. Projects would be subject to the National Pollution Discharge Elimination System (NPDES) permitting regulations, including the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) as applicable. Construction contractors would be required to prepare and implement a SWPPP and associated Best Management Practices (BMPs) in compliance with the Construction

General Permit (CGP) during grading and construction of any site that disturbs more than one acre of land. Adherence to the BMPs in the SWPPP and adherence with local, regional, and state codes and requirements for erosion control and grading during construction would reduce, prevent, or minimize soil erosion from grading and construction activities. Therefore, soil erosion impacts would be less than significant.

VII. c) & d) Less Than Significant Impact. Hazards from liquefaction and lateral spreading are addressed above in VII.a. As concluded in that section, impacts would be less than significant, and no mitigation measures are necessary. Following is a discussion of the potential impacts resulting from other geologic and soil conditions.

Lateral Spreading

Lateral spreading is a phenomenon that occurs in association with liquefaction and includes the movement of non-liquefied soil materials.

Subsidence

The major cause of ground subsidence is the excessive withdrawal of groundwater. Soils with high silt or clay content are particularly susceptible to subsidence.

Expansive Soils

Expansive soils shrink or swell as the moisture content decreases or increases; the shrinking or swelling can shift, crack, or break structures built on such soils.

Geotechnical investigations, as required by the CBC, evaluate the potential for adverse impacts from lateral spreading, subsidence, and expansive soils and propose appropriate site design measures. If required to comply with PR 2305, all grading, design, and construction work would conform with the recommended design parameters of a geotechnical investigation. Cities and Counties would impose the recommended design parameters as a condition of any required planning approval, and compliance would be ensured through plan checks and development review processes. Compliance with the requirements of the CBC would reduce hazards to less than significant.

VII. e) No Impact. Implementation of PR 2305 would not involve the use of septic tanks or other alternative wastewater disposal systems since each affected warehouse would be expected to have an existing sewer system. Therefore, the implementation of PR 2305 will not adversely affect soils associated with installing a new septic system or alternative wastewater disposal system or modifying an existing sewer. Thus, no impact would occur, and no mitigation measures are necessary.

VII. f) Less Than Significant Impact. Paleontological resources, commonly known as fossils, are the recognizable physical remains or evidence of past life forms found on earth in past geological periods — and can include bones, shells, leaves, tracks, burrows, and impressions. Ground-disturbing activities such as grading, or excavation have the potential to unearth paleontological resources that might underly a site. However, PR 2305 would only result in construction activities where owners or operators of warehouses choose certain WAIRE Menu items for onsite improvements (e.g., solar panels, ZE/ZNE charging infrastructure). These WAIRE Menu items are unlikely to require substantial soil excavation underneath the existing footings and would be located on already disturbed and developed industrial settings; and therefore, no

significant impact would occur. Further, projects implemented as a result of PR 2305 would be subject to project-level review, including review of paleontological impacts under CEQA, as applicable. Therefore, PR 2305 is not expected to directly or indirectly destroy a unique paleontological resource or site or unique geological feature.

Conclusion

Based upon these considerations, significant adverse geology and soils impacts are not expected from the implementation of PR 2305. Since no significant geology and soils impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
VIII. HAZARDS AND HAZARDOUS MATERIALS. Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions, or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Significantly increased fire hazard in areas with flammable materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Significance Criteria

Impacts associated with hazards will be considered significant if any of the following occur:

- Non-compliance with any applicable design code or regulation.
- Non-conformance to National Fire Protection Association standards.
- Non-conformance to regulations or generally accepted industry practices related to operating policy and procedures concerning the design, construction, security, leak detection, spill containment or fire protection.
- Exposure to hazardous chemicals in concentrations equal to or greater than the Emergency Response Planning Guideline (ERPG) 2 levels.

Discussion

The term “hazardous material” can be defined in different ways. For purposes of this environmental document, the definition of “hazardous material” is the one outlined in the Health and Safety Code, Section 25501:

Hazardous materials that, because of their quantity, concentration, or physical or chemical characteristics, pose a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, and any material that a handler or the unified program agency has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.

“Hazardous waste” is a subset of hazardous materials, and the definition is essentially the same as in the Health and Safety Code, Section 25117, and in the California Code of Regulations, Title 22, Section 66261.2:

Hazardous wastes are those that, because of their quantity, concentration, or physical, chemical, or infectious characteristics, may either cause, or significantly contribute to an increase in mortality or an increase in serious illness, or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed.

Hazardous materials can be categorized as hazardous nonradioactive chemical materials, radioactive materials, and biohazardous materials (infectious agents such as microorganisms, bacteria, molds, parasites, viruses, and medical waste).

Exposure of the public or the environment to hazardous materials could occur through but not limited to the following means: improper handling or use of hazardous materials or waste, particularly by untrained personnel; transportation accident; environmentally unsound disposal methods; and/or fire, explosion, or other emergencies. The severity of potential effects varies with the activity conducted, the concentration and type of hazardous material or wastes present, and the proximity of sensitive receptors.

All the activities identified in Table 2-1 would be expected to have impacts to the topic of hazards and hazardous wastes. As such, the following responses to the checklist questions discuss these activities. Both construction and operational impacts are addressed as applicable.

VIII. a), b) & c) Less than Significant. PR 2305 has been developed to reduce local and regional emissions, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses. Affected owners and operators of warehouses are expected to comply with the rule by earning WAIRE points through the selection and implementation of WAIRE Menu items such as onsite solar panels or installing charging and refueling ZE and NZE infrastructure. The proposed project does not cause or require owners or operators of warehouses to select WAIRE Menu items that require construction; however, owners or operators of warehouses may choose to comply with PR 2305 by selecting WAIRE Menu items that require minor construction. Any construction activities that occur as a result of PR 2305 are expected to be minor and are not expected to generate additional hazards at the affected warehouses. Operational activities could involve the use and disposal of batteries, associated with ZE trucks, ZE yard trucks, and solar panels. The operational phase could also involve the use and disposal of air filters. Furthermore, the use of ZE or NZE trucks and installation of ZE or NZE refueling stations could involve the use of natural gas or hydrogen fuel. However, these hazardous materials are not expected to create a new significant hazard to the public or environment. The following is a discussion of potential hazards and hazardous materials impacts that could occur during construction and operation as a result of implementing PR 2305.

Construction

Construction activities associated with onsite and near site installations of structures, equipment, and infrastructure could involve the use of hazardous materials. If construction activities occur at affected warehouses, those activities could involve use of hazardous materials including cleansers and degreasers; fluids used in routine maintenance and operation of construction equipment, such as oil and lubricants; and architectural coatings including paints. However, if any hazardous materials are used during construction the use, storage, transportation, and management of such hazardous materials and wastes would be regulated by federal, state, and local laws and would not be in such quantities or stored in such a manner as to pose a significant safety hazard. Further, construction activities would be temporary and are expected to cease upon completion.

For example, all spills or leakage of petroleum products during construction activities are required to be immediately contained, the hazardous material identified, and the material remediated in compliance with applicable state and local regulations for the cleanup and disposal of that contaminant.

For the reasons described above, impacts to the public, the environment, or nearby schools through the routine use and transport of hazardous materials, or reasonably foreseeable upset conditions involving the release of hazardous materials into the environment during construction are expected to be less than significant.

Operation

Implementation of PR 2305 may result in hazards and hazardous materials operational impacts due to: 1) the installation and/or use of ZE charging/refueling infrastructure, such as natural gas or hydrogen fuel, which may require preparation of a hazardous materials business plan if fuels are stored onsite in substantial quantities¹⁴; 2) acquiring and/or using on-road NZE trucks and the

¹⁴ State of California, California Code, Health and Safety Code - § 25507, January 1, 2019, Section 4.3.4.2, Use of Alternative Fuels, pages 4.3-17 through 4.3-29.

http://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?lawCode=HSC§ionNum=25507

associated increase demand for alternative fuels; 3) an increase in the number of battery-powered trucks and yard trucks powered by lithium batteries, which are regulated as a hazardous material; 4) batteries associated with the use of solar panels; and 4) maintenance and replacement of community based air filters/filtration systems.

The March 2017 Final Program EIR for the 2016 Air Quality Management Plan analyzed control measure MOB-03, *Emission Reductions at Warehouse Distribution Centers*, and dismissed impacts associated with the routine transport, use, or disposal of alternative fuels and batteries and impacts associated with the reasonably foreseeable upset and accident conditions involving the release of these hazardous materials into the environment.¹⁵

The use and transport of alternative fuels and batteries associated with installing and/or using ZE charging/refueling infrastructure, the increased use of NZE vehicles, and the increased use of battery-powered trucks and yard trucks as part of implementing the proposed project is consistent with the analysis in the March 2017 Final Program EIR as shown in Section 4.3.4.2, *Use of Alternative Fuels*, and Section 4.3.4.7, *Transport Hazards*, of this report.

The March 2017 Final Program EIR includes various existing regulations and recommended safety procedures that, when employed, will reduce hazards impacts associated with the use of alternative clean fuels and batteries when compared to conventional fuels (see Table 4.3-5, *Summary of Hazards and Existing Safety Regulations/Procedures Associated with Alternative Fuels*, of the March 2017 Final Program EIR). Consistent with the analysis in the March 2017 Final Program EIR, when users of alternative fuels and batteries comply with existing regulations and recommended safety procedures, hazards impacts from activities as a result of the proposed project are expected to be the same or less than those of conventional fuels.

Additionally, the use of alternative fuels and batteries requires additional knowledge and training of emergency responders and owners/operators of charging/fueling stations. Further, as use of alternative fuels and batteries increases, the use of conventional fuels such as gasoline and diesel will decline. As a result, explosion and flammability hazards associated with conventional fuels will also decline. Furthermore, hazards and hazardous clean-up associated with accidental releases of conventional fuels, especially diesel, are reduced with increasing use of alternative fuels. The March 2017 Final Program EIR also found that hazards associated with the transportation of the alternative fuels would not be a significant risk factor.¹⁶

Operations would also involve the use of small amounts of hazardous materials, such as cleansers, paints, degreasers, adhesive, and sealers for cleaning and maintenance purposes. Operations would also generate small amounts of hazardous waste from the maintenance and replacement of community based air filters/filtration systems and the maintenance and replacement of batteries for solar panels. The use, storage, transport, and disposal of hazardous materials would be governed by existing regulations of several agencies, including the U.S. EPA, US Department of Transportation, the California Regional Water Quality Control Board, California Division of Occupational Safety and Health, and local or regional environmental health departments and fire departments. Strict adherence to all local and regional emergency response plan requirements would also be required. Furthermore, warehouse owners or operators would be required to provide

¹⁵ South Coast AQMD, Final Program Environmental Impact Report for the 2016 Air Quality Management Plan, March 2017. <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfpeir.pdf?sfvrsn=10>

¹⁶ State of California, California Code, Health and Safety Code - § 25507, January 1, 2019. http://leginfo.ca.gov/faces/codes_displaySection.xhtml?lawCode=HSC§ionNum=25507

workers with training on safe use, handling, and storage of hazardous materials and would maintain equipment and supplies for containing and cleaning up spills of hazardous materials that could be safely contained and cleaned by onsite workers.

For the reasons described above, impacts to the public or environment through the continued routine operations at warehouses are expected to be less than significant.

VIII. d) Less Than Significant Impact. Implementation of PR 2305 might include the installation of ZE charging/refueling infrastructure, and solar panels on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 such as a leaking underground storage tank site, cleanup program sites, hazardous waste sites, and brownfield sites.

Remediation of such sites prior to development would comply with the following federal, State, local laws and regulations:

- **Transportation of Hazardous Waste.** Hazardous materials and hazardous wastes will be transported to and/or from the projects developed pursuant to regulation XXIII in compliance with the U.S. Department of Transportation regulations listed in the Code of Federal Regulations (Title 49, Hazardous Materials Transportation Act); California Department of Transportation standards; and the California Occupational Safety and Health Administration standards.
- **Resource Conservation and Recovery Act.** Hazardous waste generation, transportation, treatment, storage, and disposal will be conducted in compliance with the Subtitle C of the Resource Conservation and Recovery Act (RCRA) (Code of Federal Regulations, Title 40, Part 263), including the management of nonhazardous solid wastes and underground tanks storing petroleum and other hazardous substances. Designated Certified Unified Program Agencies would implement state and federal regulations for the following programs: (1) Hazardous Materials Release Response Plans and Inventory Program, (2) California Accidental Release Prevention Program, (3) Aboveground Petroleum Storage Act Program, and (4) Underground Storage Tank Program (5) Hazardous Waste Generator and Onsite Hazardous Waste Treatment Programs (6) Hazardous Materials Management Plan and Hazardous Material Inventory Statement Program.
- **California UST Regulations.** Underground storage tank (UST) repairs and/or removals will be conducted in accordance with the California UST Regulations (Title 23, Chapter 16 of the California Code of Regulations). Any unauthorized release of hazardous materials will require release reporting, initial abatement, and corrective actions that will be completed with oversight from the Regional Water Quality Control Board, Department of Toxic Substances Control, Fire Protection Districts, South Coast AQMD, and/or other regulatory agencies, as necessary.
- **Requirements for Phase I Environmental Site Assessments.** Phase I Environmental Site Assessments are required for land purchasers to qualify for the Innocent Landowner Defense under Comprehensive Environmental Response, Compensation, and Liability Act, to minimize environmental liability under other laws such as RCRA, and as a lender prerequisite to extend a loan for purchase of land.

- **Volatile Organic Compound Emissions.** South Coast AQMD's Rule 1166, *Volatile Organic Compound Emissions from Decontamination of Soil*, establishes requirements to control the emission of VOCs from excavating, grading, handling, and treating soil contaminated from leakage, spillage, or other means of VOCs deposition. Rule 1166 stipulates that any parties planning on excavating, grading, handling, transporting, or treating soils contaminated with VOCs must first apply for and obtain, and operate pursuant to, a mitigation plan prior to commencement of operation. Best available control technology is required during all phases of remediation of soil contaminated with VOCs. Rule 1166 also sets forth testing, record keeping and reporting procedures that must be followed at all times. Non-compliance with Rule 1166 can result in the revocation of the approved mitigation plan, the owner and/or the operator being served with a Notice of Violation for creating a public nuisance, or an order to halt the offending operation until the public nuisance is mitigated.
- **Earth Moving Activities of Soils Contaminated by Toxic Air Contaminants.** South Coast AQMD's Rule 1466, *Control of Particulate Emissions from Soils with Toxic Air Contaminants*, applies to any owner or operator conducting earth-moving activities of soil with applicable toxic air contaminant(s) as defined in paragraph (c)(15) of the rule that have been identified as contaminant(s) of concern at a site. The provisions in Rule 1466 include ambient PM10 monitoring, dust control measures, notification, signage, and recordkeeping requirements. The rule does not apply to earth-moving activities of soil with applicable toxic air contaminant(s) of less than 50 cubic yards.

Installation of equipment such as solar panels would not require ground disturbance underneath the current foundations. However, installation of ZE charging/refueling infrastructure could require grading activities, which may or may not require excavations underneath the current foundations. Excavation is expected to be minimal and would be associated with the installation of conduits, foundations for infrastructure, or underground storage tank. However, the installation of ZE charging/refueling infrastructure is not expected to exacerbate existing hazards since construction activities would be managed to minimize disturbance onsite, in accordance with applicable federal, state, and local rules and regulations. Projects that would require a grading permit prior to installation of ZE charging/fueling infrastructure would be subject to local regulations. Activities resulting from the compliance of the proposed project would also be subject to project-level review, including review of hazard impacts under CEQA, as applicable. Therefore, significant hazards from sites that might be included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 would be less than significant.

VIII. e) No Impact. The State Aeronautics Act of the California Public Utilities Code establishes statewide requirements for the airport land use compatibility planning and requires nearly every county to create an Airport Land Use Commission or an alternative process with a designated responsible agency or agencies. The main goal of the Airport Land Use Commission (ALUC) or designated responsible agency is to protect the public health, safety and welfare by ensuring the orderly expansion of airports and the adoption of land use measures that minimize the public's exposure to extensive noise and safety hazards within areas around airports. Compatibility issues are identified and analyzed in Airport Land Use Compatibility Plans for each airport, as applicable, and implementation of these plans promotes compatible development around the airports. ALUCs and/or designated responsible agencies would review land use compatibility issues for any projects

pursuant to PR 2305 that are within airport safety zones including safety, noise, overflight and airspace protection.

Furthermore, Federal Aviation Administration regulation, 14 CFR Part 77 – *Safe, Efficient Use and Preservation of the Navigable Airspace*, provides information regarding the types of projects that may affect navigable airspace. Projects may adversely affect navigable airspace if they involve construction or alteration of structures greater than 200 feet above ground level within a specified distance from the nearest runway or objects within 20,000 feet of an airport or seaplane base with at least one runway more than 3,200 feet in length and the object would exceed a slope of 100:1 horizontally (100 feet horizontally for each one foot vertically from the nearest point of the runway). As such, the installation of ZE charging/refueling infrastructure and solar panels is not expected to affect navigable airspace. Therefore, projects located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would not result in a safety hazard for people residing or working in the project area.

VIII. f) No Impact. Local emergency management plans, evacuation plans, and/or safety elements included in General Plans typically include emergency evacuation route maps that help residents evacuate during emergencies while simultaneously allowing first responders' access into a disaster area without congestion and gridlock. Identified routes consist mostly of interstate freeways and state highways. The maps are intended to support pre-emergency identification of options for ingress and egress. The specific emergency routes employed in the case of an actual emergency are usually designated by evacuation authorities based on emergency conditions and are communicated to residents at the time of the emergency.

Local emergency management plans or hazard mitigation plans address how counties and cities should respond to extraordinary events or disasters (e.g., aviation accidents, civil unrest and disobedience/riot, dam and reservoir failure, disease, earthquake, flood, etc.), from the preparedness phase through recovery. County or city fire and law enforcement departments are responsible for coordinating all emergency management activities and implementing local emergency management or hazard mitigation plans.

PR 2305 would cause no physical changes to roadways or alter traffic patterns on highways and freeways and new offsite structures might include ZE charging/refueling infrastructure near applicable warehouses. Construction activities associated with the proposed project, including staging and stockpiling, would occur within the project boundaries and would not occur on any major arterials or highways that may be used during potential emergency situations. Activities resulting from the compliance of the proposed project would also be required to provide adequate access for emergency vehicles per the California Fire Code. Any short-term temporary impacts on adjacent roadways would be temporary and limited to the construction period. Therefore, PR 2305 is not expected to impair the implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

VIII. g) Less than Significant. WAIRE Menu items, such as high power electric equipment, solar panels, and hydrogen and natural gas infrastructure could increase fire hazard risk. The California Fire Code and CBC set standards intended to minimize risks from flammable or otherwise hazardous materials. Local jurisdictions are required to adopt the uniform codes or comparable regulations. Local fire agencies require permits for the use or storage of hazardous materials and permit modifications for proposed increases in their use. Permit conditions depend on the type and quantity of the hazardous materials at the facility. Permit conditions may include, but are not

limited to, specifications for sprinkler systems, electrical systems, ventilation, and containment. The fire departments make annual business inspections to ensure compliance with permit conditions and other appropriate regulations. Further, businesses are required to report increases in the storage or use of flammable and otherwise hazardous materials to local fire departments. Local fire departments ensure that adequate permit conditions are in place to protect against the potential risk of upset. In addition, the National Fire Protection Association has special designations for deflagrations (e.g., explosion prevention) when using materials that may be explosive. Therefore, impacts would be less than significant.

Conclusion

Based upon these considerations, significant adverse hazards and hazardous materials impacts are not expected from implementing the proposed project. Since no significant hazards and hazardous materials impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
IX. HYDROLOGY AND WATER QUALITY. Would the project:				
a) Violate any water quality standards, waste discharge requirements, or otherwise substantially degrade surface or ground water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
• Result in substantial erosion or siltation on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
• Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
• Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
• Impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
f) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, facilities or new storm water drainage facilities, the construction or relocation of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
g) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
h) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Significance Criteria

Potential impacts on water resources will be considered significant if any of the following criteria apply:

Water Demand

- The existing water supply does not have the capacity to meet the increased demands of the project, or the project would use more than 262,820 gallons per day of potable water.
- The project increases demand for total water by more than five million gallons per day.

Water Quality

- The project will cause degradation or depletion of ground water resources substantially affecting current or future uses.
- The project will cause the degradation of surface water substantially affecting current or future uses.
- The project will result in a violation of National Pollutant Discharge Elimination System (NPDES) permit requirements.
- The capacities of existing or proposed wastewater treatment facilities and the sanitary sewer system are not sufficient to meet the needs of the project.
- The project results in substantial increases in the area of impervious surfaces, such that interference with groundwater recharge efforts occurs.
- The project results in alterations to the course or flow of floodwaters.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing NZE and ZE charging and fueling infrastructure, and installing solar panels would be expected to have impacts to the topic of hydrology and water quality. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

IX. a) Less Than Significant Impact. PR 2305 contains no requirements regarding the new usage of water or the new generation of wastewater, though water may be used and wastewater generated through normal existing warehouse operations. Implementation of PR 2305 will take place within South Coast AQMD's jurisdiction where water quality is regulated by the applicable Regional Water Quality Control Board (RWQCB) and its Water Quality Control (Basin Plan). Basin Plans contain water quality standards and identify beneficial uses (wildlife habitat, agricultural supply, fishing, etc.) for receiving waters along with water quality criteria and standards necessary to support these uses consistent with federal and state water quality laws.

The following is a discussion of potential water quality impacts from urban runoff generated during implementation of PR 2305.

Construction

Construction-related runoff pollutants are typically generated from waste and hazardous materials handling or storage areas, outdoor work areas, material storage areas, and general maintenance areas (e.g., vehicle or equipment fueling and maintenance, including washing). Construction activities associated with the installation of ZE and NZE charging and refueling stations and solar panels would be minimal in nature and would not involve long construction schedules or the extensive use of hazardous materials and construction equipment.

Furthermore, construction-related activities that are primarily responsible for sediment releases are related to exposing previously stabilized soils to potential mobilization by rainfall/runoff and wind. Such activities may include earthwork for the installation of conduits and foundations. Grading may also be necessary for the installation of solar panels, ZE and NZE charging and refueling stations, including storage tanks for hydrogen fuel and natural gas, which typically would be installed above ground.

Construction-related activities would generate pollutants that could adversely affect the water quality of downstream receiving waters if appropriate and effective stormwater and non-stormwater management measures are not used to keep pollutants out of and remove pollutants from urban runoff.

Construction projects greater than 1 acre would be subject to the NPDES permitting regulations. Projects develop and implement a SWPPP estimating sediment risk from construction activities to receiving waters and specifying BMPs that would be implemented as a part of the project to minimize pollution of stormwater. Adherence to the BMPs in the SWPPP would reduce, prevent, minimize, and/or treat pollutants and prevent degradation of downstream receiving waters. BMPs identified in the SWPPP would reduce or avoid contamination of stormwater with sediment and other pollutants such as trash and debris; oil, grease, fuels, and other toxic chemicals; paint, concrete, asphalt, bituminous materials, etc.; and nutrients. Therefore, impacts to water quality during construction as a result of implementing PR 2305 would be less than significant.

Operation

Operational-related activities (e.g., runoff from the charging and refueling areas and solar panels) would generate pollutants that could adversely affect the water quality of downstream receiving waters if effective measures are not used to keep pollutants out of and remove pollutants from urban runoff. Operational activities resulting from PR 2305 are required to comply with requirements included in local municipal codes or standards and guidelines established by local stormwater management programs. Additionally, activities that result from compliance with the proposed project would be subject to project-level review, including review of impacts to water quality under CEQA, as applicable.

Based on the preceding, no significant water quality and waste-discharge impacts from operation activities would occur and impacts would be less than significant.

IX. b) Less than Significant Impact. Under PR 2305, warehouse operators and/or warehouse and fleet operators might replace trucks with ZE and NZE trucks. The proposed project might also include installing ZE charging/fueling infrastructure, solar panels, and ZE charging/refueling infrastructure near existing warehouses. The proposed replacement and/or installation of vehicles, equipment, and infrastructure require a minimal amount of water supply. Implementation of PR 2305 does not include agriculture or residential land uses which are considered to be land uses with higher water demand requirements. Furthermore, activities that result from compliance with the proposed project would be subject to project-level review, including review of impacts to groundwater supply under CEQA, as applicable; thus impacts would be less than significant.

IX. c) Less Than Significant Impact. PR 2305 would require owners or operators of affected warehouse to select compliance options from the WAIRE Menu; some of which may require minor construction activities. Erosion and siltation impacts potentially resulting from alteration of the drainage pattern due to compliance with PR 2305 would, for the most part, occur during construction activities associated with implementation of WAIRE Menu items such as onsite infrastructure improvements, which could include site preparation and grading activities. Environmental factors that affect erosion include topographic, soil, wind, and rainfall characteristics. Siltation is most often caused by soil erosion or sediment spill. The following is a discussion of the potential erosion and siltation impacts that could occur as a result of implementing PR 2305.

Construction

Construction to complete activities that result from compliance with the proposed project may require some minor earthwork to prepare affected areas at an affected warehouse. Construction activities; however, would not be expected to permanently create unpaved areas that would be vulnerable to surface runoff in a manner that would result in substantial erosion or siltation on- or off-site or flooding on- or offsite. In addition, PR 2305 would not create new or contribute to existing runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff, because PR 2305 does not contain any requirements that would change existing drainage patterns or the procedures for how surface runoff is handled.

Further, as discussed above in section IX.a, construction contractors would be required to prepare and implement an SWPPP pursuant to the CGP during grading and construction, as applicable. The SWPPP would specify erosion- and sediment-control BMPs that the project construction contractor would implement prior to and during grading and construction to minimize erosion and

siltation impacts on- and offsite at affected warehouses. Erosion control BMPs are designed to prevent erosion, whereas sediment controls are designed to trap or filter sediment once it has been mobilized. Adherence to the BMPs in the SWPPP would reduce, prevent, or minimize soil erosion from grading and construction activities. These construction-phase BMPs would also ensure effective control of not only sediment discharge, but also of pollutants associated with sediments (e.g., nutrients, heavy metals, and certain pesticides).

Therefore, construction activities would not result in substantial erosion or siltation on- or offsite. Construction-related impacts would be less than significant and no mitigation measures are necessary.

Operation

As discussed above in section IX.a all activities undertaken as a result of implementing PR 2305 that have the potential to discharge urban runoff must comply with NPDES permitting regulations and utilize BMPs as applicable to reduce the discharge of pollutants to receiving waters. Activities resulting from compliance with PR 2305 are required to comply with local municipal codes, standards, and guidelines established by the applicable stormwater management programs and will also be subject to project-level review. Furthermore, offsite projects that may alter the course of a stream or river would be subject to project-level review, including review of impacts to hydrology and water quality under CEQA, as applicable. Therefore, operation of PR 2305 is not expected to result in substantial erosion or siltation on- or offsite. Operation-related impacts would be less than significant and no mitigation measures are necessary.

Activities that occur onsite at applicable warehouses as a result of implementing PR 2305 are unlikely to be located in a flood zone as indicated on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMs) since affected warehouse are already developed. The FRIMs provide flood information and identify flood hazard zones. The design standard for flood protection is established by FEMA. FEMA's minimum level of flood protection for new development is the 100-year flood event, also described as a flood that has a 1-in-100 chance of occurring in any given year. Furthermore, counties and cities include flood protection measures and policies in local General Plans, Code of Ordinances and municipal codes. Activities undertaken to comply with PR 2305 would also be subject to project-level review, including review of impacts due to flooding under CEQA, as applicable. Lastly, any flood event that occurs would be part of the existing setting and therefore not an impact from compliance with PR 2305.

Therefore, impacts to the existing drainage pattern of an affected warehouse site or the area beyond what currently exists at an existing warehouse would be less than significant.

IX. d) No Impact. As noted in section IX d. above, impacts due to flood zones indicated on FEMA FIRM maps would be less than significant because affected warehouses are already developed, and PR 2305 does not require new warehouse development in undeveloped areas. In addition to flood zones, activities implemented to comply with PR 2305 could be located in dam inundation zones; however because those activities undertaken to comply with PR 2305 will be occurring on existing warehouse sites any inundation as the result of a dam failure would be part of the existing setting that is present for reasons unrelated to PR 2305. Further, dams in California are monitored and inspected annually by the California Division of Safety of Dams. Dam owners are required to maintain Emergency Action Plans (EAPs) that include procedures for damage assessment and emergency warnings. An EAP identifies potential emergency conditions at a dam and specifies preplanned actions to help minimize property damage and loss of life should those

conditions occur. EAPs contain procedures and information that instruct dam owners to issue early warning and notification messages to downstream emergency management authorities.

A seiche is an oscillating surface wave in a restricted or enclosed body of water, generated by ground motion, usually during an earthquake. Seiches are of concern for water storage facilities, because inundation from a seiche can occur if the wave overflows a containment wall, such as the wall of a reservoir, water storage tank, dam, or other artificial body of water. Activities undertaken to comply with PR 2305 may be at risk of inundation due to seiches however any flood event of this nature would be part of the existing setting that is present for reasons unrelated to PR 2305.

Furthermore, tsunamis are a type of earthquake-induced flooding produced by large-scale sudden disturbances of the sea floor. Tsunami waves interact with the shallow sea floor when approaching a landmass, resulting in an increase in wave height and a destructive wave surge into low-lying coastal areas. Activities undertaken to comply with PR 2305 may be at risk of inundation due to Tsunamis if they occur at existing warehouse locations which are at risk for Tsunamis. However, any Tsunami hazard would be part of the existing setting that is present and unrelated to PR 2305.

Activities undertaken to comply with PR 2305 would be subject to project-level review, including the review of impacts due to inundation under CEQA, as applicable. Furthermore, the storage of hazardous materials onsite would be governed by existing regulations of several agencies, including the U.S. EPA, US Department of Transportation, the California RWQCB, California Division of Occupational Safety and Health, and local or regional environmental health departments and fire departments. Strict adherence to all local and regional emergency response plan requirements would also be required. In addition, implementing PR 2305 would not be expected to violate any regulatory requirements in regard to storage of hazardous materials onsite. Based on the preceding, activities that result from compliance with the proposed project would not release pollutants as the result of floods, tsunami, or seiche. Therefore, no impact would occur and no mitigation measures are necessary.

IX. e) Less Than Significant Impact. Water quality for proposed projects within South Coast AQMD's jurisdiction are regulated by the applicable RWQCB and its Water Quality Control Basin Plan. As described in section IX a. above, activities undertaken to comply with PR 2305 would not violate any water quality standards and will therefore not obstruct the implementation of the Basin Plan.

On September 16, 2014, Governor Jerry Brown signed into law a three-bill legislative package, composed of AB 1739 (Dickinson), SB 1168 (Pavley), and SB 1319 (Pavley), collectively known as the Sustainable Groundwater Management Act (SGMA). The SGMA sets a framework for sustainable, groundwater management. SGMA requires governments and water agencies of high and medium priority basins to halt overdraft and bring groundwater basins into balanced levels of pumping and recharge. SGMA empowers local agencies to form Groundwater Sustainability Agencies (GSAs) to manage basins sustainably and requires those GSAs to adopt Groundwater Sustainability Plans (GSPs) for crucial groundwater basins in California. Activities undertaken to comply with PR 2305 may be located in areas that are governed under a GSP. As discussed in section IX b. above, activities that result from compliance with the proposed project would not violate any groundwater quality standards and will not decrease groundwater supplies or interfere substantially with groundwater recharge. Therefore, PR 2305 would not conflict with or obstruct the implementation of a groundwater management plan and impacts would be less than significant.

IX. f), g) & h) Less Than Significant Impact. As indicated in section IX.b, replacement of vehicles and equipment, and installation of ZE charging/refueling infrastructure require a minimal amount of water. Activities that result from compliance with the proposed project do not include agriculture or residential land uses which are considered to be land uses with higher water demand requirements. Furthermore, activities pursuant to the implementation of the proposed project would not generate wastewater. Local county and city ordinances that apply to water conservation and efficiency would also be implemented and activities that result from compliance with the proposed project would be subject to project-level review, including review of impacts to water facilities under CEQA, as applicable. Therefore, impacts from any relocation or construction of new or expanded water and wastewater treatment facilities would be less than significant. Furthermore, sufficient water supplies would be available to serve activities pursuant to PR 2305 and would not result in a determination by the wastewater treatment provider that it has adequate capacity to serve the projected demand in addition to the provider's existing commitments.

Conclusion

Based upon these considerations, significant adverse hydrology and water quality impacts are not expected from implementing the proposed project. Since no significant hydrology and water quality impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
X. LAND USE AND PLANNING.				
Would the project:				
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause an environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Land use and planning impacts will be considered significant if the project conflicts with the land use and zoning designations established by local jurisdictions.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing and using NZE and ZE charging and fueling infrastructure would be expected to have impacts to the topic of land use and planning. As such, the following responses to the checklist questions limit the discussion to these activities.

X. a) No Impact. PR 2305 would not require or induce new warehouse development and the physical effects that will result from PR 2305 will occur at existing affected warehouses located in industrial and commercial areas and would not be expected to go beyond existing site boundaries. However, PR 2305 could result in installation of ZE charging/refueling infrastructure near applicable warehouses. Offsite improvements would be located in close proximity to existing highways. Therefore, PR 2305 would not result in activities that would physically divide an established community and there would be no impacts.

X. b) No Impact. PR 2305 would not require or induce new warehouse development and the physical effects that will result from PR 2305 will occur at existing affected warehouses located in industrial and commercial areas and would not be expected to go beyond existing site boundaries. Activities resulting from compliance with PR 2305 that would occur near existing warehouses would be governed by adopted planning and regulatory documents such as General Plans, Specific Plans, and zoning codes. The development and design standards contained in these documents constitute the zoning regulations that govern development of project sites. Activities that result from compliance with the proposed project would be subject to project-level review that would assess consistency with these adopted land use regulations, including review of impacts to land use and planning under CEQA, as applicable. Further, PR 2305 does not alter any land use or planning requirements. Therefore, the proposed project would not cause an environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Conclusion

Based upon these considerations, significant adverse land use and planning impacts are not expected from implementing the proposed project. Since no significant land use and planning impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XI. MINERAL RESOURCES. Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Project-related impacts on mineral resources will be considered significant if any of the following conditions are met:

- The project would result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.
- The proposed project results in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing and using NZE and ZE charging and fueling infrastructure would be expected to have impacts to the topic of mineral resources. As such, the following responses to the checklist questions limit the discussion to these activities.

XI. a) & b) No Impact. ZE and NZE trucks, equipment, and infrastructure necessary to achieve the WPCO would be implemented at existing warehouses. Furthermore, ZE charging/refueling infrastructure may be installed near existing warehouses. Some examples of mineral resources are gravel, asphalt, bauxite, and gypsum, which are commonly used for construction activities or industrial processes. PR 2305 would not require these mineral resources and would have no effects on the use of important minerals, such as those described above. Therefore, there are no activities associated with PR 2305 compliance that would result in the loss of availability of known mineral resources that have value to the region and the residents of the state, or of a locally important mineral resource site shown on a local general plan, specific plan or other land use plan.

Conclusion

Based upon these considerations, significant adverse mineral resource impacts are not expected from implementing the proposed project. Since no significant mineral resource impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XII. NOISE. Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Noise impact will be considered significant if:

- Construction noise levels exceed the local noise ordinances or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three decibels (dBA) at the site boundary. Construction noise levels will be considered significant if they exceed federal Occupational Safety and Health Administration (OSHA) noise standards for workers.
- The proposed project operational noise levels exceed any of the local noise ordinances at the site boundary or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three dBA at the site boundary.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing NZE and ZE charging and fueling infrastructure, and installing solar panels would be expected to have impacts to the topic of noise. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

XII. a) Less than Significant. The warehouses that may be affected by PR 2305 are typically located in urbanized industrial and commercial areas. To limit population exposure to physically and/or psychologically damaging, as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise.

PR 2305 would result in installation of ZE charging/refueling infrastructure near applicable warehouses. Facilities might also install onsite ZE charging/fueling infrastructure and solar panels. Construction of new equipment could result in additional ambient noise levels. Construction activities could require some diesel powered construction equipment (e.g., concrete saws, delivery trucks, trenchers, backhoes, cranes, concrete mixers etc.) however this equipment is typically no larger or noisier than the diesel powered trucks already operating at a warehouse. The construction equipment noise sources identified in Table 2-3 represent equipment that are anticipated to be used for the installation of ZE charging/refueling infrastructure and solar panels.

Table 2-3
Noise Levels from Anticipated Construction Noise Sources

Equipment	Typical Noise Levels in Decibels (dBA)
Backhoe	80
Concrete Mixers	85
Concrete Pump	82
Crane, Derrick	88
Crane, Mobile	83
Loader	85
Saw	76
Truck	88
Shovel	89
Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment, FTA-VA-90-1003-06, May 2006. https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/FTA_Noise_and_Vibration_Manual.pdf Levels are in dBA at 50 feet from the source.	

Per Table 2-3, construction noise can be assumed to be an average of 84 dBA at 50 feet from the center of construction activity and using an estimated six dBA reduction for every doubling of distance, the noise levels are expected to decrease to about 60 dBA at about 800 feet from construction activities. Since warehouse facilities are typically located in industrial areas, which have a higher background noise level when compared to other areas, such as a residential neighborhood, the noise generated during construction will likely be indistinguishable from the background noise levels at the property line. Therefore, construction noise impacts on sensitive receptors are expected to be less than significant.

Additionally, noise from the operation of ZE trucks or yard trucks is quieter than the equivalent diesel powered vehicles that are typically used. Any new equipment would be subject to project-level review, including review of noise levels based on the jurisdiction's noise standard, as applicable. Therefore, PR 2305 would not generate noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

XII. b) Less than Significant. Operation of the proposed project would not generate substantial levels of vibration because there are no notable sources of vibrational energy associated with the proposed project. Therefore, operation would not result in significant groundborne vibration impacts. Impacts would be less than significant and no mitigation measures are necessary.

Construction activities generate varying degrees of ground vibration, depending on the construction procedures, construction equipment used, and proximity to vibration-sensitive uses. The generation of vibration can range from no perceptible effects at the lowest vibration levels, to low rumbling sounds and perceptible vibrations at moderate levels, to slight damage at the highest levels. Vibration associated with ground-borne sources is generally not a common environmental problem. However, construction activities such as blasting, pile driving, and heavy earthmoving equipment are potential sources of vibration during construction activities. In general, demolition of structures during construction generates the highest levels of vibration. The proposed project would not include construction activities that would generate high levels of vibration, rather construction activities would be minimal, short term, and one time in nature and would cease upon completion of the construction phase. Furthermore, activities that result from compliance with the proposed project would be subject to project-level review, including review of noise impacts under CEQA, as applicable.

XII. c) No Impact. The proposed project does not include any activities that might expose people residing or working in the project area to excessive aircraft noise. All activities associated with the implementation of the proposed project will be conducted at existing warehouses and there will be no additional exposure beyond existing conditions. Therefore, there will be no impact.

Conclusion

Based upon these considerations, no significant noise impacts are expected from implementing the proposed project and further analysis would not be included in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XIII. POPULATION AND HOUSING.				
Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Impacts of the proposed project on population and housing will be considered significant if the following criteria are exceeded:

- The demand for temporary or permanent housing exceeds the existing supply.
- The proposed project produces additional population, housing or employment inconsistent with adopted plans either in terms of overall amount or location.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project none of these activities would have an impact to the topic of population and housing.

XIII. a) & b) No Impact. The proposed project is not anticipated to generate any significant effects, either direct or indirect, on the population or population distribution of people living in the South Coast AQMD's jurisdiction as no additional workers are anticipated to be required to comply with the proposed project. Population growth with South Coast AQMD's jurisdiction is anticipated to grow regardless of the implementation of PR 2305.

Furthermore, compliance with PR 2305 does not include the removal of housing or necessitate the construction of replacement housing elsewhere.

Conclusion

Based upon these considerations, significant adverse population and housing impacts are not expected from implementing the proposed project. Since no significant population and housing impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XIV. PUBLIC SERVICES. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:				
a) Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Impacts on public services will be considered significant if the project results in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response time or other performance objectives.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing NZE and ZE charging and fueling infrastructure, and installing solar panels would be expected to have impacts to the topic of public services. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

XIV. a) Less Than Significant Impact. Fire protection and emergency medical services would be provided to affected warehouses subject to PR 2305 by local county and city fire departments. The implementation of the proposed project would not result in an increase in calls for fire protection, and emergency medical service. In addition, activities that result from compliance with the proposed project would be subject to project-level review, including review of fire protection impacts under CEQA, as applicable.

Furthermore, all activities undertaken as a result of PR 2305 would be required to comply with fire-related safety features in accordance with the applicable provisions of the adopted California

Fire Code (CFC) and any county or city ordinances, and standard regarding fire prevention and suppression measures related to water improvement plans, fire hydrants, fire access, and water availability.

Based on the preceding, activities pursuant to PR 2305 would not adversely affect the ability of local fire protection to provide adequate service and impacts would be less than significant and no mitigation measures are necessary.

XIV. b), c) d) & e) No Impact. Activities undertaken to comply with PR 2305 would not result in an increase in calls for police protection. Activities would occur at existing warehouse sites that have established security measures onsite and are subject to compliance with local law enforcement authorities. During plan check and the development review process, the project applicants would be required to comply with the existing regulations in effect at the time building permits are issued, including payment of the established development impact fee as applicable.

The need for new or the expansion of existing schools, parks, or library services and facilities is tied to population growth. As indicated under item XIII, *Population and Housing*, implementing PR 2305 would not induce population growth either directly or indirectly. Therefore, with no increase in local population, there would be no additional demand for new or expanded schools, parks, and libraries and no significant impacts are expected.

Conclusion

Based upon these considerations, significant adverse public services impacts are not expected from implementing the proposed project. Since no significant public services impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XV. RECREATION.				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Impacts to recreation will be considered significant if:

- The project results in an increased demand for neighborhood or regional parks or other recreational facilities.
- The project adversely affects existing recreational opportunities.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project none of these activities would have an impact to the topic of recreation.

XV. a) & b) No Impact. Demand for parks and recreational facilities in an area are usually determined by the area's population. The proposed project does not include the development of new homes, which lead to an increase in population and thereby, the need for additional park and recreation facilities. Therefore, the proposed project would not increase the use of existing neighborhood and regional parks or other recreational facilities, nor would it require construction of new or expanded parks or recreational facilities. No impact to park and recreational facilities would occur and no mitigation measures are necessary.

Furthermore, the implementation of the proposed project does not include the development of recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment.

Conclusion

Based upon these considerations, significant adverse recreation impacts are not expected from implementing the proposed project. Since no significant recreation impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XVI. SOLID AND HAZARDOUS WASTE. Would the project:				
a) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Comply with federal, state, and local management and reduction statutes and regulations related to solid and hazardous waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

The proposed project impacts on solid and hazardous waste will be considered significant if the following occurs:

- The generation and disposal of hazardous and non-hazardous waste exceeds the capacity of designated landfills.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only the use of on-road ZE trucks, using ZE yard trucks, installing solar panels, and installing high-efficiency filters or filter systems would be expected to have impacts to the topic of solid and hazardous waste. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

XVI. a) Less Than Significant Impact.

Construction

Installing ZE charging/fueling infrastructure, and the installation of solar panels would result in minor construction activities that may result in the generation of some construction waste that may need to be disposed in a landfill. PR 2305 does not contain any requirements that would cause existing practices for disposing of solid and hazardous waste to change. For this reason, warehouses that currently comply with all applicable local, state, or federal waste disposal regulations would not be expected to change their current practices due to implementation of PR 2305. If a warehouse owner or operator chooses a WAIRE Menu item that requires construction such as onsite fueling or charging infrastructure there is a possibility that small amounts of waste will be generated from replacement of parts during routine servicing and maintenance of the onsite improvements. The amount of waste generated would be negligible when considering the existing regular waste generation from ordinary warehouse operations. Further, all construction activities associated with compliance with PR 2305 should abide by the requirements of CALGreen Section 5.408, *Construction Waste Reduction, Disposal and Recycling*, as applicable. As currently

codified, these regulatory sections require diversion of 65 percent of nonhazardous construction and demolition waste through recycling, reuse, and diversion programs.

Operation

The March 2017 Final Program EIR for the 2016 Air Quality Management Plan analyzed control measure MOB-03, *Emission Reductions at Warehouse Distribution Centers*, and dismissed impacts associated with spent batteries from electric vehicles based on the following discussion.

As interest in the use of electric vehicles has increased over the years, battery technologies have been developing and improving. Most battery technologies employ materials that are recyclable, since California laws have created incentives and requirements for recycling batteries as follows:

- California and federal law require the recycling of lead-acid batteries (Health and Safety Code §25215). Spent lead-acid batteries being reclaimed are regulated under 22 CCR §66266.80 and 66266.81, and 40 CFR part 266, Subpart G.
- The federal Battery Act promulgated in 1996 requires that each regulated battery be labeled with a recycling symbol. Nickel-Cadmium (NiCad) batteries must be labeled with the words “NiCad” and the phrase “Battery must be recycled or disposed of properly.” Lead-acid batteries must be labeled with the words “Lead,” “Return,” and “Recycle.”
- The Health and Safety Code does not allow the disposal of lead-acid batteries at a solid waste facility or on or in any land, surface waters, water courses, or marine waters. Legal disposal methods for used lead-acid batteries are to recycle/reuse the battery or to dispose of it at a hazardous waste disposal facility. A lead-acid battery dealer is required to accept spent batteries when a new one is purchased.
- The Universal Waste Rule requires that spent batteries exhibiting hazardous waste characteristics and are not recycled need to be managed as hazardous waste. This includes lead-acid and NiCad batteries.

Existing battery recovery and recycling programs have limited the disposal of batteries in landfills. For example, the recycling of lead-acid and NiCad batteries is already a well-established activity. Further penetration of NZE and ZE emission mobile sources is expected to result in a reduction in the use of lead-acid and NiCad batteries. Implementation of the proposed project would be expected to result in an increased use of electric vehicles which use nickel-metal hydride (NiMH) and lithium ion (Li-ion) batteries, instead of lead-acid and NiCad batteries. NiMH and Li-ion batteries generally contain materials that have high economic value and, therefore, are recyclable.

Improper disposal of NiMH batteries poses less environmental hazard because of the absence of lead and cadmium, which is considered to be toxic. Most industrial nickel is recycled, due to the relatively easy retrieval of the magnetic element from scrap using electromagnets, and due to its high value. Additionally, Li-ion batteries are between 70 and 100 percent recyclable, depending on the particular chemistry of the batteries. There are a number of different types of Li-ion batteries in use, and more are being developed. The components of Li-ion batteries that cannot be recycled are mostly consumed as fuel in the furnaces that are used to melt down the metals, which include cobalt, copper, iron, nickel, manganese, and lithium. Because Li-ion batteries have a potential for after-automotive use, destructive recycling can be postponed for years even after batteries can no longer hold and discharge sufficient electricity to power a motor. Furthermore, electric batteries

tend to last substantially longer than lead-acid batteries in conventional vehicles and an increase in the use of electric vehicles would result in a decrease in the amount of spent lead-acid batteries that require recycling.¹⁷

Therefore, for the reasons described above and consistent with the analysis in the March 2017 Final Program EIR, impacts from the generation of hazardous solid waste associated with the use of ZE trucks, ZE yard trucks, and solar panels that occur as a result of compliance with the proposed project would be less than significant.

Furthermore, during the operational phase, the requirements of the local Integrated Waste Management Plan (IWMP) and any local solid waste ordinances would be implemented to ensure that all activities comply with all applicable state and federal laws. IWMPs ensure that cities reach the diversion and other goals mandated by the California Integrated Waste Management Act of 1989 (AB 939). AB 939 requires all California cities to divert 50 percent of their waste stream from landfills by the year 2000. Additionally, activities that result from compliance with PR 2305 would be subject to project-level review, including review of impacts from solid waste under CEQA, as applicable.

Based on the preceding, impacts on landfill capacity would be less than significant and no mitigation measures are necessary.

XVI. b) No Impact. The following federal, state, and local laws and regulations govern solid waste disposal:

- U.S. EPA's Resource Conservation and Recovery Act of 1976 which contains regulations for municipal solid waste landfills and requires states to implement their own permitting programs incorporating the federal landfill criteria.
- AB 341 (Chapter 476, Statutes of 2011) which increases the statewide waste diversion goal to 75 percent by 2020.
- AB 939 (Integrated Solid Waste Management Act of 1989; Public Resources Code 40050 et seq.) which requires every California city and county to divert 50 percent of its waste from landfills by the year 2000 by such means as recycling, source reduction, and composting. In addition, AB 939 requires each county to prepare a countywide siting element specifying areas for transformation or disposal sites to provide capacity for solid waste generated in the county that cannot be reduced or recycled for a 15-year period.
- AB 1327 (California Solid Waste Reuse and Recycling Access Act of 1991) which requires local agencies to adopt ordinances mandating the use of recyclable materials in development projects.

Any project-related construction and operation resulting from compliance with PR 2305 would be implemented in accordance with all applicable federal, state, and local laws and regulations governing solid waste disposal. Therefore, no impact would occur, and no mitigation measures are necessary.

¹⁷ State of California, California Code, Health and Safety Code - § 25507, January 1, 2019, Section 4.6.4.1, Spent Batteries from Electric Vehicles, pages 4.6-8 through 4.6-12 and Section 4.4.4.2.4, Electric Vehicles, pages 4.4-13 through 4.4-17 http://leginfo.ca.gov/faces/codes_displaySection.xhtml?lawCode=HSC§ionNum=25507

Conclusion

Based upon these considerations, significant adverse solid and hazardous waste impacts are not expected from implementing the proposed project. Since no significant solid and hazardous waste impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XVII. TRANSPORTATION.				
Would the project:				
a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with or be inconsistent with CEQA Guidelines Section 15064.3(b)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Significance Criteria

Impacts on transportation and traffic will be considered significant if any of the following criteria apply:

- A major roadway is closed to all through traffic, and no alternate route is available.
- The project conflicts with applicable policies, plans or programs establishing measures of effectiveness, thereby decreasing the performance or safety of any mode of transportation or contributes to changes in overall vehicle miles traveled.
- There is an increase in vehicle miles traveled that is substantial in relation to the existing travel activity.
- Water borne, rail car or air traffic is substantially altered.
- Traffic hazards to motor vehicles, bicyclists or pedestrians are substantially increased.
- The need for more than 350 employees.
- An increase in heavy-duty transport truck traffic to and/or from the facility by more than 350 truck round trips per day.
- Increase customer traffic by more than 700 visits per day.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only the use of on-road NZE and ZE trucks, installing and/or using ZE charging/fueling infrastructure, installing solar panels, and installing high-efficiency filters or filter systems would be expected to have impacts to the topic of transportation. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

XVII. a) & b) Potentially Significant Impact. Construction trips and vehicle miles traveled are associated with vendor trucks that provide deliveries of equipment and building materials, as well

as worker vehicles as they commute to construction sites. Construction trips could be potentially significant and will be discussed further in the EA.

Furthermore, it is anticipated that implementation of PR 2305 could change regional truck travel patterns within the South Coast AQMD's jurisdiction during the operational phase but would not result in an increase in passenger vehicle or truck trips for individual warehouses. This change in travel patterns might conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities and impacts would be potentially significant. Further analysis is required to assess the significance of this impact and will be included in the Draft EA.

XVII. c) No Impact. PR 2305 does not involve or require the construction of new roadways, alter existing roadways, or introduce incompatible uses to existing roadways. Thus, there will be no change to current public roadway designs that could increase traffic hazards. Further, PR 2305 is not expected to substantially increase traffic hazards or create incompatible uses at or adjacent to the facilities. Therefore, no impact resulting from hazards due to design features or incompatible uses would occur and no mitigation measures are necessary.

XVII. d) No Impact. Since PR 2305 includes the installation of ZE charging/refueling infrastructure and solar panels. No changes are expected to emergency access at or in the vicinity of the affected facilities. PR 2305 does not contain any requirements specific to emergency access points and each facility would be expected to continue to maintain their existing emergency access. Based on the preceding, no impact to emergency access would occur and no mitigation measures are necessary.

Conclusion

Based upon these considerations, significant construction related transportation impacts may occur from the installation of ZE charging/refueling infrastructure, solar panels, or community benefits projects (e.g., new HVAC systems to filter particulates). Significant operational impacts may also arise from using on-road NZE and ZE trucks and ZE charging/refueling stations. These impacts would be further analyzed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XVIII. WILDFIRE. If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildfires?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Significance Criteria

A project's ability to contribute to a wildfire will be considered significant if the project is located in or near state responsibility areas or lands classified as very high fire hazard severity zones, and any of the following conditions are met:

- The project would substantially impair an adopted emergency response plan or emergency evacuation plan.
- The project may exacerbate wildfire risks by exposing the project's occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors.
- The project may exacerbate wildfire risks or may result in temporary or ongoing impacts to the environment because the installation or maintenance of associated infrastructure

(such as roads, fuel breaks, emergency water sources, power lines, or other utilities) are required.

- The project would expose people or structures to significant risks such as downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.
- The project would expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildfires.

Discussion

While the activities identified in Table 2-1 would be expected as a result of implementing the proposed project, only installing and/or using ZE charging/fueling infrastructure, and installing solar panels would be expected to have impacts to the topic of wildfire. As such, the following responses to the checklist questions limit the discussion to these activities. Both construction and operational impacts are discussed as applicable.

XVIII. a) No Impact. Refer to section VIII.f, activities that result from compliance with the proposed project would not block or otherwise interfere with the use of evacuation routes nor would they interfere with operations of emergency response agencies or with coordination and cooperation between such agencies.

XVIII. b) Less Than Significant Impact. Wildland fire protection in California is the responsibility of either the local government, state, or the federal government. State Responsibility Areas (SRA) are the areas in the state where the State of California has the primary financial responsibility for the prevention and suppression of wildland fires.¹⁸ Local responsibility areas (LRA) include incorporated cities, cultivated agriculture lands, and portions of the desert. LRA fire protection is typically provided by city fire departments, fire protection districts, counties, and by California Department of Forestry and Fire Protection (CAL FIRE) under contract to local government. CAL FIRE uses an extension of the SRA Fire Hazard Severity Zone model as the basis for evaluating fire hazard in LRAs. The local responsibility area hazard rating reflects flame and ember intrusion from adjacent wildlands and from flammable vegetation in the urban area. Fire Hazard Severity Zones (FHSZ) are identified by Moderate, High and Very High in an SRA, and Very High in an LRA. Activities resulting from compliance with PR 2305 may occur on existing warehouses located in or near state responsibility areas or lands classified as very high fire hazard severity zones.

All structures pursuant to the implementation of the proposed project that would be located in fire hazard severity zones are required to be designed, built, and operated in accordance with state regulations specifying building materials and structural designs for structures in such zones, including CBC Chapter 7A and California Fire Code (CFC) Chapter 49; and regulatory requirements for defensible space including California Public Resources Code Sections 4291 et seq. Furthermore, structures pursuant to the implementation of the proposed project located in SRA areas will implement the Wildfire SRA Fire Safe Regulations' basic wildland fire protection standards. Electric utilities are required to abide by the requirements of the California Public Utilities Commission (CPUC) Fire Safety Regulations as they relate to utility poles and wires, and vegetation management.

¹⁸ California Department of Forestry and Fire Prevention's Fire and Resource Assessment Program. 2019. Wildfire Hazard Real Estate Disclosure. <https://frap.fire.ca.gov/frap-projects/wildfirehazard-real-estate-disclosure-old/>.

Additional measures are in place to sidestep the impacts of pollutant concentrations from wildfire ash. Recognition of the growing threat that wildfire smoke poses to public health and safety has resulted in a response led by the US Forest Service and enhanced through partnership with many other agencies, such as the National Park Service. The Wildland Fire Air Quality Response Program (WFAQRP) was created to directly assess, communicate, and address risks posed by wildfire smoke to the public as well as fire personnel. The program depends on four primary components: specially trained personnel called Air Resource Advisors (ARAs), air quality monitoring, smoke concentration and dispersion modeling, and coordination and cooperation with agency partners. ARAs are technical specialists that are trained to work on smoke issues from wildland fire. They are deployed nationwide during large smoke events. ARAs are dispatched to an incident to assist with understanding and predicting smoke impacts on the public and fire personnel. They analyze, summarize, and communicate these impacts to incident teams, air quality regulators, and the public.¹⁹ South Coast AQMD also issues air quality alerts, advisories, and forecasts by email through AirAlerts.org. South Coast AQMD also maintains an interactive online map to view current air quality conditions in the region.²⁰ Furthermore, activities that result from compliance with the proposed project would be subject to project-level review, including review of wildfire impacts under CEQA, as applicable. Therefore, there would be no impacts from pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

XVIII. c) No Impact. PR 2305 would not add new structures that might need to be supported by expanded infrastructure and associated maintenance, including new roads, fuel breaks, emergency water sources, power lines and other utilities. However, as indicated in section XVIII b. above, structures pursuant to the implementation of the proposed project that are developed in FHSZs are required to comply with regulations governing development in such zones, including CBC Chapter 7A, CFC Chapter 49, and California Public Resources Code Sections 4291 et seq. Any new powerlines would be required to comply with fire safety regulations pertaining to electric utilities including California Code of Regulations Title 14 Sections 1250 et seq.; and CPUC fire safety regulations. Furthermore, activities that result from compliance with the proposed project would be subject to project-level review, including review of wildfire impacts under CEQA, as applicable. Therefore, there would be no impacts.

XVIII. d) No Impact. Catastrophic wildfire can create favorable conditions for other hazards, such as flooding and landslides during the rainy season. However, the installation of ZE charging/refueling infrastructure and solar panels at applicable existing warehouses would have a nominal footprint and would not expose people or structure to post-fire hazards such as flooding, landslides, slope instability, or drainage changes. Installation of ZE charging/refueling infrastructure near warehouses would also have a nominal footprint and would not result in any post-fire impacts.

XVIII. e) Less Than Significant Impact. As discussed in section XVIII b above, any new developed or redevelopment in FHSZs are required to comply with regulations governing development in such zones, including CBC Chapter 7A, CFC Chapter 49, and California Public Resources Code Sections 4291 et seq. Established regulations and policies, will reduce wildfire hazards to less than significant.

¹⁹ US Forest Service accessed August 20, 2018, Wildland Fire Air Quality Response Program. United States Department of Agriculture, <https://www.wildlandfiresmoke.net/>

²⁰ South Coast Air Quality Management District accessed August 20, 2018, Wildfire Smoke & Ash Health & Safety Tips, <https://www.aqmd.gov/wildfire-health-info-smoke-tips>.

Conclusion

Based upon these considerations, significant adverse wildfire impacts are not expected from implementing the proposed project. Since no significant wildfire impacts were identified, no mitigation measures are necessary or required and therefore will not be further discussed in the Draft EA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
XIX. MANDATORY FINDINGS OF SIGNIFICANCE.				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Does the project have impacts that are individually limited, but cumulatively considerable? (“Cumulatively considerable” means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Does the project have environmental effects that will cause substantial adverse effects on human beings, either directly or indirectly?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Discussion

XIX. a) Less than Significant Impact. Activities resulting from compliance with the proposed project could occur at or near existing warehouses. Such project sites would not typically include appropriate habitat for fish or wildlife species or rare, endangered species of plant or animal. Cultural resources are also limited at such sites. Furthermore, individual development projects would be subject to project-level review under CEQA, as applicable. Thus, impacts to biological and cultural resources would be less than significant.

XIX. b) Potentially Significant Impact. Implementation of PR 2305 could have cumulative considerable impacts associated with air quality and greenhouse gases, energy, and transportation. These impacts could be potentially significant and will be studied further in the Draft EA.

XIX. c) Potentially Significant Impact. It is possible that new warehouses may be developed outside of the South Coast Air Basin to avoid implementing compliance with PR 2305. This could result in longer truck trips within the South Coast AQMD's jurisdiction which could result in additional operational emissions. These additional emissions might cause potential health impacts to sensitive receptors and will be addressed in further detail in the Draft EA.

Conclusion

As previously discussed in environmental topics I through XIX, the proposed project has impacts with the potential to cause significant adverse environmental effects. These impacts will be discussed in further detail in the Draft EA.

APPENDICES

Appendix A: Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program

Appendix B: Proposed Rule 316 – Fees for Regulation XXIII

APPENDIX A

Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions And Investments To Reduce Emissions (WAIRE) Program

**PROPOSED RULE 2305 WAREHOUSE INDIRECT SOURCE RULE –
WAREHOUSE ACTIONS AND INVESTMENTS TO REDUCE EMISSIONS
(WAIRE) PROGRAM**

(a) Purpose

The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter.

(b) Applicability

This rule applies to owners and operators of warehouses located in the South Coast Air Quality Management District (South Coast AQMD) jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building dedicated to that may be used for warehousing activities by one or more warehouse operators.

(c) Definitions

For the purpose of this rule, the following definitions shall apply:

- (1) ALTERNATIVE ENERGY GENERATION EQUIPMENT means systems at a warehouse facility capable of generating electricity without the use of diesel or gasoline.
- (2) ALTERNATIVE-FUELED VEHICLE means a vehicle or engine ~~that~~ is which is not powered by gasoline or diesel fuel.
- (3) ALTERNATIVE FUELING STATION means fuel dispensing equipment for alternative-fueled vehicles.
- (4) CLASS 2B TRUCK means a truck with a Gross Vehicle Weight Rating (GVWR) of 8,501 to 10,000 pounds.
- (5) CLASS 3 TRUCK means a truck with a GVWR of 10,001 to 14,000 pounds.
- ~~(4)~~(6) CLASS 4 TRUCK means a truck with a GVWR ~~Gross Vehicle Weight Rating (GVWR)~~ of 14,001 to 16,000 pounds.
- ~~(5)~~(7) CLASS 5 TRUCK means a truck with a GVWR of 16,001 to 19,500 pounds.

Proposed Rule 2305

- ~~(6)~~(8) CLASS 6 TRUCK means a truck with a GVWR of 19,501 to 26,000 pounds.
- ~~(7)~~(9) CLASS 7 TRUCK means a truck with a GVWR of 26,001 to 33,000 pounds.
- ~~(8)~~(10) CLASS 8 TRUCK means a truck with a GVWR of greater than 33,001 pounds.
- ~~(9)~~(1) ~~ELECTRIC CHARGER means an electric charging station for vehicles. Each unique plug that can charge an individual vehicle at any time, regardless of whether other electric chargers/plugs are operating, counts as one electric charger.~~
- ~~(10)~~(11) COLD STORAGE FACILITY means a distribution facility that temporarily stores perishable goods ~~that are~~which are required to be either refrigerated or frozen.
- (12) DIESEL PARTICULATE MATTER (DPM) means the particles found in the exhaust of diesel fueled internal combustion engines. DPM is a component of fine particulate matter.
- ~~(11)~~(13) DWELL TIME means the number of hours per day ~~that~~ a truck or tractor is parked at a warehouse.
- (14) ELECTRIC CHARGER means an electric charging station for vehicles. Each unique plug that can charge an individual vehicle at any time, regardless of whether other electric chargers/plugs are operating, counts as one electric charger. This equipment is also referred to as Electric Vehicle Supply Equipment (EVSE).
- (15) FUEL TYPE means the fuel used to power a vehicle, such as electricity, hydrogen, natural gas, gasoline, or diesel fuel.
- ~~(12)~~(16) LEVEL 2 CHARGER means electric vehicle supply equipment (EVSE) that can deliver an electric charge up to a rate of 19.2 kilowatts (kW).
- ~~(13)~~(17) LEVEL 3 CHARGER means EVSE that can deliver an electric charge between 19.2 and 50 kW.
- ~~(14)~~(18) LEVEL 4 CHARGER means an EVSE that can deliver an electric charge between 51 and 150kW.
- ~~(15)~~(19) LEVEL 5 CHARGER means an EVSE that can deliver an electric charge ~~above~~greater than 151 kW.
- ~~(16)~~(20) NEAR-ZERO EMISSIONS (NZE) TRUCKS means trucks or tractors with engines ~~that meeting~~ the California Air Resources Board's

Proposed Rule 2305

lowest non-zero optional NOx standard as defined in the California Code of Regulations Title 13, section 1956.8.

(21) NITROGEN OXIDES (NOx) mean the sum of nitric oxides and nitrogen dioxides emitted, calculated as nitrogen dioxide.

(17)(22) PARENT COMPANY means a company or other entity that owns a controlling interest in a company directly or through one or more subsidiaries.

(18)(23) STRAIGHT TRUCK means a truck that carries cargo on the same chassis as the power unit and cab.

(19)(24) TRACTOR means a heavy-duty Class 7 or 8 truck designed to pull a semi-trailer.

(20)(25) TRUCK CLASS means the size of a truck based on its GVWR.

(26) TRUCK TRIP means the one-way trip ~~that~~ a truck or tractor makes to or from a site with at least one warehouse to deliver or pick up goods stored at that warehouse, for later distribution to other locations. A truck or tractor entering a warehouse site and then leaving that site counts as two trips.

(24)(27) VEHICLE MILES TRAVELED (VMT) means total annual miles of vehicle travel.

(28) WAREHOUSE means a building facility consisting of one or more buildings that stores cargo, goods, or products on a short- or long-term basis for later distribution to businesses and/or retail customers.

(22)(29) WAREHOUSE FACILITY means a property that includes a warehouse as well as accessory uses such as parking areas and driving lanes for trucks, trailers, or passenger vehicles; entry and exit points for vehicles; accessory maintenance or security buildings; and fueling or charging infrastructure for vehicles.

~~(23)(1) WAREHOUSING ACTIVITIES means operations at a warehouse related to the storage and distribution of goods, including but not limited to the storage, labelling, sorting, consolidation and deconsolidation of products into different size packages. Supporting office administration, maintenance, or manufacturing areas within the same warehouse building, that are physically separate from the warehouse area, are not considered warehousing activities for the purpose of this rule.~~

(24)(30) WAREHOUSE OPERATOR means the ~~business~~ entity who conducts day-to-day operations at a warehouse, either with its employees or through the contracting out of services for all or part of the warehouse

Proposed Rule 2305

operations. A warehouse operator can be, but is not necessarily the warehouse owner.

~~(25)~~(31) WAREHOUSE OWNER means the legal, beneficial, and/or equitable owner or owners of a warehouse facility~~business entity or entities who hold the deed to a warehouse.~~

~~(26)~~(32) WAREHOUSE SIZE means the indoor floor space, measured in square feet, of an individual warehouse building~~dedicated to warehousing that may be used for warehousing activities.~~

(33) WAREHOUSING ACTIVITIES means operations at a warehouse related to the storage and distribution of goods, including but not limited to the storage, labelling, sorting, consolidation and deconsolidation of products into different size packages. Supporting office administration, maintenance, or manufacturing areas within the same warehouse building, that are physically separate from the warehouse area, are not considered warehousing activities for the purpose of this rule.

~~(27)~~(34) YARD TRUCK means a mobile utility vehicle, that operates as either~~with an on- or off-road vehicle engine installed, used to carry cargo containers with or without a chassis; also commonly known as a terminal tractor, utility tractor rig (UTR), yard tractor, yard goat, or yard hostler.; yard hustler, or prime mover, means a tractor that moves trailers short distances at a warehouse, or to a nearby warehouse.~~

~~(28)~~(35) ZERO-EMISSION (ZE) TRUCK has the same meaning as “zero emission vehicle” defined in California Code of Regulations, Title 13, Section 1963.

(d) Requirements

(1) Warehouse Points Compliance Obligation

Beginning with the Initial Reporting Date in Table 21, a warehouse operator shall earn the applicable WAIRE Points, for the prior 12-month period from July 1 through June 30, in the amount identified in Table 4-2 as specified in subparagraph (d)(1)(A). WAIRE Points shall be earned for actions and investments completed during the compliance period while the warehouse operator occupied the warehouse, except as specified in paragraph (d)(~~36~~). ~~Subdivision (d) only applies to~~ Only warehouse operators in buildings with greater than or equal to 100,000 square feet of floor area dedicated to warehousing that may be used for warehousing activities and who operate

Proposed Rule 2305

at least 50,000 square feet of the warehouse are required to earn WAIRE Points.

- (A) The number of WAIRE Points that a warehouse operator must earn in the applicable compliance period shall be calculated according to the following equation.

$$WPCO = WATTs \times Stringency \times \left(\frac{Annual}{Variable} \right)$$

Where:

WPCO = WAIRE Points Compliance Obligation, or the number of WAIRE Points that a warehouse operator must earn every year

WATTs = Weighted Annual Truck Trips as calculated in subparagraph (d)(1)(B) or (d)(1)(C), as applicable

Stringency = XXX

Annual Variable = As specified in Table 24

- (B) The Weighted Annual Truck Trips (WATTs) at a warehouse include all actual truck trips that occurred at a warehouse while the warehouse operator was responsible for operations during the 12-month compliance period. If a warehouse is occupied by more than one warehouse operator, the WATTs are calculated only for truck trips to or from that operator. Actual truck trip data to a warehouse shall be collected by the warehouse operator and WATTs shall be calculated according to the following equation and as specified in the WAIRE Program Implementation Guidelines.

$$WATTs = [Class\ 4\text{--}2b\ to\ 7\ truck\ trips] + [2.5 \times Class\ 8\ truck\ trips]$$

Where:

Class 4-2b to 7 truck trips = All trucks or tractors ~~that~~ entering or exiting a warehouse truck gate(s) or driveway(s) that are truck ~~e~~Class 2b, 3, 4, 5, 6, or 7. If truck class

information is not available, Class 42b to 7 trucks are all straight trucks that entered or exited a warehouse truck gate(s) or driveway(s).

Class 8 truck trips = All ~~e~~Class 8 trucks or tractors ~~that~~ entereding or exiting a warehouse truck gate(s) or driveway(s). If truck class information is not available, Class 8 trucks are all tractors that entered or exited a warehouse truck gate(s) or driveway(s).

- (C) If a warehouse operator does not have information about the number of truck trips at a warehouse due to a force majeure event such as a destruction of records from a fire, the WATTs shall be calculated according to the following equation.

$$WATTs = Days\ per\ Year \times Warehouse\ Size \times WTTR$$

Where:

Days per Year = The number of days that the warehouse operator has operational control of the warehouse during the 12-month compliance period

Warehouse Size = Warehouse size in thousand square feet (tsf), as defined in subdivision (c)

WTTR = Weighted Truck Trip Rate, where:
Warehouses $\geq 200,000$ = 0.95 trips/tsf/day
Warehouses $\geq 100,000$ = 0.67 trips/tsf/day
Cold Storage Warehouses = 2.17 trips/tsf/day

(2) Earning WAIRE Points

WAIRE Points shall only be earned through completing actions in the WAIRE Menu in Table 3 and as described in (d)(3), or by completing actions in an approved Custom WAIRE Plan as described in (d)(4), or by choosing to pay a mitigation fee as described in (d)(5) in lieu of completing actions in the WAIRE Menu or in an approved Custom WAIRE Plan.

(2)(3) Determining the Number of WAIRE Points Earned Using the WAIRE Menu

~~All WAIRE Points a~~ warehouse operator may earn WAIRE Points shall be determined for actions completed in the WAIRE Menu in Table 3 and based on the point values specified therein. ~~the WAIRE Menu in Table 3.~~

- (A) WAIRE Points may not be earned from WAIRE Menu items in Table 3 if those same actions or investments are required by a separate the United States Environmental Protection Agency (U.S. EPA), the California Air Resources Board (CARB), or South Coast AQMD rules and regulations during the compliance year in paragraph (d)(1). Actions or investments that go beyond U.S. EPA, CARB, or South Coast AQMD rules and regulations can earn WAIRE Points.

(3)(4) WAIRE Points Earned Using a Custom WAIRE Plan

- (A) Warehouse owners or operators may apply to earn WAIRE Points through a customized plan for their facility. The Custom WAIRE Plan application shall follow the WAIRE Implementation Guidelines and the criteria below.

- (i) Custom WAIRE Plan applications must demonstrate how the proposed action will earn WAIRE Points based on the incremental cost of the action, the NOx emission reductions from the action, and the DPM emission reductions from the action, relative to baseline conditions if the warehouse operator had not completed the action in that compliance year.

- (A) The methodology to determine the total WAIRE Points for an action in a Custom WAIRE Plan application shall be consistent with methods in the WAIRE Program Implementation Guidelines.

- (ii) Any WAIRE Points for emission reductions must be quantifiable, verifiable, and real as determined by the Executive Officer and consistent with the WAIRE Implementation Guidelines.

- (iii) Custom WAIRE Plan applications must include the elements described below:

- (A) A description how the proposed actions will achieve quantifiable, verifiable, and real NOx and DPM emission reductions as quickly as feasible, but no later than three years after plan approval; and
 - (B) A quantification of expected NOx and/or DPM emission reductions from the proposed project within the South Coast AQMD and within three miles of the warehouse; and
 - (C) A description of the method to be used to verify that the proposed project will achieve NOx and/or DPM emission reductions; and
 - (D) A schedule of key milestones showing the increments of progress to complete the proposed project; and
 - (E) A description of the location and a map of where the proposed project will occur; and
 - (F) Any expected permits or approvals required by other private parties, or South Coast AQMD, or other federal, state, or local government agencies to implement the proposed plan.
- (iv) Any proposed plan that relies on VMT reduction must demonstrate that these reductions are surplus to what is included in the most recent approved Regional Transportation Plan (RTP) and Air Quality Management Plan (AQMP).
- (B) Review of Custom Option Plan Applications
 - (i) A Custom WAIRE Plan application must be submitted at least 9 months before an Annual WAIRE Report is due for the year in which the Plan will earn Points.
 - (ii) Within 30 days of receipt of the Custom Option Plan, the Executive Officer will conduct an initial review of the Custom Option Plan and confirm receipt.
 - (iii) The Executive Officer shall approve or reject the Custom Option Plan within 3 months of submittal. If no formal approval or rejection is received by the applicant, the application is presumed rejected unless otherwise provided

for by the Executive Officer in writing. Approval or rejection will be based on whether:

(A) The Custom Option Plan was prepared consistent with paragraph (d)(4)(A) and in accordance with the WAIRE Program Implementation Guidelines; and

(A) The information provided was complete and accurate.

(iv) Within 30 days of the date of notification by the Executive Officer of disapproval of a Custom WAIRE Plan application, an owner or operator shall revise and resubmit a Custom Plan Proposal that corrects all identified deficiencies. If the Executive Officer does not approve the subsequent revised plan within 30 days of resubmission, then no WAIRE Points may be earned from the Custom WAIRE Plan in the current compliance period.

(v) A Custom WAIRE Plan application shall be made available, by the Executive Officer, for public review no less than thirty (30) days prior to approval.

(C) For any Plan that requires implementation beyond the subsequent Annual WAIRE Report, a progress report must be provided every six months after Plan approval. The progress report shall be consistent with the WAIRE Program Implementation Guidelines and include at a minimum, all of the following:

(i) The key milestones achieved and a schedule indicating dates for future increments of progress; and

(ii) Identification of any milestones that have been or will be achieved later than specified in the approved Custom Plan and the reason for achieving the milestones late. The progress report must describe how each late milestone will be achieved and when WAIRE Points are anticipated to be earned from that action.

(D) If the Executive Officer determines that a warehouse owner or operator is not making adequate progress to complete an approved Custom WAIRE Plan, then the Executive Officer may rescind approval of the plan 30 days after notifying the plan applicant of the proposed rescission. The notice to the plan applicant shall contain

a description of the identified deficiencies in the Custom WAIRE Plan implementation.

(i) If the owner or operator does not subsequently demonstrate to the Executive Officer's satisfaction that the deficiencies in implementing the plan have been corrected, then the Executive Officer will rescind approval of the Custom WAIRE Plan and notify the owners or operators of the rescission.

(A)(E) If the expected WAIRE Points from an approved Custom Plan are not earned during the applicable compliance period, the owner or operator shall be in violation of this rule unless the owner or operator demonstrates that they have met their Warehouse Points Compliance Obligation by the date that they submit their Annual WAIRE Report using WAIRE Points earned through requirements in paragraphs (d)(3) or (d)(5).

(4)(5) Mitigation Fee

In lieu of earning the required number of WAIRE Points in paragraph (d)(3) or (d)(4) If a warehouse operator does not earn a sufficient number of WAIRE Points to may choose to satisfy all or any remaining part of their WAIRE Points Compliance Obligation in (d)(1), they shall pay through payment of a mitigation fee to make up the difference according to the schedule below. The mitigation fee rate shall be equal to in the amount of \$1,000XX for each WAIRE Point.

(A) In any one compliance year, if a warehouse operator does not complete at least 50% of their WAIRE Points Compliance Obligation through the earning of WAIRE points from Table 3, the following year the mitigation fee rate shall be ten percent more than the dollar value per WAIRE Point that the warehouse operator paid in the previous year.

(5)(6) Transferring WAIRE Points

WAIRE Points are not transferable, except as specified below.

(A) Transferring WAIRE Points to a Different Warehouse

If a warehouse operator conducts warehousing activities at more than one warehouse, then WAIRE Points earned for one warehouse may be used at the other warehouse(s) under the operational control of that same warehouse operator. Only those points ~~that are earned~~

in excess of a warehouse operator's WAIRE Points Compliance Obligation at that site may be transferred. Any WAIRE Points transferred to a different warehouse shall be discounted as calculated using the values specified in the WAIRE Menu in Table 3.

(B) Transferring WAIRE Points to a Different Compliance Year

If a warehouse operator earns more WAIRE Points than is required for its annual Warehouse Points Compliance Obligation, then it may use those remaining WAIRE Points at the same warehouse to satisfy its Warehouse Points Compliance Obligation in any of the following three years.

(i) WAIRE Points may not be transferred to a subsequent compliance year if the WAIRE Menu items used to earn WAIRE Points are required by a U.S. EPA, CARB, or South Coast AQMD rules and regulations in that subsequent year.

(ii) Owners or operators transferring WAIRE Points to a different compliance year shall demonstrate that any onsite improvements or equipment installations that were used to earn the WAIRE Points being transferred are still operational at that warehouse facility in the year that WAIRE Points are used.

(iii) WAIRE Points earned prior to a warehouse operator's first compliance year pursuant to paragraph (d)(1) may be banked and transferred up to three years after the warehouse operator's first compliance year. This early compliance must be documented in an Annual WAIRE Report immediately following the year in which the action or investment was completed.

(C) Transferring WAIRE Points Between a Warehouse Owner and a Warehouse Operator

A warehouse owner may earn WAIRE Points during a compliance period using the methods specified in paragraphs (d)(23), (d)(4), or (d)(5) or may have WAIRE Points transferred to them from the warehouse operator at that site. The warehouse owner may transfer these WAIRE Points to any warehouse operator at the site where the WAIRE Points were earned within a three-year period after the

points were earned.

(7) Reporting

(A) Warehouse Operations Notification

Warehouse owners shall notify the South Coast AQMD in the manner specified in paragraph (e)(1) when any of the following conditions occur:

- (i) Within 60 calendar days of rule adoption;
- (ii) Within 14 calendar days after a new warehouse operator has the ability to use at least 50,000 square feet of a warehouse that has greater than or equal to 100,000 square feet used for warehousing activities;
- (iii) Within 30 calendar days after a renovated warehouse has received a certificate of occupancy from the local land use agency such that the total warehouse space that may be used for warehousing activities has increased or decreased; or
- (iv) Within three calendar days of a request from the Executive Officer.

(B) Initial Site Information Report

Warehouse operators shall submit an Initial Site Information Report in the manner specified in paragraph (e)(2) no later than January 15 of the year that they must submit their first annual WAIRE Report for that warehouse facility, or within 30 calendar days of a request by the Executive Officer.

~~(D)~~(C) Annual WAIRE Report

Warehouse operators shall submit an annual WAIRE Report in the manner specified in paragraph (e)(3) by the Executive Officer no more than 30 calendar days after July 1, beginning with the Initial Reporting Date in Table 12. The annual WAIRE Report, in accordance with the WAIRE Program Implementation Guidelines, shall include the information described in paragraph (e)(3) to demonstrate how the warehouse operator satisfied the requirement of paragraph (d)(1) in the preceding compliance period.

- (D) If a warehouse operator vacates a warehouse prior to the Annual WAIRE Report submission date in subparagraph (d)(7)(c) June 30 in any year that they must satisfy an annual WAIRE Points

Proposed Rule 2305

Compliance Obligation, then the Annual WAIRE Report shall be submitted to South Coast AQMD no later than the date that they vacate the warehouse.

(e) Reporting, Notification, and Recordkeeping Requirements

~~(1) Warehouse Operations Notification~~

~~The warehouse owner shall notify the South Coast AQMD within two months of rule passage and also no later than two weeks after any of the following conditions:~~

~~(A) A new warehouse operator has taken over operational control of a warehouse with more than 100,000 square feet dedicated to warehousing activities;~~

~~(B) A warehouse building has been modified and the total warehouse space dedicated to warehousing activities has been changed~~

~~(C) Upon request of the Executive Officer.~~

~~(2)~~(1) Warehouse Operations Notification

The notification required ~~in~~ pursuant to subparagraph (d)(7)(A)~~(e)(1)~~ shall be made in the manner specified by the Executive Officer and the WAIRE Program Implementation Guidelines. The notification shall include:

(A) The ~~business-legal~~ name and contact information of the warehouse operator;

(B) The duration of the current lease term, if applicable;

(C) The warehouse size(s) and the square footage ~~dedicated to warehousing that may be used for warehousing~~ activities under the operational control of each of the current warehouse operators(s) at a site; and

(D) The ~~business name~~last known legal name and contact information of the previous warehouse operator and the end date of the previous warehouse operator's warehousing activities at that site, if applicable.

~~(3) Initial Site Information Report~~

~~The warehouse operator shall submit an Initial Site Information Report by January 15 of the year that they must submit their first annual WAIRE Report for that facility, or within 30 days of a request by the Executive Officer. The Initial Site Information Report shall include information as specified in subparagraphs (A) through (G) below.~~

(2) Initial Site Information Report

The Initial Site Information Report required in subparagraph (d)(7)(B) shall be made in the manner specified by the Executive Officer and the WAIRE Implementation Guidelines, and shall include the following information:

(A) ~~The Initial Site Information Report shall include the w~~Warehouse size, and the square footage that may be used for ~~dedicated to~~ warehousing activities.

(i) If the warehouse building has less than 100,000 square feet ~~dedicated to~~that may be used for warehousing activities, then no additional information ~~is~~ pursuant to—subparagraphs (e)(2)(B) through (e)(2)(G) ~~below~~ is required.

~~(i)~~(ii) Any operator leasing less than 50,000 square feet of warehouse space that may be used for warehousing activities is not required to report additional information pursuant to subparagraphs (e)(2)(B) through (e)(2)(G), unless the same parent company owns or controls multiple operators in the same building who collectively use greater than or equal to 50,000 square feet of warehousing space for warehousing activity.

(B) ~~The Initial Site Information Report shall include~~Actual truck trip data, including:

(i) Number of truck trips in the previous 12—month period for the warehouse operator at that warehouse;

(ii) Number of truck trips anticipated for the next applicable 12—month compliance period in subdivision (d); and

(iii) For the purposes of this subparagraph, truck trips shall be reported in two categories. The first category shall include all trucks or tractors using a facility's truck gate or driveway that are truck eClass 4-2b through truck eClass 7, or straight trucks if truck class information is not available. The second category shall include all trucks and tractors that are truck eClass 8, or all tractors if truck class information is not available.

(C) If the warehouse operator owns or leases on-road trucks or tractors that serve that warehouse, the Initial Site Information Report shall include fleet data including:

Proposed Rule 2305

- (i) Number of trucks and tractors in the fleet serving that warehouse, by truck class, and fuel type;
 - (ii) Total VMT by truck class and fuel type; and
 - ~~(iii)~~ (iii) Typical dwell time at the facility by truck class; and
 - ~~(iii)(iv)~~ (iv) Information about which trucks or tractors are owned or leased.
- (D) If the warehouse has an alternative fueling station(s) or electric charging station(s) located onsite, the Initial Site Information Report shall include:
 - (i) Number of electric chargers/alternative fueling stations installed. The report must include the level for each electric charging station. For alternative-fueling stations, the report must include the fuel type, maximum fuel dispensing rate, the maximum amount of fuel that can be dispensed daily, and the pressure of the fueling system, if applicable;
 - (ii) Types of vehicles served;
 - (iii) Total fuel dispensed and/or charging provided in the previous 12-month period.
- (E) If the warehouse operator has yard trucks that are ~~based~~ used at that ~~site~~ warehouse facility, the Initial Site Information Report shall include:
 - (i) Number of yard trucks, and indicate which of these are registered as motor vehicles under Vehicle Code section 4000, et seq. by onroad and offroad classification;
 - (ii) Fuel type and engine size; and
 - (iii) Total annual hours of operation of all yard trucks.
- (F) If the warehouse has onsite alternative energy generation equipment and/or onsite energy storage equipment, the Initial Site Information Report shall include:
 - (i) The type and rated capacity of the alternative energy generation system in kilowatts and kilowatt-hours per year, and/or rated capacity of the energy storage system in kilowatt-hours, as applicable.
 - (ii) The total energy generation and/or usage of the energy storage system in kilowatt hours expected during the next applicable 12-month compliance period in subdivision (d).

(G) The Initial Site Information Report shall include whether the warehouse operator anticipates earning WAIRE Points from the WAIRE Menu, from a Custom WAIRE Plan, or by choosing to pay a mitigation fee the anticipated categories from the WAIRE Menu that the warehouse operator expects to use for the next applicable 12-month compliance period in subdivision (d). If the warehouse operator anticipates using the WAIRE Menu, the anticipated actions in the WAIRE Menu shall be reported. The actual WAIRE Menu items used for compliance ~~in the next applicable 12-month compliance period~~ can be from ~~those~~ the methods reported in the Initial Site Information Report, or from any other category in the WAIRE Menu, or any other method to earn WAIRE Points in paragraph (d)(2).

~~(4)(3)~~ Annual WAIRE Report

~~Annual WAIRE Reports required under subdivision (d) shall contain information as specified in subparagraphs (e)(4)(A) and (e)(4)(B) below.~~ Annual WAIRE Reports required pursuant to subparagraph (d)(7)(C) or (D) shall be made in the manner specified by the Executive Officer and as specified in the WAIRE Implementation Guidelines, and shall include the following information:-

- (A) The Annual WAIRE Report shall include truck trip data, including:
- (i) Number of actual truck trips during the compliance period in described in paragraph (d)(1); and
 - (ii) Truck trips shall be reported in the same manner as described in subparagraph (e)(32)(B)(iii)

(B) For every WAIRE Menu item used to earn WAIRE Points, the WAIRE Annual Report shall contain the information about the Reporting Metric specified in Table 3.

~~(B)(C)~~ Every Annual WAIRE Report shall include current contact information for the warehouse operator.

(4) Recordkeeping

Records which document the accuracy and validity of all information submitted to the South Coast AQMD as required by this Rule shall be kept by the warehouse operator or owner as applicable, for a minimum of seven years from the reporting deadline, and made available upon request during

Proposed Rule 2305

normal business hours.

(f) WAIRE Implementation Guidelines

The Executive Officer shall periodically publish guidelines for implementing the WAIRE Program.

(g) Exemptions

(5)(1) Operators In Warehouses That Have Less Than 50,000 Square Feet That They May Use For Warehousing Activities

Warehouse operators who can only use less than 50,000 square feet of a warehouse for warehousing activities due to terms of their lease are not subject to the requirements in subdivision (d)(1) unless the same parent company owns or controls multiple operators in the same building who collectively use more than 50,000 square feet of space for warehousing activity.

(6)(2) Unforeseen Circumstances

In instances where investments or actions completed by an owner or operator perform at a level significantly lower than anticipated due to unforeseen circumstances beyond the control of the warehouse operator and such that the anticipated WAIRE Points for that action can not be fully earned, the owner or operator may apply for a partial or complete exemption to the Executive Officer following procedures in the WAIRE Program Implementation Guidelines. The application must specify what portion of the WPCO determined by subparagraph (d)(1) that the malfunctioning equipment would have satisfied and why WAIRE Points can not be earned from other actions in subparagraph (d)(2).

(f)(h) Severability

If any provision of this rule is held by judicial order to be invalid, ~~or invalid~~ or inapplicable to any person or circumstance, such order shall not affect the validity of the remainder of this rule, or the validity or applicability of such provision to other persons or circumstances. In the event any of the exceptions to this rule are held by judicial order to be invalid, the persons or circumstances covered by the exception shall instead be required to comply with the remainder of this rule.

APPENDIX B

Proposed Rule 316 – Fees for Regulation XXIII

PROPOSED RULE 316 FEES FOR REGULATION XXIII

(a) Purpose

California Health and Safety Code Section 40522.5 provides authority for the South Coast Air Quality Management District to adopt a fee schedule for areawide or indirect sources of emissions which are regulated, but for which permits are not issued, to recover the costs of programs related to these sources. The purpose of this rule is to recover the South Coast AQMD's cost of implementing the programs in Regulation XXIII.

(b) Applicability

This rule applies to owners and operators of facilities subject to Rule 2305 that submit an Annual WAIRE Report, a Custom WAIRE Plan application, an Initial Site Information Report, a Warehouse Operations Notification, or that pay a Mitigation Fee.

(c) Definitions

For the purpose of this rule, the following definitions shall apply:

- (1) ANNUAL WAIRE REPORT is the annual report submitted by a warehouse operator or owner demonstrating how they satisfied their Warehouse Points Compliance Obligation pursuant to Rule 2305 (d)(7)(C).
- (2) CUSTOM WAIRE PLAN APPLICATION is the application submitted by a warehouse operator or owner that describes the customized method that they propose to use to satisfy their Warehouse Points Compliance Obligation pursuant to Rule 2305 (d)(4).
- (3) INITIAL SITE INFORMATION REPORT is the report submitted by a warehouse operator pursuant to Rule 2305 (d)(7)(B).
- (4) MITIGATION FEE is the fee paid by a warehouse operator or owner pursuant to Rule 2305 (d)(5).
- (5) WAREHOUSE has the same definition as in Rule 2305 (c)(28).
- (6) WAREHOUSE OPERATIONS NOTIFICATION is the report submitted by a warehouse owner with information about the warehouse building and any business leasing the warehouse pursuant to Rule 2305 (d)(7)(A).
- (7) WAREHOUSE OPERATOR has the same definition as in Rule 2305 (c)(30).
- (8) WAREHOUSE OWNER has the same definition as in Rule 2305 (c)(31).
- (9) WAREHOUSING ACTIVITIES has the same definition as in Rule 2305 (c)(33).

(d) Annual WAIRE Fees

Warehouse operators and owners who submit reports or notifications required by Rule 2305 shall pay fees according to Table 1. These fees are due at the time that the applicable report or notification must be submitted pursuant to Rule 2305.

Table 1

Report or Notification	Fee
Annual WAIRE Report	\$XXX.XX
Initial Site Information Report	\$XXX.XX
Warehouse Operations Notification	\$XXX.XX

(e) Custom WAIRE Plan Application Evaluation Fee

- (1) Warehouse owners who submit a Rule 2305 Custom WAIRE Plan Application shall be charged fees on a time and materials basis. The amount charged shall be an amount equal to the total actual and reasonable time incurred by South Coast AQMD staff for evaluation of the application, assessed at the hourly rate or prorated portion of \$XXX.XX. The initial fee shall be \$XXX.XX for each plan, and shall be paid when the Custom WAIRE Plan application is submitted.
- (2) The adjustment to plan application evaluation fees will be determined at the time a plan is approved or rejected and may include additional fees based upon actual review and work time billed. Notification of the amount due or refund will be provided to the applicant, and any additional fees due to the adjustment to plan evaluation fees will be billed following project completion.

(f) Mitigation Program Administrative Fee

Warehouse owners or operators who pay a mitigation fee pursuant to Rule 2305 (d)(5) shall pay an additional fee to cover the reasonable costs incurred by South Coast AQMD staff and/or its consultants to administer the Mitigation Program. This administrative fee shall be equal to five percent of the mitigation fee paid by the warehouse owner or operator, and shall be paid when the mitigation fee is paid.

(g) Payment Due Date

Payment of all applicable fees in subdivisions (d) and (e) shall be due in sixty (60) days from the date of personal service or sending by mail, electronic mail, or other electronic means, of the notification of the amount due. For the purpose of this paragraph, the fee payment will be

considered to be received by the South Coast AQMD if it is delivered, postmarked, or electronically paid on or before the expiration date stated on the billing notice. If the expiration date falls on a Saturday, Sunday, or a state holiday, the fee payment may be delivered, postmarked, or electronically paid on the business day following the Saturday, Sunday, or the state holiday with the same effect as if it had been delivered, postmarked, or electronically paid on the expiration date.

(h) Late Fees

The monetary charge for those warehouse owners or operators who violate the fee due date specified in subdivisions (f) and (g) shall be added to the original amount of the fee due according to the schedule in Table 2.

Table 2

Less than 30 days	5% of original fee
30 days to 90 days	15% of original fee
91 days to 1 year	25% of original fee
More than 1 year	50% of original fee

(i) Exemptions

- (1) Any warehouse owner who submits a Warehouse Operations Notification for a warehouse that has less than 100,000 square feet of floor area dedicated to warehousing activities that year is not required to pay fees described in subdivisions (d) through (h).
- (2) Any warehouse operator who operates less than 50,000 square feet of a warehouse for warehousing activities and for which Rule 2305 (e)(2)(A)(ii) applies is not required to pay fees described in subdivision (d).

APPENDIX C

NOP/IS Comments and Responses

Responses to Comments Received on the Notice of Preparation of a Draft EA and Initial Study

PR 2305 and PR 316 are considered a “project” as defined by the California Environmental Quality Act (CEQA). Pursuant to CEQA, the South Coast AQMD, as lead Agency, prepared a Notice of Preparation of the Draft Environmental Assessment and Initial Study (referred to as the NOP/IS) to analyze environmental impacts from the proposed project pursuant to its certified regulatory program (Public Resources Code Section 21080.5, CEQA Guidelines Section 15251(l), and South Coast AQMD Rule 110). The NOP/IS was released for a 32-day public review and comment period that began Friday, November 13, 2020 and ended on Tuesday, December 15, 2020. In addition, because the proposed project could have statewide, regional or areawide significance, a CEQA Scoping Meeting was held on December 2, 2020 pursuant to Public Resources Code Section 21083.9(a)(2).

A total of 12 comment letters were received during the comment period; one comment was received in regard to CEQA at the CEQA Scoping Meeting; and one comment letter was received after close of the comment period. Table C-1 provides a list of the comment letters received in response to the NOP/IS. For the purpose of identifying comments, comment letters are assigned a number (top center of the first page of each letter). For example, the first comment letter received from Augustine Band of Cahuilla Indians is labeled Comment Letter #1.

Table C-1 – List of Commenters on the NOP/IS Received by South Coast AQMD

Number	Commenting Organization/Person	Date Received
Comment Letters That Do Not Require a Response		
1	Augustine Band of Cahuilla Indians	11/16/2020
2	Native American Heritage Commission	11/16/2020
3	Santa Ynez Band of Chumash Indians	12/2/2020
4	California Highway Patrol – Southern Division	12/3/2020
5	California Highway Patrol – Mojave Area	12/4/2020
6	California Highway Patrol – San Bernardino	12/8/2020
14	San Pasqual Band of Mission Indians	12/28/2020
Comment Letters For Which Responses Have Been Prepared		
7	Holland & Knight	12/15/2020
8	Snell & Wilmer	12/15/2020
9	General Motors Customer Care & Aftersales	12/15/2020
10	Earthjustice; East Yard Communities For Environmental Justice; Natural Resources Defense Council; San Pedro & Peninsula Homeowners Coalition; Sierra Club San Geronimo Chapter; Urban & Environmental Policy Institute	12/15/2020
11	Coalition for Clean Air	12/15/2020
12	Inland Empire Economic Partnership and the Southern California Logistics Council	12/15/2020
Comments Received at CEQA Scoping Meeting for Which Responses Have Been Prepared		
13	Frances Keeler, California Council for Environmental and Economic Balance	12/2/2020

Comment Letters 1 to 6 and 14 do not require a response because they do not raise issues related to the environmental analysis. Comment Letters 7 to 13 raise environmental issues and responses have been prepared. However, these letters included comments on both the proposed project and the NOP/IS. Please note that the comment received at the CEQA Scoping Meeting was transcribed by South Coast AQMD staff from the video conference recording. Although there were other comments raised and questions asked at the scoping meeting, they were directly related to the proposed project and rule requirements and did not raise environmental issues necessitating a response.

Thank you for the opportunity to offer input concerning the development of the above-identified project. We appreciate your sensitivity to the cultural resources that may be impacted by your project and the importance of these cultural resources to the Native American peoples that have occupied the land surrounding the area of your project for thousands of years. Unfortunately, increased development and lack of sensitivity to cultural resources have resulted in many significant cultural resources being destroyed or substantially altered and impacted. Your invitation to consult on this project is greatly appreciated.

At this time, we are unaware of specific cultural resources that may be affected by the proposed project, however, in the event, you should discover any cultural resources during the development of this project please contact our office immediately for further evaluation.

Very truly yours,

Victoria Martin, Tribal Secretary

Govin Newsom, Governor

NATIVE AMERICAN HERITAGE COMMISSION

November 16, 2020

Ryan Banuelos
South Coast Air Quality Management District (South Coast AQMD)
21865 Copley Drive
Diamond Bar, CA 91765-4182

Re: 2020110225, Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII Project, Los Angeles, Orange, Riverside, and San Bernardino Counties

Dear Mr. Banuelos:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

Comment Letter #2 (Continued) – Native American Heritage Commission

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
 - a. A brief description of the project.
 - b. The lead agency contact information.
 - c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
 - d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).
2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).
 - a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).
3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
 - a. Alternatives to the project.
 - b. Recommended mitigation measures.
 - c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).
4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
 - a. Type of environmental review necessary.
 - b. Significance of the tribal cultural resources.
 - c. Significance of the project's impacts on tribal cultural resources.
 - d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).
5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).
6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
 - a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
 - b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

Comment Letter #2 (Continued) – Native American Heritage Commission

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

- a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
- b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

- a. Avoidance and preservation of the resources in place, including, but not limited to:
 - i. Planning and construction to avoid the resources and protect the cultural and natural context.
 - ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
- b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - i. Protecting the cultural character and integrity of the resource.
 - ii. Protecting the traditional use of the resource.
 - iii. Protecting the confidentiality of the resource.
- c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
- d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).
- e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
- f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

- a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
- b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
- c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

Comment Letter #2 (Continued) – Native American Heritage Commission

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. **Tribal Consultation:** If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. **No Statutory Time Limit on SB 18 Tribal Consultation.** There is no statutory time limit on SB 18 tribal consultation.
3. **Confidentiality:** Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. **Conclusion of SB 18 Tribal Consultation:** Consultation should be concluded at the point in which:
 - a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
 - b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: <http://nahc.ca.gov/resources/forms/>.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
 - a. If part or all of the APE has been previously surveyed for cultural resources.
 - b. If any known cultural resources have already been recorded on or adjacent to the APE.
 - c. If the probability is low, moderate, or high that cultural resources are located in the APE.
 - d. If a survey is required to determine whether previously unrecorded cultural resources are present.
2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

Comment Letter #2 (Continued) – Native American Heritage Commission

- b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.
- 3.** Contact the NAHC for:
- a.** A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
 - b.** A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.
- 4.** Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
- a.** Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, § 15064.5(f) (CEQA Guidelines § 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
 - b.** Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
 - c.** Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code § 7050.5, Public Resources Code § 5097.98, and Cal. Code Regs., tit. 14, § 15064.5, subdivisions (d) and (e) (CEQA Guidelines § 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Re: South Coast AQMD – Proposed Rule 2305

Dear Mrs. Radlein:

Thank you for contacting the Tribal Elders' Council for the Santa Ynez Band of Chumash Indians.

At this time, the Elders' Council requests no further consultation on this project; however, we understand that as part of NHPA Section 106, we must be notified of the project.

Thank you for remembering that at one time our ancestors walked this sacred land.

Sincerely Yours,

Kelsie Merrick

RE: Proposed Rule 2305 Warehouse Indirect Source Rules -Salton Sea Air Basin

Sent via E-mail- Due to COVID -19

Dear Mr. Banuelos,,

The San Pasqual Band of Mission Indians Tribal Historic Preservation Office has received your notification of the project referenced above. This letter constitutes our response on behalf of David L. Toler THPO Officer.

We have consulted our maps and determined that the project as described is not within the boundaries of the recognize San Pasqual Indian Reservation. The project is within the boundaries of the territory that the tribe considers its Traditional Use Area (TUA). Therefore, we request to be kept in the information loop as the project progresses and would appreciate being maintained on the receiving list for project updates, reports of investigations, and/or any documentation that might be generated regarding previously reported or newly discovered sites. Further, we may recommend archaeological monitoring pending the results of site surveys and records searches associated with the project. If the project boundaries are modified to extend beyond the currently proposed limits, we request updated information and the opportunity to respond to your changes. Also, San Pasqual Band of Mission Indians can provide Native American monitoring if needed for this project.

We appreciate involvement with your initiative and look forward to working with you on future efforts. If you have questions or need additional information, please do not hesitate to contact me by telephone 760-651-5142 or by e-mail at

Thpo@sanpasqualtribe.org please CC: Angelinag@sanpasqualtribe.org thank you.

Respectfully,

Angelina Gutierrez

Re: CEQA Scoping Comments for Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII

Dear Mr. Bañuelos:

Our client, the California Trucking Association (“CTA”), appreciates the opportunity to submit comments on the scope and content of the South Coast Air Quality Management District’s (“SCAQMD” or “District”) Environmental Assessment (“EA”) for the Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees For Regulation XXIII (collectively, the “Proposed Rules”).

Many members of the CTA will be directly regulated by the Proposed Rules and many others will be compelled to assist the covered warehouses in achieving compliance with the Proposed Rules. This will require substantial capital investment by CTA members and will have far reaching environmental and economic effects. To that end, CTA respectfully requests that SCAQMD give the consequences of its proposed action a thorough examination.

7-1

I. Statement of Interest.

“Truck driver” is one of the most common jobs in California. There are approximately 550,000 commercial vehicles registered in California and an additional 1.5 million commercial vehicles registered in other states to operate in California. Most of these vehicles are owned by small businesses: 50% of all trucks are owned by fleets of 3 or fewer trucks and 80% of all trucks are owned by fleets with fewer than 50 trucks.

Atlanta | Austin | Boston | Charlotte | Chicago | Dallas | Denver | Fort Lauderdale | Houston | Jacksonville | Lakeland
Los Angeles | Miami | New York | Orlando | Philadelphia | Portland | San Francisco | Stamford | Tallahassee | Tampa
Tysons | Washington, D.C. | West Palm Beach

Comment Letter #7 (Continued) – Holland & Knight

Ryan Bañuelos
December 14, 2020
Page 2

The CTA is the largest state trade association representing trucking in the United States. Its 1800 members include both large and small fleets with an average fleet size of 20 trucks. CTA members are actively participating in the development, piloting, and demonstration of alternative fuel and electric-drive capable vehicles. In fact, some member fleets have been working to bring electric-drive vehicles to market for nearly ten years. The CTA continues to support a coordinated and measured transition to alternative fuel and electric-drive capable vehicles.

7-1 cont.

II. Adequate Project Description.

The EA must include a project description that adequately describes and analyzes the effects of the compliance actions of covered entities if the Proposed Rules are adopted. As the Initial Study explains, “The purpose of PR 2305 is to facilitate NO_x and PM, including DPM, emission reductions associated with warehouses and the mobile sources attracted to applicable warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. Implementation of the proposed project is expected to result in NO_x and PM, including DPM, emission reductions and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed.” However, the Initial Study fails to adequately discuss the reasonably foreseeable compliance responses and their effects.

A project description that omits integral components of the project may result in an EIR that fails to disclose all of the impacts of the project. *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 829 (project description for sand and gravel mine omitted water pipelines serving project); *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 80. The “project” is “the whole of an action” that may result in either a direct physical environmental change or a reasonably foreseeable indirect change. CEQA Guidelines § 15378; *Habitat & Watershed Caretakers v. City of Santa Cruz* (2013) 213 Cal.App.4th 1277, 1297; *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1220. Project descriptions have been found inadequate when they failed to include discussion of necessary expansions to accommodate the contemplated project. See *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713 (project description inadequate when it failed to discuss sewer lines and wastewater treatment expansion necessary for the contemplated housing development); *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 830 (project description for sand and gravel mine inadequate when it failed to describe or analyze the construction of water pipelines needed for operations); *Whitman v. Board of Supervisors* (1979) 88 Cal.App.3d 397 (project description for oil well inadequate for failure to describe or analyze associated pipeline).

7-2

The Proposed Rules rely on actions by covered entities to: utilize zero emission (“ZE”) and near zero emission (“NZE”) trucks for their warehouse operator fleets, control ZE/NZE truck visits, utilize ZE yard trucks, install onsite ZE charging or fueling infrastructure, install and use onsite solar panels, and install high efficiency filters at sensitive receptors. However, the magnitude of the compliance response is not adequately described in the project description. The Notice of

7-3

Comment Letter #7 (Continued) – Holland & Knight

Ryan Bañuelos
December 14, 2020
Page 3

Preparation contains a version of the Proposed Rules that calculates the compliance obligation of covered entities based in part on an undefined “stringency factor.” The stringency factor is described as “a dimensionless multiplier that determines how many Points an operator needs to earn.” But without even a range of potential values, it is impossible to adequately describe or analyze the full scope of compliance responses that will be required. Even in the absence of a full description or analysis of the scale, it is clear that the reasonably foreseeable compliance responses to the Proposed Rules would likely result in an increase in manufacturing and associated facilities to increase the supply of ZE/NZE trucks, along with construction of new hydrogen fueling stations and electric vehicle charging stations to support ZE/NZE operations and associated increases in hydrogen fuel supply and transportation. Increased deployment of ZE/NZE trucks would require an increase in production of electricity and hydrogen fuel and result in associated increases in lithium and platinum mining and exports from source countries or other states. This would also result in increased rates of disposal of lithium batteries and hydrogen fuel cells and also increased need for facilities capable of recycling these batteries and fuel cells. Long-term operation of new manufacturing plants, stations, and recycling facilities would often include the presence of workers; movement of automobiles, trucks, and heavy equipment; and operation of stationary equipment. None of these reasonably foreseeable consequences of compliance actions are disclosed in the Initial Study. This must be corrected in the EA.

7-3 cont.

A. Increases in Grid Capacity.

While the installation of vehicle charging stations and onsite solar panels will presumably occur in developed industrial areas, the supporting infrastructure for the Proposed Rules will require the development of offsite resources, including new power plants, energy storage, and other utility infrastructure to support the significant load that ZE trucks add to the electrical grid. Charging just ten ZE vehicles during “off peak” hours increases the “off peak” load to “peak” or higher levels. Local distribution grid infrastructure could be significantly impacted by the Proposed Rules and would require expansive upgrades. According to E3, a consultant for the California Energy Commission, California’s electrical demand will increase from 300,000 gigawatt hours (“GWh”) under present conditions to over 500,000 GWh by 2050. To meet the state’s ambitious climate goals, nearly all of this new demand would be met by wind, solar and battery storage.¹ This would require the construction of 109,834 megawatts (“MW”) of new solar capacity (a nearly 900 percent increase from current levels), 14,585 MW of new wind capacity (more than a 200 percent increase from current levels), and 73,933 MW of new available grid battery storage (a 15,560 percent increase from the current 478 MW).² These dramatic increases in capacity come with correspondingly dramatic impacts. The Proposed Rules include the actions

Page 4

necessary to comply, which increase the demand for electrical generation and transmission and which will have potentially significant impacts on the environment including in areas such as air quality, greenhouse gases, biological resources, land use, and agricultural resources. The District must describe and analyze the compliance actions and their foreseeable effects as part of the project description of the Proposed Rules.

7-4 cont.

B. Increased Need for Lithium Extraction.

A key component of the Proposed Rules is incentivizing conversion to ZE vehicles, which rely on lithium batteries. This compliance action is a component of the “project as a whole,” and it must be described and its impacts disclosed. By increasing the demand for lithium and other ores, a foreseeable consequence of the Proposed Rules is more extraction.

Lithium can be extracted in one of two ways—from hard rock mining or from brines. Mining of hard rock would require the use of conventional mining practices including the creation of underground mines and open pits. Collecting lithium from lake brines and clays requires the pumping of salty groundwater into lagoons where it undergoes evaporation producing salts containing lithium compounds. Both hard rock mining and brine evaporation cause significant environmental harm, including potential harm to biological resources through reduction in sensitive habitat, interference with wildlife corridors, loss of special-status species, and potential conflicts with a habitat conservation plan or natural community conservation plan.

7-5

Extraction of lithium also increases the risk of hazardous releases through leaching, spills or air emissions that can harm both human health and the environment. Water contamination associated with lithium ore extraction could have acute and adverse effects to sensitive habitat and sensitive species. While the vast majority of lithium production occurs outside of California, the California Energy Commission recently funded efforts to extract lithium from areas around the Salton Sea. As demand for lithium increases around the world, extraction activities are more likely to take place in sensitive environments in California and the United States. By inducing demand for lithium, the Proposed Rules at least cumulatively contribute to this environmental harm. Because an increase in lithium demand is a reasonable consequence of the behaviors the District seeks to induce, the District must evaluate these consequences.

C. Disposal Facilities.

Similarly, the reasonable compliance actions taken pursuant to the Rule will increase the demand for specialized disposal facilities. Again, these compliance actions are part of the “project as a whole” and their effects must be described. The Proposed Rules will increase the number of batteries and fuel cells in the District and specialized disposal facilities will be needed to handle these materials. SCAQMD must analyze whether there is sufficient capacity in the existing hazardous waste system to accommodate the waste that is a reasonably foreseeable result of the Proposed Rules. If there is not, then SCAQMD must analyze the likely effects from the need for increased capacity.

7-6

Comment Letter #7 (Continued) – Holland & Knight

Ryan Bañuelos
December 14, 2020
Page 5

In order to comply with CEQA, the EA must adequately describe and analyze the project as a whole, including the reasonably foreseeable consequences of project approval. This includes not only the foreseeable compliance activities undertaken by covered entities, but also the necessary infrastructure to support those activities. The effects of these reasonably foreseeable consequences may affect agricultural and biological resources through land use conversions, geologic and hydrologic impacts due to increased lithium extraction activities, substantial increases in the demand for water supply, wastewater treatment, storm water drainage, energy, and solid waste services. In light of these sweeping effects, it is inappropriate for the District to scope these issues out of the EA.

7-7

III. Environmental Impacts.

CTA strongly supports a comprehensive evaluation of the impacts of the Proposed Rules, including a lifecycle analysis of the reasonably foreseeable consequences of the Proposed Rules. SCAQMD has identified the issues of (1) air quality and greenhouse gases, (2) energy, and (3) transportation for further evaluation in the Draft EA. CTA agrees that these topics merit robust discussion and also encourages SCAQMD to evaluate the effects of the reasonably foreseeable compliance responses.

7-8

A. Air Quality and Greenhouse Gas Emissions.

The Proposed Rules encourage the premature transition from conventional to ZE/NZE trucks without considering the consequences outside of the District. The Proposed Rules compel the deployment of new ZE/NZE vehicles before the end of the useful life of the existing conventional fleet. Because these vehicles continue to be assets, they are unlikely to be retired and will instead be transitioned to other uses or jurisdictions. While the Proposed Rules may reduce truck emissions in the District, it is highly foreseeable that these emissions will merely migrate elsewhere. While more difficult to move outside of the District's jurisdiction, it is also likely that the Proposed Rules will force many warehouses to relocate outside of the SCAQMD. Again, while this may reduce the emissions in the District itself, these emissions are ultimately reshuffled rather than eliminated. The effects of the Proposed Rules on air quality cannot be considered in a vacuum. The District must realistically evaluate any emission reductions from the Proposed Rules in light of the significant and foreseeable leakage outside of its jurisdiction.

7-9

The District must also evaluate any emission reductions from the Proposed Rules against increased emissions from electricity generation. While the Proposed Rules anticipate the use of on-site solar panels, these are unlikely to fully offset the demand created by compliance actions. Until greater renewable capacity is realized, grid electricity will continue to be generated through fossil fuels. In the last two years, almost 60% of electricity supplied by Southern California Edison was generated from non-renewable sources. The Proposed Rules will force the transition to ZE/NZE vehicles and the District must analyze the greater emissions generated by this increased electrical demand.

Comment Letter #7 (Continued) – Holland & Knight

Ryan Bañuelos
December 14, 2020
Page 6

Similarly, increased demand for lithium batteries could increase production, lithium mining, and exports from source countries or other states, which requires energy for mineral extraction, processing, and transport, all of which may diminish the benefits of the Proposed Rules. The EA must contain a full discussion of the lifecycle of the various fuels used in ZE/NZE vehicles to provide full disclosure to the public and decisionmakers.

7-10

B. Energy.

Increased deployment of ZE/NZE vehicles would place greater demand on the existing electricity grid. As discussed above, this will necessitate additional grid capacity to accommodate demand. For example, Southern California Edison predicts 26 million light-duty electric vehicles will be on the road in California in 2045 and transportation electrification will increase electric load by 130 terawatt-hours, accounting for more than one-third of the grid-served load. As of 2019, Southern California Edison had only 60 terawatt-hours of net generation. As explained above, even ten ZE vehicles during “off peak” hours will increase the “off peak” load to “peak” or higher levels. One hundred medium duty e-trucks charging at the same time demand 1.5 megawatts of electricity and approximately 3,000 warehouses will be subject to the Proposed Rules. The EA must assess the impacts of the Proposed Rules on the state’s energy infrastructure.

While pilot projects have been successfully deployed using ZE/NZE vehicles, this success reflects the trucking industry’s well-established understanding of existing fueling suppliers. To date, existing demonstration and deployment has been accomplished on a smaller scale and is typically limited to prevent cost-prohibitive utility upgrades. Increasing utility interaction as electric-capable vehicles scale to the levels envisioned in the Proposed Rules will result in potential misalignments between utility policy and regulation and fleet operations. Broader deployment will necessitate extensive coordination with utilities. SCAQMD must include an analysis of the impacts of reasonably foreseeable compliance activities on the utility grid.

7-11

The EA must also assess how the Proposed Rules cumulatively contribute to impacts to the State’s energy system. Many municipalities and regulators have advanced electrification initiatives which have the potential to cumulatively overwhelm existing generation and transmission capacity. The cumulative effect of these initiatives is to push the state into a high electrification scenario without the infrastructure necessary to support the new load. The EA must analyze the Proposed Rules’ cumulative contribution to this impact in light of the many varied electrification initiatives being adopted.

C. Transportation.

The Proposed Rules create significant uncertainty in commercial transportation. By compelling the early transition to ZE/NZE vehicles, the Proposed Rules drive rapid and premature fleet turnover for high-cost ZE/NZE vehicles while imposing the uncertain but often high costs of electricity and hydrogen fuel on the logistics sector. Additionally, while the Proposed Rules may incentivize the transition to ZE/NZE vehicles in the SCAQMD’s jurisdiction, the Initial Study

7-12

Comment Letter #7 (Continued) – Holland & Knight

Ryan Bañuelos
December 14, 2020
Page 7

does not appear to have considered whether there is sufficient charging infrastructure to support these fleets outside of the District. Additionally, as California responds to increasing wildfire threats, public safety power shutoff (“PSPS”) events have become increasingly common. The EA should consider the interaction between expedited electrification and PSPS events. It is reasonably foreseeable that the Proposed Rules will lead to significant disruptions to freight transportation in light of these shut off events.

While impacts to the State’s logistics infrastructure are not specifically listed as impacts in Appendix G, the Appendix “is only an illustrative checklist and does not set forth an exhaustive list of potentially significant environmental impacts under CEQA or standards of significance for those impacts.” *City of San Diego v California State University* (2011) 201 Cal.App.4th 1134, 1191; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1111. “Also, the lack of precise quantification or criteria for determining whether an environmental effect is ‘significant’ under CEQA does not excuse a lead agency from using its best efforts to evaluate whether an effect is significant. *City of San Diego*, 201 Cal.App.4th at 1191; *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.* (2001) 91 Cal.App.4th 1344, 1370. The District must comprehensively evaluate the impacts to infrastructure in its EA.

7-12 cont.

IV. Conclusion.

The many impacts that can be expected from the Proposed Rules, as explained throughout this document, necessitate a great deal of caution in the approvals process. CTA urges SCAQMD to pursue the studies and recommendations in this document as well as those contained in the suggestions of the numerous other commenters at public scoping meetings and in written comments to the District.

7-13

Sincerely yours,

HOLLAND & KNIGHT LLP

Marne S. Sussman

Responses to Comment Letter #7 – Holland & Knight

Comment 7-1

Dear Mr. Bañuelos:

Our client, the California Trucking Association (“CTA”), appreciates the opportunity to submit comments on the scope and content of the South Coast Air Quality Management District’s (“SCAQMD” or “District”) Environmental Assessment (“EA”) for the Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees For Regulation XXIII (collectively, the “Proposed Rules”).

Many members of the CTA will be directly regulated by the Proposed Rules and many others will be compelled to assist the covered warehouses in achieving compliance with the Proposed Rules. This will require substantial capital investment by CTA members and will have far reaching environmental and economic effects. To that end, CTA respectfully requests that SCAQMD give the consequences of its proposed action a thorough examination.

7-1

I. Statement of Interest.

“Truck driver” is one of the most common jobs in California. There are approximately 550,000 commercial vehicles registered in California and an additional 1.5 million commercial vehicles registered in other states to operate in California. Most of these vehicles are owned by small businesses: 50% of all trucks are owned by fleets of 3 or fewer trucks and 80% of all trucks are owned by fleets with fewer than 50 trucks.

The CTA is the largest state trade association representing trucking in the United States. Its 1800 members include both large and small fleets with an average fleet size of 20 trucks. CTA members are actively participating in the development, piloting, and demonstration of alternative fuel and electric-drive capable vehicles. In fact, some member fleets have been working to bring electric-drive vehicles to market for nearly ten years. The CTA continues to support a coordinated and measured transition to alternative fuel and electric-drive capable vehicles.

7-1 cont.

Response to Comment 7-1

This comment does not raise any issues related to the proposed project’s impact on the physical environment under CEQA. No further response is necessary.

Comment 7-2**II. Adequate Project Description.**

The EA must include a project description that adequately describes and analyzes the effects of the compliance actions of covered entities if the Proposed Rules are adopted. As the Initial Study explains, “The purpose of PR 2305 is to facilitate NOx and PM, including DPM, emission reductions associated with warehouses and the mobile sources attracted to applicable warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. Implementation of the proposed project is expected to result in NOx and PM, including DPM, emission reductions and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed.” However, the Initial Study fails to adequately discuss the reasonably foreseeable compliance responses and their effects.

A project description that omits integral components of the project may result in an EIR that fails to disclose all of the impacts of the project. *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 829 (project description for sand and gravel mine omitted water pipelines serving project); *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 80. The “project” is “the whole of an action” that may result in either a direct physical environmental change or a reasonably foreseeable indirect change. CEQA Guidelines § 15378; *Habitat & Watershed Caretakers v. City of Santa Cruz* (2013) 213 Cal.App.4th 1277, 1297; *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1220. Project descriptions have been found inadequate when they failed to include discussion of necessary expansions to accommodate the contemplated project. See *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713 (project description inadequate when it failed to discuss sewer lines and wastewater treatment expansion necessary for the contemplated housing development); *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 830 (project description for sand and gravel mine inadequate when it failed to describe or analyze the construction of water pipelines needed for operations); *Whitman v. Board of Supervisors* (1979) 88 Cal.App.3d 397 (project description for oil well inadequate for failure to describe or analyze associated pipeline).

7-2

Response to Comment 7-2

CEQA Guidelines Section 15124 requires the description of the project contains information that should not supply extensive detail beyond that needed for evaluation and review of the environmental impact. South Coast AQMD Rule 110, which implements the South Coast AQMD’s certified regulatory program, does not impose any greater requirements for the description of the project in an EA than is required for an EIR under CEQA. To comply with CEQA Guidelines Section 15124 and South Coast AQMD Rule 110, Chapter 2, *Proposed Project* includes specific information about the proposed project such as the project location, project background, project objectives, project description, a summary of warehouses that would be subject to the proposed project, and WAIRE Menu actions and investments technology overview.

CEQA Guidelines Section 15144 states that drafting an EIR or preparing a Negative Declaration necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that *it reasonably can* (*emphasis added*). The degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR (CEQA Guidelines Section 15146). Chapter 4, *Environmental Impact Analysis and Mitigation Measures* includes an analysis of the proposed project’s potential direct, indirect, and cumulative environmental impacts from compliance responses on aesthetics, agriculture and forestry resources, air quality and greenhouse gas (GHG) emissions, biological resources, cultural resources, energy, geology and

soils, hazardous materials and solid and hazardous waste, hydrology and water quality, mineral resources, noise, transportation, and utilities and service systems.

Comment 7-3

The Proposed Rules rely on actions by covered entities to: utilize zero emission (“ZE”) and near zero emission (“NZE”) trucks for their warehouse operator fleets, control ZE/NZE truck visits, utilize ZE yard trucks, install onsite ZE charging or fueling infrastructure, install and use onsite solar panels, and install high efficiency filters at sensitive receptors. However, the magnitude of the compliance response is not adequately described in the project description. The Notice of

7-3

Preparation contains a version of the Proposed Rules that calculates the compliance obligation of covered entities based in part on an undefined “stringency factor.” The stringency factor is described as “a dimensionless multiplier that determines how many Points an operator needs to earn.” But without even a range of potential values, it is impossible to adequately describe or analyze the full scope of compliance responses that will be required. Even in the absence of a full description or analysis of the scale, it is clear that the reasonably foreseeable compliance responses to the Proposed Rules would likely result in an increase in manufacturing and associated facilities to increase the supply of ZE/NZE trucks, along with construction of new hydrogen fueling stations and electric vehicle charging stations to support ZE/NZE operations and associated increases in hydrogen fuel supply and transportation. Increased deployment of ZE/NZE trucks would require an increase in production of electricity and hydrogen fuel and result in associated increases in lithium and platinum mining and exports from source countries or other states. This would also result in increased rates of disposal of lithium batteries and hydrogen fuel cells and also increased need for facilities capable of recycling these batteries and fuel cells. Long-term operation of new manufacturing plants, stations, and recycling facilities would often include the presence of workers; movement of automobiles, trucks, and heavy equipment; and operation of stationary equipment. None of these reasonably foreseeable consequences of compliance actions are disclosed in the Initial Study. This must be corrected in the EA.

7-3 cont.

Response to Comment 7-3

While there is a list of actions or investments a warehouse operator may choose to comply with the proposed project (included as Appendix A of the EA), it is speculative to determine and describe the magnitude of the compliance response in the project description. Warehouse operators may earn WAIRE Points through a Custom WAIRE Plan specific to their operation that satisfy prescribed performance metrics. In lieu of satisfying or to supplement earned WAIRE Points to meet the Warehouse Points Compliance Obligation (WPCO) within each compliance year, a warehouse operator may choose to pay an optional mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve the emissions reductions. The selection of specific WAIRE Menu actions or WPCO compliance strategy (in the form of WAIRE Menu actions, a Custom WAIRE Plan, and/or the payment of mitigation fee) cannot be precisely forecasted at this time. The unknown is also driven by and dependent upon warehouse-specific factors, including, for example, the physical configuration of a warehouse and space available for EV charging infrastructure onsite. To account for the uncertainty, the analysis of environmental impacts for the proposed project was analyzed using the currently proposed rule stringency factor of 0.0025 WAIRE Points per Weighted Annual Truck Trip (WATT) which was presented and discussed in the Warehouse ISR Working Group Meeting held on December 17, 2020¹. For more information on the currently proposed rule stringency

¹ South Coast AQMD, December 17, 2020, Warehouse ISR Working Group. Accessed on December, 18, 2020. <https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/warehouse-isr-presentation-121720.pdf>

factor, please see Chapters 2 and 3 of the Preliminary Draft Staff Report² as well as Chapter 2, *Proposed Project*, in the EA.

As analyzed and disclosed in the NOP/IS, potentially significant construction impacts related to air quality and GHG emissions, energy, and transportation may occur from, for example, the installation of zero-emissions (ZE) charging/fueling infrastructure, and potentially significant operational impacts may also occur on air quality and GHG emissions, energy, and transportation from using ZE and near-zero emissions (NZE) trucks and ZE yard trucks (e.g., increased energy usage). These impacts were further analyzed in Chapter 4 of this EA. Although the NOP/IS concluded that the proposed project is expected to result in less than significant impacts on hazards and hazardous materials and solid and hazardous waste, the EA analyzes the environmental issues associated with increased disposal of batteries and hydrogen fuel cells and their potential impacts on the battery recycling infrastructure in Chapter 4.3.4, *Operational Impacts in Excess of Capacity of Local Recycling Infrastructure*. Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, also analyzes the environmental issues associated with construction waste and transport, use, and disposal of liquefied natural gas (LNG) fuel. Additionally, the NOP/IS concluded that the proposed project is expected to result in less than significant impacts on aesthetics, agricultural and forestry, biological resources, cultural and tribal resources, geology and soils, hydrology and water quality (including water supply, wastewater treatment, stormwater drainage), land use and planning, mineral resources, noise, population and housing, public services, recreation, and utilities and service systems; however, this EA analyzes the indirect environmental impacts to these areas to the extent that they may be impacted by potential future construction of new manufacturing and recycling facilities, and improvements to the electrical grid in Chapter 4.5, *Other Impact Areas*. Please also see *Executive Summary* for the potential environmental impacts that were found to be less than significant.

Consistent with CEQA Guidelines Sections 15204, 15144, and 15146, the EA appropriately and conservatively analyzes the various potential compliance actions as a result of the proposed project. It is not feasible to determine which compliance actions each of the 2,902 warehouse operators will choose to comply with the proposed project at this time without undue speculation. South Coast AQMD used a good-faith effort to develop 18 WAIRE Points scenarios to represent a wide range of potential compliance options and modeled each of them using the available technical information as discussed in the Draft WAIRE Menu Technical Report³, data on the logistics industry and goods movement from the Southern California Association of Governments (SCAG) and CALSTART⁴, and the modeling tools such as EMFAC2017⁵ and the California Air Resources Board (CARB) META tool⁶. The WAIRE Points scenarios, which provide “book-ends”

of the range of potential environmental impacts associated with the proposed project, formed the conceptual and technical basis for the environmental impact analysis in Chapter 4, *Environmental Impact Analysis and Mitigation Measures*. The potential long-term environmental impacts from implementing the WAIRE Program are discussed in Chapter 6, *Other CEQA Considerations*. It is important to note that CEQA does not require a full lifecycle analysis of potential environmental effects. Please see Chapter 4.1.1.3, *Lifecycle Analysis* for more information.

Comment 7-4

A. Increases in Grid Capacity.

While the installation of vehicle charging stations and onsite solar panels will presumably occur in developed industrial areas, the supporting infrastructure for the Proposed Rules will require the development of offsite resources, including new power plants, energy storage, and other utility infrastructure to support the significant load that ZE trucks add to the electrical grid. Charging just ten ZE vehicles during “off peak” hours increases the “off peak” load to “peak” or higher levels. Local distribution grid infrastructure could be significantly impacted by the Proposed Rules and would require expansive upgrades. According to E3, a consultant for the California Energy Commission, California’s electrical demand will increase from 300,000 gigawatt hours (“GWh”) under present conditions to over 500,000 GWh by 2050. To meet the state’s ambitious climate goals, nearly all of this new demand would be met by wind, solar and battery storage.¹ This would require the construction of 109,834 megawatts (“MW”) of new solar capacity (a nearly 900 percent increase from current levels), 14,585 MW of new wind capacity (more than a 200 percent increase from current levels), and 73,933 MW of new available grid battery storage (a 15,560 percent increase from the current 478 MW).² These dramatic increases in capacity come with correspondingly dramatic impacts. The Proposed Rules include the actions

7-4

¹ Ming et al., Long-Run Resource Adequacy under Deep Decarbonization Pathways for California, June 2019 https://www.ethree.com/wp-content/uploads/2019/06/E3_Long_Run_Resource_Adequacy_CA_Deep-Decarbonization_Final.pdf.

² Ming et al., Long-Run Resource Adequacy under Deep Decarbonization Pathways for California, June 2019 https://www.ethree.com/wp-content/uploads/2019/06/E3_Long_Run_Resource_Adequacy_CA_Deep-Decarbonization_Final.pdf.

necessary to comply, which increase the demand for electrical generation and transmission and which will have potentially significant impacts on the environment including in areas such as air quality, greenhouse gases, biological resources, land use, and agricultural resources. The District must describe and analyze the compliance actions and their foreseeable effects as part of the project description of the Proposed Rules.

7-4 cont.

Response to Comment 7-4

Chapter 4.2, *Energy* analyzes the proposed project’s potential energy impacts from construction activities undertaken to comply with the proposed project and from increases in electricity from electric vehicle (EV) trucks, installation of EV chargers to charge electric vehicles installation of high-efficiency filter systems, and purchase and use of ZE yard trucks in the South Coast AQMD region. Impacts to electricity providers are also analyzed and discussed in Chapter 4.2.3.2.5, *Impacts to Electricity Providers*. The proposed project’s potential air quality and GHG emissions impacts are analyzed in Chapter 4.1, *Air Quality and Greenhouse Gas Emissions*. Additionally, the potential significant irreversible changes that would be caused by the proposed project from increased grid capacity are analyzed in Chapter 6, *Other CEQA Considerations*.

It is important to note that implementation of the proposed project relies on efforts by other sectors such as the utilities sector which has engaged in the rulemaking process for the proposed project. The proposed project will contribute towards accelerating the use of ZE and NZE trucks and

infrastructure, and at the same time planning efforts and actions by public and private partners, including the California Energy Commission (CEC), the California Public Utilities Commission (CPUC), and Southern California Edison Energy have shared responsibilities and make important contributions towards the state's ZE future. It is also important to note that South Coast AQMD intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These "check-ins" will provide useful information on implementation details and help identify effects on warehouses subject to the WAIRE Program.

Although Chapter 2 of the IS concluded that the proposed project's potential impacts on agricultural and forestry resources, biological resources, and land use and planning would be less than significant, the EA analyzes the indirect environmental impacts to these areas to the extent that they may be impacted by potential future construction of new manufacturing and recycling facilities, and improvements to the electrical grid in Chapter 4.5, *Other Impact Areas*. Please also see *Executive Summary* for the potential environmental impacts that were found to be less than significant.

Comment 7-5

B. Increased Need for Lithium Extraction.

A key component of the Proposed Rules is incentivizing conversion to ZE vehicles, which rely on lithium batteries. This compliance action is a component of the "project as a whole," and it must be described and its impacts disclosed. By increasing the demand for lithium and other ores, a foreseeable consequence of the Proposed Rules is more extraction.

Lithium can be extracted in one of two ways—from hard rock mining or from brines. Mining of hard rock would require the use of conventional mining practices including the creation of underground mines and open pits. Collecting lithium from lake brines and clays requires the pumping of salty groundwater into lagoons where it undergoes evaporation producing salts containing lithium compounds. Both hard rock mining and brine evaporation cause significant environmental harm, including potential harm to biological resources through reduction in sensitive habitat, interference with wildlife corridors, loss of special-status species, and potential conflicts with a habitat conservation plan or natural community conservation plan.

Extraction of lithium also increases the risk of hazardous releases through leaching, spills or air emissions that can harm both human health and the environment. Water contamination associated with lithium ore extraction could have acute and adverse effects to sensitive habitat and sensitive species. While the vast majority of lithium production occurs outside of California, the California Energy Commission recently funded efforts to extract lithium from areas around the Salton Sea. As demand for lithium increases around the world, extraction activities are more likely to take place in sensitive environments in California and the United States. By inducing demand for lithium, the Proposed Rules at least cumulatively contribute to this environmental harm. Because an increase in lithium demand is a reasonable consequence of the behaviors the District seeks to induce, the District must evaluate these consequences.

7-5

Response to Comment 7-5

The proposed project is intended to accelerate the use of ZE trucks and yard trucks that operate at warehouses in the South Coast AQMD region. The IS concluded that the proposed project is expected to result in less than significant impacts on hazardous materials and solid and hazardous waste and mineral resources. However, the EA analyzes the environmental issues associated with the increased disposal of batteries and hydrogen fuel cells and their potential impacts on the capacity of local recycling infrastructure in Chapter 4.3.4, *Operational Impacts in Excess of Capacity of Local Recycling Infrastructure*. Chapter 4.3, *Hazardous Materials and Solid and*

Hazardous Waste, also analyzes the environmental issues associated with construction waste and transport, use, and disposal of LNG fuel. The EA also analyzes the indirect impacts associated with the potential increase in mineral extraction and impacts on mineral resources in Chapter 4.5, *Other Impact Areas*. Additionally, the EA considers the environmental issues associated with mineral resources and increased disposal of batteries and hydrogen fuel cells in Chapter 6, *Other CEQA Considerations*, as required by CEQA Guidelines Section 15126(c).

It is important to note that implementation of the proposed project relies on efforts by other sectors such as the waste management sector. The proposed project will contribute towards accelerating the use of ZE and NZE trucks and infrastructure, and at the same time regulations and policies pertaining to the receiving and recycling of lithium-ion vehicle batteries are needed. Please see Chapter 4.3.4, *Operational Impacts in Excess of the Capacity of Local Recycling Infrastructure* for more information. Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, also analyzes the environmental issues associated with construction waste and transport, use, and disposal of LNG fuel.

Comment 7-6

C. Disposal Facilities.

Similarly, the reasonable compliance actions taken pursuant to the Rule will increase the demand for specialized disposal facilities. Again, these compliance actions are part of the “project as a whole” and their effects must be described. The Proposed Rules will increase the number of batteries and fuel cells in the District and specialized disposal facilities will be needed to handle these materials. SCAQMD must analyze whether there is sufficient capacity in the existing hazardous waste system to accommodate the waste that is a reasonably foreseeable result of the Proposed Rules. If there is not, then SCAQMD must analyze the likely effects from the need for increased capacity.

7-6

Response to Comment 7-6

Although the IS concluded that the proposed project is expected to result in less than significant impacts on hazards and hazardous materials and solid and hazardous waste, the EA analyzes the environmental issues associated with the increased disposal of batteries and hydrogen fuel cells and their potential impacts on the capacity of local recycling infrastructure in Chapter 4.3.4, *Operational Impacts in Excess of the Capacity of Local Recycling Infrastructure*. Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, also analyzes the environmental issues associated with construction waste and transport, use, and disposal of LNG fuel. Additionally, the EA considers the environmental issues associated with mineral resources and increased disposal of batteries and hydrogen fuel cells in Chapter 6, *Other CEQA Considerations*, as required by CEQA Guidelines Section 15126(c).

Implementation of the proposed project relies on efforts by other sectors such as the waste management sector. The proposed project will contribute its share towards accelerating the use of ZE and NZE trucks and infrastructure, and at the same time regulations and policies pertaining to the receiving and recycling of lithium-ion vehicle batteries are also needed (see Chapter 4.3.4, *Operational Impacts in Excess of the Capacity of Local Recycling Infrastructure*). It should also be noted that if and when landfill or recycling facilities expand their capacity, those expansions would likely be subject to project-level environmental review under CEQA by the appropriate lead agency.

Comment 7-7

In order to comply with CEQA, the EA must adequately describe and analyze the project as a whole, including the reasonably foreseeable consequences of project approval. This includes not only the foreseeable compliance activities undertaken by covered entities, but also the necessary infrastructure to support those activities. The effects of these reasonably foreseeable consequences may affect agricultural and biological resources through land use conversions, geologic and hydrologic impacts due to increased lithium extraction activities, substantial increases in the demand for water supply, wastewater treatment, storm water drainage, energy, and solid waste services. In light of these sweeping effects, it is inappropriate for the District to scope these issues out of the EA.

7-7

Response to Comment 7-7

As discussed in Chapter 2, *Proposed Project*, the proposed project consists of PR 2305 and PR 316. The focus of the environmental impacts analysis in the EA is on potential regional-scale impacts associated with implementation of the WAIRE Program as a whole. The proposed project includes approximately 3,320 warehouses that would be subject to the WAIRE Program, including 2,902 warehouse that would likely be required to earn WAIRE Points. Because the proposed project and the EA are from a regional perspective and is programmatic in nature, it does not include site-specific analysis of any warehouse that would be regulated by the proposed project. Chapter 4, *Environmental Impact Analysis and Mitigation Measures* analyzes the proposed project's environmental impacts to the level that they can be assessed without undue speculation (CEQA Guidelines Sections 15145 and 15146).

As discussed in Chapter 4.0.1, *Overview of Impact Analysis*, since it is speculative to foresee the compliance activities undertaken by all of the 2,902 warehouses and supporting, the environmental impacts analysis was based on 18 WAIRE Points scenarios to provide “book-ends” of the range of potential environmental impacts associated with the proposed project. The modeled WAIRE Points scenarios reflect the South Coast AQMD's good-faith, best efforts in identifying a way to disclose the greatest potential environmental impacts from actions undertaken to earn WAIRE Points, assuming all of the initial 2,902 warehouse operators chose to undertake one scenario as the single, sole option to comply with the proposed project. Therefore, the WAIRE Points scenarios formed the conceptual and technical basis for the environmental impact analyses in this EA. The necessary infrastructure such as ZE chargers and hydrogen fueling stations was modeled as WAIRE Points scenarios and was also analyzed in Chapter 4, *Environmental Impact Analysis and Mitigation Measures* of the EA. Although the IS concluded that the proposed project is expected to result in less than significant impacts on aesthetics, agricultural and forestry resources, biological resources, cultural and tribal resources, geology and soils, hydrology and water quality (including water supply, wastewater treatment, stormwater drainage), land use and planning, mineral resources, noise, population and housing, public services, recreation, and utilities and service systems, the EA analyzes the indirect environmental impacts to these areas to the extent that they may be impacted by potential future construction of new manufacturing and recycling facilities, and improvements to the electrical grid in Chapter 4.5, *Other Impact Areas*. Please also see *Executive Summary* for the potential environmental impacts that were found to be less than significant.

Although the IS concluded that the proposed project is expected to result in less than significant impacts on hazards and hazardous materials and solid and hazardous waste, the EA analyzes the environmental issues associated with the increased disposal of lithium batteries and hydrogen fuel

cells and their potential impacts on the capacity of local recycling infrastructure in Chapter 4.3.2, *Hazards Associated with Routine Transport, Use, or Disposal of Batteries and Fuels Cells (Significance Criteria)* and Chapter 4.3.4, *Operational Impacts in Excess of the Capacity of Local Recycling Infrastructure*. Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, also analyzes the environmental issues associated with construction waste and transport, use, and disposal of LNG fuel. Additionally, the environmental issues associated with mineral resources and increased disposal of batteries and hydrogen fuel cells are discussed in Chapter 6, *Other CEQA Considerations*, as required by CEQA Guidelines Section 15126(c).

Comment 7-8

III. Environmental Impacts.

CTA strongly supports a comprehensive evaluation of the impacts of the Proposed Rules, including a lifecycle analysis of the reasonably foreseeable consequences of the Proposed Rules. SCAQMD has identified the issues of (1) air quality and greenhouse gases, (2) energy, and (3) transportation for further evaluation in the Draft EA. CTA agrees that these topics merit robust discussion and also encourages SCAQMD to evaluate the effects of the reasonably foreseeable compliance responses.

7-8

Response to Comment 7-8

As discussed in Chapter 4.1.1.3, *Lifecycle Analysis*, CEQA does not require a full lifecycle analysis of potential environmental effects; therefore, a lifecycle analysis was not conducted. While it is infeasible and speculative to foresee compliance actions facilities would undertake, South Coast AQMD used its best efforts to find out and disclose all that *it reasonably can (emphasis added)* (CEQA Guidelines Section 15144). The technical approach for the environmental impact analysis is based on the 18 modeled WAIRE Points scenarios because the modeled scenarios provide “book-ends” of the range of potential environmental impacts associated with the proposed project. They also provide a framework for understanding the greatest potential impacts.

The proposed project’s potential environmental impacts on air quality and GHG emissions, energy, and transportation are analyzed and included in Chapter 4, *Environmental Impact Analysis and Mitigation Measures*. Although the IS concluded that the proposed project is expected to result in less than significant impacts on hazards and hazardous materials and solid and hazardous waste, the EA analyzes the environmental issues associated with the increased disposal of lithium batteries and hydrogen fuel cells and their potential impacts on the capacity of local recycling infrastructure in Chapter 4, *Environmental Impact Analysis and Mitigation Measures*. Chapter 4, *Environmental Impact Analysis and Mitigation Measures* of the EA also includes an analysis of the indirect environmental impacts on aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hydrology and water quality, land use and planning, noise, population and housing, public services, recreation, and utilities and service systems to the extent that they may be impacted by potential future construction of new manufacturing and recycling facilities, and improvements to the electrical grid.

Comment 7-9**A. Air Quality and Greenhouse Gas Emissions.**

The Proposed Rules encourage the premature transition from conventional to ZE/NZE trucks without considering the consequences outside of the District. The Proposed Rules compel the deployment of new ZE/NZE vehicles before the end of the useful life of the existing conventional fleet. Because these vehicles continue to be assets, they are unlikely to be retired and will instead be transitioned to other uses or jurisdictions. While the Proposed Rules may reduce truck emissions in the District, it is highly foreseeable that these emissions will merely migrate elsewhere. While more difficult to move outside of the District's jurisdiction, it is also likely that the Proposed Rules will force many warehouses to relocate outside of the SCAQMD. Again, while this may reduce the emissions in the District itself, these emissions are ultimately reshuffled rather than eliminated. The effects of the Proposed Rules on air quality cannot be considered in a vacuum. The District must realistically evaluate any emission reductions from the Proposed Rules in light of the significant and foreseeable leakage outside of its jurisdiction.

7-9

The District must also evaluate any emission reductions from the Proposed Rules against increased emissions from electricity generation. While the Proposed Rules anticipate the use of on-site solar panels, these are unlikely to fully offset the demand created by compliance actions. Until greater renewable capacity is realized, grid electricity will continue to be generated through fossil fuels. In the last two years, almost 60% of electricity supplied by Southern California Edison was generated from non-renewable sources. The Proposed Rules will force the transition to ZE/NZE vehicles and the District must analyze the greater emissions generated by this increased electrical demand.

Response to Comment 7-9

Chapter 4, *Environmental Impact Analysis and Mitigation Measures* includes an analysis of the proposed project's potential direct, indirect, and cumulative environmental impacts from compliance responses on air quality and greenhouse gas (GHG) emissions, energy, hazardous materials and solid and hazardous waste from increased disposal of batteries and hydrogen fuel cells, and transportation. Chapter 4, *Environmental Impact Analysis and Mitigation Measures* also includes an analysis of the proposed project's indirect environmental impacts on aesthetics, agriculture and forestry resources, biological resources, cultural resources, geology and soils, hydrology and water quality, land use and planning, noise, population and housing, public services, recreation, and utilities and service systems to the extent that they may be impacted by potential future construction of new manufacturing and recycling facilities, and improvements to the electrical grid.

Chapter 4, *Environmental Impact Analysis and Mitigation Measures* also analyzed impacts from transition to NZE and ZE trucks which was modeled as WAIRE Points Scenarios 1-6, 8-10, and 12-14 and replacement of diesel fueled trucks with new NZE and ZE trucks [see Chapter 4.1.3.3, *Transition to NZE and ZE Trucks (Scenarios 1-6, 8-10, 12-14)* of the EA]. In addition, as identified in the Draft WAIRE Menu Technical Report it is anticipated that the operating life of a truck is, on average, 12 years. The general characteristics and operations of truck fleets that serve the South Coast AQMD's jurisdiction are summarized in the Technical Memorandum on Truck Fleets that Serve Warehouses in South Coast AQMD jurisdiction prepared by CALSTART⁷. It is anticipated that when warehouse operators replace trucks with NZE and ZE trucks some of the older trucks will be retired (i.e., scrapped) and some of these trucks would be transitioned to other uses or

⁷ CALSTART, Technical Memorandum on Truck Fleets that Serve Warehouses in SCAQMD Jurisdiction. [http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf)

warehouses outside of South Coast AQMD's jurisdiction for trucks that are no longer eligible to access the San Pedro Bay Ports. However, even in this instance where the trucks are transitioned to other uses, it can be presumed that they would replace even older, higher emissions trucks in an operator's truck fleet. This assumption is based on the fact that the proposed project does not generate an increase in the national or even international demand for trucks used in the goods movement sector. Thus, operators that purchase the trucks replaced by NZE and ZE trucks pursuant to the proposed project would be replacing an existing truck that has aged out of or is nearing the end its useful life. These assumptions support the conclusion that the proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without implementation of the proposed project, and that there would be an emissions benefit from the proposed project due to its incentives for replacing older trucks with newer ones. Regardless of whether or not trucks are retired or transferred, there would be a reduction in emissions from replacement of an older truck. These potential reductions as a direct result of the proposed project are captured in the scenario modeling shown in Table 4.1-6 in the EA.

In addition, after the year 2023 the baseline fleet of trucks that are replaced are the same as the baseline fleet of trucks throughout the State due to CARB's Truck and Bus Rule⁸. Therefore, the majority of trucks in the state would be post-2010 trucks. In the event that a truck is sold early, prior to the end of its useful life, in order to purchase a new ZE truck for compliance with the WAIRE Program and the existing truck is sold elsewhere in the state, then the existing truck sold would be equal to the baseline fleet. Since the existing truck is still part of the baseline fleet in the state there would be no change in state-wide emissions. In addition, in the event that the oldest and most polluting truck is replaced, it is speculative to assume that if the oldest and most polluting truck is sold elsewhere in the state that it would be more polluting than the baseline fleet in that location regardless of where it is sold. Further, deployment of ZE and NZE trucks as a result of compliance with PR 2305 does not restrict the use of ZE and NZE trucks to South Coast AQMD's jurisdiction. Therefore, it can be reasonably expected that ZE and NZE trucks will travel to other jurisdictions throughout the state (and potentially other states) to deliver goods and would create an air quality benefit.

It should be noted that the proposed project itself does not cause an expansion of total cargo carried or total miles driven by the truck industry. In addition, the scenario analysis conducted for the Preliminary Draft Staff Report found that older vehicles would need to be retired early only in extreme examples where all operators chose a single compliance option (e.g., all operators only purchased a specific class of truck to earn Points). Otherwise, the number of new trucks entering the market due to PR 2305 would be no greater than normal annual turnover as demonstrated in CARB's EMFAC modeling. The difference would be that instead of new trucks being powered by traditional diesel engine technology, they instead would use NZE or ZE powertrains. This decrease in the number of diesel fueled trucks in the South Coast AQMD region will result in lower emissions of NO_x and diesel particulate matter (DPM). Therefore, the WAIRE Program is intended to incentivize the demand and use of NZE and ZE trucks. Instead of acquiring a new diesel fueled truck, it will be a new NZE or ZE truck.

⁸ California Air Resources Board, Truck and Bus Regulation. Accessed on 12/18/2020.
<https://ww2.arb.ca.gov/our-work/programs/truck-and-bus-regulation/about>

The proposed project's potential impacts on GHG emissions from increased electricity demands and usage are analyzed in Chapter 4.1.4.3, *Potential GHGs Emissions from Operations (Increased Electricity)*. Actions on the WAIRE Menu that could result in increases in electricity include EV trucks (WAIRE Points Scenario 6), high efficiency filter systems (WAIRE Points Scenario 15), and ZE yard trucks (WAIRE Points Scenario 18). Additionally, Chapter 4.1.4.4, *Scenario Modeling GHG Emissions Reduction Benefits* evaluates potential GHG emissions reductions benefits from purchase and use of solar panels (WAIRE Points Scenario 11). Impacts to electricity providers are analyzed and discussed in Chapter 4.2.3.2.5, *Impacts to Electricity Providers*. Chapter 6, *Other CEQA Considerations* discusses the potential significant irreversible changes that would be caused by the proposed project from increased grid capacity.

Comment 7-10

Similarly, increased demand for lithium batteries could increase production, lithium mining, and exports from source countries or other states, which requires energy for mineral extraction, processing, and transport, all of which may diminish the benefits of the Proposed Rules. The EA must contain a full discussion of the lifecycle of the various fuels used in ZE/NZE vehicles to provide full disclosure to the public and decisionmakers.

7-10

Response to Comment 7-10

As discussed in Chapter 4.2.1.1, *Lifecycle Analysis*, CEQA does not require a full lifecycle analysis of potential environmental effects; therefore, a lifecycle analysis was not conducted.

The proposed project is intended to accelerate the use of ZE trucks and yard trucks that visit the warehouses in the South Coast AQMD region. Although the IS concluded that the proposed project is expected to result in less than significant impacts on hazardous materials and solid and hazardous waste, the EA the environmental issues associated with the increased disposal of batteries and hydrogen fuel cells and their potential impacts on the capacity of local recycling infrastructure in Chapter 4.3.4, *Operational Impacts in Excess of Capacity of Local Recycling Infrastructure*. Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, also analyzes the environmental issues associated with construction waste and transport, use, and disposal of LNG fuel. The EA also analyzes the indirect impacts associated with the potential increase in mineral extraction and impacts on mineral resources in Chapter 4.5.1, *Indirect Impacts*. Additionally, the EA considers the environmental issues associated with mineral resources and increased disposal of batteries and hydrogen fuel cells in Chapter 6, *Other CEQA Considerations*, as required by CEQA Guidelines Section 15126(c).

Implementation of the proposed project relies on efforts by other sectors such as the waste management sector. The proposed project will contribute its share towards accelerating the use of ZE and NZE trucks and infrastructure, and at the same time regulations and policies pertaining to the receiving and recycling of lithium-ion vehicle batteries are needed. Please see Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste* for more information.

Comment 7-11**B. Energy.**

Increased deployment of ZE/NZE vehicles would place greater demand on the existing electricity grid. As discussed above, this will necessitate additional grid capacity to accommodate demand. For example, Southern California Edison predicts 26 million light-duty electric vehicles will be on the road in California in 2045 and transportation electrification will increase electric load by 130 terawatt-hours, accounting for more than one-third of the grid-served load. As of 2019, Southern California Edison had only 60 terawatt-hours of net generation. As explained above, even ten ZE vehicles during “off peak” hours will increase the “off peak” load to “peak” or higher levels. One hundred medium duty e-trucks charging at the same time demand 1.5 megawatts of electricity and approximately 3,000 warehouses will be subject to the Proposed Rules. The EA must assess the impacts of the Proposed Rules on the state’s energy infrastructure.

While pilot projects have been successfully deployed using ZE/NZE vehicles, this success reflects the trucking industry’s well-established understanding of existing fueling suppliers. To date, existing demonstration and deployment has been accomplished on a smaller scale and is typically limited to prevent cost-prohibitive utility upgrades. Increasing utility interaction as electric-capable vehicles scale to the levels envisioned in the Proposed Rules will result in potential misalignments between utility policy and regulation and fleet operations. Broader deployment will necessitate extensive coordination with utilities. SCAQMD must include an analysis of the impacts of reasonably foreseeable compliance activities on the utility grid.

The EA must also assess how the Proposed Rules cumulatively contribute to impacts to the State’s energy system. Many municipalities and regulators have advanced electrification initiatives which have the potential to cumulatively overwhelm existing generation and transmission capacity. The cumulative effect of these initiatives is to push the state into a high electrification scenario without the infrastructure necessary to support the new load. The EA must analyze the Proposed Rules’ cumulative contribution to this impact in light of the many varied electrification initiatives being adopted.

7-11

Response to Comment 7-11

Chapter 4.2, *Energy* analyzes the proposed project’s potential energy impacts from construction activities undertaken to comply with the proposed project, and from increases in electricity from ZE trucks, installation of electric chargers to charge ZE trucks, installation of high-efficiency filter systems, purchase and use of ZE yard trucks in the South Coast AQMD region, and impacts to electricity providers. Additionally, the potential significant irreversible changes that would be caused by the proposed project from increased grid capacity that might be caused by the use of ZE trucks, ZE yard trucks, and electric chargers are discussed in Chapter 6, *Other CEQA Considerations*.

It is important to note that implementation of the proposed project relies on efforts by other sectors such as the utilities sector which has engaged in the rulemaking process for the proposed project. The proposed project will contribute its share towards accelerating the use of ZE and NZE trucks and infrastructure, and at the same time planning efforts and actions by public and private partners, including the CEC, the CPUC, Southern California Edison Energy, and publicly owned utilities have shared responsibilities and make important contributions towards the state’s ZE future. South Coast AQMD intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These “check-ins” will provide useful information on implementation details and help identify effects from complying with WAIRE Program. South Coast AQMD will continue to engage and coordinate with the utilities sector as part of the “check-ins.”

Comment 7-12**C. Transportation.**

The Proposed Rules create significant uncertainty in commercial transportation. By compelling the early transition to ZE/NZE vehicles, the Proposed Rules drive rapid and premature fleet turnover for high-cost ZE/NZE vehicles while imposing the uncertain but often high costs of electricity and hydrogen fuel on the logistics sector. Additionally, while the Proposed Rules may incentivize the transition to ZE/NZE vehicles in the SCAQMD's jurisdiction, the Initial Study does not appear to have considered whether there is sufficient charging infrastructure to support these fleets outside of the District. Additionally, as California responds to increasing wildfire threats, public safety power shutoff ("PSPS") events have become increasingly common. The EA should consider the interaction between expedited electrification and PSPS events. It is reasonably foreseeable that the Proposed Rules will lead to significant disruptions to freight transportation in light of these shut off events.

7-12

While impacts to the State's logistics infrastructure are not specifically listed as impacts in Appendix G, the Appendix "is only an illustrative checklist and does not set forth an exhaustive list of potentially significant environmental impacts under CEQA or standards of significance for those impacts." *City of San Diego v California State University* (2011) 201 Cal.App.4th. 1134, 1191; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1111. "Also, the lack of precise quantification or criteria for determining whether an environmental effect is 'significant' under CEQA does not excuse a lead agency from using its best efforts to evaluate whether an effect is significant. *City of San Diego*, 201 Cal.App.4th at 1191; *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.* (2001) 91 Cal.App.4th 1344, 1370. The District must comprehensively evaluate the impacts to infrastructure in its EA.

7-12 cont.

Response to Comment 7-12

The proposed project is intended to accelerate the use of ZE trucks and ZE yard trucks that visit and operate the warehouses in the South Coast AQMD region. Instead of acquiring a new diesel fueled truck, fleet operators will acquire a new NZE or ZE truck. As analyzed in Chapter 4.4.3.2, *Truck VMT*, there is a potential for trucks to be diverted by operators of warehouses to meet their WPCO, thus decreasing the efficiency of goods movement in the South Coast AQMD region, assuming truck routes are currently optimized for efficiency, which may not be true. It is also possible that warehouse operators will consolidate the number of truck visits at a warehouse facility when the proposed project becomes effective. In fact, there is an incentive for the truck trip consolidation because WPCO are based on the annual truck trips that are reported to South Coast AQMD. If a warehouse operator could increase efficiency of truck movements to reduce the number of truck trips, it would reduce the number of WAIRE Points that would need to be earned within any given compliance year. Please see Chapter 4.4.3, *Transportation Impacts During Operations* for more detailed analysis.

Regarding the cost analysis for the proposed project on freight transportation, please see the Preliminary Draft Staff Report and the upcoming Socioeconomic Report.

Chapter 2 of the IS analyzed the proposed project's potential environmental impacts on wildfire and found that significant adverse wildfire impacts are not expected from implementing the proposed project. Therefore, implementing the proposed project is not expected to increase wildfire threats. Additionally, it is not feasible to anticipate the frequency of public safety power shutoff (PSPS) events and analyze their effects in this EA without undue speculation. If a PSPS event were to occur, it would likely be temporary. Therefore, because the proposed project is not expected to increase the amount of PSPS events, no additional analysis is warranted. It should also

be noted that if a PSPS event were to occur, the additional solar and battery technologies implemented as part of compliance with the proposed project could be used to offset any such disruptions. Moreover, South Coast AQMD intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These “check-ins” will provide useful information on implementation details and help identify effects from complying with WAIRE Program. As part of the “check-ins,” South Coast AQMD will continue to engage and coordinate with the utilities sector and the effects of PSPS events on the implementation of the proposed project.

The comment does not specify the state logistics infrastructure and what potential impacts should be considered. As discussed in the economic studies prepared by IEc, implementing the proposed project at the currently proposed rule stringency factor is expected to cause no warehouse relocation. However, for the purpose of providing a conservative analysis, the analysis in the EA assumed up to three warehouse relocations. Chapter 4.4.3, *Transportation Impacts During Operations* analyzes the proposed project’s potential impacts on transportation and the efficiency of goods movement in Southern California.

Comment 7-13

IV. Conclusion.

The many impacts that can be expected from the Proposed Rules, as explained throughout this document, necessitate a great deal of caution in the approvals process. CTA urges SCAQMD to pursue the studies and recommendations in this document as well as those contained in the suggestions of the numerous other commenters at public scoping meetings and in written comments to the District.

7-13

Response to Comment 7-13

South Coast AQMD has prepared and circulated an IS and this EA to analyze the potential environmental impacts from implementation of the proposed project. This appendix (Appendix C) includes public comments on the NOP/IS that were received at the public scoping meeting on December 2, 2020 and during the 32-day public comment period (see Table C-1). Responses to comments that raise an environmental issue are prepared and included in this appendix, which will be circulated with the Draft EA for public review. Please refer to Chapter 4, *Environmental Impact Analysis and Mitigation Measures* for analysis of the potential environmental impacts as a result of the proposed project.

Re: Comments on Notice of Preparation and Initial Study for Proposed Rule 2305

Dear Mr. Banuelos:

This firm represents NAIOP, the Commercial Real Estate Development Association, SoCal and Inland Empire Chapters (collectively, “NAIOP”), and on their behalf we are submitting comments in response to the District’s Notice of Preparation of a Draft Environmental Assessment, Initial Study, and Opportunity for Public Comment. Thank you for the opportunity to comment on this matter. Through its representative Peter Herzog, NAIOP has participated in the various working group meetings held by the District in its early rulemaking process, and we thank the District and its staff for the opportunity to do so. Please include these comments in the administrative record for your rulemaking.

NAIOP is the leading organization for the commercial real estate industry in Southern California. It has approximately 1,300 members comprising commercial real estate owners, developers, investors, lenders, contractors, brokers, insurers, engineers, architects, planners, educators, law firms, and others. Its mission is to provide a unified voice to protect and enhance the commercial real estate industry and quality of life in Southern California. This is accomplished through proactive involvement in public policy, superior educational programs and interactive business relationship opportunities. A significant portion of NAIOP’s membership is involved on a daily basis in the support and development of distribution warehouses that are integral to the Southern California logistics industry. As we have all seen, the logistics industry is playing a key role in our response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment, but also in the delivery goods to a public that has become increasingly dependent on e-commerce.

8-1

Page 2

In that regard, the District should explain why, in the midst of the COVID-19 pandemic, it is pursuing a regulation targeted at a sector that serves as a lifeline to our region and the Nation, and which is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption, and the substantive WAIRE Points obligations will commence as soon as July, 2021. This novel rule will impose an entirely new regulatory compliance regime onto distribution warehouse operators. Many warehouse operators are not structured or staffed with the systems and personnel needed to comply with the proposed rule. They generally lack personnel with the expertise to distinguish among the various classes of trucks, and they lack systems needed to gather the information required to be reported. Thus, the District's rulemaking is diverting industry resources and attention to this rule at a time when the industry needs to maintain focus on the efficient and reliable delivery of medical supplies, vaccines, equipment, food, and other essential goods.

8-2

At this time NAIOP SoCal has the following comments in response to the District's Notice of Preparation of a Draft Environmental Assessment and Initial Study:

1. Please quantify the NOx and diesel particulate matter ("DPM") mass and concentration reductions the District expects to achieve with Rule 2305 for each of the first 10 years of its implementation. Please explain how the District computes such reductions and what data it is using in such computations.

8-3

2. Please quantify the ozone concentration reductions the District expects to achieve with Rule 2305, how it computes such reductions, and what data it is using in such computations.

8-4

3. We understand that the District has observed that ozone concentrations have not decreased with corresponding decreases in nitrogen oxide ("NOx") concentrations. Please explain this phenomenon. Specifically, what has been the correlation between NOx emissions, NOx concentrations, and ozone concentrations since 2012 (ref. Figure 1-2).

8-5

4. In regard to Figure 1-2, please explain whether and how the NOx emissions used in the figure account for other planned regulatory measures controlling NOx and other ozone precursors.

8-6

5. The Environmental Assessment should evaluate and consider the following alternatives, among others: (1) Stricter engine emission standards to be adopted by the California Air Resources Board ("CARB"); (2) Implementation of stricter truck emission standards at the ports of Los Angeles & Long Beach; (3) Requiring owners of truck fleets to phase in ZE and NZE vehicles.

8-7

6. Please discuss and provide references for the commercial availability of all items on the WAIRE Menu. Please identify all suppliers of such items and the current number of such items available, as well as the number of such items projected to be available in each of the first 10 years of Rule 2305's implementation, and provide the basis for such projections.

8-8

Comment Letter #8 (Continued) – Snell & Wilmer

Snell & Wilmer

LLP

Ryan Banuelos

December 15, 2020

Page 3

- | | |
|--|------|
| 7. Please discuss and provide references for the availability of design and construction specifications that may be used for on-site ZE and NZE charging or fueling infrastructure. | 8-9 |
| 8. Please explain how the District has derived points attributable to each of the items on its WAIRE Menu, and provide all computations and data supporting the same. | 8-10 |
| 9. Please explain how certain items on the WAIRE Menu (specifically on-site solar panels and high-efficiency filters or filter systems) will reduce ambient ozone concentrations, and provide quantification and supporting data. | 8-11 |
| 10. Please explain with as much specificity and detail as possible how the annual mitigation fees generated to satisfy WAIRE Points obligations under Rule 2305(d)(5) will be used. | 8-12 |
| 11. The Environmental Checklist states that the District will apply collected mitigation fees to subsidize the purchase of ZE and NZE trucks and installation of ZE charging/fueling infrastructure. Please explain the subsidy plan in detail and make a copy of the subsidy plan publicly available. | 8-13 |
| 12. Please explain with as much specificity and detail as possible how the District derives the amount of the mitigation fee payment under Rule 2305(d)(5). Please provide all computations and identify all data used in such computations. | 8-14 |
| 13. In regard to Figure 1-5b, please quantify the NOx reductions to be achieved upon implementation of these other emission control measures, and the incremental NOx reductions to be achieved by Rule 2305 once the other control measures are implemented. | 8-15 |
| 14. In the latest version of the draft rule (10/6/20), the rule is missing information needed to determine owners' and operators' WAIRE Points obligations. Specifically, the draft rule is lacking the Stringency and Annual Variable factors needed to compute an owner or operator's WAIRE Points obligation. The draft rule also provides that operators' obligations will depend in part on the provisions of the WAIRE Program Implementation Guidelines, which to our knowledge are not yet developed. Please explain how the District can assess the impacts of the rule when it doesn't yet know the extent of operators' compliance obligations. Any environmental review is premature until the District has fully defined the extent of operators' compliance obligations, including but not limited to how many points each warehouse will be required to earn. | 8-16 |
| 15. The Environmental Assessment should address the environmental impacts of manufacture, use, and disposal of batteries that will be used in the ZE and NZE trucks used in response to Rule 2305. | 8-17 |
| 16. The Environmental Assessment should address the source, availability, and cost of hydrogen fuel, and the environmental impacts associated with the production, transfer, and storage of hydrogen fuel used in response to Rule 2305. | 8-18 |

Comment Letter #8 (Continued) – Snell & Wilmer**Snell & Wilmer**

L.L.P.

Ryan Banuelos

Page 4

17. The Environmental Assessment should address the environmental impacts associated with the generation, importation, transmission, and distribution of electricity needed to power the ZE and NZE vehicles contemplated by the rule. Additionally, the Environmental Assessment should address the rule's impact on future rolling blackouts and California's dependence on importation of electricity generated in other states. 8-19

18. The Environmental Assessment should address the potential disruption to supply chain and logistics, including to the distribution of medical equipment, vaccines, medical supplies, food, and other essential goods in emergency and non-emergency circumstances. 8-20

19. The Environmental Assessment should address the uses and environmental impacts associated with trucks that will be replaced by the ZE and NZE vehicles that are purchased and used as a result of Rule 2305. 8-21

20. Please explain whether traffic volumes used in the District's evaluation were pre-COVID traffic or projected post-COVID traffic. Please explain why the District chose as it did, and provide citation to all studies, surveys and other data from which the District obtained the traffic volumes used. 8-22

Thank you for your attention to these comments. Please include me on your list of persons to receive all future notices concerning this rule.

Best regards,

Snell & Wilmer

Responses to Comment Letter #8 – Snell & Wilmer

Comment 8-1

This firm represents NAIOP, the Commercial Real Estate Development Association, SoCal and Inland Empire Chapters (collectively, “NAIOP”), and on their behalf we are submitting comments in response to the District’s Notice of Preparation of a Draft Environmental Assessment, Initial Study, and Opportunity for Public Comment. Thank you for the opportunity to comment on this matter. Through its representative Peter Herzog, NAIOP has participated in the various working group meetings held by the District in its early rulemaking process, and we thank the District and its staff for the opportunity to do so. Please include these comments in the administrative record for your rulemaking.

NAIOP is the leading organization for the commercial real estate industry in Southern California. It has approximately 1,300 members comprising commercial real estate owners, developers, investors, lenders, contractors, brokers, insurers, engineers, architects, planners, educators, law firms, and others. Its mission is to provide a unified voice to protect and enhance the commercial real estate industry and quality of life in Southern California. This is accomplished through proactive involvement in public policy, superior educational programs and interactive business relationship opportunities. A significant portion of NAIOP’s membership is involved on a daily basis in the support and development of distribution warehouses that are integral to the Southern California logistics industry. As we have all seen, the logistics industry is playing a key role in our response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment, but also in the delivery goods to a public that has become increasingly dependent on e-commerce.

8-1

Response to Comment 8-1

This comment does not raise any issues related to the proposed project’s impact on the physical environment under CEQA. No further response is necessary.

Comment 8-2

In that regard, the District should explain why, in the midst of the COVID-19 pandemic, it is pursuing a regulation targeted at a sector that serves as a lifeline to our region and the Nation, and which is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption, and the substantive WAIRE Points obligations will commence as soon as July, 2021. This novel rule will impose an entirely new regulatory compliance regime onto distribution warehouse operators. Many warehouse operators are not structured or staffed with the systems and personnel needed to comply with the proposed rule. They generally lack personnel with the expertise to distinguish among the various classes of trucks, and they lack systems needed to gather the information required to be reported. Thus, the District’s rulemaking is diverting industry resources and attention to this rule at a time when the industry needs to maintain focus on the efficient and reliable delivery of medical supplies, vaccines, equipment, food, and other essential goods.

8-2

Response to Comment 8-2

The need for the proposed project is addressed in Chapter 1 of the Preliminary Draft Staff Report⁹. This comment does not raise any issues related to the proposed project’s impact on the physical environment under CEQA. In addition, Chapter 5, *Alternatives* includes a “no project” alternative and at the public hearing, the Governing Board may choose to adopt the proposed project or to adopt a version of the rule such as one of the alternatives analyzed in Chapter 5, *Alternatives*.

⁹ <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf>

Comment 8-3

1. Please quantify the NO_x and diesel particulate matter (“DPM”) mass and concentration reductions the District expects to achieve with Rule 2305 for each of the first 10 years of its implementation. Please explain how the District computes such reductions and what data it is using in such computations. | 8-3

Response to Comment 8-3

Chapter 4.1, *Air Quality and Greenhouse Gas Emissions* analyzes the air quality and greenhouse gas emissions, including NO_x and DPM emission reductions, as a result of compliance with the proposed project. Additional information on the calculations can be found in the Preliminary Draft Staff Report¹⁰. Potential changes in NO_x and DPM concentrations would be speculative and have not been calculated as the underlying assumptions needed to conduct this analysis are too uncertain (e.g., thousands of facilities covered by PR 2305, various compliance options that are available, uncertainty about which routes trucks take going to and from each facility, etc.). Therefore, for the purposes of this EA, NO_x and DPM concentration reductions were not modeled.

Comment 8-4

2. Please quantify the ozone concentration reductions the District expects to achieve with Rule 2305, how it computes such reductions, and what data it is using in such computations. | 8-4

Response to Comment 8-4

Chapter 3, *Existing Setting* describes the need for NO_x emission reductions as a strategy to reduce ozone in the South Coast AQMD jurisdiction, including how NO_x emission reductions are more effective to reduce the formation of ozone. Chapter 4.1, *Air Quality and Greenhouse Gas Emissions* analyzes the air quality and GHG emissions from the proposed project, including emission reduction benefits, of the primary emitted pollutants such as a NO_x and PM in order to compare to South Coast AQMD’s CEQA significance thresholds. Ozone is a secondary pollutant which is not primarily emitted and South Coast AQMD does not have a significance threshold for ozone, using the ozone precursors of NO_x and VOC as surrogates for ozone formation. Therefore, for purposes of this EA, ozone concentrations were not modeled. Ozone concentrations cannot be reasonably calculated for individual rules given the many variables needed to conduct this regional modeling analysis. This multi-year regional modeling effort is regularly conducted by South Coast AQMD as part of its Air Quality Management Plans (AQMPs). The proposed rule is included as a control measure in the 2016 AQMP, and modeling conducted for that report found that if all control measures are implemented that ozone would be reduced and would meet federal and state air quality standards.

¹⁰ <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf>

Comment 8-5

3. We understand that the District has observed that ozone concentrations have not decreased with corresponding decreases in nitrogen oxide (“NOx”) concentrations. Please explain this phenomenon. Specifically, what has been the correlation between NOx emissions, NOx concentrations, and ozone concentrations since 2012 (ref. Figure 1-2). | 8-5

Response to Comment 8-5

Chapter 3, *Existing Setting* addresses how ozone is formed and summarizes the monitored ozone concentrations in the South Coast AQMD region. For an additional overview of ozone formation and the challenges associated with achieving ozone reductions in the South Coast AQMD jurisdiction refer to the Final 2016 AQMP¹¹.

Comment 8-6

4. In regard to Figure 1-2, please explain whether and how the NOx emissions used in the figure account for other planned regulatory measures controlling NOx and other ozone precursors. | 8-6

Response to Comment 8-6

Figure 1-2 of the IS shows the total NOx emissions in the SCAB that must be reduced by approximately 45 percent beyond baseline 2023 levels, and 55 percent beyond baseline 2031 levels to meet the 8-hour ozone NAAQS. ‘Baseline’ emissions include the projected future emissions accounting for all adopted regulations at the time that the 2016 AQMP was adopted. Figure 1-2 from the IS is also included in Chapter 2, *Proposed Project* of the EA as Figure 2-2. To meet air pollution reduction goals, the 2016 AQMP contains FBMSMs to reduce NOx emissions from mobile sources utilized as part of the goods movement industry as one of many local, state, and federal strategies to meet the federal 8-hour ozone standard. These strategies rely on reducing NOx emissions as a precursor to the formation of both ozone and PM 2.5 but also include measures to reduce primary emitted PM2.5. The FBMSMs were focused on four sectors of the goods movement industry: commercial marine ports, rail yards and intermodal facilities, warehouse distribution centers, and commercial airports. The proposed project is part of the FBMSMs intended to reduce NOx and therefore help achieve the federal 8-hour ozone standard. Emission reductions from regulations adopted since the 2016 AQMP have been accounted for in the analysis included in the Preliminary Draft Staff Report and in the EA.

Comment 8-7

5. The Environmental Assessment should evaluate and consider the following alternatives, among others: (1) Stricter engine emission standards to be adopted by the California Air Resources Board (“CARB”); (2) Implementation of stricter truck emission standards at the ports of Los Angeles & Long Beach; (3) Requiring owners of truck fleets to phase in ZE and NZE vehicles. | 8-7

Response to Comment 8-7

Chapter 5, *Alternatives* includes an analysis of alternatives to the proposed project. The WAIRE Program includes options for the warehouse operators to phase in ZE and NZE trucks and ZE yard trucks. Alternatives D and E envision all natural gas only and all electric only options, respectively.

¹¹ South Coast AQMD, Final 2016 Air Quality Management Plan. <https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf>

The other alternatives that the comment recommends are outside the scope of the South Coast AQMD's legal authority and ability to enforce as an air district; therefore, they have not been included in Chapter 5, *Alternatives*. The suggestion to implement truck emission standards at the ports is beyond the scope of the proposed project as it addresses facilities that are not warehouses (the subject of the proposed project), and most truck visits to warehouses are not to or from the ports. Other measures underway (including the ports' updates to their Clean Truck Program and CARB's proposed requirement for drayage trucks as part of its upcoming Advanced Clean Fleets rule) that would reduce emissions from trucks visiting the ports would also reduce emissions from trucks visiting warehouses, and any requirements there would complement the proposed project's emissions reduction approach. Existing and upcoming CARB regulations are addressed in Chapter 3, *Existing Setting* of the EA.

Comment 8-8

6. Please discuss and provide references for the commercial availability of all items on the WAIRE Menu. Please identify all suppliers of such items and the current number of such items available, as well as the number of such items projected to be available in each of the first 10 years of Rule 2305's implementation, and provide the basis for such projections. | 8-8

Response to Comment 8-8

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. The Draft WAIRE Menu Technical Report¹² addresses commercial availability of items on the WAIRE Menu. Further identification of specific suppliers of a particular WAIRE Menu action or investment or the quantity of items available is speculative because the South Coast AQMD cannot predict and has no feasible way to identify which manufacturers or retailers would supply items from the WAIRE Menu. It should also be noted that technologies and companies change over time due to dynamic market conditions for which South Coast AQMD has no control over and cannot reasonably predict or foresee this.

Nonetheless, CARB researched the commercial availability of ZE vehicles and referenced commercial availability statistics on their slide presentation for their August 21, 2019 workshop¹³.

Comment 8-9

7. Please discuss and provide references for the availability of design and construction specifications that may be used for on-site ZE and NZE charging or fueling infrastructure. | 8-9

Response to Comment 8-9

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. South Coast AQMD cannot predict design specifications for ZE or NZE charging or fueling infrastructure because it is not reasonably foreseeable to determine the location, manner, and scope that an individual owner or operator would choose to implement these WAIRE Menu actions or investments for compliance with the WAIRE Program. The proposed project does not prescribe design and construction specifications that must be met other than the

¹² South Coast AQMD, March 3, 2020, Draft WAIRE Menu Technical Report. Accessed on December, 18, 2020. https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/waire-menu-technical-report_draft_3-3-20.pdf

¹³ https://ww2.arb.ca.gov/sites/default/files/2019-08/190821actpres_0.pdf

kilowatt rating of charging equipment. Local building codes, local utility requirements, site specific characteristics, and business needs will determine the requested specifications.

Comment 8-10

8. Please explain how the District has derived points attributable to each of the items on its WAIRE Menu, and provide all computations and data supporting the same. | 8-10

Response to Comment 8-10

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. Calculating and earning WAIRE points, including how the weight of each WAIRE point was determined, is discussed in Chapter 2 and Appendix B of the Preliminary Draft Staff Report⁹.

Comment 8-11

9. Please explain how certain items on the WAIRE Menu (specifically on-site solar panels and high-efficiency filters or filter systems) will reduce ambient ozone concentrations, and provide quantification and supporting data. | 8-11

Response to Comment 8-11

As described in Chapter 2, *Proposed Project*, solar panels are included in the WAIRE Menu to offset the amount of energy required to power ZE charging infrastructure in addition to allowing warehouses to draw energy from a renewable power source in lieu of natural gas fueled power plants. Solar energy production has a direct criteria pollutant emission reduction impact to the extent that this power generation replaces natural gas power plants which emit NO_x, thus assisting in meeting federal ozone standards (see 2016 AQMP¹¹ page 4-4). Since atmospheric ozone is formed photochemically from precursors such as NO_x and VOC, in order to ultimately achieve the ozone ambient air quality standards and demonstrate attainment, significant NO_x emission reductions are necessary in the South Coast AQMD. Therefore, a reduction in criteria pollutants such as NO_x from power plants as a result of installing and using solar panels to comply with the WAIRE Program will help the South Coast AQMD reach attainment for ozone. In addition, a co-benefit to solar energy production is the reduction in GHGs due to expanded renewable energy availability and production. Quantification of potential benefits from solar power generation are included in the Preliminary Draft Staff Report and in Chapter 4.2, *Energy* of the EA.

MERV 16 or greater filters or filter systems are intended to provide a local benefit to communities that are in close proximity to a warehouse by reducing community exposure to particulate matter, such as DPM. The filters do not reduce emissions of NO_x or PM at the source or cause a reduction in ozone concentration nor is that the intent of including filters in the WAIRE Menu. The high efficiency filters and filter systems are a method to achieve exposure reduction for the community surrounding warehouses.

Comment 8-12

10. Please explain with as much specificity and detail as possible how the annual mitigation fees generated to satisfy WAIRE Points obligations under Rule 2305(d)(5) will be used. | 8-12

Response to Comment 8-12

The WAIRE Mitigation Program, including the use of the funds, is discussed in Chapter 2 of the Preliminary Draft Staff Report⁹. It is anticipated that the annual mitigation fees would be used to achieve the emission reductions envisioned by the items on the WAIRE Menu, therefore, the environmental impacts of using the mitigation fee would be similar to those of the WAIRE Menu and have been analyzed in Chapter 4 of this EA.

Comment 8-13

11. The Environmental Checklist states that the District will apply collected mitigation fees to subsidize the purchase of ZE and NZE trucks and installation of ZE charging/fueling infrastructure. Please explain the subsidy plan in detail and make a copy of the subsidy plan publicly available. | 8-13

Response to Comment 8-13

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. The proposed WAIRE mitigation program is discussed in further detail in Chapter 2 of the Preliminary Draft Staff Report. The WAIRE Mitigation Program has not yet been finalized but is discussed in the Preliminary Draft Staff Report¹⁴.

Comment 8-14

12. Please explain with as much specificity and detail as possible how the District derives the amount of the mitigation fee payment under Rule 2305(d)(5). Please provide all computations and identify all data used in such computations. | 8-14

Response to Comment 8-14

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. Additional discussion about this calculation is included in Chapter 2 of the Preliminary Draft Staff Report. Discussion on the mitigation fee is provided in the Preliminary Draft Staff Report¹⁵.

Comment 8-15

13. In regard to Figure 1-5b, please quantify the NOx reductions to be achieved upon implementation of these other emission control measures, and the incremental NOx reductions to be achieved by Rule 2305 once the other control measures are implemented. | 8-15

Response to Comment 8-15

Chapter 4, *Environmental Impact Analysis and Mitigation Measures* analyzes NOx and PM 2.5 emission reductions expected as a result of implementation of the proposed project. Quantification of upcoming regulations is speculative and cannot reasonably be accomplished without sufficient details of the proposed regulatory approach. Three regulations that are imminent that are

¹⁴ <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf>

¹⁵ <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf>

sufficiently detailed (Advanced Clean Trucks, Low NOx Omnibus, Heavy Duty I/M) have been quantified and are included in the analysis within the EA and the Preliminary Draft Staff Report.

Comment 8-16

14. In the latest version of the draft rule (10/6/20), the rule is missing information needed to determine owners' and operators' WAIRE Points obligations. Specifically, the draft rule is lacking the Stringency and Annual Variable factors needed to compute an owner or operator's WAIRE Points obligation. The draft rule also provides that operators' obligations will depend in part on the provisions of the WAIRE Program Implementation Guidelines, which to our knowledge are not yet developed. Please explain how the District can assess the impacts of the rule when it doesn't yet know the extent of operators' compliance obligations. Any environmental review is premature until the District has fully defined the extent of operators' compliance obligations, including but not limited to how many points each warehouse will be required to earn.

8-16

Response to Comment 8-16

Chapter 2, *Proposed Project* includes a discussion of how to calculate and earn WAIRE points, and how to calculate the Warehouse Points Compliance Obligation (WPCO). The proposed stringency and the annual variable are included in the most recent draft rule language and the Preliminary Draft Staff Report. Although it is not feasible to determine which compliance actions each of the 2,902 warehouse operators will choose to comply with the proposed project at this time without undue speculation, South Coast AQMD used a good-faith effort to develop 18 WAIRE Points scenarios to represent a wide range of potential compliance options and modeled each of them. Warehouse operators may earn WAIRE Points through a Custom WAIRE Plan specific to their operation that satisfies prescribed performance metrics. In lieu of satisfying or to supplement earned WAIRE Points to meet the WPCO within each compliance year, a warehouse operator may choose to pay an optional mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve the emissions reductions. The selection of specific WAIRE Menu actions or WPCO compliance strategy (in the form of WAIRE Menu actions, a Custom WAIRE Plan, and/or the payment of mitigation fee) cannot be precisely forecasted at this time. The unknown is also driven by and dependent upon warehouse-specific factors, including, for example, the physical configuration of a warehouse and space available for EV charging infrastructure onsite. Environmental impacts of the proposed project were analyzed using conservative assumptions.

Comment 8-17

15. The Environmental Assessment should address the environmental impacts of manufacture, use, and disposal of batteries that will be used in the ZE and NZE trucks used in response to Rule 2305.

8-17

Response to Comment 8-17

The proposed project is intended to accelerate the use of ZE trucks and yard trucks that visit the warehouses in the South Coast AQMD region. Although the IS concluded that the proposed project is expected to result in less than significant impacts on hazardous materials and solid and hazardous waste, the EA analyzes the environmental issues associated with the increased disposal of batteries and hydrogen fuel cells and their potential impacts on the capacity of local recycling infrastructure in Chapter 4.3.4, *Operational Impacts in Excess of Capacity of Local Recycling Infrastructure*. Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, also analyzes the environmental issues associated with construction waste and transport, use, and disposal of LNG

fuel. The EA also analyzes the indirect impacts associated with the potential increase in mineral extraction and impacts on mineral resources in Chapter 4.5.1, *Indirect Impacts*. Additionally, the EA considers the environmental issues associated with mineral resources and increased disposal of batteries and hydrogen fuel cells in Chapter 6, *Other CEQA Considerations*, as required by CEQA Guidelines Section 15126(c).

Comment 8-18

16. The Environmental Assessment should address the source, availability, and cost of hydrogen fuel, and the environmental impacts associated with the production, transfer, and storage of hydrogen fuel used in response to Rule 2305. | 8-18

Response to Comment 8-18

The Draft WAIRE Menu Technical Report¹⁶ addresses hydrogen fueling station installation, usage, availability, and costs. Chapter 4, *Environmental Impact Analysis and Mitigation Measures* analyzes the environmental impacts associated with installation of a hydrogen fueling station as well as the quantity of fuel expected to be used as a result of the proposed project. The EA appropriately and conservatively analyzed the various reasonably foreseeable compliance actions as a result of the proposed project.

Comment 8-19

17. The Environmental Assessment should address the environmental impacts associated with the generation, importation, transmission, and distribution of electricity needed to power the ZE and NZE vehicles contemplated by the rule. Additionally, the Environmental Assessment should address the rule's impact on future rolling blackouts and California's dependence on importation of electricity generated in other states. | 8-19

Response to Comment 8-19

The environmental impacts associated with energy are addressed in Chapter 4.2, *Energy*. The increase in the need for utilities like SCE to expand their energy production, storage, and transmission lines is addressed in Chapter 6. If a rolling blackout were to occur, it would be temporary in nature and it is impossible to predict the frequency and duration of rolling blackouts. The EA appropriately and conservatively analyzes the reasonably foreseeable energy impacts as a result of the proposed project.

South Coast AQMD intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These “check-ins” will provide useful information on implementation details and help identify effects from complying with the WAIRE Program. As part of the “check-ins,” South Coast AQMD will continue to engage and coordinate with the utilities sector about the effects of PSPS events on the implementation of the proposed project.

¹⁶ South Coast AQMD, March 3, 2020, Draft WAIRE Menu Technical Report. Accessed on December, 18, 2020. https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/waire-menu-technical-report_draft_3-3-20.pdf

Comment 8-20

18. The Environmental Assessment should address the potential disruption to supply chain and logistics, including to the distribution of medical equipment, vaccines, medical supplies, food, and other essential goods in emergency and non-emergency circumstances. | 8-20

Response to Comment 8-20

Based on the results of the IEc Study¹⁷, under the currently proposed rule stringency factor, the proposed project would not result in warehouse relocations out of South Coast AQMD's jurisdiction therefore no disruption to supply chain logistics is expected. Under the highest rule stringency factor of 0.0050 WAIRE Points per WATT, the proposed project would result in a maximum of six warehouse relocations. The analysis in the EA conservatively considers the potential for up to three warehouse relocations when analyzing the proposed project's environmental impacts. The proposed project does not include any provisions related to the distribution of any goods including medical equipment, vaccines, medical supplies, food, or other essential good in emergency and non-emergency circumstances. Therefore, no further analysis is necessary. Potential costs of the rule are presented in the Preliminary Draft Staff Report and in the upcoming Socioeconomic Impact Assessment. As described there, the costs anticipated from this rule are consistent with cost increases regularly experienced by industry (e.g., due to annually increasing rents), and disruptions to supply chains are therefore not expected.

Comment 8-21

19. The Environmental Assessment should address the uses and environmental impacts associated with trucks that will be replaced by the ZE and NZE vehicles that are purchased and used as a result of Rule 2305. | 8-21

Response 8-21

The transition to NZE and ZE trucks is discussed in Chapter 4.1.3.3, *Transition to NZE and ZE Trucks (Scenarios 1-6, 8-10, 12-14)* of the EA. In addition, as identified in the Draft WAIRE Menu Technical Report it is anticipated that the operating life of a truck is, on average, 12 years. The general characteristics and operations of truck fleets that serve the South Coast AQMD's jurisdiction are summarized in the Technical Memorandum on Truck Fleets that Serve Warehouses in SCAQMD Jurisdiction prepared by CALSTART¹⁸. It is anticipated that when warehouse operators replace trucks with NZE and ZE trucks some of the older trucks will be retired (i.e., scrapped) and some of these trucks would be transitioned to other uses or warehouses outside of South Coast AQMD's jurisdiction for trucks that are no longer eligible to access the San Pedro Bay Ports. However, even in this instance where the trucks are transitioned to other uses, it can be presumed that they would replace even older, higher emissions trucks in an operator's truck fleet. This assumption is based on the fact that the proposed project does not generate an increase in the national or even international demand for trucks used in the goods movement sector. Thus, operators that purchase the trucks replaced by NZE and ZE trucks pursuant to the proposed project would be replacing an existing truck that has aged out of or is nearing the end its useful life. These assumptions support the conclusion that the proposed project would result in a greater turnover of

¹⁷ IEc, Memorandum, ISR Relocation Model – Methodology.

¹⁸ CALSTART, Technical Memorandum on Truck Fleets that Serve Warehouses in SCAQMD Jurisdiction. [http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf)

diesel trucks to NZE and ZE trucks than would have occurred without implementation of the proposed project, and that there would be an emissions benefit from the proposed project due to its incentives for replacing older trucks with newer ones. Regardless of whether or not trucks are retired or transferred, there would be a reduction in emissions from replacement of an older truck. These potential reductions as a direct result of the proposed project are captured in the scenario modeling shown in Table 4.1-6 in the EA.

In addition, after the year 2023 the baseline fleet of trucks that are replaced are the same as the baseline fleet of trucks throughout the State due to CARB's Truck and Bus Rule¹⁹. Therefore, the majority of trucks in the state would be post-2010 trucks. In the event that a truck is sold early, prior to the end of its useful life, in order to purchase a new ZE truck for compliance with the WAIRE Program and the existing truck is sold elsewhere in the state, then the existing truck sold would be equal to the baseline fleet. Since the existing truck is still part of the baseline fleet in the state there would be no change in state-wide emissions. In addition, in the event that the oldest and most polluting truck is replaced, it is speculative to assume that if the oldest and most polluting truck is sold elsewhere in the state that it would be more polluting than the baseline fleet in that location regardless of where it is sold. Further, deployment of ZE and NZE trucks as a result of compliance with the proposed project does not restrict the use of ZE and NZE trucks to South Coast AQMD's jurisdiction. Therefore, it can be reasonably expected that ZE and NZE trucks will travel to other jurisdictions throughout the state (and potentially other states) to deliver goods and would create an air quality benefit.

It should also be noted that compliance with the proposed project does not increase the number of trucks or truck trips from the baseline of trucks in the South Coast AQMD. If truck owners are selling trucks outside of the South Coast AQMD or out of state, then these trucks are from businesses that are replacing trucks and are not being sold as a result of compliance with the proposed project.

Comment 8-22

20. Please explain whether traffic volumes used in the District's evaluation were pre-COVID traffic or projected post-COVID traffic. Please explain why the District chose as it did, and provide citation to all studies, surveys and other data from which the District obtained the traffic volumes used.

8-22

Thank you for your attention to these comments. Please include me on your list of persons to receive all future notices concerning this rule.

Response to Comment 8-22

In light of SB 743, the transportation analysis in this EA, as required by CEQA, does not look at "level of service" which would involve an analysis of traffic volumes but rather uses VMT. The measures put into place to slow the spread of COVID-19 resulted in significant changes in human activity and VMT. Most notable are the temporary reductions in both heavy-duty and light-duty VMT across the state's highways and local roads, and the resulting temporary emission reductions. In California, VMT fell to its lowest point in early- to mid-April, with an approximately 25 percent reduction in heavy-duty VMT and 50 to 60 percent reduction in light-duty VMT. Since that time,

¹⁹ California Air Resources Board, Truck and Bus Regulation. Accessed on 12/18/2020.
<https://ww2.arb.ca.gov/our-work/programs/truck-and-bus-regulation/about>

both heavy-duty and light-duty VMT have steadily increased, with heavy-duty VMT returning to pre-COVID-19 levels in early June. COVID-19 stay-at-home orders and related closures are temporary measures. While there is potential for changes made during this time to have far-reaching implications for transportation mode choice, shared mobility, vehicle choice, and VMT into the future, the medium- or long-term effects of the COVID-19 on VMT are uncertain at this point in time, and it would be speculative to estimate any potential long-term or permanent changes. Predicting the proposed project's physical impacts on the environment without firm evidence based on facts to support the analysis would require an engagement in speculation or conjecture that is inappropriate for an EA. Accordingly, the transportation impact analysis presented in this EA is generally based on the assumption that general behavior would be similar to conditions prior to the start of COVID-19 stay-at-home orders.

Comment Letter #9
General Motors Customer Care & Aftersales (CCA)
December 15, 2020

December 15, 2020

Mr. Ryan Bañuelos (c/o CEQA)
 South Coast Air Quality Management District (SCAQMD)
 21865 Copley Dr
 Diamond Bar, CA 91765-4178

Transmitted via e-mail

RE: Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program

Dear Mr. Bañuelos,

General Motors Customer Care & Aftersales (CCA) respectfully submits these comments to SCAQMD on Proposed Rule 2305 – Warehouse Indirect Source rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. General Motors (GM) applauds SCAQMD for its efforts to reduce emissions through moving towards zero-emission truck fleets through the WAIRE Program and related California Environmental Quality Act (CEQA) Indirect Source Review (ISR) programs. GM is committed to a Zero Emissions future as well as sound regulatory policy that helps drive this vision.

9-1

To Not Hinder Emissions Reductions, Excess WAIRE Points Earned Should Not Expire

Section (d)(3)(B) states that ‘if a warehouse operator earns more WAIRE Points than is required for its annual Warehouse Points Compliance Obligation, then it may use those remaining WAIRE Points at the same warehouse to satisfy its Warehouse Points Compliance Obligation in any of the following three years’.

Recommendation: ‘If a warehouse operator earns more WAIRE Points than is required for its annual Warehouse Points Compliance Obligation, then it may use those remaining WAIRE Points at the same warehouse to satisfy its Warehouse Points Compliance Obligation in any following years.’

9-2

Warehouse owners and operators should be encouraged to go above and beyond the requirements of Proposed Rule 2305 and to do so as soon as possible. Limiting the lifetime of WAIRE points could have the unintended consequence of delaying or scaling back potential projects that might otherwise move forward. Further, larger projects in this regard encourage emission reductions faster resulting in the South Coast region meeting its targets earlier and providing tangible near-term benefits for local communities.

Comment Letter #9 (Continued)
General Motors Customer Care & Aftersales (CCA)

**Projects to Reduce Emissions Should be Allowed to be Started Immediately
(and still earn WAIRE points in the first year)**

During the PR2305 CEQA Scoping Meeting on December 2, 2020, it was stated that the installation of ZE Charging or Onsite Solar Panels prior to the first period warehouses can begin earning WAIRE points would not count for WAIRE points to be earned in the first year (currently written as the period of July 1, 2020 through June 30, 2021 in Draft PR2305 for 200,000+sq ft warehouses).

9-3

Recommendation: Allow warehouses that want to move quickly to purchase ZE or NZE vehicles, or that wish to install ZE Charging stations or onsite solar panels, to install these during the period from the date Rule 2305 is final until the start of each facility's first year WAIRE points obligation period and still accrue the WAIRE points to be used in the first year. Owners and operators that want to move quickly to reduce emissions should not be forced to wait to gain WAIRE points when such actions would effectively reduce emissions in the South Coast region faster.

Consider Adding Flexibility to Account for the Availability of ZE and NZE Trucks and Infrastructure

Warehouse owners and operators may not have control of the availability of ZE and NZE Trucks that meet operational requirements or the availability of the infrastructure necessary in which to use them for their operations. The California Air Resources Board (CARB) recognized the need to add flexibilities to account for these types of situations in the Fleet Rule for Innovative Transit (2023.4).

9-4

Recommendation: SCAQMD may want to consider adding similar flexibilities to Proposed Rule 2305 should ZE or NZE trucks that meet operational requirements for warehouses not be readily available in quantities needed to satisfy the demand as a result of this proposed rule. Similarly, SCAQMD may want to consider adding flexibility to account for site-specific infrastructure barriers or delays that may be outside the control of warehouse owners and operators.

GM believes Proposed Rule 2305 will support emission reductions necessary in the South Coast region and pave our shared path to a Zero Emissions future. We believe the above comments and recommendations will make Rule 2305 more flexible for warehouse Owners and Operators and will lead to further emission reductions faster. Questions about the above comments and recommendations can be directed to me and/or Todd Rouse, Environmental Policy Manager, at 419-205-2667 or todd.rouse@gm.com. Thank you for your attention on this matter.

Respectfully,

Carolyn Cooper
GM-CCA Leader – LA Complex

Email: carolyn.cooper@gm.com

Responses to Comment Letter #9

Comment 9-1

Dear Mr. Bañuelos,

General Motors Customer Care & Aftersales (CCA) respectfully submits these comments to SCAQMD on Proposed Rule 2305 – Warehouse Indirect Source rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. General Motors (GM) applauds SCAQMD for its efforts to reduce emissions though moving towards zero-emission truck fleets through the WAIRE Program and related California Environmental Quality Act (CEQA) Indirect Source Review (ISR) programs. GM is committed to a Zero Emissions future as well as sound regulatory policy that helps drive this vision.

9-1

Response to Comment 9-1

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. No further response is necessary.

Comment 9-2

To Not Hinder Emissions Reductions, Excess WAIRE Points Earned Should Not Expire

Section (d)(3)(B) states that 'if a warehouse operator earns more WAIRE Points than is required for its annual Warehouse Points Compliance Obligation, then it may use those remaining WAIRE Points at the same warehouse to satisfy its Warehouse Points Compliance Obligation in any of the following three years'.

Recommendation: 'If a warehouse operator earns more WAIRE Points than is required for its annual Warehouse Points Compliance Obligation, then it may use those remaining WAIRE Points at the same warehouse to satisfy its Warehouse Points Compliance Obligation in any following years.'

Warehouse owners and operators should be encouraged to go above and beyond the requirements of Proposed Rule 2305 and to do so as soon as possible. Limiting the lifetime of WAIRE points could have the unintended consequence of delaying or scaling back potential projects that might otherwise move forward. Further, larger projects in this regard encourage emission reductions faster resulting in the South Coast region meeting its targets earlier and providing tangible near-term benefits for local communities.

9-2

Response to Comment 9-2

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. To the extent that the current proposal includes a three-year sunset on banked WAIRE Points, then warehouse operators would need to take more actions than are proposed by the commenter, and the analysis in the EA is conservative with regard to environmental impacts. As this comment is more related to the proposed rule rather than a CEQA comment, it will be responded to in the upcoming Draft Staff Report.

Comment 9-3**Projects to Reduce Emissions Should be Allowed to be Started Immediately (and still earn WAIRE points in the first year)**

During the PR2305 CEQA Scoping Meeting on December 2, 2020, it was stated that the installation of ZE Charging or Onsite Solar Panels prior to the first period warehouses can begin earning WAIRE points would not count for WAIRE points to be earned in the first year (currently written as the period of July 1, 2020 through June 30, 2021 in Draft PR2305 for 200,000+sq ft warehouses).

Recommendation: Allow warehouses that want to move quickly to purchase ZE or NZE vehicles, or that wish to install ZE Charging stations or onsite solar panels, to install these during the period from the date Rule 2305 is final until the start of each facility's first year WAIRE points obligation period and still accrue the WAIRE points to be used in the first year. Owners and operators that want to move quickly to reduce emissions should not be forced to wait to gain WAIRE points when such actions would effectively reduce emissions in the South Coast region faster.

9-3

Response to Comment 9-3

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. As this comment is more related to the proposed rule rather than a CEQA comment, it will be responded to in the upcoming Draft Staff Report.

Comment 9-4**Consider Adding Flexibility to Account for the Availability of ZE and NZE Trucks and Infrastructure**

Warehouse owners and operators may not have control of the availability of ZE and NZE Trucks that meet operational requirements or the availability of the infrastructure necessary in which to use them for their operations. The California Air Resources Board (CARB) recognized the need to add flexibilities to account for these types of situations in the Fleet Rule for Innovative Transit (2023.4).

Recommendation: SCAQMD may want to consider adding similar flexibilities to Proposed Rule 2305 should ZE or NZE trucks that meet operational requirements for warehouses not be readily available in quantities needed to satisfy the demand as a result of this proposed rule. Similarly, SCAQMD may want to consider adding flexibility to account for site-specific infrastructure barriers or delays that may be outside the control of warehouse owners and operators.

9-4

GM believes Proposed Rule 2305 will support emission reductions necessary in the South Coast region and pave our shared path to a Zero Emissions future. We believe the above comments and recommendations will make Rule 2305 more flexible for warehouse Owners and Operators and will lead to further emission reductions faster. Questions about the above comments and recommendations can be directed to me and/or Todd Rouse, Environmental Policy Manager, at 419-205-2667 or todd.rouse@gm.com. Thank you for your attention on this matter.

Response to Comment 9-4

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. However, it should be noted that to comply with the proposed project, a warehouse operator may choose from a variety of compliance strategies and actions on the WAIRE Menu to earn WAIRE points as discussed in Chapter 2, *Proposed Project*. As this comment is more related to the proposed rule rather than a CEQA comment, it will be responded to in the upcoming Draft Staff Report.

RE: Comments on Notice of Preparation of a Draft Environmental Assessment and Initial Study for Proposed Rule 2305 and Proposed Rule 316

Dear Mr. Bañuelos,

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the South Coast Air Quality Management District's Notice of Preparation of a Draft Environmental Assessment and Initial Study (NOP/IS) for Proposed Rule 2305 and Proposed Rule 316.

We appreciate the opportunity to review the NOP/IS for the warehouse indirect source rule, a regulation that will have far-reaching health benefits in Southern California. The scope of the analysis, as identified in the document, is appropriate, and the "worst-case" approach employed in the NOP/IS offers a robust, comprehensive assessment of the potential adverse environmental impacts. To allow for full public participation and transparency, we request that all public comments on the NOP/IS be made available on the AQMD's website.

As stated in the NOP/IS, Proposed Rule 2305 is a critical regulatory measure that is necessary for the South Coast Air Basin to attain state and federal ambient air quality standards and meet greenhouse gas reduction targets.¹ Specifically, the purpose of the rule is to facilitate local and regional emission reductions from warehouses. Not only will this rule provide for necessary emission reductions, it is a long overdue move towards regulating an industry that imposes unacceptable health risks on nearby communities. The warehouse industry has been polluting overburdened communities for decades, and its continued growth in the region, particularly in the Inland Empire, will further perpetuate these harms absent meaningful and effective regulation. During the ongoing COVID-19 pandemic, warehouses are

10-1

10-2

¹ South Coast Air Quality Management District, Notice of Preparation of a Draft Environmental Assessment and Initial Study, Proposed Rules 2305 & 316, at 1-2, 1-16.

Comment Letter #10 (Continued)**Earthjustice; East Yard Communities For Environmental Justice; Natural Resources Defense Council; San Pedro & Peninsula Homeowners Coalition; Sierra Club San Geronimo Chapter; Urban & Environmental Policy Institute**

experiencing record profits while spewing toxic pollution in communities that are more vulnerable to the virus.²

10-2 cont.

This proposed rule has the potential to drastically reduce emissions of nitrogen oxides and particulate matter that disproportionately harm communities living near these facilities.³ But importantly, any actions undertaken by warehouses pursuant to this rule must prioritize the surrounding communities who bear the brunt of pollution from warehouse activities, and incentivize solutions that will actually reduce these health burdens.

10-3

The undersigned organizations, which include community groups with members who are impacted by warehouse operations every day, have repeatedly stressed that zero-emissions technology is the only viable solution to alleviate the serious air pollution-related health risks imposed on communities by this industry. We support the greater weighting for the acquisition and use of zero-emission technology and infrastructure in the WAIRE menu, as a shift towards zero-emissions will be crucial to lessening any potential adverse impacts that the rule may have on air quality and greenhouse gas emissions. The rule should not provide incentives for near-zero technology because this will only detract from the zero-emissions future that our communities have advocated for and lead to more combustion technologies.

10-4

Moreover, the Air District must ensure that the mitigation fund does not allow regulated facilities to simply pay their way to compliance. A “pay-to-pollute” scheme will not bring about the emissions reductions necessary for the region to meet state and federal air quality standards nor address the disproportionate pollution burdens faced by communities living near these facilities. Public health protection, rather than industry concerns, must guide the development of the warehouse indirect source rule.

10-5

We request that the Air District continue to seek input from community stakeholders as the agency moves forward with this rulemaking. Furthermore, we urge the Air District to adopt the warehouse indirect source rule as expeditiously as possible, and no later than next June.

10-6

Thank you for your consideration of these comments. We appreciate the Air District staff’s continued work on this lifesaving regulation and look forward to reviewing the draft Environmental Assessment.

Sincerely,

Regina Hsu

Comment 10-1

Dear Mr. Bañuelos,

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the South Coast Air Quality Management District's Notice of Preparation of a Draft Environmental Assessment and Initial Study (NOP/IS) for Proposed Rule 2305 and Proposed Rule 316.

We appreciate the opportunity to review the NOP/IS for the warehouse indirect source rule, a regulation that will have far-reaching health benefits in Southern California. The scope of the analysis, as identified in the document, is appropriate, and the "worst-case" approach employed in the NOP/IS offers a robust, comprehensive assessment of the potential adverse environmental impacts. To allow for full public participation and transparency, we request that all public comments on the NOP/IS be made available on the AQMD's website.

10-1

Response to Comment 10-1

The approach used to analyze the environmental impacts from the proposed project is summarized in Chapter 4.0.1, *Overview of Impact Analysis*.

Public comments received on the NOP/IS are included in this appendix (Appendix C).

Comment 10-2

As stated in the NOP/IS, Proposed Rule 2305 is a critical regulatory measure that is necessary for the South Coast Air Basin to attain state and federal ambient air quality standards and meet greenhouse gas reduction targets.¹ Specifically, the purpose of the rule is to facilitate local and regional emission reductions from warehouses. Not only will this rule provide for necessary emission reductions, it is a long overdue move towards regulating an industry that imposes unacceptable health risks on nearby communities. The warehouse industry has been polluting overburdened communities for decades, and its continued growth in the region, particularly in the Inland Empire, will further perpetuate these harms absent meaningful and effective regulation. During the ongoing COVID-19 pandemic, warehouses are

10-2

¹ South Coast Air Quality Management District, Notice of Preparation of a Draft Environmental Assessment and Initial Study, Proposed Rules 2305 & 316, at 1-2, 1-16.

experiencing record profits while spewing toxic pollution in communities that are more vulnerable to the virus.²

10-2 cont.

² See Justin Ho, *As imports boom, warehouses fill up, and businesses face a storage shortage*, Marketplace (Oct. 1, 2020), <https://www.marketplace.org/2020/10/01/imports-boom-warehouses-fill-up-businesses-face-storage-shortage-online-shopping-covid19/>; Lisa Friedman, *New Research Links Air Pollution to Higher Coronavirus Death Rates*, New York Times (Apr. 7, 2020), available at <https://www.nytimes.com/2020/04/07/climate/air-pollution-coronavirus-covid.html>.

Response to Comment 10-2

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. No further response is necessary.

Comment 10-3

This proposed rule has the potential to drastically reduce emissions of nitrogen oxides and particulate matter that disproportionately harm communities living near these facilities.³ But importantly, any actions undertaken by warehouses pursuant to this rule must prioritize the surrounding communities who bear the brunt of pollution from warehouse activities, and incentivize solutions that will actually reduce these health burdens.

10-3

³ See *id.* at 2-1; Union of Concerned Scientists, Inequitable Exposure to Air Pollution from Vehicles in California (Feb. 2019), at 1-2, <https://www.ucsusa.org/sites/default/files/attach/2019/02/cv-air-pollution-CA-web.pdf>.

Response to Comment 10-3

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. No further response is necessary.

Comment 10-4

The undersigned organizations, which include community groups with members who are impacted by warehouse operations every day, have repeatedly stressed that zero-emissions technology is the only viable solution to alleviate the serious air pollution-related health risks imposed on communities by this industry. We support the greater weighting for the acquisition and use of zero-emission technology and infrastructure in the WAIRE menu, as a shift towards zero-emissions will be crucial to lessening any potential adverse impacts that the rule may have on air quality and greenhouse gas emissions. The rule should not provide incentives for near-zero technology because this will only detract from the zero-emissions future that our communities have advocated for and lead to more combustion technologies.

10-4

Response to Comment 10-4

The use of ZE technology as the single, sole compliance option is included as an alternative to the proposed project and analyzed in Chapter 5, *Alternatives*. At the public hearing, the South Coast AQMD's Governing Board may choose to adopt the proposed project or to adopt a version of the rule such as one of the alternatives analyzed in Chapter 5, *Alternatives*.

Comment 10-5

Moreover, the Air District must ensure that the mitigation fund does not allow regulated facilities to simply pay their way to compliance. A "pay-to-pollute" scheme will not bring about the emissions reductions necessary for the region to meet state and federal air quality standards nor address the disproportionate pollution burdens faced by communities living near these facilities. Public health protection, rather than industry concerns, must guide the development of the warehouse indirect source rule.

10-5

Response to Comment 10-5

A "pay-to-pollute" structure is included as one of the areas of controversy raised by the public in Chapter 1.4, *Areas of Controversy*. While compliance options provide flexibility, there are constraints associated with transferring of WAIRE points as ways to prevent a "pay-to-pollute" structure. Additionally, fees collected will create a new source of funds to reduce pollution in the communities impacted by vehicles and other emissions sources associated with warehouses. Use of the mitigation fees will be prioritized in areas near the warehouses using this compliance option.

Comment 10-6

We request that the Air District continue to seek input from community stakeholders as the agency moves forward with this rulemaking. Furthermore, we urge the Air District to adopt the warehouse indirect source rule as expeditiously as possible, and no later than next June.

10-6

Thank you for your consideration of these comments. We appreciate the Air District staff's continued work on this lifesaving regulation and look forward to reviewing the draft Environmental Assessment.

Response to Comment 10-6

An overview of the various public meetings held in regard to the proposed project is detailed in Chapter 2, *Proposed Project*. In addition, the NOP/IS was released for a 32-day public review and comment period between November 13, 2020 and December 15, 2020. The Draft EA will be released for public review and comment period of no less than 45 days. The proposed project is currently planned to be presented to the South Coast AQMD's Governing Board for consideration for adoption at the April 2, 2021 meeting (date may be subject to change).

Comment Letter #11
Coalition for Clean Air
December 15, 2020

December 15, 2020

Ryan Bañuelos
 Air Quality Specialist
 South Coast Air Quality Management District (SCAQMD)
 21865 Copley Drive
 Diamond Bar CA 91765

Re: Comment on the Notice of Preparation (NOP) of the Draft Environmental Assessment and Initial Study (IS) for Proposed Rule 2305 – Warehouse Indirect Source Rule

Dear Mr. Bañuelos,

The Coalition for Clean Air (CCA) is writing in response to the Notice of Preparation (NOP) of the Draft Environmental Assessment (EA) and Initial Study (IS) for Proposed Rule (PR) 2305, the Warehouse Indirect Source Rule (ISR.) While we appreciate the work and the general direction of proposed language for PR 2305, we do have comments and concerns about the California Environmental Quality Act (CEQA) process. Our comments follow below:

11-1

Comment #1: The stringency of the points provision has yet to be determined. Absent complete information about the actual rule, SCAQMD cannot accurately assess its environmental impacts.

CEQA requires informed analyses and decisions. Yet, SCAQMD has not yet determined the stringency for PR 2305's points provision. The December 2, 2020 presentation only states: "Staff recommended stringency will be established before Draft Environmental Assessment is published."¹ The status over stringency becomes more muddled considering prior presentations. For example, the March 3, 2020 presentation stated SCAQMD intends to analyze stringency in the range of .0001 to .005.² A more recent presentation, however, refers to "hypothetical stringency" compliance scenarios ranging from .0002-.001.³ The stringency factor(s) should be known and publicly available prior to the Draft Environmental Assessment being conducted. This is especially important as SCAQMD plans to phase in rule stringency over time.

11-2

¹ SCAQMD, Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII CEQA Scoping Meeting, December 2, 2020 (accessed December 15, 2020), http://www.aqmd.gov/docs/default-source/rule-book/Proposed-Rules/2305/pr2305pr316_ceqascoping_120220.pdf?sfvrsn=12, slide 14

² SCAQMD, Warehouse ISR Working Group, March 3, 2020 (accessed December 15, 2020), http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/whse_isr_slides_3-3-2020.pdf?sfvrsn=6, slide 15

³ SCAQMD, Warehouse ISR Working Group, October 30, 2020 (accessed December 15, 2020), <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/presentation-slides-10-30-2020.pdf?sfvrsn=8>, slide 3

Comment Letter #11 (Continued)
Coalition for Clean Air

Further, not having a defined or even estimated stringency does not provide a full, accurate and consistent description of the project or its environmental impacts.

11-2

Comment #2: Dividing the warehouse and rail yard ISRs, along with Memoranda of Understanding with the ports and airports, could be interpreted as piecemealing. SCAQMD should demonstrate how these separate rules and efforts interact with each other to reduce emissions from the goods movement sector.

Initially, rules governing over warehouses were considered in the context of a suite of mobile source freight measures. While we understand that each indirect source requires different strategies to reduce emissions, the goods movement industry is tightly interconnected. Goods entering or leaving the ports will also be warehoused and transported by truck, rail, and/or air within the South Coast Air Basin. As such, PR 2305 and all other Facility-Based Mobile Source Measures should demonstrate how they interact with each other and reduce emissions from the goods movement industry. This is particularly important given the District's need to meet attainment of National Ambient Air Quality Standards as well as reduce diesel particulate matter throughout the South Coast Basin.

11-3

Ultimately, the warehouse ISR and all Facility-Based Mobile Source Measurements must achieve real, meaningful, and expedient emissions reductions in the South Coast Air Basin. Thank you for your consideration of our comments.

Sincerely,

Christopher Chavez
Deputy Policy Director

Ian McMillan, Planning and Rules Manager, SCAQMD
Victor Juan, Program Supervisor, SCAQMD

Comment 11-1

Dear Mr. Bañuelos,

The Coalition for Clean Air (CCA) is writing in response to the Notice of Preparation (NOP) of the Draft Environmental Assessment (EA) and Initial Study (IS) for Proposed Rule (PR) 2305, the Warehouse Indirect Source Rule (ISR.) While we appreciate the work and the general direction of proposed language for PR 2305, we do have comments and concerns about the California Environmental Quality Act (CEQA) process. Our comments follow below:

11-1

Response to Comment 11-1

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. No further response is necessary.

Comment 11-2

Comment #1: The stringency of the points provision has yet to be determined. Absent complete information about the actual rule, SCAQMD cannot accurately assess its environmental impacts.

CEQA requires informed analyses and decisions. Yet, SCAQMD has not yet determined the stringency for PR 2305's points provision. The December 2, 2020 presentation only states: "Staff recommended stringency will be established before Draft Environmental Assessment is published."¹ The status over stringency becomes more muddled considering prior presentations. For example, the March 3, 2020 presentation stated SCAQMD intends to analyze stringency in the range of .0001 to .005.² A more recent presentation, however, refers to "hypothetical stringency" compliance scenarios ranging from .0002-.001.³ The stringency factor(s) should be known and publicly available prior to the Draft Environmental Assessment being conducted. This is especially important as SCAQMD plans to phase in rule stringency over time.

11-2

Further, not having a defined or even estimated stringency does not provide a full, accurate and consistent description of the project or its environmental impacts.

11-2

Response to Comment 11-2

The proposed project currently proposed rule stringency factor of 0.0025 WAIRE Points per WATT was presented and discussed in the Warehouse ISR Working Group Meetings held on December 17, 2020²⁰ and is included in the Preliminary Draft Staff Report. A discussion of stringency is included in Chapter 2, *Proposed Project*. Chapter 4, *Environmental Impact Analysis and Mitigation Measures* includes an analysis of the proposed project's potential direct, indirect, and cumulative environmental impacts from compliance responses on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste from increased disposal of batteries and hydrogen fuel cells, and transportation.

²⁰ South Coast AQMD, December 17, 2020, Warehouse ISR Working Group. Accessed on December, 18, 2020. <https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/warehouse-isr-presentation-121720.pdf>

Comment 11-3

Comment #2: Dividing the warehouse and rail yard ISRs, along with Memoranda of Understanding with the ports and airports, could be interpreted as piecemealing. SCAQMD should demonstrate how these separate rules and efforts interact with each other to reduce emissions from the goods movement sector.

Initially, rules governing over warehouses were considered in the context of a suite of mobile source freight measures. While we understand that each indirect source requires different strategies to reduce emissions, the goods movement industry is tightly interconnected. Goods entering or leaving the ports will also be warehoused and transported by truck, rail, and/or air within the South Coast Air Basin. As such, PR 2305 and all other Facility-Based Mobile Source Measures should demonstrate how they interact with each other and reduce emissions from the goods movement industry. This is particularly important given the District's need to meet attainment of National Ambient Air Quality Standards as well as reduce diesel particulate matter throughout the South Coast Basin.

Ultimately, the warehouse ISR and all Facility-Based Mobile Source Measurements must achieve real, meaningful, and expedient emissions reductions in the South Coast Air Basin. Thank you for your consideration of our comments.

11-3

Response to Comment 11-3

As discussed in Chapter 1, *Background*, South Coast AQMD is required to adopt an air quality management plan (AQMP) demonstrating how measures taken will ensure attainment of all federal ambient air quality standards for the areas under the South Coast AQMD's jurisdiction. To meet air pollution reduction goals, the 2016 AQMP contains a variety of control measures, including Facility Based Mobile Source Measures (FBMSMs), also known as indirect source measures or rules. The FBMSMs described in the 2016 AQMPD are concentrated on the four sectors of the goods movement industry: commercial marine ports, rail yards, warehouse distribution centers, and commercial airports. Of these FBMSMs, Control Measure MOB-03 – Emissions Reductions at Warehouse Distribution Centers committed to exploring how to achieve emissions reductions from the warehouse sector.

Additionally, after the adoption of the 2016 AQMP, South Coast AQMD staff convened a working group to explore potential voluntary and regulatory approaches for warehouses²¹, consistent with what was outlined in the 2016 AQMP for Control Measure MOB-03. In May 2018, the South Coast AQMD's Governing Board directed staff to initiate rulemaking for a warehouse Indirect Source Rule (ISR)²², namely PR 2305 and PR 316. Although the FBMSMs are being undertaken in separate rulemaking efforts, this does not constitute piecemealing. The piecemeal review under CEQA is based on if there is substantial evidence in the record that future decisions linked in some way and do not exhibit independent utility. Since the four sectors of the goods movement industry are unique and have taken on different approaches (incentives-based or rulemaking) because of the different, independent sectors they affect, implementing FBMSMs for railyards, ports, and airports is not linked to the proposed project.

²¹ Presentation materials from this process are available here: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/fbmsm-mtngs>

Comment Letter #12

Inland Empire Economic Partnership and the Southern California Logistics Council

December 15, 2020

December 15, 2020

Mr. Ryan Bañuelos
c/o CEQA
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765-4178

Re: COMMENTS ON NOTICE OF PREPARATION AND INITIAL STUDY FOR PROPOSED RULE 2305

Dear Mr. Bañuelos:

On behalf of the Inland Empire Economic Partnership (IEEP) and the Southern California Logistics Council (SCLC), I write to submit comments on the notice of preparation and initial study for proposed rule 2305 – warehouse indirect source rule - warehouse actions and investments to reduce emissions (WAIRE) program; and proposed rule 316 – fees for regulation xxiii.

IEEP's mission is to serve as the two-county region's voice for business and quality of life. Our membership, a collection of large employers in the private and public sectors, is dedicated to creating economic opportunities that promote a better quality of life for our region of 4.6 million people. The SCLC works to address issues facing the logistics industry throughout Southern California. The goods movement industry represents almost 195,000 workers in San Bernardino and Riverside counties and is the largest employment sector in the region. A significant portion of our membership is involved on a daily basis in the support and development of distribution warehouses that are integral to the Southern California logistics industry. As such, we bring a unique perspective that has helped identify a number of points of concern.

12-1

The proposed rule has the potential to undermine an industry that has been critical to the health and economic well-being of the Inland Empire region. The logistics industry has and continues to play a key role in our response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment, but also in the delivery of goods to a public that has become increasingly dependent on e-commerce. The logistics industry has also helped the Inland Empire weather the economic fallout resulting from the pandemic. The South Coast Air Quality Management District (AQMD) should explain why it is pursuing a regulation targeting an essential sector that serves as a lifeline to our region and the Nation in the midst of the COVID-19 pandemic. As drafted, this regulation has the potential to result in severe impacts to this crucial industry at a time in which we can least afford it.

12-2

Comment Letter #12 (Continued)**Inland Empire Economic Partnership and the Southern California Logistics Council**

The proposed rule sets timeframes that make it virtually impossible for most distribution warehouse operators to comply. Under the draft rule, reporting obligations begin only 60 days from rule adoption, and the substantive WAIRE Points obligations will commence as soon as July, 2021. Many warehouse operators are not structured or staffed with the systems and personnel needed to comply with the proposed rule. They generally lack personnel with the expertise to distinguish among the various classes of trucks, and they lack systems needed to gather the information required to be reported. It will divert industry resources and attention to this rule at a time when the industry needs to maintain focus on the efficient and reliable delivery of medical supplies, vaccines, equipment, food, and other essential goods.

12-3

The proposed rule fails to target the source of pollution. The AQMD has stated over the years that warehouses and distribution centers are not a significant source of pollution. Rather, it is the cars and trucks that come to their facility that are the source of pollution. However, instead of examining alternatives such as stricter engine emission standards by the California Air Resources Board, or requiring owners of truck fleets to phase in zero-emission and near zero-emission vehicles it places the onus on an industry that often times does not have a say on the types of trucks that arrive at their facility. AQMD should focus its efforts on targeting mobile sources of pollution that are the source of the problem. While AQMD does not have the statutory authority to regulate mobile sources, it can advocate for policies on the state and national levels that will help that district come into compliance with state and federal goals.

12-4

IEEP supports efforts to improve the air quality in our communities. We believe the approach proposed in the aforementioned rule is not the correct way to achieve those improvements. Thank you.

Sincerely,

Luis Portillo
Director of Public Policy
Inland Empire Economic Partnership

Comment 12-1

On behalf of the Inland Empire Economic Partnership (IEEP) and the Southern California Logistics Council (SCLC), I write to submit comments on the notice of preparation and initial study for proposed rule 2305 – warehouse indirect source rule - warehouse actions and investments to reduce emissions (WAIRE) program; and proposed rule 316 – fees for regulation xxiii.

IEEP’s mission is to serve as the two-county region’s voice for business and quality of life. Our membership, a collection of large employers in the private and public sectors, is dedicated to creating economic opportunities that promote a better quality of life for our region of 4.6 million people. The SCLC works to address issues facing the logistics industry throughout Southern California. The goods movement industry represents almost 195,000 workers in San Bernardino and Riverside counties and is the largest employment sector in the region. A significant portion of our membership is involved on a daily basis in the support and development of distribution warehouses that are integral to the Southern California logistics industry. As such, we bring a unique perspective that has helped identify a number of points of concern.

12-1

Response to Comment 12-1

This comment does not raise any issues related to the proposed project’s impact on the physical environment under CEQA. No further response is necessary. As this comment is more related to the proposed rule rather than a CEQA comment, it will be responded to in the upcoming Draft Staff Report.

Comment 12-2

The proposed rule has the potential to undermine an industry that has been critical to the health and economic well-being of the Inland Empire region. The logistics industry has and continues to play a key role in our response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment, but also in the delivery of goods to a public that has become increasingly dependent on e-commerce. The logistics industry has also helped the Inland Empire weather the economic fallout resulting from the pandemic. The South Coast Air Quality Management District (AQMD) should explain why it is pursuing a regulation targeting an essential sector that serves as a lifeline to our region and the Nation in the midst of the COVID-19 pandemic. As drafted, this regulation has the potential to result in severe impacts to this crucial industry at a time in which we can least afford it.

12-2

Response to Comment 12-2

The need for the proposed project is addressed in Chapter 1 of the Preliminary Draft Staff Report²³. This comment does not raise any issues related to the proposed project’s impact on the physical environment under CEQA. In addition, Chapter 5, *Alternatives* includes a “no project” alternative and at the public hearing, the Governing Board may choose to adopt the proposed project or to adopt a version of the rule such as one of the alternatives analyzed in Chapter 5, *Alternatives*.

Chapter 4, *Environmental Impact Analysis and Mitigation Measures* includes an analysis of the proposed project’s potential direct, indirect, and cumulative environmental impacts from compliance responses on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste from increased disposal of batteries and hydrogen fuel cells, and

²³ <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf>

transportation. As this comment is more related to the proposed rule rather than a CEQA comment, it will be responded to in the upcoming Draft Staff Report.

Comment 12-3

The proposed rule sets timeframes that make it virtually impossible for most distribution warehouse operators to comply. Under the draft rule, reporting obligations begin only 60 days from rule adoption, and the substantive WAIRE Points obligations will commence as soon as July, 2021. Many warehouse operators are not structured or staffed with the systems and personnel needed to comply with the proposed rule. They generally lack personnel with the expertise to distinguish among the various classes of trucks, and they lack systems needed to gather the information required to be reported. It will divert industry resources and attention to this rule at a time when the industry needs to maintain focus on the efficient and reliable delivery of medical supplies, vaccines, equipment, food, and other essential goods.

12-3

Response to Comment 12-3

This comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. As this comment is more related to the proposed rule rather than a CEQA comment, it will be responded to in the upcoming Draft Staff Report.

Comment 12-4

The proposed rule fails to target the source of pollution. The AQMD has stated over the years that warehouses and distribution centers are not a significant source of pollution. Rather, it is the cars and trucks that come to their facility that are the source of pollution. However, instead of examining alternatives such as stricter engine emission standards by the California Air Resources Board, or requiring owners of truck fleets to phase in zero-emission and near zero-emission vehicles it places the onus on an industry that often times does not have a say on the types of trucks that arrive at their facility. AQMD should focus its efforts on targeting mobile sources of pollution that are the source of the problem. While AQMD does not have the statutory authority to regulate mobile sources, it can advocate for policies on the state and national levels that will help that district come into compliance with state and federal goals.

12-4

IEEP supports efforts to improve the air quality in our communities. We believe the approach proposed in the aforementioned rule is not the correct way to achieve those improvements. Thank you.

Response to Comment 12-4

The proposed project seeks to achieve emission reductions of NO_x and PM, including DPM, from the mobile sources of pollution that visit warehouses by allowing warehouse operators to choose from a variety of compliance options. These compliance options are focused on achieving emission reductions from the mobile sources which are the sources of pollution or exposure reductions from the emissions of those emission sources. The suggestions for other emission reduction strategies by the commenter are also being pursued in parallel with the proposed project. Additional discussion is included in the Preliminary Draft Staff Report.

Comment Received During the Scoping Meeting on December 2, 2020

Summary of Scoping Meeting Comment

Frances Keeler, California Council for Environmental and Economic Balance (CCEEB): How are you handling diesel trucks that are being replaced with EV trucks? What are the impacts from diesel trucks being transferred somewhere else?

Response to Scoping Meeting Comment

The transition to NZE and ZE trucks is discussed in Chapter 4.1.3.3, *Transition to NZE and ZE Trucks (Scenarios 1-6, 8-10, 12-14)* of the EA. In addition, as identified in the Draft WAIRE Menu Technical Report it is anticipated that the operating life of a truck is, on average, 12 years. The general characteristics and operations of truck fleets that serve the South Coast AQMD's jurisdiction are summarized in the Technical Memorandum on Truck Fleets that Serve Warehouses in SCAQMD Jurisdiction prepared by CALSTART⁴. It is anticipated that when warehouse operators replace trucks with NZE and ZE trucks some of the older trucks will be retired (i.e., scrapped) and some of these trucks would be transitioned to other uses or warehouses outside of South Coast AQMD's jurisdiction for trucks that are no longer eligible to access the San Pedro Bay Ports. However, even in this instance where the trucks are transitioned to other uses, it can be presumed that they would replace even older, higher emissions trucks in an operator's truck fleet. This assumption is based on the fact that the proposed project does not generate an increase in the national or even international demand for trucks used in the goods movement sector. Thus, operators that purchase the trucks replaced by NZE and ZE trucks pursuant to the proposed project would be replacing an existing truck that has aged out of or is nearing the end its useful life. These assumptions support the conclusion that the proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without implementation of the proposed project, and that there would be an emissions benefit from the proposed project due to its incentives for replacing older trucks with newer ones. Regardless of whether or not trucks are retired or transferred, there would be a reduction in emissions from replacement of an older truck. These potential reductions as a direct result of the proposed project are captured in the scenario modeling shown in Table 4.1-6 in the EA.

In addition, after the year 2023 the baseline fleet of trucks that are replaced are the same as the baseline fleet of trucks throughout the State due to CARB's Truck and Bus Rule²⁴. Therefore, the majority of trucks in the state would be post-2010 trucks. In the event that a truck is sold early, prior to the end of its useful life, in order to purchase a new ZE truck for compliance with the WAIRE Program and the existing truck is sold elsewhere in the state, then the existing truck sold would be equal to the baseline fleet. Since the existing truck is still part of the baseline fleet in the state there would be no change in state-wide emissions. In addition, in the event that the oldest and most polluting truck is replaced, it is speculative to assume that if the oldest and most polluting truck is sold elsewhere in the state that it would be more polluting than the baseline fleet in that location regardless of where it is sold. Further, deployment of ZE and NZE trucks as a result of compliance with PR 2305 does not restrict the use of ZE and NZE trucks to South Coast AQMD's jurisdiction. Therefore, it can be reasonably expected that ZE and NZE trucks will travel to other

²⁴ California Air Resources Board, Truck and Bus Regulation. Accessed on 12/18/2020.
<https://ww2.arb.ca.gov/our-work/programs/truck-and-bus-regulation/about>

jurisdictions throughout the state (and potentially other states) to deliver goods and would create an air quality benefit.

It should also be noted that compliance with the proposed project does not increase the number of trucks or truck trips from the baseline of trucks in the South Coast AQMD. If truck owners are selling trucks outside of the South Coast AQMD or out of state, then these trucks are from businesses that are replacing trucks and are not being sold as a result of compliance with the proposed project.

**Potential Diesel Fuel Reductions in the South Coast AQMD Region from the
Proposed Project**

Scenario	Annual Diesel Truck VMT Reduced by Year 2031	Diesel Fuel Reduced (Gallons/Year)
Scenario 1 (Class 8)	498,885,660	84,556,892
Scenario 2 (Class 8)	526,086,288	89,167,167
Scenario 3 (Class 8)	557,498,760	94,491,315
Scenario 4 (Class 8)	302,409,761	51,255,892
Scenario 5 (Class 8)	249,066,334	42,214,633
Scenario 6 (Class 6)	3,839,680	518,876
Scenario 7a (Class 8)	435,746,422	73,855,326
Scenario 7a (Class 6)	22,090,564	2,985,211
Scenario 7a	457,836,985	76,840,537
Scenario 8 (Class 6)	558,976,184	75,537,322
Scenario 9 (Class 6)	376,571,845	50,888,087
Scenario 10 (Class 6)	381,069,808	51,495,920
Scenario 12 (Class 8)	305,597,292	51,796,151
Scenario 13 (Class 3)	832,738,608	35,893,906
Scenario 14 (Class 3)	540,975,503	23,317,910
Max. Potential Reduction	832,738,608	94,491,315
Min. Potential Reduction	3,839,680	518,876

Notes: Reduction in diesel-VMT above the cumulative baseline, accounting for other approved and pending regulations that affect diesel trucks in California. Under Scenario 6, should all warehouse operators choose to purchase NZE and ZE trucks to meet their WPCO, by year 2031 ISR would have no incremental effect above existing and proposed CARB rules.

Vehicle Type¹	EMFAC Category	Diesel Fuel Miles/Gallon
Class 3	MDV	23.2
Class 6	T6-Interstate Small	7.4
Class 8	T7 Tractor	5.9

¹ VMT converted to diesel fuel using mpg of 5.9, 7.4 and 23.2 from WAIRE Technical Document for Class 8, 6 and 2b-3 Trucks, respectively.

Diesel Fuel from Potential Facility Relocations

Truck Classifications	"Worst-Case" Relocations	
	Diesel Truck Annual VMT	Diesel Fuel Gallons/Year
Class 2b-7 Truck VMT	1,162,344	93,092
Class 8 Truck VMT	3,196,446	361,281
Truck VMT Total	4,358,790	454,373

Vehicle Type ¹	EMFAC Category	Diesel Fuel Miles/Gallon
Class 6	T6-Interstate Small	12
Class 8	T7 Tractor	9

¹ Based on EMFAC2017 (v1.0.3) Emissions Inventory for year 2031 for Diesel Fuel T6 Interstate Small and T7 Tractors

Scenario 6 – EV Charger Installation
Modeling Assumptions and CalEEMod Outputs

General Assumptions

CalEEMod Inputs - South Coast AQMD Rule 2305 EV Charger Installation, Construction

Name: South Coast AQMD Rule 2305 EV Charger Installation
Project Number: SCA-04
Project Location: SCAQMD
County/Air Basin: Los Angeles County, South Coast Air Basin (SoCAB)
Climate Zone: 8
Land Use Setting: Urban
Operational Year: 2023
Utility Company: Southern California Edison
Air Basin: SoCAB
Air District: SCAQMD

CalEEMod Land Use Inputs

Land Use Type	Land Use Subtype	Unit Amount	Size Metric	Lot Acreage*	Land Use Square Feet
Parking	Parking Lot	5.000	1000 sqft	0.11	5,000
				0.11	

Southern California Edison Carbon Intensity Factors

CO₂:^{1,2} 531.44 pounds per megawatt hour
 CH₄:³ 0.029 pound per megawatt hour
 N₂O:³ 0.00617 pound per megawatt hour

¹ Based on CO₂e intensity factor of 534 pounds per megawatt hour; Southern California Edison. 2020. 2019 Sustainability Report.

<https://www.edison.com/content/dam/eix/documents/sustainability/eix-2019-sustainability-report.pdf>.

² Based on Intergovernmental Panel on Climate Change Fourth Assessment Report global warming potentials for CH₄ and N₂O; Intergovernmental Panel on Climate Change (IPCC). 2007. Fourth Assessment Report: Climate Change 2007.

³ CalEEMod default values.

Global Warming Potentials (GWP)

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Parking Lot	5.00	1000sqft	0.11	5,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	31
Climate Zone	8			Operational Year	2023
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	531.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - SCE 2019 Sustainability Report

Land Use -

Construction Phase - assuming 2 day duration for ev charger install

Off-road Equipment - based on equipment list provided by SCAQMD. Bore/Drill Rig used as proxy for skid steer with augur attachment

Trips and VMT - assuming 4 trips associated with the dump truck in addition to 1 default vendor trip

Construction Off-road Equipment Mitigation - SCAQMD Rule 403 and Rule 1186

Scenario 12 – Hydrogen Fuel Station Installation

Modeling Assumptions and CalEEMod Outputs

CalEEMod Inputs - South Coast AQMD Rule 2305 Hydrogen Fuel Station Installation, Construction

Name: South Coast AQMD Rule 2305 Hydrogen Fuel Station Installation
Project Number: SCA-04
Project Location: SCAQMD
County/Air Basin: Los Angeles County, South Coast Air Basin (SoCAB)
Climate Zone: 8
Land Use Setting: Urban
Operational Year: 2023
Utility Company: Southern California Edison
Air Basin: SoCAB
Air District: SCAQMD

CalEEMod Land Use Inputs

Land Use Type	Land Use Subtype	Unit Amount	Size Metric	Lot Acreage*	Land Use Square Feet
Parking	Parking Lot	1.307	1000 sqft	0.03	1,307
				0.03	

* based on modeling for gas station projects

Southern California Edison Carbon Intensity Factors

CO ₂ : ^{1,2}	531.44	pounds per megawatt hour
CH ₄ : ³	0.029	pound per megawatt hour
N ₂ O: ³	0.00617	pound per megawatt hour

¹ Based on CO₂e intensity factor of 534 pounds per megawatt hour; Southern California Edison. 2020. 2019 Sustainability Report.
<https://www.edison.com/content/dam/eix/documents/sustainability/eix-2019-sustainability-report.pdf>.

² Based on Intergovernmental Panel on Climate Change Fourth Assessment Report global warming potentials for CH₄ and N₂O; Intergovernmental Panel on Climate Change (IPCC). 2007. Fourth Assessment Report: Climate Change 2007.

³ CalEEMod default values.

Global Warming Potentials (GWP)		
	AR4	AR5
CO ₂	1	1
CH ₄	25	28
N ₂ O	298	265

Based on Intergovernmental Panel on Climate Change Fourth Assessment Report global warming potentials for CH₄ and N₂O;
 Intergovernmental Panel on Climate Change (IPCC).

Construction Mitigation

SCAQMD Rule 403

Replace Ground Cover	PM10:	5	% Reduction
Replace Ground Cover	PM2.5:	5	% Reduction
Water Exposed Area	Frequency:	2	per day
	PM10:	55	% Reduction
	PM25:	55	% Reduction

Unpaved Roads Vehicle Speed: 15 mph

SCAQMD Rule 1186 Clean Paved Road 9 % PM Reduction

CalEEMod Construction Off-Road Equipment Inputs

*Based on CalEEMod defaults, assumed equipment would not be shared for most conservative results

General Construction Hours: 8 hours btwn 7:00 AM to 4:00 PM (with 1 hr break), Mon-Fri

FUELING STATION INSTALLATION

		Construction Schedule		
Construction Activities	Phase Type	Start Date	End Date	CalEEMod Duration (Workday)
Demolition ¹	Demolition	1/1/2021	1/4/2021	2
Building Construction ¹	Building Construction	1/5/2021	3/8/2021	45
Total Construction Days:				47

CHAPTER 1 INTRODUCTION

1.1 OVERVIEW

This document has been prepared in accordance with the California Environmental Quality Act (CEQA) and the South Coast Air Quality Management District's (South Coast AQMD) Certified Regulatory Program Guidelines. Public Resources Code Section 21080.5(d)(2)(D), CEQA Guidelines Section 15251(l), and South Coast AQMD's Certified Regulatory Program (Codified under Rule 110) require that the final action on Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments To Reduce Emissions (WAIRE) Program and PR 316 – Fees for Rule 2305 include written responses to issues raised during the public process. South Coast AQMD Rule 110 (the rule which codifies and implements the South Coast AQMD's certified regulatory program) does not impose any greater requirements for summarizing and responding to comments than is required for an environmental impact report under CEQA.

1.2 CEQA PROCESS OF THE DRAFT EA

The Draft Environmental Assessment (EA) for PR 2305 and PR 316 was released for a 45-day public review and comment period that started on Tuesday, January 26, 2021 and ended at 5:00 p.m. on Friday, March 12, 2021. A Notice of Completion (NOC) was uploaded to the Governor's Office of Planning and Research (OPR) CEQA Submit Database (State Clearinghouse [SCH] # 2020110225) and posted on the State Clearinghouse's CEQAnet Web Portal at: <https://ceqanet.opr.ca.gov/2020110225/3>. The electronic filing and posting of the NOC and the Draft EA were implemented in accordance with Governor Newsom's Executive Orders N-54-20 (April 22, 2020) and N-80-20 (September 23, 2020) in response to the threat of COVID-19. Pursuant to Executive Order N-80-20, signed on September 23, 2020, certain requirements for filing, noticing, and posting of CEQA documents with county clerk offices have been conditionally suspended. The NOC was distributed using electronic mail to various government agencies and other interested agencies, organizations, and individuals (collectively referred to as the public). The NOC was also provided to all California Native American Tribes (Tribes) that requested to be on the Native American Heritage Commission's (NAHC) notification list per Public Resources Code Section 21080.3.1 (b)(1). The NAHC notification list provides a 30-day period during which a Tribe may respond to the formal notice, in writing, requesting consultation on the Draft EA. Additionally, the NOC was published in the Los Angeles Times on Tuesday, January 26, 2021. The Draft EA was posted on South Coast AQMD's website at: <http://www.aqmd.gov/home/research/documents-reports/lead-agency-scaqmd-projects>.

During this period, a public workshop and a community meeting were held regarding the project to solicit information, comments, and suggestions from the public on February 16, 2021 at 4:30 p.m. and February 17, 2021 at 6:00 p.m., respectively. In accordance with Governor Newsom's Executive Orders N-25-20 (March 12, 2020) and N-29-20 (March 17, 2020), these meetings were conducted via video conferencing and by telephone. Spanish language interpretation was provided at both meetings.

1.3 PROJECT SUMMARY

The proposed project is comprised of PR 2305, including a mitigation program component, PR 316 to recover administrative costs, and the submittal of PR 2305 into the State Implementation Plan (SIP). PR 2305 has been developed to facilitate local and regional emission reductions associated with existing and new warehouses with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building and the mobile sources attracted to these warehouses. Under PR 2305, operators of applicable existing and new warehouses would be subject to an annual Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points Compliance Obligation (WPCO) intended to reduce regional and local emissions from warehouse indirect sources. To meet the WPCO, WAIRE Points can be earned by warehouse operators and/or owners by selecting from a menu of implementation measures: 1) acquiring and/or using near-zero emissions (NZE) and zero-emission (ZE) trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or transport refrigeration units; 4) installing and/or using onsite energy systems (e.g., solar panels); and 5) implementing community benefits (e.g., MERV 16 or greater filters or filter systems). In addition, warehouse operators may apply to earn WAIRE Points through a Custom WAIRE Plan specific to their operations that satisfy prescribed performance metrics. WAIRE Points may be earned only for “surplus” actions that go beyond existing state and federal regulations. WAIRE points are calculated by multiplying the number of weighted annual truck trips by a stringency factor and an annual variable. The stringency factor is a dimensionless multiplier that determines how many points an operator needs to earn, and the annual variable is a dimensionless multiplier which controls how the stringency will phase in through time.

In lieu of satisfying the WPCO via implementation measures, a warehouse operator may choose to pay an optional mitigation fee to the South Coast Air Quality Management District (South Coast AQMD) that would be used in a mitigation program to achieve the emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option.

Implementation of the proposed project is expected to result in long-term and permanent emission reductions of nitrogen oxides (NO_x) and particulate matter (PM) in South Coast AQMD’s jurisdiction, including diesel PM and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed. There may be additional industrial properties and warehouse operators and owners that will only be required to provide reports but will not be required to earn WAIRE Points. PR 2305 will be submitted into the SIP.

PR 316 has been developed to establish fees to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with submittal and review of various notifications and reports, Custom WAIRE Plan evaluation, and implementing a program using mitigation fees from warehouse operators that chose to pay a mitigation fee, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records.

1.4 LIST OF COMMENTERS

A total of four comment letters were received by South Coast AQMD during the public review and comment period on the Draft EA. Three additional comment letters were received after the public review and comment period closed. This appendix (D) contains responses to those comments received on the Draft EA. Response to comments received on the proposed rule language can be found in Appendix F of the Final Staff Report.

For the purposes of identifying and responding to comments on the Draft EA, comment letters are assigned a number (top left-hand corner of the first page of each letter) and each comment within each letter is assigned a bracketed comment number. The following is a list of agencies and persons that submitted comments on the Draft EA along with the date the comment was submitted.

Number Reference	Commenting Person/Agency	Date of Comment	Page No.
Comment Letters Received During the Public Review Period			
1	Holland & Knight on Behalf of the California Trucking Association	March 2, 2021	2-2
2	San Pedro & Peninsula Homeowner's Coalition	March 12, 2021	2-73
3	Snell & Wilmer on Behalf of NAIOP	March 12, 2021	2-78
4	Coalition of Community and Environmental Organizations (Earthjustice, Center for Community Action and Environmental Justice, East Yard Communities for Environmental Justice, Natural Resources Defense Council, People Collective for Environmental Justice, Sierra Club, The Los Angeles County Electric Truck & Bus Coalition, Urban & Environmental Policy Institute, and West Long Beach Association)	March 12, 2021	2-81
Comment Letters Received After the Close of the Public Review and Comment Period			
5	Santa Ynez Band of Chumash Indians	March 22, 2021	2-86
6	Asian Pacific Planning and Policy Council	April 6, 2021	2-88
7	Vogel Properties, Inc. (William Vogel)	April 19, 2021	2-91

In addition to the comment letters received above, South Coast AQMD also received a comment letter on March 2, 2021 from United Airlines, Inc. The comment letter primarily raised issues pertaining to the rule and is therefore not considered a CEQA comment letter. However, a CEQA comment was raised and responses were provided to that comment in Appendix F of the Final Staff Report (Response to Comment Letter 35 – United – March 2, 2021).

Where responses result in a change to the EA text, table, or graphic, the response indicates that a change is made and where the change is made in the Final EA. The Final EA shows additions to text in underline and deletions in ~~strike through~~ and is available at the South Coast AQMD's

website¹ along with all comment letters. The Final EA will be submitted to the South Coast AQMD's Governing Board for review at the Governing Board Meeting (Public Hearing) on May 7, 2021 at 9 a.m., and the South Coast AQMD's Governing Board will consider certification of the Final EA prior to the consideration to approve the project and adopt PR 2305 and PR 316. Governing Board Meeting agendas, which include details on how the public can participate electronically, are posted at least 72 hours prior to the meeting and are available from South Coast AQMD's website.²

Pursuant to CEQA Guidelines Section 15088(a) and South Coast AQMD Rule 110(d), South Coast AQMD is required to respond to only those comments on significant environmental issues received from the evaluation process. Comments raised and questions asked at the project's public workshop and community meeting were answered during the meeting and did not raise any substantive environmental issues relative to the CEQA analysis in the Draft EA. Responses to comments raised during the public workshop can be found in Appendix F of the Final Staff Report and are incorporated by reference as if fully set forth herein. See, Health and Safety Code section 40440.7(d). South Coast AQMD staff has reviewed this material and determined that none of this material constitutes the type of significant new information that requires recirculation of the Draft EA for further public comment under CEQA Guidelines Section 15088.5. None of this new material indicates that the project will result in a significant new environmental impact not previously disclosed in the Draft EA. Additionally, none of this material indicates that there would be a substantial increase in the severity of a previously identified environmental impact that will not be mitigated, or that there would be any of the other circumstances requiring recirculation described in Section 15088.5.

Responses to comment letters on the proposed project and a summary of comments raised during the public workshop and community meeting can be found in Staff Report available on South Coast AQMD's website: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/warehs-distr-wkng-grp>.

1.5 CEQA REQUIREMENTS REGARDING COMMENTS AND RESPONSES

CEQA Guidelines Section 15204 (b) outlines parameters for submitting comments and reminds persons and public agencies that the focus of review and comment of the Draft EA should be “on the proposed finding that the project will not have a significant effect on the environment.” If persons and public agencies believe that the project may have a significant effect, they should (1) identify the specific effect, (2) explain why they believe the effect would occur, and (3) explain why they believe the effect would be significant. Comments are most helpful when they are as specific as possible. At the same time, reviewers should be aware that CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters.

CEQA Guidelines Section 15204 (c) further advises, “Reviewers should explain the basis for their comments, and should submit data or references offering facts, reasonable assumptions based on facts, or expert opinion supported by facts in support of the comments. Pursuant to Section 15064,

¹ <http://www.aqmd.gov/home/research/documents-reports/lead-agency-scaqmd-projects>

² South Coast AQMD. *Meeting Agendas & Minutes*. Accessed at: <http://www.aqmd.gov/home/news-events/meeting-agendas-minutes>.

an effect shall not be considered significant in the absence of substantial evidence.” Section 15204 (e) also states, “This section shall not be used to restrict the ability of reviewers to comment on the general adequacy of a document or of the lead agency to reject comments not focused as recommended by this section.”

Written responses are prepared consistent with Section 15088 of Title 14 of the California Code of Regulations. Pursuant to this section, the level of detail contained in the response may correspond to the level of detail provided in the comment (i.e., responses to general comments may be general).

CHAPTER 2 COMMENT LETTERS AND RESPONSES

2.1 COMMENT LETTERS RECEIVED DURING THE PUBLIC REVIEW PERIOD

This section includes responses to the four comment letters received by South Coast AQMD during the public review and comment period. The 45-day public review and comment period started on Tuesday, January 26, 2021 and ended at 5:00 p.m. on Friday, March 12, 2021.

Re: Comments for Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII

Dear Mr. Bañuelos and Mr. Juan:

Our client, the California Trucking Association (“CTA”), appreciates the opportunity to submit comments on the South Coast Air Quality Management District’s (“SCAQMD” or “District”) Preliminary Draft Staff Report (“PDSR”) and Draft Environmental Assessment (“Draft EA”) for the Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees For Regulation XXIII (collectively, the “Proposed Rules”).

Many members of the CTA will be directly regulated by the Proposed Rules and many others will be compelled to assist the covered warehouses in achieving compliance with the Proposed Rules. This will require substantial capital investment by CTA members and will have far reaching environmental and economic effects. The Proposed Rules as drafted are preempted by federal law and extend beyond the authority granted to the District by the State. For this reason, the District must revise the Proposed Rules before continuing with its rulemaking process.

1.1

I. Statement of Interest.

“Truck driver” is one of the most common jobs in California. There are approximately 550,000 commercial vehicles registered in California and an additional 1.5 million commercial vehicles registered in other states to operate in California. Most of these vehicles are owned by small businesses: 50% of all trucks are owned by fleets of 3 or fewer trucks and 80% of all trucks are owned by fleets with fewer than 50 trucks.

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 2 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 2

The CTA is the largest state trade association representing trucking in the United States. Its 1,800 members include both large and small fleets with an average fleet size of 20 trucks. CTA members are actively participating in the development, piloting, and demonstration of alternative fuel and electric-drive capable vehicles. In fact, some member fleets have been working to bring electric-drive vehicles to market for nearly ten years. The CTA continues to support a coordinated and measured transition to alternative fuel and electric-drive capable vehicles.

1.1
cont.

II. The District Does Not Have Authority to Adopt an Indirect Source Rule that Applies to Existing Warehouses.

Prior to the adoption of any regulation, the District must determine under Health and Safety Code section 40727 that it has the authority to adopt the regulation under state and federal law. Health and Safety Code (“HSC”) § 40727(a). The District cannot make such findings regarding the Proposed Rules. The District, as a creation of the Legislature, only possesses the authority specifically granted to it by state law. *PaintCare v. Mortensen* (2015) 233 Cal.App.4th 1292, 1305 (“An administrative agency ‘has only as much rulemaking power as is invested in it by statute’”); *Friends of the Kings River v. County of Fresno* (2014) 232 Cal.App.4th 105, 117 (similar). The District is an administrative agency which has no inherent “police power” nor any other “authority” beyond that explicitly conferred on the District by statute. *Candid Enterprises v. Grossmont Union High School Dist.* (1985) 39 Cal.3d 878, 885. “An air pollution control district, as a special district, has only such powers as are given to it by statute and it is an entity, the powers and functions of which are derived entirely from the Legislature.” 74 Cal. Atty. Gen. Op. 196 (1991) (citing *People ex rel. City of Downey v. Downey County Water Dist.* (1962) 202 Cal.App.2d 786, 795). “The powers of public [agencies] are derived from the statutes which create them and define their functions.” *Imperial Irr. Dist. v. State Water Resources Control Bd.* (1990) 225 Cal.App.3d 548, 567; see also *Carmel Valley Fire Prot. Dist. v. State of California* (2001) 25 Cal.4th 287, 299-300. “No matter how altruistic its motives, an administrative agency has no discretion to promulgate a regulation that is inconsistent with the governing statutes.” *Terhune v. Superior Court* (1998) 65 Cal.App.4th 864, 874. That an agency has been granted some authority to act within a given area does not mean that it enjoys plenary authority to act in that area. *Railway Labor Exec. Ass’n v. National Mediation Bd.* (D.C. Cir. 1994) 29 F.3d 655, 670 (en banc).

1.2

The District has identified no law that expressly grants it authority to adopt an indirect source rule (“ISR”) that regulates existing sources. Federal law allows, but does not require, states to adopt an “indirect source review program” as part of the state implementation plan. 42 U.S.C. § 7410(a)(5)(A)(i). However, an “indirect source program” is defined by statute to mean “the facility-by-facility review of indirect sources of air pollution, including such measures as are necessary to assure . . . that a *new or modified* indirect source will not attract mobile sources of pollution” that would cause or contribute to an exceedance of or prevent the maintenance of a National Ambient Air Quality Standard (“NAAQS”). *Id.* at § 7410(a)(5)(D) (emphasis added). The EPA expressly understood this to apply to the evaluation of indirect sources “effects on air

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 3 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 3

quality *prior to* their construction and modification.” 38 Fed. Reg. 9599 (1973) (emphasis added).¹ Nowhere does federal law grant states the authority to develop an indirect source program that applies to *existing* sources.

The authority granted to Air Districts to promulgate indirect source rules under the California Clean Air Act is similar. Section 40716 of the Health and Safety Code provides that a district “may adopt and implement regulations” that *both* “[r]educe or mitigate emissions from indirect and areawide sources of air pollution” and “[e]ncourage or require the use of measures which reduce the number or length of vehicle trips.” The District does not substantiate its claim that the Proposed Rules will reduce the number or length of trips. But even if it did, the District’s authority is further proscribed. First, the statute specific to the District grants limited authority for the District to create an indirect source rule. It explains that the District shall provide for indirect source controls for “any *new* source that will have a significant effect on air quality in the South Coast Air Basin.” HSC § 40440(b)(3) (emphasis added).² “In the grants [of powers] and the regulation of the mode of exercise, there is an implied negative; an implication that no other than the expressly granted power passes by the grant; that it is to be expressed only in the prescribed mode....” *Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 196. The express statutory authority of the District is thus to implement indirect source controls for *new* sources only, not existing, unmodified sources. “Any reasonable doubt concerning the existence of the power is to be resolved against the agency.” *California Chamber of Commerce v. State Air Resources Board* (2017) 10 Cal.App.5th 604, 620. Second, the statute requires all air districts to adopt “indirect source control programs.” *Id.* at § 40918. This term is not defined in California law, but is identical to the term used under the federal Clean Air Act in which indirect source control programs are limited to *new or modified* indirect sources. 42 U.S.C. § 7410(a)(5)(D). Thus, the Legislature did not grant the District authority to require existing, unmodified sources to comply with an indirect source control program.³

1.2
cont.

¹ “It should be emphasized that the primary purpose of the review procedures is to insure that *proposed projects* are designed and located in a manner consistent with air quality requirements.” *Id.* (emphasis added).

² The District has also not demonstrated that “there are high-level, localized concentrations of pollutants” in the vicinity of covered warehouses. See HSC 40440(b)(3). The PDSR relies on an association between CalEnviroScreen rankings and warehouses. PDSR at 16-17. CalEnviroScreen uses a suite of 19 indicators to characterize pollution burden (12 indicators) and population characteristics (7 indicators). Each indicator is assigned a score for each census tract in the state based on the most up-to-date suitable data. Scores are weighted and added together within the two groups to derive a pollution burden score and a population characteristics score. Those scores are multiplied to give the final CalEnviroScreen score. These indicators are not limited to air quality, let alone to NOx which is a basin-wide contaminant (not one of “localized concentrations”). Instead, the indicators include drinking water contaminants, pesticide use, toxic releases from facilities, lead risk from housing, clean-up sites, ground water threats, and numerous other factors wholly unrelated to “high-level, localized concentrations of pollutants.” See Office of Environmental Health Hazard Assessment, Indicators Overview, available at <https://oehha.ca.gov/calenviroscreen/indicators>.

³ It also appears no court has upheld such a program. See *National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District* (2010) 627 F.3d 730 (upheld ISR program applied only to qualifying

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 4 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 4

The only support that the District references for its novel interpretation of its authority to adopt an existing source ISR is an Attorney General Opinion from 1993. Atty. Gen. Opinion 92-519 (1993). While opinions of the Attorney General are entitled to great weight, they are not binding law and may be “simply wrong.” *Building Industry Assn. v. City of Livermore* (1996) 45 Cal.App.4th 719, 730. In addition, the Attorney General cannot expand the authority granted to an entity created by state law via an advisory opinion. As explained above, the District’s authority only extends to the powers which it was expressly granted by the Legislature. *See PaintCare*, 233 Cal.App.4th at 1405; *Valero Refining Company-California v. Bay Area Air Quality Management District* (2020) 49 Cal.App.5th 618, 640 (same). Even if the Opinion were controlling law, it does not support the District’s claims of authority to adopt an ISR. The District apparently contends that because the Attorney General concluded that air districts may impose “reasonable post-construction measures,” the District’s authority to adopt ISRs extends to all indirect sources, even if they are long-standing and unmodified. However, nowhere in the Opinion does the Attorney General state that “reasonable post-construction measures” may be required for indirect sources that are neither new nor modified. The District’s strained interpretation is inconsistent not only with the law at the time the Opinion was issued, but also with the District’s own contemporaneous Air Quality Management Plan (“AQMP”).

1.2
cont.

Both the California Clean Air Act and the AQMP anticipated the implementation of control measures that could only come into effect after an indirect source was constructed. In 1993, at the time of the Opinion, Section 40716 allowed the districts to implement post-construction measures such as “encourag[ing] or requir[ing] ridesharing, vanpooling, flexible work hours, or other measures to reduce the number or length of vehicle trips.” HSC § 40716 (1993). For traditional indirect sources such as shopping centers or stadiums, these measures could only be implemented post-construction. In its 1989 AQMP, the District itself included numerous similar measures it characterized as indirect source controls that would be implemented post-construction, including:

- (1) Alternative work weeks and flextime, *id.* app. IV-G at 47-52;
- (2) Telecommunications, *id.* at 53-62;
- (3) Employer rideshare and transit incentives, *id.* at 65-70;
- (4) Vanpool purchase incentives, *id.* at 77-82; and
- (5) Merchant transportation incentives, *id.* at 83-88.

In the context of the law at the time and the District’s own contemporaneous understanding, it is clear the Opinion was referring to these types of measures as “reasonable post-construction

new or modified development); *California Building Industry Association v. San Joaquin Valley Unified Air Pollution Control District* (2009) 178 Cal.App.4th 120 (same).

Page 5

measures,” not establishing a carte blanche authority for the District to impose an ISR program on existing, unmodified sources. Thus, while the District may impose reasonable post-construction measures on new or modified indirect sources, the District has identified no law granting it authority to extend these measures to indirect sources that are neither new nor modified.

1.2
cont.

III. The Proposed Rules Are Preempted by Federal Law.

Under the U.S. Constitution’s Supremacy Clause, “Congress has the authority, when acting pursuant to its enumerated powers, to preempt state and local law.” *Oxygenated Fuels Association, Inc. v. Davis* (9th Cir. 2003) 331 F.3d 665, 667. “Congressional intent to preempt state law must be clear and manifest” (*Williamson v. General Dynamics Corp.* (9th Cir. 2000) 208 F.3d 1144, 1150), but congressional purpose is the “ultimate touchstone” of preemption analysis. *Cippollone v. Liggett Group, Inc.* (1992) 505 U.S. 504, 516. In this case, Congress has been clear in reserving to the federal government the ability to regulate purchase mandates under the Clean Air Act, the Federal Aviation and Administration Authorization Act (“FAAAA”), and the Energy Policy and Conservation Act (“EPCA”).

A. The Proposed Rules Are Preempted as Purchase Mandates Under the Clean Air Act.

The District may not adopt a purchase mandate under the guise of an ISR rule. Federal law preempts the adoption of such standards. While the District claims that the Proposed Rules provide sufficient flexibility to avoid a preempted mandate, the cost differential associated with the compliance pathways constitute an offer which cannot, in practical effect, be refused.

1.3

1. Rules Establishing Purchase Mandates Are Preempted.

Section 209(a) of the Clean Air Act (“CAA”) states:

“No State or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part. No State shall require certification, inspection, or any other approval relating to the control of emissions ... as condition precedent to the initial retail sale, titling (if any), or registration of such motor vehicle, motor vehicle engine, or equipment.” 42 U.S.C. § 7543(a).

This prohibition is interpreted broadly. As the Supreme Court explained, because “[t]he manufacturer’s right to sell federally approved vehicles is meaningless in the absence of a purchaser’s right to buy them,” the term “standard” is not limited to regulations on manufacturers. *Engine Manufacturers Assn v. South Coast Air Quality Management Dist.* (2004) 541 U.S. 246, 252, 255 (“*EMA*”). To that end, the Supreme Court found that, “A command, accompanied by sanctions, that certain purchasers may buy only vehicles with particular

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 6 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 6

emission characteristics is as much an ‘attempt to enforce’ a ‘standard’ as a command, accompanied by sanctions, that a certain percentage of a manufacturer’s sales volume must consist of such vehicles.” *Id.* at 255.

The EPA has agreed and further explained that even if a standard is not a direct mandate, it may still be preempted under the CAA. Specifically in the context of ISR regulations, the EPA identified two ways that an ISR rule that on its face is authorized under CAA section 110(a)(5) could nonetheless be preempted. 76 Fed. Reg. 26609, 26611 (May 9, 2011). First, the ISR rule could be preempted if the rule in practice acts to compel either the manufacturer or user of a vehicle to change the emission control design of the engine or vehicle, or second, an ISR rule could be preempted if it creates incentives so onerous as to be in effect a purchase mandate. *Id.*

This was the exact question placed before the U.S. District Court of New York in 2009 in *Metropolitan Taxicab Bd. of Trade v. City of New York* (2009) 633 F. Supp. 2d 83 (“*MTB*”). The City of New York (“City”) adopted new regulations for taxis that were designed to encourage the transition to cleaner vehicles. Specifically, the City adopted a rule, the Lease Cap Rule, increasing the maximum allowable lease rate for hybrid vehicles while decreasing the maximum allowable lease rate for conventional vehicles. While the new maximum did not eliminate the profit margin for the leasing of conventional taxis, it rendered these conventional fleets substantially less profitable than hybrid fleets. *Id.* at 85. The Court first considered whether the Lease Cap Rule effected a purchase mandate, finding that “[t]he combined effect of the lease cap changes, and even the disincentive alone, constitutes an offer which can not, in practical effect, be refused.” *Id.* at 99. While the City argued that fleet operators could continue to utilize conventional taxis under the Lease Cap Rule, the Court found that the cost differential made it clear that “the Lease Cap Rules do not present viable options for Fleet Owners and instead operate as an effective mandate to switch to hybrid vehicles.” *Id.* at 100.⁴

1.3
cont.

2. The Intent of the Proposed Rules Is to Force the Acquisition of ZE/NZE Vehicles.

The District has made no secret of its dissatisfaction with the state-level progress on regulating emissions from mobile sources. In its comment letter on the Draft Mobile Source Strategy (“MSS”), the District called on CARB to “go even further” since CARB’s efforts to regulate

⁴ This is distinct from Rule 9510 considered by the Ninth Circuit in *National Assn. of Home Builders v. San Joaquin Valley Unified Air Pollution Control Dist.* (2010) 627 F.3d 730 (“*NAHB*”). In that case, the ISR rule considered emissions that were “site-based,” rather than “engine- or vehicle-based.” Stated differently, Rule 9510 evaluated emissions from the whole of the development, including the emissions from the construction equipment used during development and from the vehicles of the final users of the site. While NAHB challenged the rule as a preempted purchase mandate, the court found that Rule 9510 “escape[d] preemption” because it did “not measure emissions by fleets or groups of vehicles”—the construction equipment—but rather the facility as a whole *Id.* at 740. The same cannot be said of the Proposed Rules which are entirely based on the emissions from vehicles that visit the site and for which the practical compliance mechanisms are limited to acquisition.

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 7 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 7

mobile sources were insufficient to meet upcoming 2023 and 2031 federal deadlines for ozone reduction. PDSR at 52. The District has explained the problem that the emissions reductions modeled in the Draft MSS were insufficient to meet federal deadlines and that, even in the most aggressive modeling in the Draft MSS, in 2023 more than 95% of heavy-duty trucks will be no cleaner than 2010 engine standards assumed for all trucks in the baseline emissions inventory from the 2016 AQMP and that these trucks will continue to make up about 57% of the truck fleet in 2031. PDSR at 52. In commenting on the Advance Clean Truck (“ACT”) regulation, the District explained that the 15% ZEV sales requirement in 2030 “will be insufficient and must be increased to generate the needed NOx reductions.” SCAQMD Letter to CARB, Comment Letter on Proposed Advanced Clean Trucks Regulation (Dec. 6, 2019).

With the Proposed Rule, the District is attempting to step into CARB’s shoes and regulate mobile sources by proxy, an action for which it lacks authority. The PDSR explains that the ACT Rule and the Low NOx Omnibus regulations have left a gap in that their “lower emissions occur only *if* trucks are sold.” *Id.* (emphasis original). The Proposed Rules are designed to fill this gap by forcing acquisition of lower emission trucks. Similarly, the District explained that while the upcoming TRU regulation is expected to require lower PM standards, it “will not mandate that fleets purchase them, nor will it direct sales in certain parts of the state.” *Id.* The Proposed Rules are designed to correct this deficiency by creating a de facto purchase mandate in the South Coast Basin. The District explains that NOx reductions are necessary to meet federal air quality standards and “mobile sources associated with goods movement make up about 52% of all NOx emissions” in the South Coast Basin. PDSR at 14. The Proposed Rules are intended “to support statewide efforts to increase the number of ZE vehicles.” *Id.* The Proposed Rules “provide a mechanism to require warehouse operators to encourage ZE vehicle use at their facilities.” *Id.* at 15. “The proposed project is intended to accelerate the use of ZE trucks and yard trucks that visit the warehouses in the South Coast AQMD region” and “encourage and incentivize the purchase and use of NZE and ZE vehicles instead of conventional gasoline and diesel vehicles.” Draft EA at 4.1-1, C-46.⁵ The purpose of the Proposed Rules is thus clearly to force the acquisition and deployment of ZE trucks in the Basin.

1.3
cont.

3. Beyond the District’s Clear Intent to Force Purchase of ZE/NZE Vehicles, the Cost Differential Associated with the Compliance Pathways Forces Acquisition in Any Event.

While the District has ostensibly designed the Proposed Rules to provide multiple compliance pathways, the actual effect is uniform—ZE trucks must be acquired. The PDSR analyzed 18 compliance pathways as shown in Table 14. Scenarios 1, 2, 3, 6, 8, 12, 13, and 18 require the acquisition and usage of ZE vehicles by the warehouse itself. Scenarios 4, 5, 9, 10, and 14 require ZE trucks to visit the warehouses, requiring non-warehouse fleet owners to acquire such

⁵ “[T]he proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without the proposed project....” Draft EA at C-48–49.

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 8 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 8

vehicles. But, for the 45% of warehouses that own and operate their own fleet, relying on the indirect acquisition by non-covered fleet owners is not an option. The only scenarios that do not force an acquisition of a ZE vehicle are Scenarios 7 (pay mitigation fee), 11 (rooftop solar and mitigation fee), 15 (filter system installations) and 16 (filter purchases).⁶ However, the costs of these non-acquisition pathways are far higher than acquisition.

Type	Sc. #	Description	Annual Cost per Year per Sq. Ft.
Direct Acquisition	1	NZE Class 8 truck acquisitions and subsequent visits from those trucks	\$0.08
Direct Acquisition	2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase)	\$0.11
Direct Acquisition	3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks	\$0.05
Direct Acquisition	6	Level 3 charger installations followed by ZE Class 6 & Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers	\$0.14
Direct Acquisition	8	NZE Class 6 truck acquisitions and subsequent visits from those trucks	\$0.16
Direct Acquisition	12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station	\$0.82
Direct Acquisition	13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks	\$0.04
Direct Acquisition	18	ZE Hostler Acquisitions and Usage	\$0.12
Average Annual Cost per Year per Sq. Ft. for Direct Acquisition Compliance			\$0.19
Indirect Acquisition	4	NZE Class 8 truck visits from non-owned fleets	\$0.05
Indirect Acquisition	5	ZE Class 8 truck visits from non-owned fleets	\$0.74
Indirect Acquisition	9	NZE Class 6 truck visits from non-owned fleets	\$0.79
Indirect Acquisition	10	ZE Class 6 truck visits from non-owned fleets	\$0.04

1.3
cont.

⁶ Scenario 17 requires TRU plug installations and usage in cold storage facilities but is applicable only to cold storage warehouses.

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 9 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 9

Indirect Acquisition	14	ZE Class 2b-3 truck visits from non-owned fleets	\$0.48
Average Annual Cost per Year per Sq. Ft. for Indirect Acquisition Compliance			\$0.42
Non-Acquisition	7	Pay Mitigation Fee	\$0.78
Non-Acquisition	11	Rooftop solar panel installations and usage	\$1.14
Non-Acquisition	15	Filter System Installations	\$0.92
Non-Acquisition	16	Filter Purchases	\$0.92
Non-Acquisition	17	TRU plug installations and usage in cold storage facilities	\$0.50
Average Annual Cost per Year per Sq. Ft. for Non- Acquisition Compliance			\$0.85

1.3
cont.

Scenario 7 (Mitigation Fee) averages approximately \$0.90 per square foot in 2025, with an average of \$0.78 per square foot per year. PDSR at 66, 74. The estimated compliance cost for Scenarios 15 and 16 (Filter System Installations and Filter Purchases) is even higher at approximately \$1.00 per square foot in 2025, with an average of \$0.92 per square foot per year. *Id.* at 70, 74. Solar begins in 2025 at \$2.50 per square foot and an average annual cost of \$1.14 per square foot per year. *Id.* By contrast, the estimated compliance costs for “acquisition” based scenarios are less than \$0.20 in 2025, with an annual average cost per square foot typically ranging from \$0.04 to \$0.16 per square foot per year. *Id.* at 66, 74. This cost differential is of the District’s own making, by assigning a certain number of WAIRE points to each compliance action the District has intentionally chosen to compel acquisition by pricing other compliance pathways out of the running.

While the District may argue that the Proposed Rules are not a purchase mandate because of the varying compliance pathways, the non-acquisition pathways at least triple the compliance costs of covered warehouses. District staff acknowledged at the February 16, 2021 public workshop that facilities will find the “most cost-effective means to comply.” Just as the fleet owners in *MTB*, warehouse operators are “profit oriented and business owners trying to maximize profits” and will always choose the option that the District makes the least costly. *MTB*, 633 F. Supp. 2d at 100. Looking at all the evidence, it is clear that the Proposed Rules do not “present viable options” for warehouses other than acquisition and “instead operate[] as an effective mandate to switch to [ZE] vehicles.” *Id.* For this reason, the Proposed Rules are preempted as a purchase mandate.

March 2, 2021
Page 10

B. The Proposed Rules Are Preempted Under the FAAAA.

The FAAAA “preempts a wide range of state regulation of intrastate motor carriage.” *Californians for Safe & Competitive Dump Truck Transp. v. Mendonca* (9th Cir. 1998) 152 F.3d 1184, 1187. It specifically provides that, “a State ... may not enact or enforce a law, regulation, or other provision having the force and effect of law related to a price, route, or service of any motor carrier ... with respect to the transportation of property.” 49 U.S.C. § 14501(c)(1). The terms “rates, routes, and services” were “used by Congress in the public utility sense; that is, service refers to such things as the frequency and scheduling of transportation, and to the selection of markets to or from which transportation is provided.... Rates indicates price; routes refers to courses of travel.” *Air Transport Ass’n of Am. v. City & Cnty. of San Francisco* (9th Cir. 2001) 266 F.3d 1064, 1071. Congress enacted this preemption provision because it “believed that across-the-board deregulation was in the public interest as well as necessary to eliminate non-uniform state regulations of motor carriers which had caused significant inefficiencies, increased costs, reduction of competition, inhibition of innovation and technology, and curtailed the expansion of markets.” *Id.* at 1187 (quotations omitted).

1.4

The Supreme Court has observed that state laws may be preempted “even if a state law’s effect on rates, routes or services is only indirect.” *Rowe v. New Hampshire Motor Transport Ass’n* (2008) 552 U.S. 364, 370. The District has acknowledged that the Proposed Rules will increase the costs for warehouses in the District, many of whom are fleet owners. PDSR at 58 (“there will be financial impacts to industry to implement PR 2305, and it will also require many warehouse operators and cargo owners to change their business practices to implement actions required by PR 2305”), 45 (“Of the warehouses expected to be required to earn WAIRE Points ... about 45% may own a truck fleet”). The District also acknowledges that the Proposed Rules incentivize changes to routes and service. PDSR at 33 (“Because the WPCO is tied to a warehouse’s annual truck trips, if a facility can find ways to improve efficiency and reduce its number of truck trips, then its compliance obligation under PR 2305 will be lower.”). Because the Proposed Rules have a force and effect that is related to the price, route, and service of motor carriers, they are preempted under the FAAAA.

C. The Proposed Rules Are Preempted Under the EPCA.

The EPCA authorizes the National Highway Traffic Safety Administration (“NHTSA”) to create fuel-efficiency standards in order “to conserve energy supplies through energy conservation programs, and, where necessary, the regulation of certain energy uses” and “to provide for improved energy efficiency of motor vehicles.” 49 U.S.C. § 6201. “[W]hile the primary focus of the EPCA was to regulate the country’s consumption of energy resources, Congress intended that passage of the EPCA would not unnecessarily restrict purchase options.” *Ophir v. City of Boston* (2009) 647 F. Supp. 2d 86, 93. To that end, NHTSA may only establish a fuel economy standard after evaluating four factors: “technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United

1.5

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 11 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 11

States to conserve energy.” *Id.* § 32902(f). In order to promote a uniform application, the EPCA preempts the authority of the states or any political subdivision of a state from “adopt[ing] or enforce[ing] a law or regulation *related to* fuel economy standards or average fuel economy standards for automobiles covered by an average fuel economy standard under this chapter.” *Id.* at § 32919 (emphasis added). “Fuel economy” is defined as “the average number of miles traveled by an automobile for each gallon of gasoline (or equivalent amount of other fuel) used.” *Id.* at 32901(a)(11). The EPA Administrator is directed by EPCA to “include in the calculation of average fuel economy ... equivalent petroleum-based fuel economy values determined by the Secretary of Energy for various classes of electric vehicles,” (*id.* at 32904(a)(2)(B)), which the EPA calculates in terms of miles per gallon equivalent, or MPGe. *Id.*

1.5
cont.

As described above, it is the District’s intent to drive the acquisition of ZE/NZE vehicles in the District’s jurisdiction. The City of Boston had a similar objective when it adopted a taxi regulation requiring the acquisition of hybrid vehicles. A federal district court found the regulation preempted by the EPCA, even though the rule was adopted to “modernize and improve the quality of appearance” of the taxi fleet, not for purposes of increased fuel economy. *Ophir*, 647 F. Supp. 2d at 89, 94. Here, the District is compelling the acquisition of a certain type of vehicle, ostensibly to reduce vehicle emissions, but with the effect of mandating lower fuel economy standards. As the Supreme Court explained in *EMA*, “if one State or political subdivision may enact such rules, then so may any other; and the end result would undo Congress’s carefully calibrated regulatory scheme.” 541 U.S. at 255.

IV. The Proposed Rules Are An Improper Regulatory Fee.

There are three general categories of fees or assessments that are distinguishable from special taxes and thus can be imposed without a two-thirds majority vote: special assessments based on the value of benefits conferred on property, development fees exacted in return for permits or government privileges, and regulatory fees imposed under the police power. *California Building Industry Association v. San Joaquin Valley Unified Air Pollution Control District* (2009) 178 Cal.App.4th 120, 130. ISR fees are regulatory fees in that they are not associated with the issuance of a permit or government privilege.⁷ *Id.* However, a regulatory fee may not exceed the amount required to carry out the purposes and provisions of the regulation and cannot be levied for unrelated revenue purposes. *Id.* at 131.

1.6

In the first instance, the District has identified no authority allowing it to impose an ISR fee on existing, unmodified sources. See Part II, *supra*. The District has also not established a reasonable relationship between the fee charged and the activity the District seeks to regulate.

⁷ In the alternative, the fees under the Proposed Rules are an improper tax under Proposition 13. Unlike the allowances at issue in *Cal. Chamber of Commerce v. State Air Resources Board* (2017) 10 Cal.App.5th 604, the WAIRE points have no economic value that can be traded, a fixed price unchanged by market forces, and—as state and federal regulations phase in—will become compulsory. Thus, they are a tax subject to the requirements of Proposition 13, which have not been met.

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 12 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 12

The District states that the amount of the fee was calculated based on the cost-per-point of various other compliance actions. PDSR at 33. However, as the District acknowledges, these costs vary across the actions. *Id.* The District does not explain its methodology for determining the \$1,000 per point cost. Additionally, the District’s proposed cost is based on the cost of compliance for individual entities, not on the cost of the offsets the *District* would need to fund to offset total emissions from truck trips to warehouses in the Basin to achieve the emission reductions goals of the program. The District has acknowledged that there are economies of scale associated with the compliance pathways, which the District is uniquely positioned to access as the administrator of the mitigation funds. The District is required by law to perform an analysis of administering the costs of its own program, i.e., funding the offsets necessary to reduce emissions, rather than analyzing the cost of compliance actions of individual entities.

1-6
cont.

In addition, the court in *California Building Industry Association* upheld an ISR fee where the covered entities could choose whether or not to pay the fee based on their activities. However, in light of the increasing requirements for ZE/NZE vehicles discussed *infra* and the additionality requirement found in Proposed Rule 2305(d)(3), it is very likely that covered warehouses will have no option but to pay the fee at some point. As District staff acknowledged during the February 17, 2021 community meeting, Proposed Rule 2305 has no sunset and no off-ramp available for even fully electric warehouses. Yet these warehouses will continue to accumulate a compliance obligation based on the trucks that visit their locations regardless of the type of truck. Thus, no true choice between paying the fee and other compliance pathways exists in the Proposed Rules.

V. The Goals of the Proposed Rules Are Presently Infeasible.

As explained in Parts III.B and III.C, *supra*, the intent of the Proposed Rules is to accelerate the transition to ZE trucks. Yet, the District specifically acknowledges that it “cannot predict and has no feasible way to identify” suppliers of items necessary to accumulate WAIRE points and that the “investment or the quantity of items is speculative.” Draft EA at 532. CARB recently rejected a proposal to require a higher sales percentage of ZE vehicles under the ACT Rule “due to concerns about the feasibility of manufacturers to comply with even higher sales requirements especially for Class 2b-3 vehicles and tractors.” Advanced Clean Trucks Regulation, Final Statement of Reasons (January 2021) at 99 (“ACT FSOR”). As CARB explained just last month:

“At this time, both Class 2b-3 and Class 7-8 tractors have more focused concerns about payload, range, towing, charging/refueling infrastructure, and model availability than other vehicles. These issues will present more challenges in identifying suitable applications for their deployment in the early market. Increasing the number of ZEV sales further also increases the likelihood that manufacturers would need to produce more costly long-range vehicles, and that vehicles may need to be placed in applications where they may not be fully

1.7

March 2, 2021
Page 13

suitable. Therefore, the Board determined that the approved regulation is the most feasible path to meet ZEV deployment goals at this time.” *Id.*

The District has not explained how its mandate to increase the use of ZE vehicles—which is intended to be in excess of CARB’s requirement (*see* PDSR at 15)—is in fact feasible when CARB determined it is not.

Additionally, the District has not contended with whether it is feasible to impose these accelerated requirements for trucks that leave the District. Industrial Economics, Incorporated determined that only 34% of goods moved within the District stay in the District; the vast majority are bound for destinations outside of the District’s authority.⁸ Yet the District has offered no evidence of whether the infrastructure exists in other jurisdictions to support the endpoint of these trips. A rule that is infeasible is necessarily arbitrary and capricious and unsupported by substantial evidence.

1.7
cont.

VI. The District Cannot Make the Findings Required by Health and Safety Code Section 40727.

Prior to the adoption of any new regulation, the District must make findings regarding “necessity, authority, clarity, consistency, nonduplication, and reference.” HSC § 40727. The District’s findings must be based on substantial evidence that is “reasonable, credible, and of solid value” (*Plastic Pipe and Fittings Ass’n v. Cal. Bldg. Standards Comm.* (2004) 124 Cal.App.4th 1390, 1407), and that bears a “rational connection” to the District’s ultimate determination (*Am. Coatings Ass’n v. South Coast Air Quality Dist.* (2012) 54 Cal.4th 446, 460). The District cannot make the necessary findings for the Proposed Rules.

“Authority” is defined to mean a provision of law or of state or federal regulation that permits or requires the regional agency to adopt the regulation. *Id.* As discussed in Part II, *supra*, the District has no authority to adopt a regulation imposing an ISR on existing, unmodified sources and, as discussed in Part III, *infra*, the Proposed Rules are preempted by federal law. The District cites to Health and Safety Code sections 39002, 39650 to 39669, 40000, 40001, 40440, 40441, 40522.5, 40701, 40702, 40716, 47017 to 40728, 40910, 40920.5, 41508, 41511, and 41700 for authority for the Proposed Rules. PDSR at 83. None of these provide authority for either an ISR for existing, unmodified sources or for a program effecting a purchase mandate of vehicle sources.

1.8

“Necessity” means that a need exists for the regulation as demonstrated by the record. HSC § 40727(b). The District has failed to demonstrate that there is a need for the Proposed Rules.

⁸ Industrial Economics, Inc., Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule (Dec. 23, 2020), available at [http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf?sfvrsn=8](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf?sfvrsn=8).

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 14 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 14

The District explains that the District will not meet federal standards for ozone and fine particulate matter, that NOx is the primary pollutant needed to meet federal air quality standards, and that mobile sources associated with goods movement make up about 52% of all NOx emissions in the Basin. PDSR at 13-14. But the District does not bridge the analytical gap between the projected NOx emissions and the federal standards for ozone. For example, the District projects in Table 3 of the PDSR that NOx emissions per day will decrease from 42.72 tons to 26.86 tons (PDSR at 13), but does not explain or quantify how these reductions will achieve federal ozone standards, the actual cited need. Further, the District does not explain what NOx emissions are attributable to the specific entities it seeks to regulate. The Proposed Rules apply to the owners and operators of warehouses in the District's jurisdiction. Proposed Rule 2305(b). But the District has not demonstrated that the warehouses are a significant indirect source. While the District states that 52% of all NOx emissions in the Basin are attributable to the movement of goods, this figure includes locomotives, cargo handling equipment, ocean going vessels and commercial harbor craft.⁹ Trucks themselves are responsible for only 58% of the 52% of NOx emissions, or less than a third of the need originally cited by the District. In its later modeling, the District claims that NOx emissions from trucks that visit warehouses account for less than 20% of the District's carrying capacity even before the Proposed Rules. PDSR at 52. The District's necessity finding is further undercut by its own scenario analysis which demonstrate that despite the enormous implementation costs, it is possible that the Proposed Rules will result in no reduced emissions of NOx and PM at all. PDSR at 63-64.

1.8
cont.

The District has also claimed that the Proposed Rules are necessary because, while CARB's Draft MSS calls for a 100% ZE truck fleet by 2045, a 100% ZE drayage truck fleet (trucks that visit ports and railyards) by 2035, and 100% ZE off-road equipment operations by 2035, CARB's policy does not include any enforceable mechanism to achieve these targets. PDSR at 10. To reach this conclusion, the District ignores the effects of the ACT Rule requiring greater sales of ZE/NZE trucks and ignores CARB's further efforts to adopt the Advanced Clean Fleets ("ACF") rule, which CARB anticipates will be implemented from 2024 to 2045.¹⁰ During its public workshops, the District further discounted these regulations by emphasizing that the Proposed Rules will begin achieving emissions reductions beginning in 2023, where the ACT Rule and proposed ACF rule will not reach full implementation until 2035 and 2045 respectively. But the annual variable associated with the Proposed Rules indicates that they will not reach full implementation until after CARB's programs go into effect. The District thus has not demonstrated that it is necessary for it to usurp CARB's authority in this area.

Under section 40727, the District must also find that the regulation "is written or displayed so that its meaning can be easily understood by the persons directly affected by it," a required

⁹ PDSR at 14, citing Southern California Association of Governments, Transportation System Goods Movement Technical Report (Sept. 2020) at 58, available at https://scag.ca.gov/sites/main/files/file-attachments/0903connectsocial_goods-movement.pdf?1606001690.

Page 15

“clarity” finding. The District cannot make such a finding for the Proposed Rules because the means to comply with the Proposed Rules are based on a landscape of shifting sand. Specifically, each warehouse operator can only earn points toward their compliance obligation by taking actions beyond the requirements of U.S. EPA, CARB, and the District’s other regulations. Proposed Rule 2305(d)(3). But as described above, these regulations are becoming increasingly stringent and new rules are being evaluated continuously. Covered warehouses are therefore unable to evaluate how the Proposed Rules will specifically affect them or the level of compliance actions that may be necessary. This materially effects the ability of covered warehouses to operate and makes the District unable to make the required finding of clarity.

1.8
cont.

VII. The Environmental Assessment Fails as an Informational Document.

The basic purpose of an EIR is to “provide public agencies and the public in general with detailed information about the effect [that] a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project.” *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 511 (quoting Pub. Res. Code § 21061) (“*Friant Ranch*”). “If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees.” *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392 (“*Laurel Heights*”). For environmental review to be successful, it must not only provide a comprehensive disclosure but also connect the analytical dots in order to explain to the decisionmakers and the public the effects of the agency’s decision.

1.9

While the District has significantly improved the discussion of the environmental impacts of the Proposed Rules from the Initial Study, the Draft EA still fails to provide a full picture of the reasonably foreseeable effects of the Proposed Rules.

A. The District Improperly Relies on Analysis from an Earlier Project.

The District has abandoned its attempt to fully divorce the Proposed Rules from their indirect effects and now provides a cursory discussion of the Proposed Rules’ hazards and hazardous materials, aesthetic, mineral, biological, air quality, greenhouse gases, biological resources, land use, and agricultural resources impacts. However, the analysis remains legally insufficient. The District’s analysis is largely limited to incorporating CARB’s analysis of the impacts associated with the ACT Rule in order to describe and assess the effects of the Proposed Rules. This is improper and misleading. The District has repeatedly explained that the Proposed Rules are designed to be in surplus of state and federal regulations, meaning that the effects of the Proposed Rules are also necessarily in surplus of the effects described in the ACT Rule Environmental Assessment.

1.10

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 16 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 16

To illustrate, the District acknowledges that the Proposed Rules will drive an increase in specialized hazardous waste, including various types of batteries and fuel cells as well as prematurely retired vehicles. The District relies on CARB’s description and assessment of the ACT Rule’s effects on the creation and management of hazards, but the District never explains how the specific effects of the Proposed Rule—e.g., how much more demand for recycling or solid waste disposal the Proposed Rules generate vis a vis the ACT Rule. Because the District will be driving additional fleet turnover and additional ZE/NZE deployment, the effects of the Proposed Rules are necessarily in excess of what CARB analyzed in its own assessment. The District has failed to meaningfully inform the public and the Board of the reasonably foreseeable effects of the covered warehouses’ compliance actions. These incremental effects are likely substantial. While CARB predicts total deployment of 100,000 ZE vehicles under the ACT Rule by 2032 (ACT Environmental Assessment at IX-6), the District’s bounding analysis indicates the Proposed Rules could add an additional 28,000 ZE trucks by 2031, a 28% increase. The District’s repeated reliance on CARB’s assessment thus fails to disclose the effects of the District’s action in adopting the Proposed Rules.

1.10
cont

A lead agency may reuse an EIR prepared for an earlier project for another separate project if the “circumstances of the projects are essentially the same.” CEQA Guidelines § 15153(a). An EIR from an earlier project “shall not be used” for a later project if any of the conditions for supplementation have been met. In *Save Berkeley’s Neighborhoods v. Regents of University of California* (2020) 51 Cal.App.5th 226, the court found that the university could not rely on a previously prepared EIR that analyzed an increase in enrollment when the proposed project would further increase student enrollment. The same principles apply to the District. The District cannot crib from CARB’s own analysis when the District intends its Proposed Rules to increase turnover and deployment beyond what CARB contemplated, particularly not when the District can reasonably foresee a 28% increase in deployment *in a single air district* beyond what CARB anticipated for the *entire state*.

This error is not unique to the hazards analysis, although the comparison is particularly apt. The same problem permeates the District’s analysis of other impact areas, including but not limited to, aesthetic, mineral, biological, air quality, greenhouse gases, biological resources, land use, and agricultural resources impacts. While the District argues that these impacts are speculative and subject to the permitting decisions of other agencies, the District has demonstrated it is capable of performing a bounding analysis to determine the maximum potential impacts associated with air emissions and electricity demand and could certainly use this scenario to forecast potential impacts across other impact areas.

1. Increased Grid Capacity.

The District has modeled 18 compliance scenarios to provide a “bracketing” of the fiscal impact associated with the Proposed Rules and should provide the same level of information for the environmental impacts. While the District now quantifies a high-electrification scenario, it does

1.11

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 17 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 17

not disclose what this means to the public or the environment. To meet the state's ambitious climate goals, nearly all of this new demand would be met by wind, solar and battery storage.¹¹ This would require the construction of 109,834 megawatts ("MW") of new solar capacity (a nearly 900 percent increase from current levels), 14,585 MW of new wind capacity (more than a 200 percent increase from current levels), and 73,933 MW of new available grid battery storage (a 15,560 percent increase from the current 478 MW).¹² The District can and should evaluate and disclose to the public the approximate amount of acreage required to generate the necessary electricity from wind and solar and should quantify the amount of emissions that would result from the use of natural gas power plants.

1.11
cont.

2. Increased Need for Lithium Extraction.

The District could use its most battery-intense scenario along with projections of useful life to determine the demand for lithium and other necessary minerals and inform the public and decisionmakers of the potential real world impacts of the Proposed Rules, including the percentage increase over existing extraction to accommodate these Rules and other similar reasonably foreseeable electrification efforts.

1.12

3. Increased Disposal Facilities.

Using the same bounding scenario, the District could project the amount and type of waste the Proposed Rules would induce through accelerated transition. While the District indicates that conventional trucks replaced by ZE/NZE vehicles before the end of their useful life will likely replace older, dirtier trucks, the District must still contend with the disposal of these trucks. Additionally, the District's reliance on still-in-development battery recycling technology is speculative and lacks the support of substantial evidence. In order to succeed as an informational document, the District must provide an assessment of the foreseeable impacts, including increased demand for disposal facilities. This is not outside of the realm of reason. The District has demonstrated it is capable of preparing a bounding analysis and can use this, along with reasonable assumptions regarding useful life, to determine the rate of waste generation attributable to the Proposed Rules. This can and must be prepared and compared against existing disposal capacity in light of other reasonably foreseeable projects to inform the public of the potential scale of development necessary to accommodate the Proposed Rules.

March 2, 2021
Page 18

B. The District’s Analysis of Air Quality Effects Relies on Outdated Modeling and Inconsistent Assumptions.

The District relies on a version of CARB’s Emission Factor (“EMFAC”) from 2017 to characterize emissions and reductions. While CARB applies some post-hoc modifications to approximate the effect of CARB’s more recent regulations including the ACT Rule and Low NOx Omnibus, these are merely approximations. CARB has recently released EMFAC2021 which reflects CARB’s own best estimates of the effect of these regulations on emissions. The District should re-characterize its analysis based on EMFAC2021 before taking action on the Proposed Rules. At the very least, the District should verify its modifications against the latest EMFAC modeling. Not doing so means that the District’s analysis supporting adoption of the Proposed Rules is not based on the most up-to-date information and thus lacks substantial evidence. Similarly, the District relies on a version of the Southern California Association of Government’s (“SCAG”) Regional Transportation Plan/Sustainable Community Strategy (“RTP/SCS”) that is a half-decade out of date. SCAG adopted its latest RTP/SCS in September 2020 which incorporates updated trip modeling. This information was plainly available the District long before it released its draft EA and thus there is no excuse for the District not to include the updated trip modeling information in the EA. The EA thus must be updated to reflect the most recent trip lengths analysis. *See Citizens to Preserve the Ojai v. County of Ventura* (1985) 176 Cal.App.3d 421, 430; *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 17 Cal.App.5th 413, 444-45 (court invalidated an EIR’s analysis of farmland impacts because the agency relied on “a methodology with known data gaps, [which] produced unreliable estimates ... of the [project’s] impacts”).

1.14

The assessment of the Proposed Rules’ air quality effects also rely on faulty assumptions. First, the scenario analyses do not account for increasingly strict state-level requirements that could reduce the emission reductions achieved by the Proposed Rules. These new requirements include the ACT Rule, the Low NOx Omnibus regulation, the ACF regulation, and the Ports Clean Air Action Plan. While these regulations are at least partially incorporated into an assessment of baseline emissions through the post-hoc modifications discussed above, the District does not carry these forward through its scenario analysis. This means that the range of emission reductions stated in the PDSR do not represent realistic assumptions of potential emission reductions from the Proposed Rules. Because all WAIRE points must constitute reductions that are additional to those generated by other federal and state laws, the District over counts potential reductions as attributable to the Proposed Rules, when they will actually be attributable to the enhanced state requirements and thus not eligible for WAIRE points. In this way, the District overstates the emission reductions the Proposed Rules will achieve. Second, the scenario analyses compares apples and oranges. The District claims as benefits of the Proposed Rules decreases in emissions associated from decreased demand for utility-based electricity as a result of the installation of on-site solar. But the District neglects to perform a similar analysis regarding the increased emissions from increased demand for utility-based electricity as a result of ZE vehicle deployment and charger installations. The District cannot adequately inform the

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 19 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 19

public by quantifying only the benefits and none of the costs. The District must quantify and disclose both halves of the equation, including whether compelling ZE deployment actually results in the scale of emissions reductions the District has predicted.

1.14
cont.

C. The District Fails to Adequately Explain the Proposed Rules' Effects on the Environment.

It is not enough for an agency to declare that there is an environmental effect; “there must be a disclosure of the analytic route the ... agency traveled from evidence to action.” *Laurel Heights*, 47 Cal.3d at 403 (quotations and citations omitted); *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514-15 (“an EIR’s designation of a particular adverse environmental effect as ‘significant’ does not excuse the EIR’s failure to reasonably describe the nature and magnitude of the adverse effect”); *Berkeley Keep Jets Over the Bay Com. v. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1371 (“The EIR’s approach of simply labeling the effect ‘significant’ without accompanying analysis of the project’s impact on the health of the Airport’s employees and nearby residents is inadequate to meet the environmental assessment requirements of CEQA.”). Unfortunately, the District has obfuscated the real impacts of the Proposed Rules and failed to provide a meaningful analysis of the effects.

For example, the District declares that “impacts associated with the need for new or substantially altered power utility systems, new and expanded infrastructure, and effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure by compliance year 2031” are conservatively considered a significant environmental effect of the proposed project, but it fails to provide a meaningful analysis of this effect. Like the agency in *Friant Ranch*, the District has analyzed the issue and disclosed the general effects, but it “did not connect the raw” energy numbers and their effects to specific adverse effects on the built environment. 6 Cal.5th at 518. After reading the EA, “the public would have no idea of the ... consequences that result from” dramatically increasing electricity demand. *Id.* at 519.

1.15

And the increase will be dramatic. The Draft EA discloses the electricity demands created by various compliance options, including Scenario 6 which would result in an additional 847 gigawatt hours per year of electricity demand. But the District never explains to the reader what this means for the electricity grid. The District predicts up to 28,569 new ZE/NZE trucks in 2031 as a result of the Proposed Rules (Draft EA at 4.1-24) and states that the California Energy Commission (“CEC”) assumed that 100,000 ZE trucks will be deployed by 2031 (Draft EA at 4.2-17), but fails to bridge the analytical divide and further fails to contextualize this increase. A cursory review of the ACT Rule Environmental Assessment indicates that CARB already anticipates driving the deployment of the full 100,000 ZE capacity assumed by the CEC by 2032 through the ACT Rule. ACT Environmental Assessment at IX-6. The additional 28,569 NE/NZE trucks that would occur from implementation of the Proposed Rules are thus wholly unaccounted

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 20 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 20

for in the CEC’s assumptions—as the District has gone to great pains to ensure that all trucks under the Proposed Rules will be in addition to those required by CARB. Thus, the District has failed the lead agency’s obligation to explain how the large increase in ZE/NZE trucks will affect electricity demand and energy supply, and lead to environmental impacts in California.

Further, the District never explains what a nearly 30% increase in ZE/NZE trucks in a single air district means for the human environment. What are the “effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure by compliance year 2031”? The public and the Board are left—figuratively and possibly literally—in the dark.

1.15
cont.

This cursory conclusion without a full disclosure of the real effects on the human environment is widespread throughout the District’s analysis. “Because the [EA] as written makes it impossible for the public to translate the bare numbers provided into adverse health impacts or to understand why such translation is not possible at this time (and what limited translation is, in fact, possible)” (*Friant Ranch*, 6 Cal.5th at 521), the EA fails in its purpose as an informational document.

D. The Draft EA Fails to Adequately Analyze the Proposed Rule’s Impacts on the Transportation Sector.

As raised in CTA’s Scoping Comment letter, the Proposed Rules create significant uncertainty in commercial transportation. By compelling the early transition to ZE/NZE vehicles, the Proposed Rules drive rapid and premature fleet turnover for high-cost ZE/NZE vehicles while imposing the uncertain but often high costs of electricity and hydrogen fuel on the logistics sector. Additionally, while the Proposed Rules may incentivize the transition to ZE/NZE vehicles in the District’s jurisdiction, neither the Initial Study nor the Draft EA appears to have considered whether there is sufficient charging infrastructure to support these fleets outside of the District. Goods move across the air districts, but there is no analysis of whether the infrastructure exists for the anticipated ZE/NZE vehicles to complete these trips. Additionally, as California responds to increasing wildfire threats, public safety power shutoff (“PSPS”) events have become increasingly common.

1.16

In response to CTA’s Scoping Comment, the District first states that it is not feasible to anticipate the frequency of PSPS events or to analyze their effects. Draft EA at C-34. This is incorrect. Following each PSPS event, California utilities are required to file reports with the Public Utilities Commission disclosing what occurred. These reports are publicly available and the District can and should assess the number and coverage of PSPS events in its jurisdiction to understand, evaluate, and disclose the interaction between increased electrification and increasing grid instability. The District also deflects from the impacts of PSPS events by relying on the additional solar and battery technologies that it envisions will be implemented at covered warehouses. *Id.* at C-35. However, the District repeatedly explained throughout the PDSR and

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 21 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 21

the Draft EA that predicting the manner in which the warehouse may choose to comply would be pure speculation. The District's reliance on solar infrastructure to defray the potential significant effects of reliance on unstable grids thus is similarly pure speculation. Additionally, as discussed *supra*, the cost differential created by the District in fact disincentivizes the deployment of on-site solar in favor of ZE/NZE acquisition. Thus, there is evidence that the District's reliance on solar infrastructure to defray potentially significant effects on the grid is misplaced.

While impacts to the State's logistics infrastructure are not specifically listed as impacts in Appendix G, the Appendix "is only an illustrative checklist and does not set forth an exhaustive list of potentially significant environmental impacts under CEQA or standards of significance for those impacts." *City of San Diego v California State University* (2011) 201 Cal.App.4th 1134, 1191; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1111. "Also, the lack of precise quantification or criteria for determining whether an environmental effect is 'significant' under CEQA does not excuse a lead agency from using its best efforts to evaluate whether an effect is significant. *City of San Diego*, 201 Cal.App.4th at 1191; *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.* (2001) 91 Cal.App.4th 1344, 1370. The District provides no satisfactory explanation for its failure to analyze and disclose the effects of the Proposed Rules on the State's logistics infrastructure. The EA should consider the interaction between expedited electrification and PSPS events. It is reasonably foreseeable that the Proposed Rules will lead to significant disruptions to freight transportation, specifically in light of PSPS events.

cont.

E. The District Omits Projects from Its Cumulative Impact Analysis.

An EIR must discuss a cumulative impact if the project's incremental effect combined with the effects of other projects is "cumulatively considerable." CEQA Guidelines § 15130(a). This determination is based on an assessment of the project's incremental effects "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." *Id.* at § 15065(a)(3); *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1228.

The District contends that a cumulative impact analysis is not required because the Proposed Rules are consistent with the 2016 AQMP, the State SIP Strategy, and the ACT Rule. Draft EA at 4-11–12. However, the Proposed Rules are not consistent with the ACT Rule in that they are specifically designed to be additional to the requirements of the ACT Rule. Similarly, the District cannot rely on the analysis completed for the State SIP strategy since that analysis was focused on statewide emission control strategies adopted by CARB (including the ACT Rule), and did not contemplate further purchase mandates from local air districts.

1.17

As to the 2016 AQMP, the District may only rely on the cumulative analysis discussion to the extent cumulative effects were previously adequately addressed and there are no new significant cumulative effects. CEQA Guidelines § 15152(f). In the half decade that has elapsed since the

March 2, 2021
Page 22

environmental review for the 2016 AQMP, numerous other proposals to reduce emissions through electrification have been proposed both within and outside the District’s jurisdiction that will impact the same electric grid and resources. For example, the cities of Santa Monica and West Hollywood have adopted Reach Building Codes driving full electrification. The cities of Culver City and Hermosa Beach are considering similar initiatives. The California Public Utilities Commission has initiated a rulemaking along with the CEC on building decarbonization (R.19-01-011) and on transitioning from natural gas (R.20-01-007). The cumulative effects of these and other electrification initiatives must be analyzed. CEQA Guidelines § 15130(a)(1); *City of Long Beach v. Los Angeles Unified Sch. Dist.* (2009) 176 Cal.App.4th 889, 907 (an EIR’s analysis of cumulative impacts must consider all sources of related impacts, not just similar sources or projects). While a lead agency has discretion to establish a reasonable cutoff date for future projects to include in its cumulative impact analysis, that determination must be supported by substantial evidence. *South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 336. The cumulative effects of mass electrification initiatives adopted and proposed since the 2016 AQMP may risk environmental disaster or severe environmental harm and require evaluation. *Whitman v. Board of Supervisors* (1979) 88 Cal.App.3d 397, 408; *San Joaquin Raptor/Wildlife Rescue Ctr. v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 720. The EA must disclose these new projects and their cumulative effects.

1.17
cont.

F. The Draft EA Unlawfully Rejects Alternative B.

The Draft EA impermissibly dismisses an alternative that, if appropriately analyzed and characterized, could reduce environmental impacts. “Pursuant to CEQA’s ‘substantive mandate,’ an agency may not approve a proposed project if feasible alternatives exist that would substantially lessen its significant environmental effects.” *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 520; see Pub. Resources Code § 21002. Despite identifying environmental benefits associated with Alternative B (Decreased Emissions Reductions), the Draft EA determines that it is not environmentally superior to the Proposed Rules. The Draft EA does not adequately support its conclusion that only Alternative C (Increased Emissions Reductions) is “environmentally superior.” Draft EA at 5-27.

The Draft EA indicates that the Proposed Rules would have significant and unavoidable direct impacts (1) on energy resources, (2) from hazardous materials and solid and hazardous waste, and (3) on transportation and significant and unavoidable indirect impacts on (1) aesthetics, (2) agriculture and forestry, (3) biological resources, (4) cultural resources, (5) geology and soils, (6) hydrology and water quality, (7) noise, (8) mineral resources and (9) utilities and service systems. Draft EA at 6-2–3. The Draft EA further acknowledges that *all* of these significant and unavoidable impacts are in fact *worsened* by Alternative C. *Id.* at 5-16–17. Yet the District paradoxically labels this as the environmentally superior alternative because the NOx and PM emissions will be lower than under the Proposed Rules. The District is measuring with the wrong yardstick. The environmentally superior alternative is an alternative that *lessens* the project’s *significant effects*. The District itself acknowledges that the Proposed Rules have a less than

1.18

#82448881_v1

COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association (page 23 of 24)

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 23

significant effect on long-term air quality impacts. *Id.* at ES-4. There is no significant effect of the Proposed Rules that Alternative C in fact lessens.

By contrast, Alternative B would “lead to less cargo growth potentially being diverted to other ports and resulting in less GHG emissions from cargo growth diversion than the proposed project,” “lead to a lower demand on utilities,” reduce infrastructure needs, “reduce the number of batteries that need to be recycled, and “have less adverse direct impacts to energy and hazardous materials and solid and hazardous waste.” *Id.* at 5-15. “Alternative B’s indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation would likely be less than the proposed project.” *Id.* “The reduction in the number or intensity of development of new facilities and grid improvement would likely lead to less adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from reduced demand for new mines and mining activities because of the reduced use and demand of lithium-based batteries in ZE vehicles), Noise, and Utilities than the proposed project.” *Id.* The only metric by which the District finds Alternative B insufficient is that “Alternative B’s ongoing, long-term, and permanent air quality and public health *benefits would be less* when compared to the proposed project.” *Id.* at 5-16. But as described above, this is not the standard—the question is whether the alternative would lessen the significant effects and the District has determined that the Proposed Rules’ effect on long-term air quality impacts is *less than significant*.

1.18
cont.

The only grounds on which the District may reject an environmentally superior alternative is if it is infeasible. The District evaluated five alternatives to the Proposed Rules, including a no project alternative. One of these, Alternative B, was a version of the Proposed Rules with a narrower application (only to warehouses greater than 200,000 square feet), a year delay in compliance obligations, and less aggressive emissions reduction targets as a result of a decreased rule stringency factor. Draft EA at 5-6. As noted in Table 5-2, Alternative B would accomplish *all* of the District’s objectives. Draft EA at 5-12. Despite the reduced environment impacts described above, the District rejected Alternative B because it did not reduce emissions quite as much. However, a lead agency cannot adopt artificially narrow project objectives that would preclude consideration of reasonable alternatives for achieving the project’s underlying purpose. *North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 647, 669; *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 203. Alternative B accomplishes the District’s aims while reducing the environmental impacts.

VIII. Conclusion.

The District has not been granted the authority to impose a sweeping purchase mandate on existing, unmodified warehouses under the guise of an ISR regulation. While the District’s goals of reducing air emissions in the Basin are laudable, the District has only the rulemaking authority

1.19

invested in it by statute. Even if the Legislature had granted the District such authority, it is preempted by federal law. The regulation as proposed fails to meet the standards specified by the Health and Safety Code and the accompanying Draft EA fails to meet the District's obligations under CEQA and fails as an informational document. For this reason, the District must revise the Proposed Rules and EA before adoption in order to bring them into compliance with state and federal law.

RESPONSE TO COMMENT LETTER #1 – Holland & Knight on behalf of the California Trucking Association, dated March 2, 2021

Our client, the California Trucking Association (“CTA”), appreciates the opportunity to submit comments on the South Coast Air Quality Management District’s (“SCAQMD” or “District”) Preliminary Draft Staff Report (“PDSR”) and Draft Environmental Assessment (“Draft EA”) for the Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees For Regulation XXIII (collectively, the “Proposed Rules”).

Many members of the CTA will be directly regulated by the Proposed Rules and many others will be compelled to assist the covered warehouses in achieving compliance with the Proposed Rules. This will require substantial capital investment by CTA members and will have far reaching environmental and economic effects. The Proposed Rules as drafted are preempted by federal law and extend beyond the authority granted to the District by the State. For this reason, the District must revise the Proposed Rules before continuing with its rulemaking process.

1.1

I. Statement of Interest.

“Truck driver” is one of the most common jobs in California. There are approximately 550,000 commercial vehicles registered in California and an additional 1.5 million commercial vehicles registered in other states to operate in California. Most of these vehicles are owned by small businesses: 50% of all trucks are owned by fleets of 3 or fewer trucks and 80% of all trucks are owned by fleets with fewer than 50 trucks.

The CTA is the largest state trade association representing trucking in the United States. Its 1,800 members include both large and small fleets with an average fleet size of 20 trucks. CTA members are actively participating in the development, piloting, and demonstration of alternative fuel and electric-drive capable vehicles. In fact, some member fleets have been working to bring electric-drive vehicles to market for nearly ten years. The CTA continues to support a coordinated and measured transition to alternative fuel and electric-drive capable vehicles.

1.1

Response 1.1

Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment. This comment provides background information about the CTA and does not raise any issues related to the proposed project or the proposed project’s impact on the physical environment under CEQA. No further response is necessary.

II. The District Does Not Have Authority to Adopt an Indirect Source Rule that Applies to Existing Warehouses.

Prior to the adoption of any regulation, the District must determine under Health and Safety Code section 40727 that it has the authority to adopt the regulation under state and federal law. Health and Safety Code (“HSC”) § 40727(a). The District cannot make such findings regarding the Proposed Rules. The District, as a creation of the Legislature, only possesses the authority specifically granted to it by state law. *PaintCare v. Mortensen* (2015) 233 Cal.App.4th 1292, 1305 (“An administrative agency ‘has only as much rulemaking power as is invested in it by statute’”); *Friends of the Kings River v. County of Fresno* (2014) 232 Cal.App.4th 105, 117 (similar). The District is an administrative agency which has no inherent “police power” nor any other “authority” beyond that explicitly conferred on the District by statute. *Candid Enterprises v. Grossmont Union High School Dist.* (1985) 39 Cal.3d 878, 885. “An air pollution control district, as a special district, has only such powers as are given to it by statute and it is an entity, the powers and functions of which are derived entirely from the Legislature.” 74 Cal. Atty. Gen. Op. 196 (1991) (citing *People ex rel. City of Downey v. Downey County Water Dist.* (1962) 202 Cal.App.2d 786, 795). “The powers of public [agencies] are derived from the statutes which create them and define their functions.” *Imperial Irr. Dist. v. State Water Resources Control Bd.* (1990) 225 Cal.App.3d 548, 567; *see also Carmel Valley Fire Prot. Dist. v. State of California* (2001) 25 Cal.4th 287, 299-300. “No matter how altruistic its motives, an administrative agency has no discretion to promulgate a regulation that is inconsistent with the governing statutes.” *Terhune v. Superior Court* (1998) 65 Cal.App.4th 864, 874. That an agency has been granted some authority to act within a given area does not mean that it enjoys plenary authority to act in that area. *Railway Labor Exec. Ass’n v. National Mediation Bd.* (D.C. Cir. 1994) 29 F.3d 655, 670 (en banc).

1.2

The District has identified no law that expressly grants it authority to adopt an indirect source rule (“ISR”) that regulates existing sources. Federal law allows, but does not require, states to adopt an “indirect source review program” as part of the state implementation plan. 42 U.S.C. § 7410(a)(5)(A)(i). However, an “indirect source program” is defined by statute to mean “the facility-by-facility review of indirect sources of air pollution, including such measures as are necessary to assure . . . that a *new or modified* indirect source will not attract mobile sources of pollution” that would cause or contribute to an exceedance of or prevent the maintenance of a National Ambient Air Quality Standard (“NAAQS”). *Id.* at § 7410(a)(5)(D) (emphasis added). The EPA expressly understood this to apply to the evaluation of indirect sources “effects on air

quality **prior to** their construction and modification.” 38 Fed. Reg. 9599 (1973) (emphasis added).¹ Nowhere does federal law grant states the authority to develop an indirect source program that applies to **existing** sources.

The authority granted to Air Districts to promulgate indirect source rules under the California Clean Air Act is similar. Section 40716 of the Health and Safety Code provides that a district “may adopt and implement regulations” that **both** “[r]educe or mitigate emissions from indirect and areawide sources of air pollution” and “[e]ncourage or require the use of measures which reduce the number or length of vehicle trips.” The District does not substantiate its claim that the Proposed Rules will reduce the number or length of trips. But even if it did, the District’s authority is further proscribed. First, the statute specific to the District grants limited authority for the District to create an indirect source rule. It explains that the District shall provide for indirect source controls for “any **new** source that will have a significant effect on air quality in the South Coast Air Basin.” HSC § 40440(b)(3) (emphasis added).² “In the grants [of powers] and the regulation of the mode of exercise, there is an implied negative; an implication that no other than the expressly granted power passes by the grant; that it is to be expressed only in the prescribed mode...” *Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 196. The express statutory authority of the District is thus to implement indirect source controls for **new** sources only, not existing, unmodified sources. “Any reasonable doubt concerning the existence of the power is to be resolved against the agency.” *California Chamber of Commerce v. State Air Resources Board* (2017) 10 Cal.App.5th 604, 620. Second, the statute requires all air districts to adopt “indirect source control programs.” *Id.* at § 40918. This term is not defined in California law, but is identical to the term used under the federal Clean Air Act in which indirect source control programs are limited to **new or modified** indirect sources. 42 U.S.C. § 7410(a)(5)(D). Thus, the Legislature did not grant the District authority to require existing, unmodified sources to comply with an indirect source control program.³

1.2
cont.

¹ “It should be emphasized that the primary purpose of the review procedures is to insure that **proposed projects** are designed and located in a manner consistent with air quality requirements.” *Id.* (emphasis added).

² The District has also not demonstrated that “there are high-level, localized concentrations of pollutants” in the vicinity of covered warehouses. See HSC 40440(b)(3). The PDSR relies on an association between CalEnviroScreen rankings and warehouses. PDSR at 16-17. CalEnviroScreen uses a suite of 19 indicators to characterize pollution burden (12 indicators) and population characteristics (7 indicators). Each indicator is assigned a score for each census tract in the state based on the most up-to-date suitable data. Scores are weighted and added together within the two groups to derive a pollution burden score and a population characteristics score. Those scores are multiplied to give the final CalEnviroScreen score. These indicators are not limited to air quality, let alone to NOx which is a basin-wide contaminant (not one of “localized concentrations”). Instead, the indicators include drinking water contaminants, pesticide use, toxic releases from facilities, lead risk from housing, clean-up sites, ground water threats, and numerous other factors wholly unrelated to “high-level, localized concentrations of pollutants.” See Office of Environmental Health Hazard Assessment, Indicators Overview, available at <https://oehha.ca.gov/calenviroscreen/indicators>.

³ It also appears no court has upheld such a program. See *National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District* (2010) 627 F.3d 730 (upheld ISR program applied only to qualifying

The only support that the District references for its novel interpretation of its authority to adopt an existing source ISR is an Attorney General Opinion from 1993. Atty. Gen. Opinion 92-519 (1993). While opinions of the Attorney General are entitled to great weight, they are not binding law and may be “simply wrong.” *Building Industry Assn. v. City of Livermore* (1996) 45 Cal.App.4th 719, 730. In addition, the Attorney General cannot expand the authority granted to an entity created by state law via an advisory opinion. As explained above, the District’s authority only extends to the powers which it was expressly granted by the Legislature. See *PaintCare*, 233 Cal.App.4th at 1405; *Valero Refining Company-California v. Bay Area Air Quality Management District* (2020) 49 Cal.App.5th 618, 640 (same). Even if the Opinion were controlling law, it does not support the District’s claims of authority to adopt an ISR. The District apparently contends that because the Attorney General concluded that air districts may impose “reasonable post-construction measures,” the District’s authority to adopt ISRs extends to all indirect sources, even if they are long-standing and unmodified. However, nowhere in the Opinion does the Attorney General state that “reasonable post-construction measures” may be required for indirect sources that are neither new nor modified. The District’s strained interpretation is inconsistent not only with the law at the time the Opinion was issued, but also with the District’s own contemporaneous Air Quality Management Plan (“AQMP”).

1.2
cont.

Both the California Clean Air Act and the AQMP anticipated the implementation of control measures that could only come into effect after an indirect source was constructed. In 1993, at the time of the Opinion, Section 40716 allowed the districts to implement post-construction measures such as “encourag[ing] or requir[ing] ridesharing, vanpooling, flexible work hours, or other measures to reduce the number or length of vehicle trips.” HSC § 40716 (1993). For traditional indirect sources such as shopping centers or stadiums, these measures could only be implemented post-construction. In its 1989 AQMP, the District itself included numerous similar measures it characterized as indirect source controls that would be implemented post-construction, including:

- (1) Alternative work weeks and flextime, *id.* app. IV-G at 47-52;
- (2) Telecommunications, *id.* at 53-62;
- (3) Employer rideshare and transit incentives, *id.* at 65-70;
- (4) Vanpool purchase incentives, *id.* at 77-82; and
- (5) Merchant transportation incentives, *id.* at 83-88.

In the context of the law at the time and the District’s own contemporaneous understanding, it is clear the Opinion was referring to these types of measures as “reasonable post-construction

new or modified development); *California Building Industry Association v. San Joaquin Valley Unified Air Pollution Control District* (2009) 178 Cal.App.4th 120 (same).

measures,” not establishing a carte blanche authority for the District to impose an ISR program on existing, unmodified sources. Thus, while the District may impose reasonable post-construction measures on new or modified indirect sources, the District has identified no law granting it authority to extend these measures to indirect sources that are neither new nor modified.

1.2
cont.

Response 1.2 Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment.

III. The Proposed Rules Are Preempted by Federal Law.

Under the U.S. Constitution’s Supremacy Clause, “Congress has the authority, when acting pursuant to its enumerated powers, to preempt state and local law.” *Oxygenated Fuels Association, Inc. v. Davis* (9th Cir. 2003) 331 F.3d 665, 667. “Congressional intent to preempt state law must be clear and manifest” (*Williamson v. General Dynamics Corp.* (9th Cir. 2000) 208 F.3d 1144, 1150), but congressional purpose is the “ultimate touchstone” of preemption analysis. *Cippollone v. Liggett Group, Inc.* (1992) 505 U.S. 504, 516. In this case, Congress has been clear in reserving to the federal government the ability to regulate purchase mandates under the Clean Air Act, the Federal Aviation and Administration Authorization Act (“FAAAA”), and the Energy Policy and Conservation Act (“EPCA”).

A. The Proposed Rules Are Preempted as Purchase Mandates Under the Clean Air Act.

The District may not adopt a purchase mandate under the guise of an ISR rule. Federal law preempts the adoption of such standards. While the District claims that the Proposed Rules provide sufficient flexibility to avoid a preempted mandate, the cost differential associated with the compliance pathways constitute an offer which cannot, in practical effect, be refused.

1.3

1. Rules Establishing Purchase Mandates Are Preempted.

Section 209(a) of the Clean Air Act (“CAA”) states:

“No State or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part. No State shall require certification, inspection, or any other approval relating to the control of emissions ... as condition precedent to the initial retail sale, titling (if any), or registration of such motor vehicle, motor vehicle engine, or equipment.” 42 U.S.C. § 7543(a).

This prohibition is interpreted broadly. As the Supreme Court explained, because “[t]he manufacturer’s right to sell federally approved vehicles is meaningless in the absence of a purchaser’s right to buy them,” the term “standard” is not limited to regulations on manufacturers. *Engine Manufacturers Assn v. South Coast Air Quality Management Dist.* (2004) 541 U.S. 246, 252, 255 (“*EMA*”). To that end, the Supreme Court found that, “A command, accompanied by sanctions, that certain purchasers may buy only vehicles with particular

emission characteristics is as much an ‘attempt to enforce’ a ‘standard’ as a command, accompanied by sanctions, that a certain percentage of a manufacturer’s sales volume must consist of such vehicles.” *Id.* at 255.

The EPA has agreed and further explained that even if a standard is not a direct mandate, it may still be preempted under the CAA. Specifically in the context of ISR regulations, the EPA identified two ways that an ISR rule that on its face is authorized under CAA section 110(a)(5) could nonetheless be preempted. 76 Fed. Reg. 26609, 26611 (May 9, 2011). First, the ISR rule could be preempted if the rule in practice acts to compel either the manufacturer or user of a vehicle to change the emission control design of the engine or vehicle, or second, an ISR rule could be preempted if it creates incentives so onerous as to be in effect a purchase mandate. *Id.*

This was the exact question placed before the U.S. District Court of New York in 2009 in *Metropolitan Taxicab Bd. of Trade v. City of New York* (2009) 633 F. Supp. 2d 83 (“*MTB*”). The City of New York (“City”) adopted new regulations for taxis that were designed to encourage the transition to cleaner vehicles. Specifically, the City adopted a rule, the Lease Cap Rule, increasing the maximum allowable lease rate for hybrid vehicles while decreasing the maximum allowable lease rate for conventional vehicles. While the new maximum did not eliminate the profit margin for the leasing of conventional taxis, it rendered these conventional fleets substantially less profitable than hybrid fleets. *Id.* at 85. The Court first considered whether the Lease Cap Rule effected a purchase mandate, finding that “[t]he combined effect of the lease cap changes, and even the disincentive alone, constitutes an offer which can not, in practical effect, be refused.” *Id.* at 99. While the City argued that fleet operators could continue to utilize conventional taxis under the Lease Cap Rule, the Court found that the cost differential made it clear that “the Lease Cap Rules do not present viable options for Fleet Owners and instead operate as an effective mandate to switch to hybrid vehicles.” *Id.* at 100.⁴

1.3
cont.

2. The Intent of the Proposed Rules Is to Force the Acquisition of ZE/NZE Vehicles.

The District has made no secret of its dissatisfaction with the state-level progress on regulating emissions from mobile sources. In its comment letter on the Draft Mobile Source Strategy (“MSS”), the District called on CARB to “go even further” since CARB’s efforts to regulate

⁴ This is distinct from Rule 9510 considered by the Ninth Circuit in *National Assn. of Home Builders v. San Joaquin Valley Unified Air Pollution Control Dist.* (2010) 627 F.3d 730 (“*NAHB*”). In that case, the ISR rule considered emissions that were “site-based,” rather than “engine- or vehicle-based.” Stated differently, Rule 9510 evaluated emissions from the whole of the development, including the emissions from the construction equipment used during development and from the vehicles of the final users of the site. While NAHB challenged the rule as a preempted purchase mandate, the court found that Rule 9510 “escape[d] preemption” because it did “not measure emissions by fleets or groups of vehicles”—the construction equipment—but rather the facility as a whole *Id.* at 740. The same cannot be said of the Proposed Rules which are entirely based on the emissions from vehicles that visit the site and for which the practical compliance mechanisms are limited to acquisition.

mobile sources were insufficient to meet upcoming 2023 and 2031 federal deadlines for ozone reduction. PDSR at 52. The District has explained the problem that the emissions reductions modeled in the Draft MSS were insufficient to meet federal deadlines and that, even in the most aggressive modeling in the Draft MSS, in 2023 more than 95% of heavy-duty trucks will be no cleaner than 2010 engine standards assumed for all trucks in the baseline emissions inventory from the 2016 AQMP and that these trucks will continue to make up about 57% of the truck fleet in 2031. PDSR at 52. In commenting on the Advance Clean Truck (“ACT”) regulation, the District explained that the 15% ZEV sales requirement in 2030 “will be insufficient and must be increased to generate the needed NOx reductions.” SCAQMD Letter to CARB, Comment Letter on Proposed Advanced Clean Trucks Regulation (Dec. 6, 2019).

With the Proposed Rule, the District is attempting to step into CARB’s shoes and regulate mobile sources by proxy, an action for which it lacks authority. The PDSR explains that the ACT Rule and the Low NOx Omnibus regulations have left a gap in that their “lower emissions occur only *if* trucks are sold.” *Id.* (emphasis original). The Proposed Rules are designed to fill this gap by forcing acquisition of lower emission trucks. Similarly, the District explained that while the upcoming TRU regulation is expected to require lower PM standards, it “will not mandate that fleets purchase them, nor will it direct sales in certain parts of the state.” *Id.* The Proposed Rules are designed to correct this deficiency by creating a de facto purchase mandate in the South Coast Basin. The District explains that NOx reductions are necessary to meet federal air quality standards and “mobile sources associated with goods movement make up about 52% of all NOx emissions” in the South Coast Basin. PDSR at 14. The Proposed Rules are intended “to support statewide efforts to increase the number of ZE vehicles.” *Id.* The Proposed Rules “provide a mechanism to require warehouse operators to encourage ZE vehicle use at their facilities.” *Id.* at 15. “The proposed project is intended to accelerate the use of ZE trucks and yard trucks that visit the warehouses in the South Coast AQMD region” and “encourage and incentivize the purchase and use of NZE and ZE vehicles instead of conventional gasoline and diesel vehicles.” Draft EA at 4.1-1, C-46.⁵ The purpose of the Proposed Rules is thus clearly to force the acquisition and deployment of ZE trucks in the Basin.

1.3
cont.

3. Beyond the District’s Clear Intent to Force Purchase of ZE/NZE Vehicles, the Cost Differential Associated with the Compliance Pathways Forces Acquisition in Any Event.

While the District has ostensibly designed the Proposed Rules to provide multiple compliance pathways, the actual effect is uniform—ZE trucks must be acquired. The PDSR analyzed 18 compliance pathways as shown in Table 14. Scenarios 1, 2, 3, 6, 8, 12, 13, and 18 require the acquisition and usage of ZE vehicles by the warehouse itself. Scenarios 4, 5, 9, 10, and 14 require ZE trucks to visit the warehouses, requiring non-warehouse fleet owners to acquire such

⁵ “[T]he proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without the proposed project....” Draft EA at C-48–49.

vehicles. But, for the 45% of warehouses that own and operate their own fleet, relying on the indirect acquisition by non-covered fleet owners is not an option. The only scenarios that do not force an acquisition of a ZE vehicle are Scenarios 7 (pay mitigation fee), 11 (rooftop solar and mitigation fee), 15 (filter system installations) and 16 (filter purchases).⁶ However, the costs of these non-acquisition pathways are far higher than acquisition.

Type	Sc. #	Description	Annual Cost per Year per Sq. Ft.
Direct Acquisition	1	NZE Class 8 truck acquisitions and subsequent visits from those trucks	\$0.08
Direct Acquisition	2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase)	\$0.11
Direct Acquisition	3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks	\$0.05
Direct Acquisition	6	Level 3 charger installations followed by ZE Class 6 & Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers	\$0.14
Direct Acquisition	8	NZE Class 6 truck acquisitions and subsequent visits from those trucks	\$0.16
Direct Acquisition	12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station	\$0.82
Direct Acquisition	13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks	\$0.04
Direct Acquisition	18	ZE Hostler Acquisitions and Usage	\$0.12
Average Annual Cost per Year per Sq. Ft. for Direct Acquisition Compliance			\$0.19
Indirect Acquisition	4	NZE Class 8 truck visits from non-owned fleets	\$0.05
Indirect Acquisition	5	ZE Class 8 truck visits from non-owned fleets	\$0.74
Indirect Acquisition	9	NZE Class 6 truck visits from non-owned fleets	\$0.79
Indirect Acquisition	10	ZE Class 6 truck visits from non-owned fleets	\$0.04

1.3
cont.

⁶ Scenario 17 requires TRU plug installations and usage in cold storage facilities but is applicable only to cold storage warehouses.

Indirect Acquisition	14	ZE Class 2b-3 truck visits from non-owned fleets	\$0.48
Average Annual Cost per Year per Sq. Ft. for Indirect Acquisition Compliance			\$0.42
Non-Acquisition	7	Pay Mitigation Fee	\$0.78
Non-Acquisition	11	Rooftop solar panel installations and usage	\$1.14
Non-Acquisition	15	Filter System Installations	\$0.92
Non-Acquisition	16	Filter Purchases	\$0.92
Non-Acquisition	17	TRU plug installations and usage in cold storage facilities	\$0.50
Average Annual Cost per Year per Sq. Ft. for Non- Acquisition Compliance			\$0.85

1.3
cont.

Scenario 7 (Mitigation Fee) averages approximately \$0.90 per square foot in 2025, with an average of \$0.78 per square foot per year. PDSR at 66, 74. The estimated compliance cost for Scenarios 15 and 16 (Filter System Installations and Filter Purchases) is even higher at approximately \$1.00 per square foot in 2025, with an average of \$0.92 per square foot per year. *Id.* at 70, 74. Solar begins in 2025 at \$2.50 per square foot and an average annual cost of \$1.14 per square foot per year. *Id.* By contrast, the estimated compliance costs for “acquisition” based scenarios are less than \$0.20 in 2025, with an annual average cost per square foot typically ranging from \$0.04 to \$0.16 per square foot per year. *Id.* at 66, 74. This cost differential is of the District’s own making, by assigning a certain number of WAIRE points to each compliance action the District has intentionally chosen to compel acquisition by pricing other compliance pathways out of the running.

While the District may argue that the Proposed Rules are not a purchase mandate because of the varying compliance pathways, the non-acquisition pathways at least triple the compliance costs of covered warehouses. District staff acknowledged at the February 16, 2021 public workshop that facilities will find the “most cost-effective means to comply.” Just as the fleet owners in *MTB*, warehouse operators are “profit oriented and business owners trying to maximize profits” and will always choose the option that the District makes the least costly. *MTB*, 633 F. Supp. 2d at 100. Looking at all the evidence, it is clear that the Proposed Rules do not “present viable options” for warehouses other than acquisition and “instead operate[] as an effective mandate to switch to [ZE] vehicles.” *Id.* For this reason, the Proposed Rules are preempted as a purchase mandate.

Response 1.3

Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment.

B. The Proposed Rules Are Preempted Under the FAAAA.

The FAAAA “preempts a wide range of state regulation of intrastate motor carriage.” *Californians for Safe & Competitive Dump Truck Transp. v. Mendonca* (9th Cir. 1998) 152 F.3d 1184, 1187. It specifically provides that, “a State ... may not enact or enforce a law, regulation, or other provision having the force and effect of law related to a price, route, or service of any motor carrier ... with respect to the transportation of property.” 49 U.S.C. § 14501(c)(1). The terms “rates, routes, and services” were “used by Congress in the public utility sense; that is, service refers to such things as the frequency and scheduling of transportation, and to the selection of markets to or from which transportation is provided.... Rates indicates price; routes refers to courses of travel.” *Air Transport Ass’n of Am. v. City & Cnty. of San Francisco* (9th Cir. 2001) 266 F.3d 1064, 1071. Congress enacted this preemption provision because it “believed that across-the-board deregulation was in the public interest as well as necessary to eliminate non-uniform state regulations of motor carriers which had caused significant inefficiencies, increased costs, reduction of competition, inhibition of innovation and technology, and curtailed the expansion of markets.” *Id.* at 1187 (quotations omitted).

The Supreme Court has observed that state laws may be preempted “even if a state law’s effect on rates, routes or services is only indirect.” *Rowe v. New Hampshire Motor Transport Ass’n* (2008) 552 U.S. 364, 370. The District has acknowledged that the Proposed Rules will increase the costs for warehouses in the District, many of whom are fleet owners. PDSR at 58 (“there will be financial impacts to industry to implement PR 2305, and it will also require many warehouse operators and cargo owners to change their business practices to implement actions required by PR 2305”), 45 (“Of the warehouses expected to be required to earn WAIRE Points ... about 45% may own a truck fleet”). The District also acknowledges that the Proposed Rules incentivize changes to routes and service. PDSR at 33 (“Because the WPCO is tied to a warehouse’s annual truck trips, if a facility can find ways to improve efficiency and reduce its number of truck trips, then its compliance obligation under PR 2305 will be lower.”). Because the Proposed Rules have a force and effect that is related to the price, route, and service of motor carriers, they are preempted under the FAAAA.

1.4

Response 1.4 Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment.

C. The Proposed Rules Are Preempted Under the EPCA.

The EPCA authorizes the National Highway Traffic Safety Administration (“NHTSA”) to create fuel-efficiency standards in order “to conserve energy supplies through energy conservation programs, and, where necessary, the regulation of certain energy uses” and “to provide for improved energy efficiency of motor vehicles.” 49 U.S.C. § 6201. “[W]hile the primary focus of the EPCA was to regulate the country’s consumption of energy resources, Congress intended that passage of the EPCA would not unnecessarily restrict purchase options.” *Ophir v. City of Boston* (2009) 647 F. Supp. 2d 86, 93. To that end, NHTSA may only establish a fuel economy standard after evaluating four factors: “technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United

1.5

States to conserve energy.” *Id.* § 32902(f). In order to promote a uniform application, the EPCA preempts the authority of the states or any political subdivision of a state from “adopt[ing] or enforc[ing] a law or regulation *related to* fuel economy standards or average fuel economy standards for automobiles covered by an average fuel economy standard under this chapter.” *Id.* at § 32919 (emphasis added). “Fuel economy” is defined as “the average number of miles traveled by an automobile for each gallon of gasoline (or equivalent amount of other fuel) used.” *Id.* at 32901(a)(11). The EPA Administrator is directed by EPCA to “include in the calculation of average fuel economy ... equivalent petroleum-based fuel economy values determined by the Secretary of Energy for various classes of electric vehicles,” (*id.* at 32904(a)(2)(B)), which the EPA calculates in terms of miles per gallon equivalent, or MPGe. *Id.*

1.5
cont.

As described above, it is the District’s intent to drive the acquisition of ZE/NZE vehicles in the District’s jurisdiction. The City of Boston had a similar objective when it adopted a taxi regulation requiring the acquisition of hybrid vehicles. A federal district court found the regulation preempted by the EPCA, even though the rule was adopted to “modernize and improve the quality of appearance” of the taxi fleet, not for purposes of increased fuel economy. *Ophir*, 647 F. Supp. 2d at 89, 94. Here, the District is compelling the acquisition of a certain type of vehicle, ostensibly to reduce vehicle emissions, but with the effect of mandating lower fuel economy standards. As the Supreme Court explained in *EMA*, “if one State or political subdivision may enact such rules, then so may any other; and the end result would undo Congress’s carefully calibrated regulatory scheme.” 541 U.S. at 255.

Response 1.5 Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment.

IV. The Proposed Rules Are An Improper Regulatory Fee.

There are three general categories of fees or assessments that are distinguishable from special taxes and thus can be imposed without a two-thirds majority vote: special assessments based on the value of benefits conferred on property, development fees exacted in return for permits or government privileges, and regulatory fees imposed under the police power. *California Building Industry Association v. San Joaquin Valley Unified Air Pollution Control District* (2009) 178 Cal.App.4th 120, 130. ISR fees are regulatory fees in that they are not associated with the issuance of a permit or government privilege.⁷ *Id.* However, a regulatory fee may not exceed the amount required to carry out the purposes and provisions of the regulation and cannot be levied for unrelated revenue purposes. *Id.* at 131.

1.6

In the first instance, the District has identified no authority allowing it to impose an ISR fee on existing, unmodified sources. See Part II, *supra*. The District has also not established a reasonable relationship between the fee charged and the activity the District seeks to regulate.

⁷ In the alternative, the fees under the Proposed Rules are an improper tax under Proposition 13. Unlike the allowances at issue in *Cal. Chamber of Commerce v. State Air Resources Board* (2017) 10 Cal.App.5th 604, the WAIRE points have no economic value that can be traded, a fixed price unchanged by market forces, and—as state and federal regulations phase in—will become compulsory. Thus, they are a tax subject to the requirements of Proposition 13, which have not been met.

The District states that the amount of the fee was calculated based on the cost-per-point of various other compliance actions. PDSR at 33. However, as the District acknowledges, these costs vary across the actions. *Id.* The District does not explain its methodology for determining the \$1,000 per point cost. Additionally, the District’s proposed cost is based on the cost of compliance for individual entities, not on the cost of the offsets the *District* would need to fund to offset total emissions from truck trips to warehouses in the Basin to achieve the emission reductions goals of the program. The District has acknowledged that there are economies of scale associated with the compliance pathways, which the District is uniquely positioned to access as the administrator of the mitigation funds. The District is required by law to perform an analysis of administering the costs of its own program, i.e., funding the offsets necessary to reduce emissions, rather than analyzing the cost of compliance actions of individual entities.

1-6
cont.

In addition, the court in *California Building Industry Association* upheld an ISR fee where the covered entities could choose whether or not to pay the fee based on their activities. However, in light of the increasing requirements for ZE/NZE vehicles discussed *infra* and the additional requirement found in Proposed Rule 2305(d)(3), it is very likely that covered warehouses will have no option but to pay the fee at some point. As District staff acknowledged during the February 17, 2021 community meeting, Proposed Rule 2305 has no sunset and no off-ramp available for even fully electric warehouses. Yet these warehouses will continue to accumulate a compliance obligation based on the trucks that visit their locations regardless of the type of truck. Thus, no true choice between paying the fee and other compliance pathways exists in the Proposed Rules.

Response 1.6 Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment.

V. The Goals of the Proposed Rules Are Presently Infeasible.

As explained in Parts III.B and III.C, *supra*, the intent of the Proposed Rules is to accelerate the transition to ZE trucks. Yet, the District specifically acknowledges that it “cannot predict and has no feasible way to identify” suppliers of items necessary to accumulate WAIRE points and that the “investment or the quantity of items is speculative.” Draft EA at 532. CARB recently rejected a proposal to require a higher sales percentage of ZE vehicles under the ACT Rule “due to concerns about the feasibility of manufacturers to comply with even higher sales requirements especially for Class 2b-3 vehicles and tractors.” Advanced Clean Trucks Regulation, Final Statement of Reasons (January 2021) at 99 (“ACT FSOR”). As CARB explained just last month:

“At this time, both Class 2b-3 and Class 7-8 tractors have more focused concerns about payload, range, towing, charging/refueling infrastructure, and model availability than other vehicles. These issues will present more challenges in identifying suitable applications for their deployment in the early market. Increasing the number of ZEV sales further also increases the likelihood that manufacturers would need to produce more costly long-range vehicles, and that vehicles may need to be placed in applications where they may not be fully

1.7

suitable. Therefore, the Board determined that the approved regulation is the most feasible path to meet ZEV deployment goals at this time.” *Id.*

The District has not explained how its mandate to increase the use of ZE vehicles—which is intended to be in excess of CARB’s requirement (*see* PDSR at 15)—is in fact feasible when CARB determined it is not.

Additionally, the District has not contended with whether it is feasible to impose these accelerated requirements for trucks that leave the District. Industrial Economics, Incorporated determined that only 34% of goods moved within the District stay in the District; the vast majority are bound for destinations outside of the District’s authority.⁸ Yet the District has offered no evidence of whether the infrastructure exists in other jurisdictions to support the endpoint of these trips. A rule that is infeasible is necessarily arbitrary and capricious and unsupported by substantial evidence.

1.7

⁸ Industrial Economics, Inc., Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule (Dec. 23, 2020), available at [http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf?sfvrsn=8](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf?sfvrsn=8).

Response 1.7 Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment.

VI. The District Cannot Make the Findings Required by Health and Safety Code Section 40727.

Prior to the adoption of any new regulation, the District must make findings regarding “necessity, authority, clarity, consistency, nonduplication, and reference.” HSC § 40727. The District’s findings must be based on substantial evidence that is “reasonable, credible, and of solid value” (*Plastic Pipe and Fittings Ass’n v. Cal. Bldg. Standards Comm.* (2004) 124 Cal.App.4th 1390, 1407), and that bears a “rational connection” to the District’s ultimate determination (*Am. Coatings Ass’n v. South Coast Air Quality Dist.* (2012) 54 Cal.4th 446, 460). The District cannot make the necessary findings for the Proposed Rules.

“Authority” is defined to mean a provision of law or of state or federal regulation that permits or requires the regional agency to adopt the regulation. *Id.* As discussed in Part II, *supra*, the District has no authority to adopt a regulation imposing an ISR on existing, unmodified sources and, as discussed in Part III, *infra*, the Proposed Rules are preempted by federal law. The District cites to Health and Safety Code sections 39002, 39650 to 39669, 40000, 40001, 40440, 40441, 40522.5, 40701, 40702, 40716, 47017 to 40728, 40910, 40920.5, 41508, 41511, and 41700 for authority for the Proposed Rules. PDSR at 83. None of these provide authority for either an ISR for existing, unmodified sources or for a program effecting a purchase mandate of vehicle sources.

1.8

“Necessity” means that a need exists for the regulation as demonstrated by the record. HSC § 40727(b). The District has failed to demonstrate that there is a need for the Proposed Rules.

The District explains that the District will not meet federal standards for ozone and fine particulate matter, that NOx is the primary pollutant needed to meet federal air quality standards, and that mobile sources associated with goods movement make up about 52% of all NOx emissions in the Basin. PDSR at 13-14. But the District does not bridge the analytical gap between the projected NOx emissions and the federal standards for ozone. For example, the District projects in Table 3 of the PDSR that NOx emissions per day will decrease from 42.72 tons to 26.86 tons (PDSR at 13), but does not explain or quantify how these reductions will achieve federal ozone standards, the actual cited need. Further, the District does not explain what NOx emissions are attributable to the specific entities it seeks to regulate. The Proposed Rules apply to the owners and operators of warehouses in the District's jurisdiction. Proposed Rule 2305(b). But the District has not demonstrated that the warehouses are a significant indirect source. While the District states that 52% of all NOx emissions in the Basin are attributable to the movement of goods, this figure includes locomotives, cargo handling equipment, ocean going vessels and commercial harbor craft.⁹ Trucks themselves are responsible for only 58% of the 52% of NOx emissions, or less than a third of the need originally cited by the District. In its later modeling, the District claims that NOx emissions from trucks that visit warehouses account for less than 20% of the District's carrying capacity even before the Proposed Rules. PDSR at 52. The District's necessity finding is further undercut by its own scenario analysis which demonstrate that despite the enormous implementation costs, it is possible that the Proposed Rules will result in no reduced emissions of NOx and PM at all. PDSR at 63-64.

1.8
cont.

The District has also claimed that the Proposed Rules are necessary because, while CARB's Draft MSS calls for a 100% ZE truck fleet by 2045, a 100% ZE drayage truck fleet (trucks that visit ports and railyards) by 2035, and 100% ZE off-road equipment operations by 2035, CARB's policy does not include any enforceable mechanism to achieve these targets. PDSR at 10. To reach this conclusion, the District ignores the effects of the ACT Rule requiring greater sales of ZE/NZE trucks and ignores CARB's further efforts to adopt the Advanced Clean Fleets ("ACF") rule, which CARB anticipates will be implemented from 2024 to 2045.¹⁰ During its public workshops, the District further discounted these regulations by emphasizing that the Proposed Rules will begin achieving emissions reductions beginning in 2023, where the ACT Rule and proposed ACF rule will not reach full implementation until 2035 and 2045 respectively. But the annual variable associated with the Proposed Rules indicates that they will not reach full implementation until after CARB's programs go into effect. The District thus has not demonstrated that it is necessary for it to usurp CARB's authority in this area.

Under section 40727, the District must also find that the regulation "is written or displayed so that its meaning can be easily understood by the persons directly affected by it," a required

⁹ PDSR at 14, citing Southern California Association of Governments, Transportation System Goods Movement Technical Report (Sept. 2020) at 58, available at https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf?1606001690.

¹⁰ CARB, Zero-Emission Fleet Rule Workshop, Advanced Clean Truck Fleets (Feb. 12, 2020), available at https://ww2.arb.ca.gov/sites/default/files/2020-02/200212presentation_ADA_1.pdf.

“clarity” finding. The District cannot make such a finding for the Proposed Rules because the means to comply with the Proposed Rules are based on a landscape of shifting sand. Specifically, each warehouse operator can only earn points toward their compliance obligation by taking actions beyond the requirements of U.S. EPA, CARB, and the District’s other regulations. Proposed Rule 2305(d)(3). But as described above, these regulations are becoming increasingly stringent and new rules are being evaluated continuously. Covered warehouses are therefore unable to evaluate how the Proposed Rules will specifically affect them or the level of compliance actions that may be necessary. This materially effects the ability of covered warehouses to operate and makes the District unable to make the required finding of clarity.

1.8
cont.

Response 1.8 Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a response to this comment.

VII. The Environmental Assessment Fails as an Informational Document.

The basic purpose of an EIR is to “provide public agencies and the public in general with detailed information about the effect [that] a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project.” *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 511 (quoting Pub. Res. Code § 21061) (“*Friant Ranch*”). “If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees.” *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392 (“*Laurel Heights*”). For environmental review to be successful, it must not only provide a comprehensive disclosure but also connect the analytical dots in order to explain to the decisionmakers and the public the effects of the agency’s decision.

1.9

While the District has significantly improved the discussion of the environmental impacts of the Proposed Rules from the Initial Study, the Draft EA still fails to provide a full picture of the reasonably foreseeable effects of the Proposed Rules.

Response 1.9 See Responses to Comments 1.10 through 1.19. The EA is sufficient as an informational document and the comment does not provide evidence to the contrary. The EA analyzes the direct, indirect, and cumulative impacts of the WAIRE Program as a whole and explains the potential effects of adopting the proposed rule.

CEQA Guidelines Section 15144 states that drafting an EIR [...] necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that *it reasonably can* (*emphasis added*). Further, the degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR (CEQA Guidelines Section 15146). While the environmental analysis should consider a

reasonable range of environmental, economic, and technical factors, an agency is not required to engage in speculation or conjecture and may choose to utilize numerical ranges and averages where specific data is not available (CEQA Guidelines Section 15187). While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144). An agency need not speculate about all conceivable impacts, but it must evaluate the reasonably foreseeable effects of the proposed project, which has been done in the Draft EA. As identified in Chapter 2, Proposed Project, the proposed project includes approximately 3,320 warehouses that would be subject to the WAIRE Program, including 2,902 warehouses that would likely be required to earn WAIRE points. Because the proposed project allows each individual warehouse to select its own method of compliance, the EA is programmatic in nature and does not include a site-specific analysis of any warehouse that would be regulated by the proposed project. Chapter 4, *Environmental Impact Analysis and Mitigation Measures*, of the Draft EA analyzes the proposed project's environmental impacts to the level that they can be assessed without undue speculation (CEQA Guidelines Sections 15145 and 15146).

Consistent with CEQA Guidelines Sections 15204, 15144, and 15146, the EA provides an appropriate and conservative evaluation of the potential direct, indirect, and cumulative impacts of the proposed project on the environment. As described in Chapter 4.0, *Introduction*, of the Draft EA, it is not possible to identify or predict how each of the 2,902 warehouse operators would comply with the proposed project at this time without undue speculation. To analyze the proposed project's direct environmental impacts, South Coast AQMD used a good-faith effort to develop the WAIRE Points Scenarios to represent a wide range of potential compliance options and modeled each of them using the available technical information (see Chapter 4.0.1.1, *WAIRE Points Scenario Modeling*, of the Draft EA). The WAIRE Points scenarios, which provide "book-ends" of the range of potential environmental impacts associated with the proposed project, formed the conceptual and technical basis for the environmental impact analysis in Chapter 4, *Environmental Impact Analysis and Mitigation Measures*, of the Draft EA.

The EA also analyzes the proposed project's indirect environmental impacts. The indirect environmental analysis is discussed in Chapter 1.2.2, *Other CEQA Documents*, Chapter 4.0.1.5, *Indirect Impacts Associated with New Facility Construction*, and Chapter 4.5.1, *Indirect Impacts*, of the Draft EA. Indirect impacts from the proposed project include impacts associated

with the development of new facilities, including manufacturing, recycling, and grid infrastructure facilities, that may be necessary to support potential WAIRE compliance options such as the purchase and use of ZE vehicles. These same indirect impacts were previously analyzed by the California Air Resources Board (CARB) in its Final EA for the Advanced Clean Trucks (ACT) Regulation. See Chapter 4.5, describing CARB Final EA for the ACT Regulation. The EA incorporated this analysis by reference to avoid duplication. See CEQA Guidelines 15006(f), (t) (encouraging use of previously prepared CEQA documents and incorporation by reference).

The EA's analysis of these indirect impacts is qualitative, not quantitative, because the specifics of these new facilities (where they would be built, what the surrounding environment would be, etc.) is simply unknown at this time. See, e.g., CEQA Guidelines, § 15064.7(a) (significance threshold can be qualitative or quantitative); § 15142 (EIR shall consider "qualitative as well as quantitative factors"); *Ebbetts Pass Forest Watch v. California Dept. of Forestry & Fire Protection* (2008) 43 Cal.4th 936, 954 (CEQA analysis may include a general discussion where detailed, site-specific analysis would be speculative and require an analysis of specific acts that cannot reasonably be foreseen). Without these specifics, it is not possible to quantify impacts, such as what the construction emissions would be. CARB took the same qualitative approach in its Final EA for the ACT Regulation.

The EA also provides a qualitative analysis of the indirect hazardous materials and solid and hazardous waste impacts associated with increased disposal of batteries and hydrogen fuel cells, and increased use of LNG, that could result from implementing the proposed project. Both the 2016 AQMP Final Program EIR and CARB's Final EA for the ACT Regulation analyzed these indirect impacts qualitatively, and the EA incorporated that analysis by reference. See Chapter 4.3. Unlike the proposed project's direct impacts, which may be analyzed qualitatively by assuming all warehouses pick one or another compliance option, these indirect impacts depend on individual operators' fleet turnover choices, potential battery recycling options, and a variety of other specific factors that cannot be determined or assumed without undue speculation. For this reason, the EA's qualitative approach, which acknowledged and described these indirect impacts as potentially significant, was appropriate. *Rodeo Citizens Assn. v. County of Contra Costa* (2018) 22 Cal.App.5th 214, 228 fn. 12 ("the RFEIR here does not ignore the impacts of downstream emissions. It explains what those impacts may be and why quantification would be speculative. No more is required.").

The EA analyzes the proposed project's cumulative environmental impacts. As discussed in Chapter 1.1.1, *Air Quality Management Plan*, Chapter

1.2.2, *Other CEQA Documents*, and Chapter 4.0.2, *Cumulative Analysis*, of the Draft EA, the proposed project would implement the Facility-Based Mobile Source Measures (FBMSMs) included in the 2016 Air Quality Management Plan. Therefore, consistent with CEQA Guidelines Section 15130(e) and California Public Resources Code Section 21094, the EA appropriately tiers off of and incorporates by reference the impact analysis included in the 2017 Final Program Environmental Impact Report (EIR) for the 2016 AQMP (State Clearinghouse No. 2016071006).

A. The District Improperly Relies on Analysis from an Earlier Project.

The District has abandoned its attempt to fully divorce the Proposed Rules from their indirect effects and now provides a cursory discussion of the Proposed Rules' hazards and hazardous materials, aesthetic, mineral, biological, air quality, greenhouse gases, biological resources, land use, and agricultural resources impacts. However, the analysis remains legally insufficient. The District's analysis is largely limited to incorporating CARB's analysis of the impacts associated with the ACT Rule in order to describe and assess the effects of the Proposed Rules. This is improper and misleading. The District has repeatedly explained that the Proposed Rules are designed to be in surplus of state and federal regulations, meaning that the effects of the Proposed Rules are also necessarily in surplus of the effects described in the ACT Rule Environmental Assessment.

1.10

To illustrate, the District acknowledges that the Proposed Rules will drive an increase in specialized hazardous waste, including various types of batteries and fuel cells as well as prematurely retired vehicles. The District relies on CARB’s description and assessment of the ACT Rule’s effects on the creation and management of hazards, but the District never explains how the specific effects of the Proposed Rule—e.g., how much more demand for recycling or solid waste disposal the Proposed Rules generate vis a vis the ACT Rule. Because the District will be driving additional fleet turnover and additional ZE/NZE deployment, the effects of the Proposed Rules are necessarily in excess of what CARB analyzed in its own assessment. The District has failed to meaningfully inform the public and the Board of the reasonably foreseeable effects of the covered warehouses’ compliance actions. These incremental effects are likely substantial. While CARB predicts total deployment of 100,000 ZE vehicles under the ACT Rule by 2032 (ACT Environmental Assessment at IX-6), the District’s bounding analysis indicates the Proposed Rules could add an additional 28,000 ZE trucks by 2031, a 28% increase. The District’s repeated reliance on CARB’s assessment thus fails to disclose the effects of the District’s action in adopting the Proposed Rules.

1.10
cont

A lead agency may reuse an EIR prepared for an earlier project for another separate project if the “circumstances of the projects are essentially the same.” CEQA Guidelines § 15153(a). An EIR from an earlier project “shall not be used” for a later project if any of the conditions for supplementation have been met. In *Save Berkeley’s Neighborhoods v. Regents of University of California* (2020) 51 Cal.App.5th 226, the court found that the university could not rely on a previously prepared EIR that analyzed an increase in enrollment when the proposed project would further increase student enrollment. The same principles apply to the District. The District cannot crib from CARB’s own analysis when the District intends its Proposed Rules to increase turnover and deployment beyond what CARB contemplated, particularly not when the District can reasonably foresee a 28% increase in deployment *in a single air district* beyond what CARB anticipated for the *entire state*.

This error is not unique to the hazards analysis, although the comparison is particularly apt. The same problem permeates the District’s analysis of other impact areas, including but not limited to, aesthetic, mineral, biological, air quality, greenhouse gases, biological resources, land use, and agricultural resources impacts. While the District argues that these impacts are speculative and subject to the permitting decisions of other agencies, the District has demonstrated it is capable of performing a bounding analysis to determine the maximum potential impacts associated with air emissions and electricity demand and could certainly use this scenario to forecast potential impacts across other impact areas.

Response 1.10

See Response 1.9. Indirect environmental impacts were analyzed in the EA at a more general level of detail because it would be speculative to analyze specific impacts that are unknown and cannot be reasonably foreseen (see Chapter 1.2.2, *Other CEQA Documents*, Chapter 4.0.1.5, *Indirect Impacts Associated with New Facility Construction*, and Chapter 4.5.1, *Indirect Impacts*, of the EA). While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project’s potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144).

Here, the Draft EA provided a quantitative analysis describing the potential range of direct project impacts associated with warehouse operators implementing various compliance options. These direct construction and operational impacts would result from, for example, installing new HVAC systems, constructing charging stations, or utilizing NZE or ZE vehicles instead of conventional diesel vehicles. Direct impacts also include impacts from potential warehouse relocations, where operators seek to avoid compliance with the proposed project. As explained in Response 1.9 and Section, 4.0.1.2, *WAIRE Points Scenario Modeling*, the Draft EA was able to provide a quantitative, “bookends” analysis of these impacts that was conservative but that did not involve undue speculation.

This comment raised indirect impacts associated with NZE and ZE battery production, manufacturing, and disposal. Such impacts include impacts associated with construction of new truck manufacturing facilities, new battery/fuel cell manufacturing Facilities, and new recycling facilities; mineral resource extraction/production; and energy infrastructure improvements. CARB’s Final EA for the ACT Regulation and the 2016 AQMP Final Program EIR for the 2016 AQMP provided qualitative analyses of these same impacts (see Chapter 4.5, *Other Impact Areas*). The EA incorporated this analysis by reference and explained why the analysis was sufficient in Chapter 4.5, *Other Impact Areas*). Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, of the EA included an evaluation of the indirect impacts associated with increased rates of disposal of batteries and hydrogen fuel cells. In addition, Chapter 4.5, *Other Impact Areas*, evaluated indirect impacts associated with mineral resource extraction and battery/fuel cell production. While this analysis was qualitative, the Draft EA also explained why it would be speculative to undertake a quantitative analysis. See *Rodeo Citizens Assn. v. County of Contra Costa* (2018) 22 Cal.App.5th 214, 228 fn. 12 (“the RFEIR here does not ignore the impacts of downstream emissions. It explains what those impacts may be and why quantification would be speculative. No more is required.”). The analysis for indirect impacts is subject to the rule of reason (see Chapter 4.5, *Other Impact Areas*, on page 4.5-1). The EA also explained in Sections 4.1.1.3 and 4.2.1.1, *Lifecycle Analysis*, that CEQA does not require a “lifecycle” analysis or speculation.³ (see Section 4.2.1.1, *Lifecycle Analysis*, in the Final EA and the *Final Statement of Reasons for the Regulatory Action, Amendments to the State CEQA Guidelines*

³ California Natural Resources Agency. 2009, December. Final Statement of Reasons for the Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97. https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/Final_Statement_of_Reasons.pdf

Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97).

The EA for the proposed project incorporates by reference CARB's Final EA for the ACT Regulation because it analyzed the same indirect impacts that are associated with the proposed project and provided relevant analysis for the Draft EA's cumulative impacts assessment. These indirect impacts are described in Chapter 4.5, *Other Impact Areas*. The comment asserts that the Draft EA should not have relied on the CARB Final EA for the ACT Regulation because PR 2305 is designed to result in the purchase and use of even more ZE vehicles than would result from implementation of the ACT Regulation alone. However, as the Draft EA explained, the proposed project would likely result in fewer indirect impacts (e.g., new facilities) than CARB's ACT Regulation, given the more limited geographic scope of the proposed project (only within South Coast AQMD's jurisdiction), its more limited application (just to subject warehouses), and the alternative methods of compliance available to warehouses (e.g., installing filtration systems at nearby sensitive receptors).

Nonetheless, even if the proposed project were to result in more indirect impacts, the analysis provided in the EA would remain the same. CARB's EA for ACT Regulation found significant, indirect impacts in the areas of aesthetics, agricultural and forestry resources, mineral resources, air quality, biological resources, cultural resources, hazards and hazardous materials, hydrology and water quality, mineral resources, noise, transportation/traffic, and utilities and service systems. These indirect impacts are the result of increased manufacturing, use, and disposal of ZE vehicles and batteries. Even if the proposed project increases those impacts by increasing the demand for new ZE vehicles beyond the demand created by the ACT Regulation, the environmental analysis would be the same: the significant indirect impacts would remain significant and unavoidable, although they may be slightly more significant than the impacts under the CARB ACT rule. The EA conservatively calls indirect impacts to environmental resources as significant impacts of the proposed project. Because the exact extent of these indirect impacts is speculative, the EA adequately discloses potential indirect impacts of the proposed project.

Save Berkeley's Neighborhoods v. The Regents of the University of California (2020) 51 Cal.App.5th 226, involved very different facts. There, the Regents had adopted a plan for the UC Berkeley campus that projected certain maximum enrollment numbers. The EIR for the plan analyzed impacts associated with those enrollment numbers. Later, the Regents exceeded those enrollment numbers without analyzing whether these additional students would create new, significant impacts. Here, the

qualitative analysis provided in the CARB Final EA was not based on a certain number of new manufacturing facilities being built; there is no evidence that the proposed project would increase the number of facilities beyond what was analyzed in CARB Final EA; and the Final EA already concluded the potential impacts of these new facilities would be significant, but only the land use permitting agency could reduce them. As a result, there is no further analysis to be provided here.

As described in Section 4.0.2, *Cumulative Analysis*, CEQA Guidelines Section 15130(e) identifies that previously approved land use documents, including, but not limited to, general plans, specific plans, regional transportation plans, plans for the reduction of greenhouse gas emissions, and local coastal plans may be used in a cumulative impact analysis; and a pertinent discussion of cumulative impacts in one or more previously certified EIRs may be incorporated by reference pursuant to the provisions for tiering and program EIRs. The proposed project is designed to work together with other state efforts towards achieving cleaner vehicles, including CARB's Final EA for the ACT Regulation (see Chapter 3.1, *Air Quality and Greenhouse Emissions*, Tables 3.1-1a and 3.1-1b, which show existing and proposed regulations, respectively that would reduce emissions from warehouses). Therefore, the EA incorporates these documents by reference pursuant to CEQA Guidelines Section 15130(e).

The EA includes a program-level analysis for the environmental resources topics in Chapter 4, *Environmental Impact Analysis and Mitigation Measures* that is specific to the proposed project's impacts, complete with analytical evaluation that identifies how the significance conclusion was reached. However, this is not a Supplement or Subsequent analysis to CARB's Final EA for the ACT Regulation; and therefore, a direct comparison between the two individual projects and language specifying that the proposed project would generate 'more' or 'less' impacts than identified in CARB's Final EA for the ACT Regulation is not needed to disclose program-level impacts of the proposed project. The EA correctly cites CARB's Final EA for the ACT Regulation and appropriately incorporates it by reference to assess potential indirect impacts of the proposed project as permissible under CEQA (CEQA Guidelines Section 15150).

Like CARB's Final EA for the ACT Regulation, the program-level impact analysis does not quantify the potential magnitude of indirect effects associated with the upstream and downstream processes from ZE truck use. For example, it is speculative to identify with any degree of accuracy how many batteries would be recycled as a result of the proposed project. As identified previously, even if all warehouse operators decided to comply

with the proposed project by purchasing and using NZE and ZE, the lifespan of an EV truck battery is not known, whether the battery would be used versus recycled is not known; and therefore, it is speculative to prepare a quantitative analysis of the indirect impacts from the upstream and downstream processes associated with ZE vehicles. As such, the EA for the proposed project includes a qualitative analysis because a quantitative analysis of the magnitude of upstream and downstream indirect effects of the proposed project is not feasible.

Lastly, the bounding analysis conducted for the project project's direct impacts is not directly applicable to the indirect effects of the proposed project analyzed in Chapter 4.5, *Other Impact Areas*, of the Draft EA, such as aesthetics, agricultural and forestry resources, biological resources, cultural resources, geology and soils, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, and utilities and service systems. Because indirect impacts are not measurable conditions (i.e., it is not possible to calculate without speculating), the EA evaluated indirect impacts at a more general level of detail than the proposed project's direct impacts and incorporated by reference the environmental impacts analysis in CARB's Final EA for the ACT Regulation. The EA also considered the feasibility of conducting a lifecycle analysis; however, as stated in Sections 4.1.1.3 and 4.2.1.1, *Lifecycle Analysis*, the EA concluded that this type of analysis of upstream and downstream impacts is not required or appropriate for a CEQA impact evaluation because they could refer to emissions or impacts beyond those that could be considered 'indirect effects' of a project under CEQA Guidelines Section 15358. The resource categories in Chapter 4.5 of the EA are only affected by the proposed project's indirect impacts from construction of new manufacturing and recycling facilities, mineral resource extraction, and infrastructure improvements; all of which are known to a much lesser degree of detail than the proposed project's direct impacts associated with individual warehouse compliance options. Therefore, it is speculative to analyze the specific impacts caused by future construction projects at this time, and these impacts are evaluated at a more general level of detail than the proposed project's direct impacts. While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144). As a result, the indirect effects of the project identified in the EA were subject to the rule of reason, such that, a person of ordinary prudence would take these impacts into account in making a decision.

In short, the EA provides an appropriate and conservative evaluation of the potential direct, indirect, and cumulative impacts of the proposed project on the environment. The EA is sufficient as an informational document.

1. Increased Grid Capacity.

The District has modeled 18 compliance scenarios to provide a “bracketing” of the fiscal impact associated with the Proposed Rules and should provide the same level of information for the environmental impacts. While the District now quantifies a high-electrification scenario, it does

1.11

not disclose what this means to the public or the environment. To meet the state’s ambitious climate goals, nearly all of this new demand would be met by wind, solar and battery storage.¹¹ This would require the construction of 109,834 megawatts (“MW”) of new solar capacity (a nearly 900 percent increase from current levels), 14,585 MW of new wind capacity (more than a 200 percent increase from current levels), and 73,933 MW of new available grid battery storage (a 15,560 percent increase from the current 478 MW).¹² The District can and should evaluate and disclose to the public the approximate amount of acreage required to generate the necessary electricity from wind and solar and should quantify the amount of emissions that would result from the use of natural gas power plants.

¹² Ming et al., Long-Run Resource Adequacy under Deep Decarbonization Pathways for California, June 2019 https://www.ethree.com/wp-content/uploads/2019/06/E3_Long_Run_Resource_Adequacy_CA_Deep-Decarbonization_Final.pdf.

Response 1.11

This comment appears to be requesting an analysis of the indirect impacts associated with grid improvements necessary to meet the state’s climate goals. Such indirect effects would go far beyond the indirect effects of PR 2305, which is the subject of this EA. With respect to PR 2305’s effects, the EA is sufficient as an informational document and includes a conservative analysis of direct impacts of the proposed project as discussed in Chapter 4.1 through 4.4 of the Draft EA based on the WAIRE Points modeled compliance scenarios. The EA includes a quantitative analysis of the direct environmental consequences of the proposed project, as described in Chapter 4.1 through 4.4. However, indirect impacts of the proposed project were not evaluated in the same level of detail because it is speculative to analyze the specific impacts caused by future infrastructure projects as discussed in Chapter 4.1 through 4.5 of the Draft EA. Nonetheless, the Draft EA did contain a qualitative analysis of indirect impacts, including improvements to grid infrastructure, that could result from implementation of PR 2305 in Chapter 4.5, *Other Impact Areas* (see pages 4.5-1 through 4.5-2).

The state's carbon neutrality goals require an expansion of renewable resources such as wind, solar, and geothermal energy; however, use of natural gas is still an integral part of the state's energy supply. For this EA, it is speculative to identify whether the state will achieve its carbon neutrality goals solely through wind, solar, and geothermal energy or the extent of which the natural gas feedstock will be from renewable gas (i.e., biogas) in the future, and thus it is impossible to tell what type of power source would be used to provide the additional energy for the proposed project. Even if all new energy for ZE truck batteries and high efficiency filtration systems were supplied from wind and solar energy sources, it would still not be possible to identify the acreage required to generate this increase in demand because of the different technologies used to generate these types of energy (e.g., towers, photovoltaic panels, distributed v. utility-scale), as further explained in the next paragraph. As a result, it is not possible to determine, without undue speculation, the "acreage" that would be required for new grid infrastructure that would supply the additional power used in implementing the proposed project. It would also be impossible to determine where that acreage would be and what potential impacts the development would have. Nonetheless, the Draft EA analyzed the potential impacts of these grid infrastructure improvements in a qualitative way in Chapter 4.5 and found them significant.

As identified previously in Response to Comment 1.9, indirect impacts associated with the proposed project are subject to the rule of reason. As stated in Sections 4.1.1.3 and 4.2.1.1, *Lifecycle Analysis*, the EA concluded that this type of analysis of upstream and downstream impacts is not required or appropriate for a CEQA impact evaluation because they could refer to emissions or impacts beyond those that could be considered 'indirect effects' of a project under CEQA Guidelines Section 15358. It is speculative to determine where in the state the increase in wind/solar or any new energy source would be located to accommodate the statewide increase in energy demand associated with the transition to a carbon neutral energy economy. Depending on where a new energy source is (northern, central, or southern California; inland or desert regions, etc.), or the type of energy source (i.e., solar or wind) the amount of energy generated per acre may vary. The type and origin of the energy source is not known this far down the stream from the actual direct consequences of the proposed project (i.e., increased energy demand from ZE trucks and filtration systems). This is why any analysis that involves an evaluation of the approximate acreage needed to generate electricity is speculative. The EA includes a good faith effort to explain the potential impacts that are not known with any degree of certainty but are reasonably foreseeable.

Additionally, it is also speculative to quantify the amount of criteria air pollutant emissions that would result from an increase in energy use. The Draft EA quantifies the increase in GHG emissions associated with rule implementation in Chapter 4.1. The Draft EA quantifies the net increase in GHG emissions based on the carbon intensity of electricity from Southern California Edison (SCE) because SCE is required to report the carbon intensity of their fuel mix. However, no such emissions factors are provided by SCE for criteria air pollutants. This is because it is not possible to discern where the electron that powers the batteries/filtration systems comes from on the energy grid supplied by SCE (e.g., electrons from a natural gas plant, solar panels, or wind). Energy providers are not required by any rules or regulations to disclose, for example, the average NO_x emissions per megawatt hour for SCE's electricity supplies. Thus, there are no criteria air pollutant emissions factors per megawatt hour of electricity available for SCE's energy production; therefore, such an analysis would be speculative. Additionally, each natural gas plant falls under an air district's permitting requirements, meaning that the natural gas plant would not be able to increase operations above its current permitted operating capacity. If a natural gas plant were expanded, any increase in operating capacity and emissions (if any) would be subject to review by the applicable air district. Moreover, the purpose of electrification of the energy grid is to reduce GHG emissions from energy sources, resulting in a reduction of petroleum use, which has criteria air pollutant emissions co-benefits.

2. Increased Need for Lithium Extraction.

The District could use its most battery-intense scenario along with projections of useful life to determine the demand for lithium and other necessary minerals and inform the public and decisionmakers of the potential real world impacts of the Proposed Rules, including the percentage increase over existing extraction to accommodate these Rules and other similar reasonably foreseeable electrification efforts.

1.12

Response 1.12

The EA provides an appropriate and conservative evaluation of the potential direct, indirect, and cumulative impacts of the proposed project on the environment. The EA is sufficient as an informational document. See also Response to Comments 1.9 and 1.10, regarding lifecycle impacts associated with the possible indirect impacts of the proposed project.

Chapter 4.5, *Other CEQA Impacts*, evaluated indirect impacts associated with an increase in mineral resource extraction (e.g., lithium) and/or production (e.g., hydrogen). Indirect impacts to mineral resources was identified as a significant impact of the project. However, as identified in Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, in the

Draft EA, it is speculative to identify the demand for ZE batteries and fuel cells that would be generated by the proposed project. Even with the bounding analysis, it is not possible to estimate the amount of lithium demand generated by the proposed project since the lifespan of a truck battery is not yet known, and thus the quantity of lithium needed is speculative. Even if the number of EV batteries could be identified using the number of trucks in the bounding analysis, it is still speculative to evaluate how this would affect mineral resource extraction. For instance, it is not known how much lithium there is a single truck battery. Additionally, it is not known where the lithium in the batteries would be sourced (i.e., whether or not the lithium used in batteries would be mined/how it would be mined or be resourced by recycled batteries) (see Section 4.3.4, *Operational Impacts in Excess of the Capacity of Local Recycling Infrastructure*). As described in Response to Comment 1.13, recycling is a viable option. Even if the amount of lithium in a single truck battery could be identified, and the EA could identify the quantity of lithium the proposed project could generate, and 100 percent of the lithium would need to be mined, the upstream and downstream impacts from that demand would still need to be evaluated at a more general level of detail than the proposed project's direct impacts because the location of where the lithium would come from is also not known this far down the stream from the actual direct consequence of the proposed project (i.e., increased demand for NZE and ZE trucks). While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144). As a result, the indirect effects of the project on mineral resource extraction identified in the EA were subject to the rule of reason and disclosed qualitatively in the EA. Furthermore, as identified in Chapter 4.5, *Other CEQA Impacts*, the EA concludes mineral resource impacts a significant unavoidable indirect impact of the proposed project.

3. Increased Disposal Facilities.

Using the same bounding scenario, the District could project the amount and type of waste the Proposed Rules would induce through accelerated transition. While the District indicates that conventional trucks replaced by ZE/NZE vehicles before the end of their useful life will likely replace older, dirtier trucks, the District must still contend with the disposal of these trucks. Additionally, the District's reliance on still-in-development battery recycling technology is speculative and lacks the support of substantial evidence. In order to succeed as an informational document, the District must provide an assessment of the foreseeable impacts, including increased demand for disposal facilities. This is not outside of the realm of reason. The District has demonstrated it is capable of preparing a bounding analysis and can use this, along with reasonable assumptions regarding useful life, to determine the rate of waste generation attributable to the Proposed Rules. This can and must be prepared and compared against existing disposal capacity in light of other reasonably foreseeable projects to inform the public of the potential scale of development necessary to accommodate the Proposed Rules.

1.13

Response 1.13

The EA includes an analysis of the environmental impacts from an increase in battery and hydrogen fuel cell disposal and their potential impacts on the capacity of local recycling infrastructure in Chapter 4.3.4, *Operational Impacts in Excess of the Capacity of Local Recycling Infrastructure*. Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, analyzes the environmental issues associated with construction waste. Section 4.3.5, *Operational Impacts in Excess of the Capacity of Local Landfills*, analyzes the potential impacts from older equipment or vehicle parts that would be taken out of service in the South Coast Air Quality Management District jurisdiction and scrapped and disposed of in landfills. It should also be noted that if and when landfill or recycling facilities expand their capacity, those expansions would likely be subject to project-level environmental review under CEQA by the appropriate lead agency.

However, as identified in Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, in the EA, it is speculative to identify how much solid waste would be generated by the proposed project. Even with the bounding analysis, it is not possible to estimate the number of trucks that the proposed project would cause to be scrapped early and how this would cause an increase in average annual disposal tonnage. It is not possible to identify whether the proposed project would cause warehouse operators to purchase new NZE and ZE trucks at the end of life of the previous diesel truck (i.e., resulting in no increase in disposal tonnage) or whether they would take an existing diesel truck out of circulation early (causing an increase in tonnage early in the proposed project life). Lastly, there are no available estimates on the tonnage of truck material being recycled/junked versus disposed of in landfills. As a result, there is no way to quantify the additional tonnage of landfilled materials that the proposed project would generate or rate of landfill disposal caused by the proposed project, even using the bounding method.

Section 4.3.5, *Operational Impacts in Excess of the Capacity of Local Landfills*, provides a qualitative analysis of the potential impacts from older equipment or vehicle parts that would be taken out of service in the Basin and scrapped and disposed of in landfills. Providing a quantitative or more specific analysis of impacts to landfills is not feasible because the location of where the solid waste disposal material would go is not known this far down the stream from the actual direct consequence of the proposed project (i.e., increased solid waste disposal). As a result, the effects of the project on solid waste disposal identified in the EA were subject to the rule of reason and disclosed qualitatively in the EA. The EA includes a good faith effort to explain the potential impacts that are not known with any degree of certainty but are reasonably foreseeable. Furthermore, the EA concludes solid and hazardous waste impacts from the retirement of equipment resulting from PR 2305 are significant and unavoidable.

See also Response to Comment 1.12, regarding batteries. This comment speculates that battery recycling technology is speculative. As identified in the Draft EA, Section 4.3.2, *Hazards Associated with Routine Transport, Use, or Disposal of Batteries and Fuels Cells (Significance Criteria)*, lithium battery recycling is feasible and is required in California. As stated in this section, lithium-ion batteries are between 70 and 100 percent recyclable, depending on the particular chemistry of the batteries. What is speculative is whether the batteries would be reused first before being recycled; and how many times truck batteries could be reused before being recycled. This is because Lithium-ion battery packs are still able to operate at about 80 percent of capacity at the time they must be retired from automotive use (see page 4.3-3 of the Draft EA). No further analysis is required. CEQA Guidelines section 15088(c).

B. The District’s Analysis of Air Quality Effects Relies on Outdated Modeling and Inconsistent Assumptions.

The District relies on a version of CARB’s Emission Factor (“EMFAC”) from 2017 to characterize emissions and reductions. While CARB applies some post-hoc modifications to approximate the effect of CARB’s more recent regulations including the ACT Rule and Low NOx Omnibus, these are merely approximations. CARB has recently released EMFAC2021 which reflects CARB’s own best estimates of the effect of these regulations on emissions. The District should re-characterize its analysis based on EMFAC2021 before taking action on the Proposed Rules. At the very least, the District should verify its modifications against the latest EMFAC modeling. Not doing so means that the District’s analysis supporting adoption of the Proposed Rules is not based on the most up-to-date information and thus lacks substantial evidence. Similarly, the District relies on a version of the Southern California Association of Government’s (“SCAG”) Regional Transportation Plan/Sustainable Community Strategy (“RTP/SCS”) that is a half-decade out of date. SCAG adopted its latest RTP/SCS in September 2020 which incorporates updated trip modeling. This information was plainly available the District long before it released its draft EA and thus there is no excuse for the District not to include the updated trip modeling information in the EA. The EA thus must be updated to reflect the most recent trip lengths analysis. *See Citizens to Preserve the Ojai v. County of Ventura* (1985) 176 Cal.App.3d 421, 430; *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 17 Cal.App.5th 413, 444-45 (court invalidated an EIR’s analysis of farmland impacts because the agency relied on “a methodology with known data gaps, [which] produced unreliable estimates ... of the [project’s] impacts”).

1.14

The assessment of the Proposed Rules’ air quality effects also rely on faulty assumptions. First, the scenario analyses do not account for increasingly strict state-level requirements that could reduce the emission reductions achieved by the Proposed Rules. These new requirements include the ACT Rule, the Low NOx Omnibus regulation, the ACF regulation, and the Ports Clean Air Action Plan. While these regulations are at least partially incorporated into an assessment of baseline emissions through the post-hoc modifications discussed above, the District does not carry these forward through its scenario analysis. This means that the range of emission reductions stated in the PDSR do not represent realistic assumptions of potential emission reductions from the Proposed Rules. Because all WAIRE points must constitute reductions that are additional to those generated by other federal and state laws, the District over counts potential reductions as attributable to the Proposed Rules, when they will actually be attributable to the enhanced state requirements and thus not eligible for WAIRE points. In this way, the District overstates the emission reductions the Proposed Rules will achieve. Second, the scenario analyses compares apples and oranges. The District claims as benefits of the Proposed Rules decreases in emissions associated from decreased demand for utility-based electricity as a result of the installation of on-site solar. But the District neglects to perform a similar analysis regarding the increased emissions from increased demand for utility-based electricity as a result of ZE vehicle deployment and charger installations. The District cannot adequately inform the

public by quantifying only the benefits and none of the costs. The District must quantify and disclose both halves of the equation, including whether compelling ZE deployment actually results in the scale of emissions reductions the District has predicted.

1.14
cont.

Response 1.14

While CARB has recently released (January 2021) the EMFAC2021 emissions factors, the EMFAC2021 database has not yet been approved by the U.S. EPA for use at the time of the release of the Final EA for the proposed project. Additionally, the Notice of Preparation for the proposed project was issued in November 2020, prior to the release of EMFAC2021. At the time of the release of the Notice of Preparation, the approved EMFAC version by the U.S. EPA was EMFAC2017. Therefore, use of EMFAC2017 is appropriate.

Additionally, modeling of the environmental benefits was conducted using CARB's Mobile Source Strategy emissions tool in order to isolate the direct effect of the proposed project. Such an analysis would not be possible with EMFAC2021 because this tool does not allow users to customize how an individual rule (in this case the ACT Regulation plus the proposed project) affects emissions rates.

The Draft EA references the latest version of the Southern California Association of Government's (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), which is Connect SoCal. As identified in Chapter 3.4, *Transportation*, of the Draft EA, the latest RTP/SCS, Connect SoCal, was completed and adopted in September 2020. Furthermore, modeling is based on the truck trip lengths in the latest SCAG 2016 RTP Model (i.e., the 2020 RTP/SCS utilizes the 2016 RTP Model). Therefore, the EA utilizes the latest information, including trip length, available from SCAG in the analysis and impact evaluation.

The comment asserts that modeling does not isolate the proposed project impacts because it does not account for increasingly more strict regulations for mobile sources. This is incorrect. As identified above, South Coast AQMD utilized CARB's Mobile Source Strategy emissions tool in order to be able to account for new and upcoming rules that have the potential to increase the amount of NZE and ZE trucks. This was done in order to isolate the incremental effect that the proposed project has on emission in the South Coast AQMD region. This was done for both baseline emissions and projected emissions reductions. Consequently, the emissions reductions as a result of the proposed project are not overstated.

See also Response to Comment 1.11 regarding criteria air pollutants from an increase in electricity use.

C. The District Fails to Adequately Explain the Proposed Rules’ Effects on the Environment.

It is not enough for an agency to declare that there is an environmental effect; “there must be a disclosure of the analytic route the ... agency traveled from evidence to action.” *Laurel Heights*, 47 Cal.3d at 403 (quotations and citations omitted); *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514-15 (“an EIR’s designation of a particular adverse environmental effect as ‘significant’ does not excuse the EIR’s failure to reasonably describe the nature and magnitude of the adverse effect”); *Berkeley Keep Jets Over the Bay Com. v. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1371 (“The EIR’s approach of simply labeling the effect ‘significant’ without accompanying analysis of the project’s impact on the health of the Airport’s employees and nearby residents is inadequate to meet the environmental assessment requirements of CEQA.”). Unfortunately, the District has obfuscated the real impacts of the Proposed Rules and failed to provide a meaningful analysis of the effects.

For example, the District declares that “impacts associated with the need for new or substantially altered power utility systems, new and expanded infrastructure, and effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure by compliance year 2031” are conservatively considered a significant environmental effect of the proposed project, but it fails to provide a meaningful analysis of this effect. Like the agency in *Friant Ranch*, the District has analyzed the issue and disclosed the general effects, but it “did not connect the raw” energy numbers and their effects to specific adverse effects on the built environment. 6 Cal.5th at 518. After reading the EA, “the public would have no idea of the ... consequences that result from” dramatically increasing electricity demand. *Id.* at 519.

1.15

And the increase will be dramatic. The Draft EA discloses the electricity demands created by various compliance options, including Scenario 6 which would result in an additional 847 gigawatt hours per year of electricity demand. But the District never explains to the reader what this means for the electricity grid. The District predicts up to 28,569 new ZE/NZE trucks in 2031 as a result of the Proposed Rules (Draft EA at 4.1-24) and states that the California Energy Commission (“CEC”) assumed that 100,000 ZE trucks will be deployed by 2031 (Draft EA at 4.2-17), but fails to bridge the analytical divide and further fails to contextualize this increase. A cursory review of the ACT Rule Environmental Assessment indicates that CARB already anticipates driving the deployment of the full 100,000 ZE capacity assumed by the CEC by 2032 through the ACT Rule. ACT Environmental Assessment at IX-6. The additional 28,569 NE/NZE trucks that would occur from implementation of the Proposed Rules are thus wholly unaccounted

for in the CEC’s assumptions—as the District has gone to great pains to ensure that all trucks under the Proposed Rules will be in addition to those required by CARB. Thus, the District has failed the lead agency’s obligation to explain how the large increase in ZE/NZE trucks will affect electricity demand and energy supply, and lead to environmental impacts in California.

Further, the District never explains what a nearly 30% increase in ZE/NZE trucks in a single air district means for the human environment. What are the “effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure by compliance year 2031”? The public and the Board are left—figuratively and possibly literally—in the dark.

This cursory conclusion without a full disclosure of the real effects on the human environment is widespread throughout the District’s analysis. “Because the [EA] as written makes it impossible for the public to translate the bare numbers provided into adverse health impacts or to understand why such translation is not possible at this time (and what limited translation is, in fact, possible)” (*Friant Ranch*, 6 Cal.5th at 521), the EA fails in its purpose as an informational document.

1.15
cont.

Response 1.15

The Draft EA analyzes the potential energy impacts of implementing the proposed Project in Chapter 4.2, *Energy*. The Draft EA further acknowledges that improvements to the electric grid may be necessary to support the increased use of ZE vehicles (see Section 4.2.3.2.5, *Impacts to Electricity Providers*). Both the direct and indirect impacts are determined to be significant and unavoidable. The comment does not identify any additional impacts (to the “human environment” or to “human health”) that could be caused by this increased demand for electricity.

As identified in Response to Comments 1.9 through 1.14 above, a quantitative analysis of the proposed project’s indirect impacts related to potential increase in batteries, solid waste disposal, mineral resource extraction, energy infrastructure, criteria air pollutant emissions from an increase in electricity use, etc. would be speculative (see Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*, Chapter 4.5, *Other Impact Areas*, Chapter 4.2, *Energy*, and Chapter 4.1, *Air Quality and Greenhouse Gas Emissions*). Furthermore, the Draft EA does not simply label these indirect impacts as significant without an accompanying analytical analysis. Chapters 4.1 through 4.5 include an analysis and discussion of how the impact conclusion was reached. The indirect effects of the project identified in the Draft EA were subject to the rule of reason, such that, a person of ordinary prudence would take it into account in making a decision.

Moreover, the Draft EA clearly states why a quantitative analysis of the proposed project’s indirect effects is not feasible in Chapter 4.1 through 4.5. See page 4.5-1 in Chapter 4.5, *Other Impact Areas*, which states, “Because

these impacts are indirect impacts of the proposed project, and because it would be speculative to analyze the specific impacts caused by future construction projects at this time, these impacts are evaluated at a more general level of detail than the proposed project's direct impacts."

To reiterate why such analysis is not feasible, the Draft EA includes a program-level evaluation of the proposed project's direct and indirect effects on the environment. In the case of the proposed project, it is also not possible to identify how individual warehouse operators would comply with the proposed project (see Section 4.0.1, *Overview of Impact Analysis*). Therefore, the Draft EA utilizes the bounding method to conservatively estimate the project's direct environmental impacts. Unlike in *Friant Ranch*, where the increase in air pollutant emissions was a direct result of the proposed project, the proposed project's effect on the upstream and downstream environmental resources from manufacturing, mineral resource extraction, and infrastructure are not the proposed project's direct effects, they are the indirect impacts of the proposed project. For indirect impacts, such analysis is not possible and would be speculative because indirect impacts are not measurable conditions (i.e., it is not possible to calculate without speculating) (see also Response to Comments 1.11, 1.12, and 1.13). As a result, for indirect impacts these impacts are evaluated at a more general level of detail than the proposed project's direct impacts. While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a project's potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144). As a result, the indirect effects of the project identified in the Draft EA were subject to the rule of reason, such that, a person of ordinary prudence would take it into account in making a decision.

For energy impacts, the Draft EA discloses the proposed project's direct impacts on the potential maximum increase in electricity demand based on the bounding analysis (see Chapter 4.2, *Energy*, in Section 4.2.3, *Energy Impacts During Operations*). As identified previously, the bounding method is overly conservative because it assumes that all warehouse operators would choose a single compliance option as the sole means of compliance with the proposed project. While this is useful in order to identify an upper bounds of potential impacts for the Draft EA, this is not information that would be utilized by Southern California Edison (SCE) in the design of their energy infrastructure because the demand cited in the Draft EA would not be realized in a single compliance year. As documented in Chapter 4.2, *Energy*, of the Draft EA, SCE, and other investor-owned utilities (IOUs) forecast improvements to the electric grid to accommodate

the forecast energy demand as part of the California Energy Commission's (CEC) biennial Integrated Energy Policy Report (IEPR). As part of its analysis of total statewide energy planning needs, the CEC has begun assessing the potential impacts to the electric grid from widespread deployment of battery-electric vehicles.

The Draft EA considers impacts to energy demand, including peak and base period energy demands, and includes an analytical discussion on how the significance conclusions regarding energy were reached (see Chapter 4.2, *Energy*, of the Draft EA, pages 4.2-16 through 4.2-18). Section 4.2.3.2, *Electricity*, included an evaluation of the project's direct impacts associated with the WAIRE points scenarios. However, the impact to electricity providers and the energy grid was handled qualitatively because it would be speculative to identify how electricity providers would respond to an increase in energy demand associated with the proposed project. In general, the energy grid is evolving to accommodate the state and nation-wide carbon neutrality goals and increase in EV use and charging infrastructure. Based on the mid case scenario in the 2019 IEPR, the proposed project's incremental increase in electricity from 22,777 Class 6 and Class 8 ZE trucks (which is far less than the 100,000+ new electric trucks analyzed by SCE) would result in less than a one to two percent grid-wide increase to SCE's energy forecast. Nonetheless, the proposed project's impact from an increase in electricity to energy providers and the energy grid was identified as a significant unavoidable impact in the EA (see Section 4.2.3.2.5, *Impacts to Electricity Providers*).

However, the indirect impacts from expansion of the electrical grid to accommodate the potential increase in demand from NZE and ZE vehicles is not known at the time of this Draft EA (see Section 4.2.3.2.5, *Impacts to Electricity Providers*). This is because SCE plans for the increase in grid capacity (from all sources, not just electric vehicles) through the IEPR planning effort. At present, it is not possible to predict what new energy grid improvements will be constructed and where they will occur. The Draft EA identifies both the direct impact of an increase in electricity and the indirect effect from the infrastructure required to meet the demand (see also Section 4.2.4, *Indirect Energy Impacts Associated with Construction of New Manufacturing Facilities, Recycling Facilities, and Infrastructure Improvements*) as a significant unavoidable impact of the proposed project based on the analytical analysis provided in the Draft EA Chapter 4.2.

As discussed in Appendix C of the Draft EA, implementation of the proposed project relies on efforts by other sectors such as the utilities sector which has engaged in the rulemaking process for the proposed project. The proposed project will contribute towards accelerating the use of ZE and

NZE trucks and infrastructure, and at the same time planning efforts and actions by public and private partners, including the CEC, the California Public Utilities Commission (CPUC), and Southern California Edison Energy have shared responsibilities and make important contributions towards the state’s ZE future. It is also important to note that South Coast AQMD intends to conduct ongoing monitoring, review, and reporting on the performance of the WAIRE Program. These “check-ins” will provide useful information on implementation details and help identify effects on warehouses subject to the WAIRE Program.

In short, the EA explains the technical basis and methodology for the indirect impact analysis and discloses in good faith that a quantitative assessment for analyzing the proposed project’s indirect impacts is not feasible. Therefore, the EA provides the level and type of analysis required by the California Supreme Court’s decision in *Sierra Club v. County of Fresno* (Friant Ranch) and is sufficient as an informational document. The EA provides an appropriate and conservative evaluation of the potential direct, indirect, and cumulative impacts of the proposed project on the environment. The EA is sufficient as an informational document.

D. The Draft EA Fails to Adequately Analyze the Proposed Rule’s Impacts on the Transportation Sector.

As raised in CTA’s Scoping Comment letter, the Proposed Rules create significant uncertainty in commercial transportation. By compelling the early transition to ZE/NZE vehicles, the Proposed Rules drive rapid and premature fleet turnover for high-cost ZE/NZE vehicles while imposing the uncertain but often high costs of electricity and hydrogen fuel on the logistics sector. Additionally, while the Proposed Rules may incentivize the transition to ZE/NZE vehicles in the District’s jurisdiction, neither the Initial Study nor the Draft EA appears to have considered whether there is sufficient charging infrastructure to support these fleets outside of the District. Goods move across the air districts, but there is no analysis of whether the infrastructure exists for the anticipated ZE/NZE vehicles to complete these trips. Additionally, as California responds to increasing wildfire threats, public safety power shutoff (“PSPS”) events have become increasingly common.

In response to CTA’s Scoping Comment, the District first states that it is not feasible to anticipate the frequency of PSPS events or to analyze their effects. Draft EA at C-34. This is incorrect. Following each PSPS event, California utilities are required to file reports with the Public Utilities Commission disclosing what occurred. These reports are publicly available and the District can and should assess the number and coverage of PSPS events in its jurisdiction to understand, evaluate, and disclose the interaction between increased electrification and increasing grid instability. The District also deflects from the impacts of PSPS events by relying on the additional solar and battery technologies that it envisions will be implemented at covered warehouses. *Id.* at C-35. However, the District repeatedly explained throughout the PDSR and

1.16

the Draft EA that predicting the manner in which the warehouse may choose to comply would be pure speculation. The District’s reliance on solar infrastructure to defray the potential significant effects of reliance on unstable grids thus is similarly pure speculation. Additionally, as discussed *supra*, the cost differential created by the District in fact disincentivizes the deployment of on-site solar in favor of ZE/NZE acquisition. Thus, there is evidence that the District’s reliance on solar infrastructure to defray potentially significant effects on the grid is misplaced.

While impacts to the State’s logistics infrastructure are not specifically listed as impacts in Appendix G, the Appendix “is only an illustrative checklist and does not set forth an exhaustive list of potentially significant environmental impacts under CEQA or standards of significance for those impacts.” *City of San Diego v California State University* (2011) 201 Cal.App.4th. 1134, 1191; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1111. “Also, the lack of precise quantification or criteria for determining whether an environmental effect is ‘significant’ under CEQA does not excuse a lead agency from using its best efforts to evaluate whether an effect is significant. *City of San Diego*, 201 Cal.App.4th at 1191; *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.* (2001) 91 Cal.App.4th 1344, 1370. The District provides no satisfactory explanation for its failure to analyze and disclose the effects of the Proposed Rules on the State’s logistics infrastructure. The EA should consider the interaction between expedited electrification and PSPS events. It is reasonably foreseeable that the Proposed Rules will lead to significant disruptions to freight transportation, specifically in light of PSPS events.

1.16
cont.

Response 1.16

The Draft EA evaluated the potential impacts to transportation sector associated with EV charging in Chapter 4.2, *Energy* (see pages 4.2-17 through 4.2-18). The EA acknowledges that EV infrastructure needs are not limited to the South Coast AQMD region and that goods move across air districts. As noted in the EA under Section 4.2.3.2, *Impacts to Electricity Providers*, the state will need to drastically increase the availability of charging infrastructure to facilitate the transition to ZE vehicles. Per the CEC Assembly Bill 2127 Electric Vehicle Charging Infrastructure Assessment Staff Report, preliminary modeling shows large areas of the grid within and throughout the state (e.g., Central Valley) have little to no excess capacity.⁴ Because there is a shortfall of EV charging stations in some areas of the state, the proposed project’s effect on the need to expedite infrastructure to support an increase in ZE sources, is conservatively considered a significant environmental effect of the proposed project. However, it is not necessarily the case that ZE trucks will be used to travel outside the District in the earlier years of the project while charging infrastructure is being developed.

Additionally, Section 4.2.4, *Indirect Energy Impacts Associated with Construction of New Manufacturing Facilities, Recycling Facilities, and Infrastructure Improvements*, evaluated indirect impacts’ associated

⁴ California Energy Commission, January 2021, Assembly Bill 2127 Electric Vehicle Charging Infrastructure Assessment: Analyzing Charging Needs to Support Zero-Emission Vehicles in 2030. <https://www.energy.ca.gov/programs-and-topics/programs/electric-vehicle-charging-infrastructure-assessment-ab-2127>

demand for energy infrastructure. Potential impacts to the energy grid were analyzed in CARB’s Final EA for the ACT Regulation, and Section 4.2.4 of the EA incorporates that analysis by reference. As identified in this section of the EA, individual compliance responses from the utility providers to meet the energy demand could potentially result in significant environmental impacts.

Furthermore, the Draft EA evaluated the proposed project’s direct impacts from an increase in energy use in Section 4.1.4.3, *Potential GHGs Emissions from Operations (Increased Electricity)*, (like Scenario 12 in Chapter 4.1, *Air Quality and Greenhouse Gas Emissions*) and Section 4.2.3.2, *Electricity*. These sections evaluated the potential electricity impacts from an increase in energy demand from ZE Truck Charger Installation and ZE Truck Use (Scenario 6), Installation of High Efficiency Filter Systems (Scenario 15), and ZE Cargo Handling Equipment Purchase and Use (Scenario 18).

Power Safety Power Shut Off (PSPS) events would occur regardless of the proposed project. The proposed project does not increase the number of PSPS events. The purpose of triggering a PSPS is to proactively cut power to electrical lines that may fail in certain weather conditions (e.g., strong winds, heat events) to reduce the likelihood that their infrastructure could cause or contribute to a wildfire, which is independent of the normal energy demands on the grid.⁵ Based on a review of PSPS event data within South Coast AQMD’s jurisdiction from Southern California Edison⁶, in 2018 there was one PSPS event that affected 17 customers, in 2019 there were six PSPS events that affected 69,146 customers, and in 2020 there were seven PSPS events that affected 117,620 customers. The customers affected included both residential and commercial customers. In 2020, the average duration of a PSPS power outage was 18 hours.⁷ PSPS events would occur regardless of the proposed project. The proposed project does not increase the number of PSPS events. Given the variability in the duration, number of circuits, and number of customers affected by each PSPS event, it is not possible to use past PSPS events to predict the frequency of future PSPS events and the impacts associated with those events.

It is unknown how many existing facilities could be directly affected by power shut offs during a PSPS event. PSPS shut offs occur only in certain

⁵ California Public Utility Commission.2021. Public Safety Power Shutoff (PSPS) / De-Energization.

https://download.newsroom.edison.com/create_memory_file/?f_id=603e696eb3aed34c92db9f08&content_verified=True

high fire affected areas within Southern California and not the entire SCE service Area. SCE maintains a list of frequently affected PSPS areas: <https://www.sce.com/sites/default/files/SCE-2020-PSPS-Frequent-Circuit-List-wcag.pdf>. As noted in SCE's PSPS Frequent Circuit list for year 2020, the majority of affected communities are in hillside areas and not in the urban areas and valley's where larger warehouses are likely to be located. Additionally, the maximum number of times a PSPS event affected a circuit in any given community was 17 times in 2020 (Porter Ranch area in Los Angeles). As such, even in the most affected community in the SCE service area, PSPS events affected consumers less than 5 percent of the year. Future warehouse operators may consider the frequency of PSPS in SCE's grid system when locating a new facility to avoid interruptions to warehouse operations. However, the presence or absence of a PSPS event in the SCE region is not directly applicable to the environmental effects of the proposed project on the energy grid. There is no correlation between new or additional PSPS events and the energy effects of proposed project. Thus, the comment that the proposed project would result in disruptions to freight transportation in light of PSPS events is without merit.

The EA analyzes the impacts of the proposed project's electricity demand on the energy grid and not impacts of the environment on the proposed project. The Draft EA analyzes impacts to the energy grid based on the annual increase in energy demand caused by the proposed project in Section 4.2.3.2, *Impacts to Electricity Providers*. Section 4.2.3.2.4, *Purchase and Use of Solar Panels*, quantifies the maximum potential environmental benefit if all warehouse operators chose Scenario 11 (installation of solar panels) as the sole means of complying with proposed project. However, the Draft EA does not rely on solar infrastructure to defray the increase in electricity demand on the grid. Each WAIRE Points Scenario was analyzed separately to ensure that the Draft EA conservatively analyzed impacts, including impacts to energy (see Section 4.2.3, *Energy Impacts During Operations*). No reductions from solar panels were accounted for in any scenario but Scenario 11 in the Draft EA.

Furthermore, NZE and ZE technology is new, emerging technology. It is not known how long trucks would charge, the time-of-day warehouse operators would charge trucks; and therefore, how truck charging would affect peak transmission loads. In order to provide conservative findings for energy impacts, the Draft EA Chapter 4.2, *Energy*, identified the proposed project's effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure as significant environmental effect of the proposed project (see page 4.2-19).

E. The District Omits Projects from Its Cumulative Impact Analysis.

An EIR must discuss a cumulative impact if the project’s incremental effect combined with the effects of other projects is “cumulatively considerable.” CEQA Guidelines § 15130(a). This determination is based on an assessment of the project’s incremental effects “viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.” *Id.* at § 15065(a)(3); *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1228.

The District contends that a cumulative impact analysis is not required because the Proposed Rules are consistent with the 2016 AQMP, the State SIP Strategy, and the ACT Rule. Draft EA at 4-11–12. However, the Proposed Rules are not consistent with the ACT Rule in that they are specifically designed to be additional to the requirements of the ACT Rule. Similarly, the District cannot rely on the analysis completed for the State SIP strategy since that analysis was focused on statewide emission control strategies adopted by CARB (including the ACT Rule), and did not contemplate further purchase mandates from local air districts.

1.17

As to the 2016 AQMP, the District may only rely on the cumulative analysis discussion to the extent cumulative effects were previously adequately addressed and there are no new significant cumulative effects. CEQA Guidelines § 15152(f). In the half decade that has elapsed since the

environmental review for the 2016 AQMP, numerous other proposals to reduce emissions through electrification have been proposed both within and outside the District’s jurisdiction that will impact the same electric grid and resources. For example, the cities of Santa Monica and West Hollywood have adopted Reach Building Codes driving full electrification. The cities of Culver City and Hermosa Beach are considering similar initiatives. The California Public Utilities Commission has initiated a rulemaking along with the CEC on building decarbonization (R.19-01-011) and on transitioning from natural gas (R.20-01-007). The cumulative effects of these and other electrification initiatives must be analyzed. CEQA Guidelines § 15130(a)(1); *City of Long Beach v. Los Angeles Unified Sch. Dist.* (2009) 176 Cal.App.4th 889, 907 (an EIR’s analysis of cumulative impacts must consider all sources of related impacts, not just similar sources or projects). While a lead agency has discretion to establish a reasonable cutoff date for future projects to include in its cumulative impact analysis, that determination must be supported by substantial evidence. *South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 336. The cumulative effects of mass electrification initiatives adopted and proposed since the 2016 AQMP may risk environmental disaster or severe environmental harm and require evaluation. *Whitman v. Board of Supervisors* (1979) 88 Cal.App.3d 397, 408; *San Joaquin Raptor/Wildlife Rescue Ctr. v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 720. The EA must disclose these new projects and their cumulative effects.

1.17
cont.**Response 1.17**

The Draft EA did not contend that a cumulative analysis is not required and included a cumulative impact analysis in each Chapter 4 topical section (see analysis starting on page 4.1-33, in Chapter 4.2, *Air Quality and Greenhouse Emissions*; page 4.2-22, in Chapter 4.2, *Energy*; page 4.3-10, in Chapter 4.3, *Hazardous Materials and Solid and Hazardous Waste*; page 4.4-14, in Chapter 4.4, *Transportation*; and page 4.5-12, in Chapter 4.5, *Other Impact Areas*) within the EA.

Under CEQA, previously approved land use documents may be used in a cumulative impact analysis. Per CEQA Guidelines Section 15130(e), previously approved land use documents, including, but not limited to, general plans, specific plans, regional transportation plans, plans for the reduction of greenhouse gas emissions, and local coastal plans may be used in a cumulative impact analysis. Pursuant to CEQA Guidelines Section 15152(f), no further cumulative impacts analysis is required when a project is consistent with a general, specific, master, or comparable programmatic plan where the lead agency determines that the regional or areawide cumulative impacts of the proposed project have already been adequately addressed in a certified EIR for that plan. Further, if a cumulative impact was adequately addressed in a prior EIR for a community plan, zoning action, or general plan, and the project is consistent with that plan or action, then an EIR for such a project should not further analyze that cumulative impact (CEQA Guidelines Section 15183(j)). The Draft EA in Section, 4.0.2, *Cumulative Analysis*, identifies three plans that address regional and state efforts that have been adopted to reduce mobile source emissions: South Coast AQMD's Air Quality Management Plan (AQMP), CARB's State Implementation Plan (SIP), and CARB's ACT Regulation. Section 1.2.2, *Other CEQA Documents*, also discusses March 2017 Final Program EIR for the 2016 AQMP and the Final EA for the ACT Regulation. Of these three, South Coast AQMD's AQMP and CARB's SIP consider indirect source review (ISR) rules to attain air quality objectives. Specifically, the AQMP includes indirect source rule for mobile sources under Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers. Additionally, Chapter 4.0, *Introduction*, of the Draft EA specifically states that due to the programmatic nature of the project, the analysis in the subsequent Chapters 4.1 through 4.4 is inherently a cumulative analysis of potential impacts (see page 4-11).

While the proposed project expedites the transition to NZE and ZE trucks beyond that identified by the ACT Regulation, air quality and GHG modeling isolates the incremental cumulative effect of the proposed project beyond that generated by the ACT Regulation. See also Response to Comment 1.14. Consequently, the Draft EA appropriately utilizes the ACT Regulation to address the cumulative impact analysis in the Chapter 4 sections; considers the incremental effect combined with the effects of other projects in its significance conclusions in accordance with CEQA Guidelines Section 15130(a); and therefore, correctly summarizes the cumulative setting for impacts associated with the proposed project.

The comment identifies that the length of time between adoption of the AQMP and the proposed project warrants a reexamination of the cumulative

setting because it has been five years since adoption of the AQMP. Firstly, five years is not a substantial time lapse since regional plans (e.g., general plans, transportation plans) typically look at a horizon of 20 years or longer. For example, there were 10 years between the 2008 Scoping Plan and the 2017 Scoping Plan; and the Scoping Plan looks at horizon years of 2030 and 2050. Secondly, the state's carbon neutrality strategies were well established under Executive Order S-03-05 (2005) and more recently under Executive Order B-55-18. Therefore, it is not necessary to identify every last City/County in the South Coast AQMD region that has identified policy goals or reach codes that would push for greater electrification of the energy grid in order to re-examine how indirect source rules, like the proposed project, affect the energy grid compared to when the original AQMP was adopted. As discussed in Chapters 4.1 through 4.5 of the Draft EA, individual cities or counties will need to conduct their own site and project-specific analysis and consider relevant policies when they serve as CEQA lead agencies for actions undertaken to comply with the proposed project.

Furthermore, the Draft EA cites the IEPR, which has been updated since the 2016 AQMP, to address cumulative impacts of the transition to ZE technologies on the grid infrastructure and evaluates the overall direction in the state to move toward a carbon neutral energy grid. Thus, the Draft EA Chapter 4.2, *Energy*, references the planning tool that is used by IOUs, including SCE, to forecast an increase in electricity demand within the southern California region. Draft EA Chapter 4.2, *Energy*, also considers the CEC's Assembly Bill 2127 Electric Vehicle Charging Infrastructure Assessment Staff Report to address the availability, or lack thereof, of charging infrastructure throughout the state. Utilizing these more recent planning documents (i.e., the IEPR and the Assembly Bill 2127 Electric Vehicle Charging Infrastructure Assessment Staff Report), the Draft EA considers the incremental cumulative effect of the proposed project coupled with the additional demand on the energy grid and infrastructure as a result of the state's carbon neutrality goals in accordance with CEQA Guidelines Section 15130(a).

F. The Draft EA Unlawfully Rejects Alternative B.

The Draft EA impermissibly dismisses an alternative that, if appropriately analyzed and characterized, could reduce environmental impacts. “Pursuant to CEQA’s ‘substantive mandate,’ an agency may not approve a proposed project if feasible alternatives exist that would substantially lessen its significant environmental effects.” *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 520; see Pub. Resources Code § 21002. Despite identifying environmental benefits associated with Alternative B (Decreased Emissions Reductions), the Draft EA determines that it is not environmentally superior to the Proposed Rules. The Draft EA does not adequately support its conclusion that only Alternative C (Increased Emissions Reductions) is “environmentally superior.” Draft EA at 5-27.

The Draft EA indicates that the Proposed Rules would have significant and unavoidable direct impacts (1) on energy resources, (2) from hazardous materials and solid and hazardous waste, and (3) on transportation and significant and unavoidable indirect impacts on (1) aesthetics, (2) agriculture and forestry, (3) biological resources, (4) cultural resources, (5) geology and soils, (6) hydrology and water quality, (7) noise, (8) mineral resources and (9) utilities and service systems. Draft EA at 6-2–3. The Draft EA further acknowledges that ***all*** of these significant and unavoidable impacts are in fact ***worsened*** by Alternative C. *Id.* at 5-16–17. Yet the District paradoxically labels this as the environmentally superior alternative because the NOx and PM emissions will be lower than under the Proposed Rules. The District is measuring with the wrong yardstick. The environmentally superior alternative is an alternative that ***lessens*** the project’s ***significant effects***. The District itself acknowledges that the Proposed Rules have a less than

1.18

significant effect on long-term air quality impacts. *Id.* at ES-4. There is no significant effect of the Proposed Rules that Alternative C in fact lessens.

By contrast, Alternative B would “lead to less cargo growth potentially being diverted to other ports and resulting in less GHG emissions from cargo growth diversion than the proposed project,” “lead to a lower demand on utilities,” reduce infrastructure needs, “reduce the number of batteries that need to be recycled, and “have less adverse direct impacts to energy and hazardous materials and solid and hazardous waste.” *Id.* at 5-15. “Alternative B’s indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation would likely be less than the proposed project.” *Id.* “The reduction in the number or intensity of development of new facilities and grid improvement would likely lead to less adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from reduced demand for new mines and mining activities because of the reduced use and demand of lithium-based batteries in ZE vehicles), Noise, and Utilities than the proposed project.” *Id.* The only metric by which the District finds Alternative B insufficient is that “Alternative B’s ongoing, long-term, and permanent air quality and public health **benefits would be less** when compared to the proposed project.” *Id.* at 5-16. But as described above, this is not the standard—the question is whether the alternative would lessen the significant effects and the District has determined that the Proposed Rules’ effect on long-term air quality impacts is **less than significant**.

1.18
cont.

The only grounds on which the District may reject an environmentally superior alternative is if it is infeasible. The District evaluated five alternatives to the Proposed Rules, including a no project alternative. One of these, Alternative B, was a version of the Proposed Rules with a narrower application (only to warehouses greater than 200,000 square feet), a year delay in compliance obligations, and less aggressive emissions reduction targets as a result of a decreased rule stringency factor. Draft EA at 5-6. As noted in Table 5-2, Alternative B would accomplish **all** of the District’s objectives. Draft EA at 5-12. Despite the reduced environment impacts described above, the District rejected Alternative B because it did not reduce emissions quite as much. However, a lead agency cannot adopt artificially narrow project objectives that would preclude consideration of reasonable alternatives for achieving the project’s underlying purpose. *North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 647, 669; *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 203. Alternative B accomplishes the District’s aims while reducing the environmental impacts.

Response 1.18

The Draft EA provides a reasonable range of alternatives in Chapter 5, *Alternatives*. The Draft EA does not ‘reject’ Alternative B. Rather, the Draft EA identifies that the ‘environmentally superior’ alternative is Alternative C. Alternative C was identified as the environmentally superior alternative because this alternative would achieve the most emissions reductions (i.e., environmental benefits) while achieving the project objectives.

Alternative C also best achieves the project objectives, which include:

- Reduce NOx emissions and PM, including DPM, and reduce associated public health impacts from warehouse activities.

- Facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and PM_{2.5}.
- Implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617.
- Reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse.

CEQA gives lead agencies discretion on how the environmental effects of the alternatives are weighted. CEQA does not prescribe requirements for identifying an environmentally superior alternative. In fact, the CEQA statute and Guidelines do not expressly require an EIR to identify the environmentally superior alternative. The Guidelines state that if the no-project alternative is the environmentally superior alternative, the EIR must also identify "an environmentally superior alternative" from among the other alternatives. 14 Cal Code Regs §15126.6(e)(2). When none of the alternatives is clearly environmentally superior to the project, an EIR may explain the environmental advantages and disadvantages of each alternative in comparison with the project. Kostka & Zischke, Practice Under the California Environmental Quality Act, § 15.37.

As a regional air quality agency tasked under the Federal and California Clean Air Acts to reduce criteria air pollutant emissions, the emissions benefits of the alternatives are a primary consideration when comparing the alternatives' environmental benefits (and costs) to those of the proposed project. If air quality impacts/benefits of the alternatives were not considered, or as the comment suggests all environmental topics needed to be weighted equally with the other significant environmental impacts, South Coast AQMD would usually need to pick the least stringent alternative as the environmentally superior alternatives regardless of whether or not that alternative achieved the project objectives. However, such an outcome would be inconsistent with the intent of identifying the environmentally superior alternative under CEQA Guidelines Section 15126.6. In most cases where there are add-on controls, the more stringent alternatives would have greater adverse environmental impacts in some areas (e.g., hazardous waste or solid waste, construction emissions and noise, etc.). Based on the analysis in Chapter 5. *Alternatives*, the potential environmental effects of the alternatives in light of the project objectives were considered and Alternative C was identified as the environmentally superior alternative. Chapter 5 of the EA provides substantial evidence to support the consideration of Alternative C as the environmentally superior alternative.

The feasibility requirement set forth in CEQA Guidelines Section 15126.6 is for the consideration and selection of the alternatives for examination in an EIR. When an alternative is infeasible, additional information explaining the choice of alternatives may be included in the administrative record (CEQA Guidelines Section 15126.6(c)). However, feasibility is not a requirement for identifying an environmentally superior alternative. As stated above, the EA included an analysis of five alternatives, including Alternative B, for detailed consideration as analyzed in Chapter 5, *Alternatives*. However, Alternative B does not meet all the project objectives as well as either the proposed project or Alternative C. Therefore, even if Alternative B was identified in the Draft EA as the Environmentally Superior Alternatives, it would not necessarily be selected by the Board in place of the proposed project.

Alternative C does not reduce the environmental impacts of the proposed project but rather increases the environmental benefit. It would result in greater emission reductions of NOx and PM2.5, which would provide greater benefits to human health and achieve the Project's pollution reduction objectives to a greater degree than Alternative B. Alternative C does this by broadening the number of warehouse facilities that would be affected by the proposed project and increasing the rule stringency. Alternative B decreases emissions reductions by reducing the number of warehouses subject to PR 2305, reducing the rule stringency, and delaying the rule; all of which would result in less emissions reductions. For these reasons, Alternative B would not meet the objectives of the proposed project to the extent that Alternative C would.

As identified in Table 5-2, *Comparison of the Proposed Project and Alternatives in Meeting Project Objectives*, Alternative B is capable of meeting three out of four project objectives to a lesser extent than the proposed project. However, Alternative C would meet all four of the project objectives, three of them to a greater extent than the proposed project. As stated above, for a project that is intended and designed to provide air quality benefits, such as the proposed project, it is important to consider both adverse impacts and beneficial environmental effects. While Alternative B would reduce the adverse environmental impacts of the proposed project identified in the Draft EA, it would also fail to achieve as much environmental benefit as the proposed project, and therefore was not identified as the environmentally superior alternative.

Section 5.4.2.2, *Alternative B: Decreased Emission Reductions*, included a discussion of Alternative B's overall effects. The EA balanced the adverse impacts and beneficial effects of all five alternatives as discussed in Chapter 5 (see also Section, 5.4.2.1, *Alternative A: No Project*; Section, 5.4.2.3,

Alternative C: Increased Emission Reductions; Section 5.4.2.4, *Alternative D: All Natural Gas Options Only*; and Section 5.4.2.5, *Alternative E: All Electric Options Only*). Based on the substantial evidence provided in Chapter 5, Alternative C was considered the environmentally superior alternative (see also Section 5.7, *Environmentally Superior Alternative*).

VIII. Conclusion.

The District has not been granted the authority to impose a sweeping purchase mandate on existing, unmodified warehouses under the guise of an ISR regulation. While the District's goals of reducing air emissions in the Basin are laudable, the District has only the rulemaking authority

1.19

invested in it by statute. Even if the Legislature had granted the District such authority, it is preempted by federal law. The regulation as proposed fails to meet the standards specified by the Health and Safety Code and the accompanying Draft EA fails to meet the District's obligations under CEQA and fails as an informational document. For this reason, the District must revise the Proposed Rules and EA before adoption in order to bring them into compliance with state and federal law.

1.19
cont.

Response 1.19

Please refer to Appendix F of the Final Staff Report, Comment Letter 44, for a Responses 1.1 through 1.8. Based on the forgoing responses (see Response to Comments 1.9 through 1.18), the proposed project is intended and designed to create environmental benefits, especially in environmental justice communities in the South Coast AQMD's jurisdiction (see Section 2.4, *Project Objectives*, in the Draft EA). South Coast AQMD has the ISR authority under Health and Safety Code Sections 40716, 40440. The EA adequately analyzes and discloses the proposed project's direct, indirect, and cumulative environmental impacts. Where an analysis is not possible, the EA discloses it. Please refer to Chapter 4, *Environmental Impact Analysis and Mitigation Measures*, for analysis of the potential environmental impacts as a result of the proposed project. Therefore, the EA complies with the CEQA requirements and is sufficient as an informational document. The proposed project is currently planned to be presented to the South Coast AQMD's Governing Board for consideration for adoption at the May 7, 2021 meeting.

COMMENT LETTER #2 – San Pedro & Peninsula Homeowners Coalition (page 1 of 4)

March 12, 2021

Ryan Bañuelos
Air Quality Specialist, CEQA
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765
rbanuelos@aqmd.gov

Dear Mr. Bañuelos,

On behalf of the San Pedro & Peninsula Homeowners Coalition, we submit these comments on the South Coast Air Quality Management District's Draft Environmental Assessment of Proposed Rules 2305 and 316. We are a coalition of homeowner's groups within the Port communities in Los Angeles and residents of our member associations are impacted daily by the freight and logistics industry. The San Pedro & Peninsula Homeowners Coalition has monitored activities at the San Pedro Bay Ports for decades in order to advocate for basic public health protections for communities like ours that suffer from air pollution every day.

2.1

We strongly support the warehouse indirect source rule because it will facilitate a long-awaited transformation of the polluting warehouse industry. As the Air District moves forward with this rule, we ask that the agency consider adopting a 0.005 stringency factor. The freight and logistics industry has expanded greatly in the South Coast Air Basin over the past decade, and the industry's profits have come at the expense of our health.

Figure 10: Industrial Building Growth by County

2.2

We write to address potential claims from industry that a higher stringency factor and greater annual compliance costs would lead to more cargo diversion and generate greater greenhouse gas emissions and other impacts by increasing shipping in other areas. Industry has often put forward this argument in opposition of other lifesaving regulatory measures with scant credible evidence to support their assumptions. Moreover, in our experience this is simply untrue. In observing activity at the San Pedro Bay Ports, our coalition has seen firsthand the enormous growth of the logistics industry in southern California. This past year, we saw record levels of cargo being moved through the Ports and an

COMMENT LETTER #2 – San Pedro & Peninsula Homeowners Coalition (page 2 of 4)

increased number of ships idling due to port congestion.¹ Contrary to industry claims, any cargo diversion can instead be attributed to the massive influx of shipping traffic causing congestion at the San Pedro Bay Ports and other ports on the West Coast.² Other instances of loss of market share are due to “macroeconomic causes that outweigh any increased regulatory costs in California,” such as changes in global trade flows.³ Even with these macroeconomic trends, rents and other operating costs for warehouses have increased steadily in the past decade, as demonstrated in the figure below.⁴ But the ever-growing demand for e-commerce has led to surges in port activity and kept warehouse vacancy rates at an all-time low.

Figure 12: Warehousing Historical Rents in South Coast AQMD Jurisdiction and Neighboring Areas

In 2019, Los Angeles had a 1.3% industrial vacancy rate, the lowest in the nation.⁵ Last year, business was even better for the warehouse industry in southern California with the covid-19 pandemic driving more e-commerce activity. The Inland Empire is “seeing its lowest vacancy rates in two decades.”⁶ But the industry’s booming business has worsened our air quality and exacerbated health risks in Port and other frontline communities, especially as we continue to contend with the covid-19 pandemic.⁷

The Air District’s own analysis show that cargo diversion and warehouse relocations are unlikely. The IEc Study demonstrates that a compliance cost of \$1.50 per square foot or less will have no impact on the industry.⁸ The Draft EA’s assumption that a 0.0025 stringency could lead to up to three warehouse

COMMENT LETTER #2 – San Pedro & Peninsula Homeowners Coalition (page 3 of 4)

relocations is a conservative “worst-case” analysis.⁹ Compliance costs of \$2.00 per square foot is also unlikely to slow the steady growth of warehousing in the South Coast. As the Draft EA notes, “it is not reasonably foreseeable that cargo owners will ship their goods to other ports to avoid the cost of the proposed project if those costs are less than or equal to \$2.00 per square foot as analyzed in the IEc Study.”¹⁰ Moreover, based on our extensive monitoring of the freight industry, all the scenarios being analyzed in the CEQA document would not have an impact on ship activity, which would divert ships to other ports. Simply speaking, the fee is just too low to have an impact. This expert opinion is bolstered by the increases in rent over the last five years at levels much greater than any of the scenarios analyzed in the CEQA document and us not seeing fewer ship calls deployed elsewhere. In fact, ship calls have increased right now as rents are higher than they have been in many years. Finally, the warehouse industry is more than able to bear a minimal cost of \$2.00 per square foot and must do so. Forecasts show that our Ports will continue to see record cargo volumes,¹¹ and the warehouse indirect source rule is greatly needed to reduce health burdens of communities like ours.

2.2
cont'd

Thank you for the opportunity to provide comments on the Draft EA. We urge the Air District to adopt a strong warehouse indirect source rule as soon as possible so that southern California residents can breathe cleaner air.

RESPONSE TO COMMENT LETTER #2 – San Pedro & Peninsula Homeowners Coalition from Peter M. Warren, dated March 12, 2021

Response 2.1 This is an introductory comment that provides background information but does not raise any issues related to the proposed project or Draft EA. Therefore, no response is necessary under CEQA.

Response 2.2 We agree with the commenter that the proposed project with the currently proposed rule stringency is not expected to cause cargo shippers to divert to other ports in the country. However, for the purpose of the environmental analysis, the Draft EA assumed some cargo growth shipping diversion and included an evaluation on potential effects from cargo growth diversion associated with the currently proposed rule stringency (see Chapter 4.0, Section 4.0.1.3.2, *Cargo Growth Diversion*, and Chapter 4.1, *Air Quality and Greenhouse Gas Emissions*, and Chapter 4.2, *Energy*).

Chapter 5 of the Draft EA included an evaluation of Alternative C, which looked at both expanding the number of warehouses affected by decreasing the size requirement and increasing the rule stringency factor (see Section 5.4.2.3, *Alternative C: Increased Emission Reductions*). The proposed project with the rule stringency factor of 0.0025 WAIRE Points per WATT along with five alternatives to the proposed project, including Alternative C with the rule stringency factor of 0.0050 WAIRE Points per WATT, will be presented to the South Coast AQMD's Governing Board for consideration and determination.

Re: Comments on Environmental Assessment for Proposed Rule 2305

Dear Mr. Banuelos:

This firm represents NAIOP, the Commercial Real Estate Development Association, SoCal and Inland Empire Chapters (collectively, “NAIOP”), and on their behalf we are submitting comments in response to the District’s Notice of Completion of a Draft Environmental Assessment prepared in connection with the District’s consideration of Proposed Rule 2305. Thank you for the opportunity to comment on this matter. Through its representative Peter Herzog, NAIOP has participated in the various working group meetings held by the District in its early rulemaking process, and we thank the District and its staff for the opportunity to do so. Please include these comments in the administrative record for your rulemaking.

3.1

NAIOP is the leading organization for the commercial real estate industry in Southern California. It has approximately 1,300 members comprising commercial real estate owners, developers, investors, lenders, contractors, brokers, insurers, engineers, architects, planners, educators, law firms, and others. Its mission is to provide a unified voice to protect and enhance the commercial real estate industry and quality of life in Southern California. This is accomplished through proactive involvement in public policy, superior educational programs and interactive business relationship opportunities. A significant portion of NAIOP’s membership is involved on a daily basis in the support and development of distribution warehouses that are integral to the Southern California logistics industry. As we have all seen, the logistics industry is playing a key role in our response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment, but also in the delivery goods to a public that has become increasingly dependent on e-commerce.

Snell & Wilmer is a member of LEX MUNDI, The Leading Association of Independent Law Firms.

RE: Comments on Draft Environmental Assessment for Proposed Rule 2305 and Proposed Rule 316

Dear Mr. Bañuelos,

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the South Coast Air Quality Management District's Draft Environmental Assessment for Proposed Rule 2305 and Proposed Rule 316.

4.1

We appreciate the opportunity to review the Draft Environmental Assessment (Draft EA) for the warehouse indirect source rule, a critical regulation that will bring us a step closer to meeting federal and state air quality standards in the South Coast Air Basin. The Draft EA provides a comprehensive analysis of the potential environmental impacts that will result from Proposed Rules 2305 and 316 and demonstrates that the benefits of Proposed Rule 2305 far outweigh any potential adverse impacts. Even under the Air District's conservative "worst-case" approach, the warehouse indirect source rule is expected to result in much-needed emissions reductions and overall air quality improvement.¹

4.2

Diesel trucks travel to and from warehouses in the South Coast every day, emitting harmful air pollutants in one of the worst-polluted regions in the nation.² The Draft EA's robust assessment shows that Proposed Rule 2305 will provide significant emissions reductions of harmful pollutants, including nitrogen oxides and particulate matter, that are needed for attainment.³ In addition, the air quality improvements that will result from this rule will have significant greenhouse gas emissions co-benefits.⁴ This regulation is necessary for our air quality and climate goals, and will provide basic public health protections to overburdened communities living near regulated facilities.⁵ Attainment of federal and state air quality standards will result in health benefits estimated at about \$173 billion, which will be felt in

¹ South Coast Air Quality Management District, Draft Environmental Assessment for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305 (Jan. 2021), 4.1-33.

³ *Id.* at 4.1-16.

⁴ *Id.* at 4.1-26.

⁵ *Id.* at 1-3, 2-6-2-8.

COMMENT LETTER #4 – Coalition of Community and Environmental Organizations (page 2 of 3)

overburdened communities including those who have borne unacceptable health risks from the freight and logistics industry.⁶ Communities living within 0.5 miles of warehouses regulated under this rule have higher asthma and heart attack rates.⁷ Warehouse-adjacent communities in the South Coast are predominantly communities of color and have higher poverty rates.⁸ Proposed Rule 2305 will provide much-needed localized air quality benefits to these communities by reducing emissions of PM_{2.5} and diesel particulate matter from polluting trucks.⁹

4.2
cont.

To ensure that the warehouse indirect source rule meets its stated objectives, we believe that the Air District should select the highest stringency factor analyzed in the Draft EA (0.005 WAIRE Points per WATT). The alternatives analysis demonstrates that a higher stringency of 0.005 will result in greater emissions reductions and is necessary to provide immediate relief to communities living near regulated facilities. According to the Draft EA, a stringency factor of 0.005 – as studied in Alternative C – would provide “ongoing, long-term, and permanent benefits on air quality and public health” that outweigh any potential adverse environmental impacts.¹⁰

4.3

Increasing the stringency factor to 0.005 would result in compliance costs of only \$2.00 per square foot.¹¹ This is an insignificant amount for a booming industry that has seen record lease rates and unprecedented demand amid the covid-19 pandemic.¹² The IEc study shows a 0.005 stringency would result in a maximum of six warehouse relocations, some of which may occur even absent the warehouse indirect source rule.¹³ As is evident from recent industry trends, this rule – even at a compliance cost of \$2.00 per square foot – is unlikely to affect the warehouse industry or cause facilities to relocate.

Thank you for your consideration of these comments on the Draft EA. As with the NOP/IS, we request that all public comments on the Draft EA be made available on the AQMD’s website to encourage full public participation and transparency. We appreciate the Air District staff’s continued work on this important lifesaving regulation.

RESPONSE TO COMMENT LETTER #4 – Coalition of Community and Environmental Organizations, dated March 12, 2021

Response 4.1 This is an introductory comment that does not raise any issues related to the proposed project or Draft EA. Therefore, no response is necessary under CEQA.

Response 4.2 This comment summarizes the analysis in the Draft EA and states the need for the proposed project. This comment does not raise any issues related to the proposed project or Draft EA. Therefore, no response is necessary under CEQA.

Response 4.3 Chapter 5, *Alternatives*, of the Draft EA included and evaluated a reasonable range of feasible alternatives to the proposed project. Section 5.4.2.3, *Alternative C: Increased Emission Reduction*, evaluated an alternative that expanded the number of warehouses affected by decreasing the size requirement and/or increasing the rule stringency. As stated on page 5-6, Alternative C considers a stringency as high as 0.0050 WAIRE Points per WATT. As identified in Section, 4.0.1.3.1, *Potential Warehouse Relocations*, with a proposed rule stringency of 0.0025 WAIRE Points per Weighted Annual Truck Trips phased in over a three-year period would not result in any warehouse relocations. However, the Draft EA conservatively analyzed up to three warehouse relocations.

When comparing the environmental adverse impacts and evaluating the effectiveness of achieving the project objectives and providing long-term, permanent beneficial effects of the project alternatives, particularly Alternative C which would be considered as the lowest toxic alternative and environmentally superior alternative to the proposed project, the proposed project balances achieving the project objectives and the potential adverse impacts (see Section 5.8, *Conclusion*). The proposed project with the rule stringency factor of 0.0025 WAIRE Points per WATT along with five alternatives to the proposed project, including Alternative C with the rule stringency factor of 0.0050 WAIRE Points per WATT, will be presented to the South Coast AQMD's Governing Board for consideration and determination.

Response 4.4 South Coast AQMD will post the Final EA at: <http://www.aqmd.gov/home/research/documents-reports/lead-agency-scaqmd-projects>. The Final EA includes public comments on the Draft EA and responses to those public comments received (Final EA, Appendix E).

2.2 COMMENT LETTERS RECEIVED AFTER THE CLOSE OF THE PUBLIC REVIEW AND COMMENT PERIOD

This section includes responses to any comment letters received after 5:00 PM Friday, March 12, 2021. Under CEQA, a lead agency is required to consider comments on the DEIR and to prepare written responses if a comment is received within the public comment period. (Public Resources Code Section 21091(d), CEQA Guidelines Section 15088). Nonetheless, for information purposes, South Coast AQMD has elected to respond to late letters.

COMMENT LETTER #5 – Santa Ynez Band of Chumash Indians (page 1 of 1)

Att.: Ryan Banuelos

Re: Proposed Rule 2305 – Warehouse Indirect Source Rule Notice of Completion of a Draft Environmental Assessment

Dear Mr. Banuelos:

Thank you for contacting the Tribal Elders' Council for the Santa Ynez Band of Chumash Indians.

At this time, the Elders' Council requests no further consultation on this project; however, we understand that as part of NHPA Section 106, we must be notified of the project.

Thank you for remembering that at one time our ancestors walked this sacred land.

5.1

Sincerely Yours,

Kelsie Merrick

Administrative Assistant | Elders' Council and Culture Department
Santa Ynez Band of Chumash Indians | Tribal Hall
(805) 688-7997 ext. 7516
kmerrick@santaynezchumash.org

RESPONSE TO COMMENT LETTER #5 – Santa Ynez Band of Chumash Indians, dated March 22, 2021**Response 5.1**

The comment that the Elders’ Council requests no further consultation on this project is noted.

Section 106 of the National Historic Preservation Act (NHPA) is only applicable to projects, activities, or programs either funded, permitted, licensed, or approved by a Federal Agency. However, South Coast AQMD provided a formal notice of the proposed project to all California Native American Tribes that requested to be on the Native American Heritage Commission’s (NAHC) notification list per Public Resources Code Section 21080.3.1(b)(1). This included the Santa Ynez Band of Chumash Indians. Furthermore, the provisions of CEQA, Public Resources Code Sections 21080.3.1 et seq. (also known as AB 52), requires meaningful consultation with California Native American Tribes on potential impacts to tribal cultural resources, as defined in Public Resources Code Section 21074. Construction resulting from the proposed project would need to obtain city or county planning department approvals prior to commencement of any construction activities and would be subject to project-level review, including separate tribal consultation under AB 52, as applicable, to address site-specific requests identified by the tribes.

COMMENT LETTER #6 Asian Pacific Planning and Policy Council (page 1 of 2)

April 6, 2021
 Ryan Bañuelos
 Air Quality Specialist, CEQA
 South Coast Air Quality Management District
 21865 Copley Drive
 Diamond Bar, CA 91765
rbanuelos@aqmd.gov

RE: Comments on Draft Environmental Assessment for Proposed Rule 2305 and Proposed Rule 316

Dear Mr. Bañuelos,

On behalf of the A3PCON (Asian Pacific Planning and Policy Council) Environmental Justice Committee, we submit these comments on the South Coast Air Quality Management District's Draft Environmental Assessment for Proposed Rule 2305 and Proposed Rule 316.

6.1

The Asian Pacific Policy and Planning Council (A3PCON) is a coalition of community-based organizations that advocates for the rights and needs of the Asian and Pacific Islander American Community in the greater Los Angeles area, with a particular focus on low income, immigrant, refugee and other disadvantaged sectors of the population. The A3PCON Environmental Justice Committee seeks to develop an engaged and empowered Asian Pacific Islander community that advocates for a healthy, equitable and sustainable earth for all.

We appreciate the opportunity to review the Draft Environmental Assessment (Draft EA) for the warehouse indirect source rule, a critical regulation that will bring us a step closer to meeting federal and state air quality standards in the South Coast Air Basin. The Draft EA provides a comprehensive analysis of the potential environmental impacts that will result from Proposed Rules 2305 and 316 and demonstrates that the benefits of Proposed Rule 2305 far outweigh any potential adverse impacts. Even under the Air District's conservative "worst-case" approach, the warehouse indirect source rule is expected to result in much-needed emissions reductions and overall air quality improvement.¹

Diesel trucks travel to and from warehouses in the South Coast every day, emitting harmful air pollutants in one of the worst-polluted regions in the nation.² The Draft EA's robust assessment shows that Proposed Rule 2305 will provide significant emissions reductions of harmful pollutants, including nitrogen oxides and particulate matter, that are needed for attainment.³ In addition, the air quality improvements that will result from this rule will have significant greenhouse gas emissions co-benefits.⁴

¹ South Coast Air Quality Management District, Draft Environmental Assessment for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305 (Jan. 2021), 4.1-33.

² South Coast Air Quality Management District, Draft Socioeconomic Impact Assessment (Mar. 2021), 4-5.

³ *Id.* at 4.1-16.

⁴ *Id.* at 4.1-26.

This regulation is necessary for our air quality and climate goals, and will provide basic public health protections to overburdened communities living near regulated facilities.⁵ Attainment of federal and state air quality standards will result in health benefits estimated at about \$173 billion, which will be felt in overburdened communities including those who have borne unacceptable health risks from the freight and logistics industry.⁶ Communities living within 0.5 miles of warehouses regulated under this rule have higher asthma and heart attack rates.⁷ Warehouse-adjacent communities in the South Coast are predominantly communities of color and have higher poverty rates.⁸ Proposed Rule 2305 will provide much-needed localized air quality benefits to these communities by reducing emissions of PM2.5 and diesel particulate matter from polluting trucks.⁹ 6.1 cont.

The A3PCON Environmental Justice Committee supports THE IMPACT Project's recommendations on the stringency factor analyzed in the Draft EA to improve the warehouse indirect source rule that would provide "ongoing, long-term, and permanent benefits on air quality and public health" that outweigh any potential adverse environmental impacts.¹⁰ The communities we represent are greatly impacted by existing poor air quality in the basin and we need stronger, innovative policies now to improve the overall quality of life in our region.

Thank you for your consideration of these comments on the Draft EA. As with the NOP/IS, we request that all public comments on the Draft EA be made available on the AQMD's website to encourage full public participation and transparency. We appreciate the Air District staff's continued work on this important lifesaving regulation.

**RESPONSE TO COMMENT LETTER #6 – Asian Pacific Planning and Policy Council,
dated April 6, 2021****Response 6.1**

The comment that the Asian Pacific Planning and Policy Council (A3PCOM) Environmental Justice Committee represents is a coalition of community-based organizations that advocates for the rights and needs of the Asian and Pacific Islander American Community in the greater Los Angeles area is noted.

A3PCOM affirms that the Draft EA provides a comprehensive analysis of the environmental impacts of the proposed project and validates that the benefits of the proposed project outweigh any potential adverse impacts. The letter further asserts that the A3PCOM supports the proposed project's stringency factor.

COMMENT LETTER #7 – Vogel Properties, Inc. (page 1 of 1)

From: William Vogel
Sent: Monday, April 19, 2021 3:36 PM

Cc: Victor Juan <vjuan@aqmd.gov>
Subject: Proposed Rule 2305

To Whom It May Concern;

We were just made aware of this proposed rule to the SCQAMD and vehemently oppose everything that is in it. As an owner of warehouses in the district we cannot fathom a possible need for a warehouse owner to report anything to the SCQAMD. We do not operate the warehouses nor do we operate the trucks that come to and from our warehouses. As a vacant warehouse we have 0% emissions and at all other times our tenants are solely responsible for the operation of the buildings including utilities consumed thereby.

As an operator of a warehouse of more than 100 SF (which is a number that is growing at a rapid pace) you don't have to be the biggest fish in the ocean anymore. This will be putting undue stress on our mom & pop operators who are already struggling to get by thanks to the Governor shutting down more than half of the state for almost one whole year. If you want the whole trucking industry to adopt fuel efficient trucks, focus on the trucking operators and not the building owners or the companies that warehouse in them.

Adopting electric trucks will only help to quicken the states already degrading electrical infrastructure that can be blamed for rolling blackouts during times of high demand, especially at night which is when everyone plugs in, as well as the public fiascos such as the massive fires up north and throughout SoCal for almost a decade. Half of our buildings aren't even supplied with enough power to allow for plugins and that can't be fixed by us as the utility never buried enough line in the city streets in order to serve that type of demand.

We already have tenants leaving the state in droves and I expect this will hurry that up over the next couple of years. If you want to keep the state's tax income rolling through the doors, start worrying about helping businesses grow and prosper and providing power to folks year round without blackouts or polluting fires. At this rate, there won't be anyone left here to breathe the air you purport to care about keeping clean.

RESPONSE TO COMMENT LETTER #7 – Vogel Properties, Inc., dated April 19, 2021**Response 7.1**

The comment does not raise any issues related to the proposed project's impact on the physical environment under CEQA. The proposed project, with the currently proposed rule stringency, is not expected to cause cargo shippers to divert to other ports in the country. However, for the purpose of the environmental analysis, the Draft EA assumed some cargo growth shipping diversion and included an evaluation on potential effects from cargo growth diversion associated with the currently proposed rule stringency (see Chapter 4.0, Section 4.0.1.3.2, *Cargo Growth Diversion*, and Chapter 4.1, *Air Quality and Greenhouse Gas Emissions*, and Chapter 4.2, *Energy*). See also Response to Comments 1.11, 1.15, and 1.16 regarding the proposed project's impacts to the electricity grid.

EXECUTIVE SUMMARY

A socioeconomic analysis was conducted to assess the potential impacts of Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305 on the four-county region of Los Angeles, Orange, Riverside, and San Bernardino. A summary of the analysis and findings is presented below.

<p>Elements of Proposed Amendments</p>	<p>Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and PR 316 – Fees for Rule 2305 would apply to operators and owners of existing and new warehouses.</p> <p>PR 2305 would be applicable to any existing or new warehouse located in South Coast AQMD’s jurisdiction with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building that may be used for warehousing activities by one or more warehouse operators.</p> <p>PR 2305 would require warehouses subject to the rule to annually take actions which either reduce emissions regionally and/or locally or that facilitate emission reductions.</p> <p>Warehouse owners or operators would be subject to an annual WAIRE Points Compliance Obligation (WPCO). WAIRE Points can be earned by selecting from the following implementation measures in the WAIRE Menu: 1) acquiring and/or using near-zero-emission (NZE) and zero-emission (ZE) trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger or hydrogen fuel station) for cars, trucks, and/or transport refrigeration units (TRUs); 4) installing and/or using onsite solar panels; and 5) installing MERV 16 or greater filters or filter systems in residences, schools, daycares, hospitals, or community centers.</p> <p>WAIRE Points may be earned only for “surplus” actions which go beyond existing federal and state regulations already applicable to warehouse owners or operators earning WAIRE Points. In lieu of satisfying the WPCO via implementation measures, warehouse owners or operators may choose the option to pay a mitigation fee to the South Coast AQMD which would be used in a mitigation program to achieve emissions reduction in the same region as the warehouse.</p> <p>PR 316 – Fees for Rule 2305 establishes fees to recover South Coast AQMD administrative costs associated with ensuring compliance, such as submittal and review of various notifications and reports, implementing an incentive program using up to 6.25% of the mitigation fees from warehouse operators that pay a mitigation fee, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records.</p>
---	--

Community Profile	<p>CalEnviroScreen 3.0 (CES 3.0) GIS data was used to quantify the environmental burdens, prevalence of existing health conditions, and the population demographics in communities adjacent to PR 2305 warehouses. Based on population-weighted averages, these communities face substantially higher burden than the district as a whole.</p> <p>The population within 0.5 miles of a large warehouse has a population-weighted average CES 3.0 Score of 46.6 (85th percentile statewide), while the South Coast AQMD jurisdiction has a population-weighted average CES 3.0 Score of 33.9 (67th percentile statewide). Risks posed from PM_{2.5} and diesel PM are also higher for populations located within 0.5 miles of warehousing facilities.</p> <p>Communities within 0.5 miles have an average asthma rate of 56 per 10,000 individuals (64th percentile) and experience heart attacks at a rate of 9.2 per 10,000 individuals (65th percentile). Comparably, the district-wide percentiles for asthma and cardiovascular incidence rates are 53rd and 57th, respectively.</p> <p>Warehouse-adjacent communities are 62.1% Hispanic and 7.6% African American, while the district-wide population is 45.4% Hispanic and 6.5% African American. In addition, the warehouse-adjacent communities experience poverty at a higher rate (46.7%) than non-warehouse-adjacent communities (38.2%).</p>
Potentially Affected Facilities and Industries	<p>PR 2305 is expected to potentially affect 3,995 warehouse operators at 2,902 warehouses classified under a variety of industry codes, mainly in the goods-movement industries of construction (NAICS 23), manufacturing (NAICS 31-33), wholesale trade (NAICS 42), retail trade (NAICS 44-45), and transportation and warehousing (NAICS 48-49). Of the 3,995 warehouse operators potentially affected by PR 2305, 1,964 are estimated to be in Los Angeles (LA) County, 468 estimated to be in Orange (OR) County, 470 estimated to be in Riverside (RV) County, and 1,093 estimated to be in San Bernardino (SB) County.</p>
Cost Assumptions	<p>All dollar figures presented in 2018 dollars.</p> <p>Purchases of ZE and NZE emission equipment is modeled as a one-time capital cost. Costs/savings resulting from the subsequent use of ZE and NZE equipment is modeled as recurring operating and maintenance (O&M) costs.</p> <p>The potential menu options available to facilities to meet compliance obligations are:</p> <ul style="list-style-type: none"> ▪ ZE and NZE Truck Acquisitions (Capital Cost) and Usage (O&M Cost) ▪ ZE and NZE Truck Visits from a Non-Owned Fleet (O&M) ▪ Electric Vehicle Charger Acquisition (Capital) and Usage (O&M) ▪ Hydrogen Filling Station Acquisition (Capital) and Usage (O&M) ▪ ZE Yard Truck Acquisition (Capital) and Usage (O&M) ▪ Solar Panel Acquisition (Capital) and Usage (O&M) ▪ High-Efficiency Filter Systems Acquisition (Capital) and Replacement Filters (O&M) ▪ TRU Plug Acquisition (Capital) and Usage (O&M) ▪ Pay Mitigation Fee (O&M)

Facilities are also expected to incur recurring O&M costs related to notification and reporting of compliance attainment.

Zero and Near-Zero Emission Truck Acquisition and Usage

Capital costs of Diesel, NZE, and ZE trucks are presented in the tables below. Diesel and NZE capital costs are assumed to remain constant across the entire compliance period. Incremental costs for NZE Class 8 and NZE Class 6 acquisitions are assumed to be \$65,000 and \$30,000, respectively, based on analysis included in the WAIRE Technical Report. The incremental acquisition cost for ZE trucks is set equal to the difference between the capital cost of each ZE truck and its diesel equivalent. An 8% sales tax is also applied to each ZE truck purchase and an additional 12% federal excise tax applies to all ZE Class 8 purchases.

Capital Costs for Diesel Truck Acquisitions

Vehicle Class	Diesel
Class 2b-3	\$50,000
Class 6	\$85,000
Class 8	\$130,000

Capital Cost by ZE Truck Class and Year (Pre-Tax)

Year	ZE Class 8	ZE Class 6	ZE Class 2b-3
2022	\$292,544	\$155,055	\$71,920
2023	\$246,948	\$143,904	\$68,318
2024	\$201,351	\$133,554	\$64,896
2025	\$194,134	\$128,321	\$63,635
2026	\$188,312	\$124,112	\$62,599
2027	\$183,371	\$120,563	\$61,684
2028	\$178,870	\$117,345	\$60,829
2029	\$174,809	\$114,456	\$60,035
2030	\$170,748	\$111,568	\$59,241
2031	\$170,748	\$111,568	\$59,241

Recurring costs associated with the use/visits of facility-owned NZE and ZE trucks is done on a per-mile basis. Per-mile usage costs resulting from fuel consumption and other costs (including maintenance, fees, insurance, and mid-life costs) were calculated for all truck classes and fuel types.

ZE and NZE Emission Truck Visits from a Non-Owned Fleet

The cost of hiring visits from clean trucks is assumed to be based on the per mile total cost of ownership (TCO) for each truck class and fuel type. More specifically, the incremental cost resulting from third-party owned ZE and NZE trucks is assumed to be

the incremental per mile TCO cost (or savings) of clean trucks when compared to the per mile TCO cost of diesel trucks.

A TCO analysis was performed for each truck class and fuel type used for compliance. A 12-year useful life is assumed for all trucks, with a 3-year payback period for equipment costs. The TCO for all diesel and NZE trucks is constant over the compliance period and does not vary based on the year purchased. Because capital costs for ZE trucks are assumed to decline over time, the TCO does vary by purchase year.

Incremental Costs per Visit from a Non-Owned Fleet for All Truck Classes and Fuel Types Purchased in Year 2022

Truck	Cost per Visit
NZE Class 8	\$11.43
NZE Class 6	\$0.93
ZE Class 8	\$98.13
ZE Class 6	-\$0.21
ZE Class 2b-3	\$10.98

Electric Vehicle Charger Acquisition and Usage

Electric vehicle charger costs are calculated on a per unit basis, where construction and permitting costs are incurred on a project basis. The cost is assumed to be \$30,000 per charger. Construction mobilization cost is assumed to be \$10,000 per project with permitting and charger energization costs are assumed to be \$70,000 per project.

Hydrogen Filling Station Acquisition and Usage

Total installed cost is \$2,000,000 per 700 kg/day project. Each Class 8 Truck is assumed to use 2,440 kg/year of hydrogen. Hydrogen usage costs are assumed to decline over time from roughly \$9.75/kg in 2020 to \$6.20/kg in 2031.

ZE Yard Truck Acquisition and Usage

The one-time incremental cost is assumed to be \$210,000 per truck. ZE yard truck capital costs are expected to decline over time due to projected future decreases in battery costs. Each ZE yard truck is assumed to operate for 1,000 hours per year for a total annual usage cost of \$6,250 per yard.

Solar Panel Acquisition and Usage

The price for a rooftop solar panel system (including installation) is set \$2.80 per kW, resulting in a total installed cost of \$280,000 for a 100 kW solar panel system. Solar panel usage is assumed to result in a net savings of \$0.17 per kWh generated. Each 100 kW system has an estimated electrical generation of 165,000 kWh annually.

High-Efficiency Filter Systems Acquisition and Replacement Filters

The estimated costs analyzed for the installation of 25 air filter systems with MERV 16 air filters is \$65,000. The cost for the replacement/installation of 200 MERV 16 air filters is \$60,000.

	<p>TRU Plug Acquisition and Usage The per unit cost of a TRU plug is assumed to be \$1,600. Associated construction and permitting costs are assumed to be \$4,700 and \$7,000 per installation project, respectively. Each installed TRU is assumed to consume 10,658 kWh of electricity annually. Assuming a rate of \$0.18/kWh, annual TRU usage cost is set to \$1,918.</p> <p>Pay Mitigation Fee In lieu of earning WAIRE Points from equipment acquisitions and usage, all facilities may choose to pay a fee of \$1,000 for each WAIRE Point in their WPCO attributed to their facility in every year of compliance.</p> <p>Administrative Costs All operators are also expected to incur expenses related to fees outlined in Rule 316 for Warehouse Operations Notifications (\$29.51/submission), Initial Site Information Reports (\$140.68/submission), and Annual WAIRE Reports (\$392.50/submission).</p> <p>All warehouse operators are also expected to incur costs associated with the reporting related to compiling all relevant compliance data and submitting the information as required by PR 2305. This type of reporting is estimated to be no more than 25 hours of work totaling \$1,250 per year.</p> <p>Many facilities already track and record the necessary truck trip information as part of their normal course of business. However, as a conservative approach for this study, all facilities are assumed to begin recording this data only due to PR 2305. To estimate truck traffic for determining compliance obligations, it is assumed all facilities will install two cameras at a one-time cost of \$2,000 per facility. Staff time will also be required for reviewing recordings. It is conservatively estimated that 144 hours per year (at \$50/hr.) for a total annual cost of \$7,200 per facility.</p> <p>It is also expected that facilities that elect to meet compliance obligations through ZE or NZE truck visits will incur additional costs related to truck tracking. For this analysis, it is assumed that tracking will be done through truck driver surveys and is expected to take one hour of work per week (at \$50/hr.) for a total annual cost of \$2,600 per facility.</p> <p>Facilities that choose to meet their compliance obligations through payment of the mitigation fee are subject to an additional fee equal to 6.25% of the amount of mitigation fee paid as outlined in Proposed Rule 316(f).</p> <p>Total annual administrative costs are expected to range from approximately \$8,900 to \$11,500 per facility per year. Facilities are also expected to incur one-time costs for camera purchase and installation, a Warehouse Operations Notifications Fee, and an Initial Site Information Report Fee.</p>
<p>Scenario Compliance Costs</p>	<p>To estimate the potential impacts of PR 2305 and PR 316, cost estimates for 19 different scenarios were developed to show the range of potential compliance outcomes. A description of the 19 scenarios analyzed is included in Table 15 of this report.</p>

Each scenario is structured to follow a series of choices a warehouse operator may make based on compliance choices from a previous year. As a bounding analysis approach, all warehouses were assumed to only comply with a single scenario approach from 2022 through 2031.

For these scenario analyses, all 2,902 potentially affected facilities were modeled for every year from 2022-2031 using their square footage and the applicable average trip generation rates to determine their compliance obligation. The amount of warehousing space was assumed to grow 1.8% per year, consistent with analysis from SCAG.

A cost summary for all 19 scenarios is included in the table below:

	Equipment	Discounted Total Cost - NPV 4% (in millions)	Average Annual Cost (in millions)	Average Annual Cost (\$/sq. ft)
Sc1	NZE Class 8	\$1,103	\$127	\$0.16
Sc2	NZE Class 8	\$1,220	\$139	\$0.17
Sc3	NZE Class 8	\$374	\$45	\$0.06
Sc4	NZE Class 8	\$750	\$94	\$0.12
Sc5	ZE Class 8	\$942	\$112	\$0.14
Sc6	ZE Class 6 & 8	\$1,604	\$187	\$0.23
Sc7	Mitigation Fee	\$5,264	\$670	\$0.83
Sc7a	Mitigation Fee	\$985	\$114	\$0.14
Sc8	NZE Class 6	\$1,627	\$184	\$0.23
Sc9	NZE Class 6	\$468	\$59	\$0.07
Sc10	ZE Class 6	-\$87	-\$13	-\$0.02
Sc11	Solar	\$9,712	\$979	\$1.21
Sc12	ZE Class 8	\$7,445	\$837	\$1.04
Sc13	ZE Class 2b-3	\$753	\$82	\$0.10
Sc14	ZE Class 2b-3	\$978	\$119	\$0.15
Sc15	Filter System	\$5,057	\$635	\$0.79
Sc16	Filter	\$4,953	\$622	\$0.77
Sc17	TRU	\$46	\$6	\$0.70
Sc18	Yard Trucks	\$1,029	\$120	\$0.15

Average annual costs range from -\$12.6M/yr. (or -\$0.02/sq. ft./yr.) for the lowest cost scenario (Scenario 10: ZE Class 6 Visits from a Non-owned Fleet) up to \$979.0M/yr. (or \$1.21/sq. ft./yr.) for the highest cost scenario (Scenario 11: Solar Panel Installations).

The costs presented here are default calculations broadly applicable to the industry, however individual warehouse operators may identify different specific costs for their operations. Warehouse operators are assumed to gravitate towards the lowest cost options

	for their specific situations. The maximum cost warehouse operators would be expected to incur is \$0.83/sq. ft./yr. resulting from the mitigation fee scenario.						
Jobs and Other Socioeconomic Impacts	<p style="text-align: center;">PR 2305 Expected Annual Foregone Jobs (2022-2031)</p> <table border="1"> <thead> <tr> <th>Cost scenario</th><th>Annual foregone jobs (% of total jobs in LA, OR, RV, and SB counties)</th></tr> </thead> <tbody> <tr> <td>Low-cost scenario (4% interest rate)</td><td>-240 (-0.002%)</td></tr> <tr> <td>High-cost scenario (4% interest rate)</td><td>11,100 (0.10%)</td></tr> </tbody> </table> <p>Based on the above assumptions, the compliance cost of PR 2305, and the application of the Regional Economic Models, Inc. (REMI) model, it is projected -240 – 11,100 jobs will be forgone on average annually from 2022 - 2031 in total across all South Coast AQMD industries for the low-cost (Scenario 10) and high-cost (Scenario 7) scenarios. Scenario 10 assumes all potentially affected warehouse operators comply with PR 2305 through third party visits from Class 6 zero-emission vehicles, while Scenario 7 assumes all potentially affected warehouse operators comply with PR 2305 by paying a mitigation fee and not receiving any funds from the mitigation fee for future compliance with PR 2305. These projected job forgone impacts represent about -0.002% - 0.10% of total employment in the four-county region.</p> <p>Retail trade (NAICS 44-45) and construction (NAICS 23) are expected to bear most of the estimated total compliance cost of PR 2305, with around an estimated total 0 – 3,100 jobs forgone on average annually between 2022 to 2031 for the low-cost (Scenario 10) and high-cost (Scenario 7) scenarios. These forgone jobs are estimated to occur from both direct rule compliance costs, as well as indirect effects of a large group of facilities directing funds away from projects/spending into sectors like retail trade and construction.</p> <p>Estimated forgone jobs are not currently existing jobs which are lost in the future. Rather they are jobs which were expected to be created in the future which no longer are expected to be created, as the total number of jobs in the compliance period is higher than the total number of jobs before the compliance period. Additionally, the negative jobs forgone values presented for Scenario 10 are indicative of estimated additional jobs created if all facilities complied in the manner modeled in Scenario 10.</p>	Cost scenario	Annual foregone jobs (% of total jobs in LA, OR, RV, and SB counties)	Low-cost scenario (4% interest rate)	-240 (-0.002%)	High-cost scenario (4% interest rate)	11,100 (0.10%)
Cost scenario	Annual foregone jobs (% of total jobs in LA, OR, RV, and SB counties)						
Low-cost scenario (4% interest rate)	-240 (-0.002%)						
High-cost scenario (4% interest rate)	11,100 (0.10%)						
Competitiveness	<p>As a result of PR 2305 being implemented, South Coast AQMD staff expects no warehouse relocation and minimal goods movement diversion. These conclusions are made from warehouse relocation estimation work performed by Industrial Economics, Inc. for South Coast AQMD, along with the Port of Los Angeles (POLA) and Port of Long Beach (POLB) clean truck fund rate study.</p> <p>Minimal effects on warehousing demand is expected as evidenced from historical trends in industrial rent prices and warehouse availability. Industrial rental prices in the South Coast AQMD jurisdiction have risen around 63% from 2012 to 2019, from \$5.88 per square foot to \$9.60 per square foot. Over the same time overall warehouse capacity within the South Coast AQMD jurisdiction has risen from 500 million square feet to around 700 million, with vacancy rates falling from around 6% to around 4%. These trends in warehousing operation costs with a concurrent increase in warehouse capacity</p>						

	<p>and decrease in warehouse vacancy lead South Coast AQMD staff to believe PR 2305 would have little effect on regional competitiveness.</p> <p>One competitiveness concern is how PR 2305 may increase annual operating costs in an example warehouse affected by PR 2305. Consider a hypothetical 500,000 sq. ft. warehouse operator. Further consider a low- and high-cost compliance scenario, e.g. Scenario 7a with an average annual compliance cost of \$0.14/sq. ft. and Scenario 7 with an average annual compliance cost of \$0.83/sq. ft. This warehouse is expected to incur an annual PR 2305 compliance cost between \$70,000 and \$415,000. In comparison, annual operating expenses for this warehouse are estimated to be \$13 million according to a 2015 Boyd Company report. This implies the cost of complying with PR 2305 for this example warehouse falls between 0.5% - 3.2% of average annual operating expenses.</p>																																
Impacts of CEQA Alternatives	<p>There are five CEQA alternatives associated with PR 2305. Alternative A, the no project alternative, would mean PR 2305 would not be adopted. Alternative B (less stringent with less emission reduction) increases minimum square feet required to be affected by PR 2305, delays the initial compliance date by one year, and relaxes the rule stringency down to 0.0001. Alternative C (more stringent with more emission reductions) increases rule stringency to 0.005 and increases the stringency phase-in period to seven years. Alternative D (no zero emission) allows for all compliance actions except for zero-emission ones. Alternative E (no natural gas) allows for all compliance actions except for natural gas ones.</p> <table><tr><th></th><th colspan="3">Average Annual, 2022-2031</th></tr><tr><th>Alternatives</th><th>Cost</th><th>Jobs Foregone</th><th>DCF Cost-Effectiveness, 4%; \$ per ton NOx</th></tr><tr><td>Proposed Amendments</td><td>-\$12,600,000 - \$670,200,000</td><td>-240 – 11,100</td><td>-\$11,000 - \$101,000</td></tr><tr><td>Alternative A - No Project</td><td>-</td><td>-</td><td>-</td></tr><tr><td>Alternative B - Decreased Emission Reductions</td><td>\$20,600,000 - \$37,300,000</td><td>150 – 490</td><td>\$139,000 - \$181,000</td></tr><tr><td>Alternative C - Increased Emission Reductions</td><td>-\$60,000,000 - \$1,015,000,000</td><td>-670 – 16,100</td><td>-\$35,000 - \$100,000</td></tr><tr><td>Alternative D - All Natural Gas Options Only</td><td>\$45,000,000 - \$670,200,000</td><td>410 – 11,100</td><td>\$32,000 - \$101,000</td></tr><tr><td>Alternative E - All Electric Options Only</td><td>-\$12,600,000 - \$670,200,000</td><td>-240 - 11,100</td><td>-\$11,000 - \$101,000</td></tr></table>		Average Annual, 2022-2031			Alternatives	Cost	Jobs Foregone	DCF Cost-Effectiveness, 4%; \$ per ton NOx	Proposed Amendments	-\$12,600,000 - \$670,200,000	-240 – 11,100	-\$11,000 - \$101,000	Alternative A - No Project	-	-	-	Alternative B - Decreased Emission Reductions	\$20,600,000 - \$37,300,000	150 – 490	\$139,000 - \$181,000	Alternative C - Increased Emission Reductions	-\$60,000,000 - \$1,015,000,000	-670 – 16,100	-\$35,000 - \$100,000	Alternative D - All Natural Gas Options Only	\$45,000,000 - \$670,200,000	410 – 11,100	\$32,000 - \$101,000	Alternative E - All Electric Options Only	-\$12,600,000 - \$670,200,000	-240 - 11,100	-\$11,000 - \$101,000

Public Health Benefits	<p>Public health benefits resulting from compliance with PR 2305 are calculated using an incidence per ton (IPT) methodology, developed by the U.S. Environmental Protection Agency. The IPT methodology is an approximation based on the general assumption that the relationship between emissions and adverse health outcomes is linear. IPT factors for</p>																																

NOx and direct PM emissions were generated based on the detailed air quality and health impact modeling completed for the 2016 Air Quality Management Plan.

PR 2305 is expected to result in 150 to 300 fewer deaths, 2,500 to 5,800 fewer asthma attacks, and 9,000 to 20,000 fewer work loss days from 2022-2031. Expected total discounted monetized public health benefits range from \$1.2 to \$2.7 billion over the compliance period. The corresponding expected total discounted costs of complying with PR 2305 are \$0.8 to \$1.1 billion over the compliance period of 2022-2031. Most scenarios modeled show about a 3:1 ratio of public health benefits compared to rule costs. Discounted total monetized health benefits and total discounted costs for each modeled scenario are included in the table below.

	<u>Equipment</u>	<u>Discounted Total Costs NPV (4%)</u>	<u>Discounted Total Benefits NPV (4%)</u>
<u>Sc1</u>	<u>NZE Class 8</u>	<u>\$1,103</u>	<u>\$2,713</u>
<u>Sc2</u>	<u>NZE Class 8</u>	<u>\$1,220</u>	<u>\$2,954</u>
<u>Sc3</u>	<u>NZE Class 8</u>	<u>\$374</u>	<u>\$3,615</u>
<u>Sc4</u>	<u>NZE Class 8</u>	<u>\$750</u>	<u>\$2,613</u>
<u>Sc5</u>	<u>ZE Class 8</u>	<u>\$942</u>	<u>\$2,611</u>
<u>Sc6</u>	<u>ZE Class 6 & 8</u>	<u>\$1,604</u>	<u>\$1,101</u>
<u>Sc7</u>	<u>Mitigation Fee</u>	<u>\$5,264</u>	<u>\$13,474</u>
<u>Sc7a</u>	<u>Mitigation Fee</u>	<u>\$985</u>	<u>\$2,473</u>
<u>Sc8</u>	<u>NZE Class 6</u>	<u>\$1,627</u>	<u>\$1,905</u>
<u>Sc9</u>	<u>NZE Class 6</u>	<u>\$468</u>	<u>\$2,239</u>
<u>Sc10</u>	<u>ZE Class 6</u>	<u>-\$87</u>	<u>\$2,449</u>
<u>Sc11</u>	<u>Solar</u>	<u>\$9,712</u>	<u>\$7,744</u>
<u>Sc12</u>	<u>ZE Class 8</u>	<u>\$7,445</u>	<u>\$1,372</u>
<u>Sc13</u>	<u>ZE Class 2b-3</u>	<u>\$753</u>	<u>\$1,212</u>
<u>Sc14</u>	<u>ZE Class 2b-3</u>	<u>\$978</u>	<u>\$1,340</u>
<u>Sc15</u>	<u>Filter System</u>	<u>\$5,057</u>	<u>=</u>
<u>Sc16</u>	<u>Filter</u>	<u>\$4,953</u>	<u>=</u>
<u>Sc17</u>	<u>TRU</u>	<u>\$46</u>	<u>\$221</u>
<u>Sc18</u>	<u>Yard Trucks</u>	<u>\$1,029</u>	<u>\$136</u>

The linearity assumption underpinning the IPT and BPT methodologies employed here is an approximation which ignores complex chemistry, precursor pollutant interactions, and finer-scale geographical effects. To get a refined estimate of the expected reduction in adverse health outcomes resulting from PR 2305, one would need to undertake a detailed analysis similar to the CMAQ and BenMAP modeling performed for the 2016 AQMP, however the level of information needed for that style of analysis is not available given the wide variety of options available for compliance. The screening analysis shown here is therefore the most appropriate and consistent with similar analyses conducted by CARB and EPA.

INTRODUCTION

Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and PR 316 – Fees for Rule 2305 would apply to operators and owners of existing and new warehouses. These warehouses are used to receive, store, and serve as a distribution point for goods. The majority of emissions associated with warehouses are from on-road vehicles such as trucks that deliver goods, and off-road vehicles such as cargo handling equipment. PR 2305 would require warehouses subject to the rule to annually take actions which directly reduce or facilitate reduction of regional and local emissions and/or pollution exposure.

If adopted, PR 2305 would be applicable to any existing or new warehouse located in South Coast AQMD’s jurisdiction with an indoor warehouse floor space of 100,000 square feet or above within a single building usable for warehousing activities by one or more warehouse operators. Warehouse operators are applicable to PR 2305 if their indoor warehouse floor space is 50,000 square feet or above within one of these warehouses. At the time of this analysis, approximately 3,320 facilities located throughout South Coast AQMD’s jurisdiction would be subject to PR 2305. An estimated 418 of these facilities are expected to only be subject to reporting requirements, and the remaining 2,902 warehouses would be required to comply with additional air quality improvement measures.

Warehouse owners or operators of these 2,902 warehouses would be subject to an annual WAIRE Points Compliance Obligation (WPCO). WAIRE Points can be earned by selecting from the following implementation measures in the WAIRE Menu: 1) acquiring and/or using near-zero emissions (NZE) and zero emission (ZE) trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or transport refrigeration units (TRUs); 4) installing and/or using onsite solar panels; and 5) installing MERV 16 or greater filters or filter systems in residences, schools, daycares, hospitals, or community centers. In addition, warehouse operators may apply to earn WAIRE Points through a Custom WAIRE Plan specific to their operations that satisfies prescribed performance metrics. Custom WAIRE Plans could include measures like installing offsite fueling/charging infrastructure or implementing new onsite practices to reduce air quality impacts from electricity consumption (such as installing and operating battery storage, or energy management systems to shift when electricity is used).¹

WAIRE Points may be earned only for “surplus” actions that go beyond existing federal and state regulations with which warehouse owners or operators earning WAIRE Points must comply. In lieu of satisfying the WPCO via implementation measures, warehouse owners or operators may choose the option to pay a mitigation fee to the South Coast AQMD that would be used in a mitigation program to achieve emissions reductions in the community of the facility using this compliance option. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The environmental impacts

¹ Given the uncertainty regarding Custom WAIRE Plans, they are not included as a part of the cost analysis performed in this Socioeconomic Impact Assessment.

associated with the mitigation program are similar to implementation of measures to earn WAIRE Points from the WAIRE Menu.

In addition, South Coast AQMD staff has developed PR 316 – Fees for Rule 2305 to establish fees to recover South Coast AQMD administrative costs associated with ensuring compliance, such as submittal and review of various notifications and reports, Custom WAIRE Plan application evaluation, implementing an incentive program using fees from warehouse operators that choose to pay a mitigation fee,² as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records.

Implementation of the proposed project is expected to result in NO_x and PM, including DPM, emission reductions and reduced associated public health impacts from warehouse activities which is expected to vary depending on the implementation measures employed.

LEGISLATIVE MANDATES

The legal mandates directly related to the assessment of the proposed rule include South Coast AQMD Governing Board resolutions and various sections of the California Health & Safety Code.

South Coast AQMD Governing Board Resolutions

On March 17, 1989 the South Coast AQMD Governing Board adopted a resolution that calls for an economic analysis of regulatory impacts that includes the following elements:

- Affected industries
- Range of probable costs
- Cost-effectiveness of control alternatives
- Public health benefits

Health & Safety Code Requirements

The state legislature adopted legislation which reinforces and expands the Governing Board resolutions for socioeconomic impact assessments. California Health and Safety Code section 40440.8, which became effective on January 1, 1991, requires a socioeconomic impact assessment be performed for any proposed rule, rule amendment, or rule repeal which "will significantly affect air quality or emissions limitations."

Specifically, the scope of the socioeconomic impact assessment should include the following:

- Type of affected industries;
- Impact on employment and the regional economy;
- Range of probable costs, including those to industry;
- Availability and cost-effectiveness of alternatives to the rule;

² A 6.25% charge is added to each mitigation fee paid to cover administrative costs of implementing the incentive program from collected mitigation fees.

- Emission reduction potential; and
- Necessity of adopting, amending, or repealing the rule in order to attain state and federal ambient air quality standards.

Health and Safety Code section 40728.5, which became effective on January 1, 1992, requires the South Coast AQMD Governing Board to actively consider the socioeconomic impacts of regulations and make a good faith effort to minimize adverse socioeconomic impacts. It also expands socioeconomic impact assessments to include small business impacts, specifically it includes the following:

- Type of industries or business affected, including small businesses; and
- Range of probable costs, including costs to industry or business, including small business.

Finally, Health and Safety Code section 40920.6, which became effective on January 1, 1996, requires incremental cost-effectiveness be performed for a proposed rule or amendment which imposes Best Available Retrofit Control Technology or “all feasible measures” requirements relating to ozone, carbon monoxide (CO), oxides of sulfur (SO_x), oxides of nitrogen (NO_x), and their precursors.

COMMUNITY PROFILE

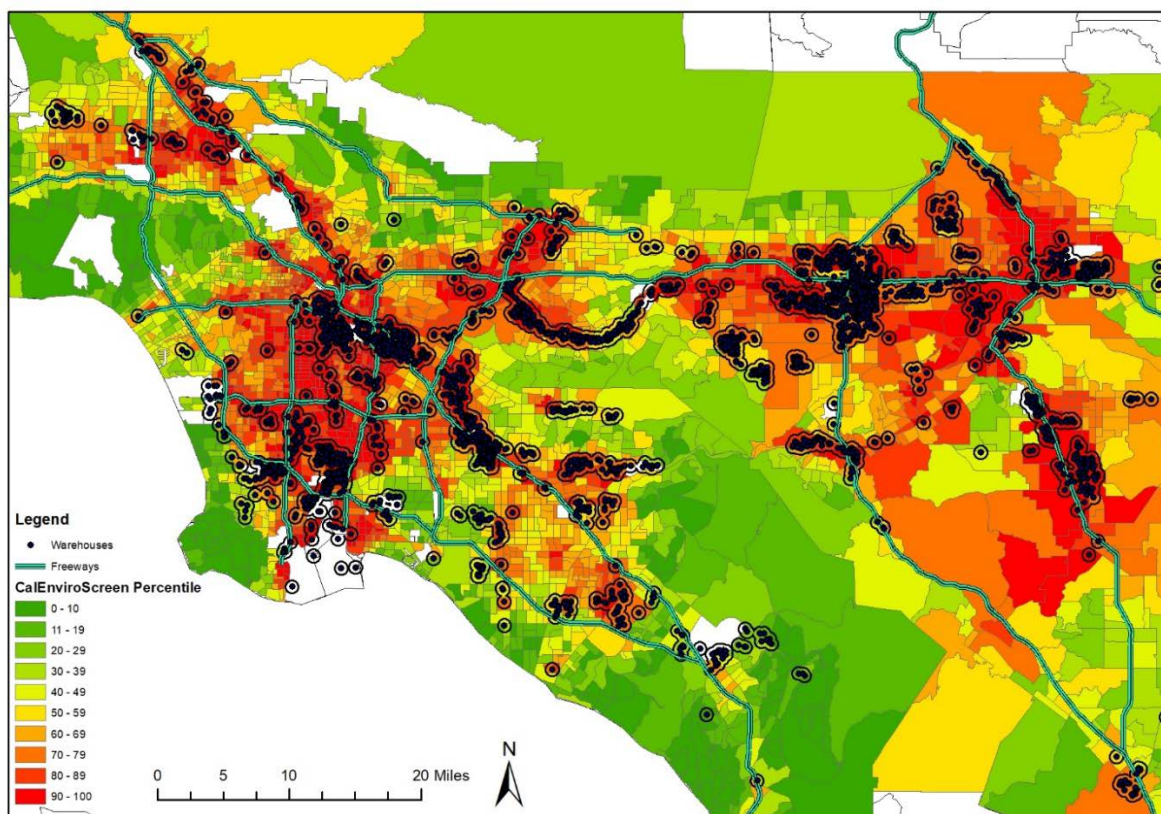

To analyze the existing environmental burdens facing communities adjacent to large warehouse facilities, we rely on CalEnviroScreen 3.0 (CES 3.0) data published by the California Office of Environmental Health Hazard Assessment (OEHHA). CES 3.0 combines local environmental, health, and socioeconomic data to generate an aggregate score for individual census tracts within the state. In general, census tracts with more sensitive populations (high prevalence of asthma, cardiovascular disease, low-birth weight infants) and elevated exposure to environmental pollution (air, groundwater, toxics) tend to have the highest CES 3.0 aggregate scores and are generally considered to be at the highest risk.^{3,4}

The census tract map in Figure 1 displays the location of the 2,902 large warehouse facilities potentially required to take actions to reduce emissions by PR 2305. The census tracts are color-coded with their CES 3.0 percentile, where dark green represents lower aggregate scores and less environmental burden, while dark red represents higher scores and higher burden. A buffer area of 0.5 miles around all warehouse locations is also shown.

³ Additional information on CalEnviroScreen 3.0 can be found here:

<https://oehha.ca.gov/media/downloads/calenviroscreen/report/ces3report.pdf>

⁴ The analysis contained in this section identifies a correlation between proximity to PR 2305 warehouses and increased CES 3.0 scores, it does not attempt to demonstrate a causal relationship. Higher levels of diesel PM have been identified around warehouses relative to other areas, due primarily to the sources of emissions associated with warehouses like trucks and TRUs (CARB 2005, 2020). In addition, trucks are the largest source of NO_x in the air basin, and some of the higher regional ozone and secondary PM levels found in communities near warehouses will therefore be attributable to truck emissions. (South Coast AQMD, 2017)

Figure 1: Map of Warehousing Facilities in the South Coast AQMD Jurisdiction

Using buffers of 0.5, 1, and 2 miles around potentially affected warehouse facilities, spatial statistics were calculated using ArcGIS to quantify the environmental burdens, prevalence of existing health conditions, and the population demographics in adjacent communities. Table 1 below summarizes some of the environmental burdens facing communities located near large warehousing facilities in the South Coast AQMD jurisdiction.

Based on population-weighted averages, these communities face substantially higher burden than the district as a whole (including both warehouse-adjacent and non-warehouse-adjacent communities).⁵ The population within 0.5 miles of a large warehouse has a population weighted average CES 3.0 Score of 46.6 (85th percentile statewide), while the South Coast AQMD jurisdiction as a whole has a population weighted average CES 3.0 Score of 33.9 (67th percentile statewide).⁶ Risks posed from PM_{2.5} and diesel PM are also higher for populations located within 0.5 miles of warehousing facilities. The higher South Coast AQMD average for ozone compared to warehouse adjacent communities reflects the regional nature of ozone formation.

⁵ Population-weighted average calculations assume population is uniformly distributed within census tracts.

⁶ Preliminary results presented at the October 9, 2020 PR 2305 Working Group Meeting and the February 16, 2021 Public Workshop reported that the population within 0.5 miles of a large warehouse was in the 80th percentile of CES 3.0 scores, while the population of the South Coast AQMD as a whole was in the 61st percentile. These results were based on taking a population-weighted average of CES 3.0 score percentiles directly. The updated percentiles reported in this document are based on a calculated population-weighted average CES 3.0 Score that is then compared to all statewide CES 3.0 Scores to determine the percentile.

Trucks are the largest source of NO_x emissions in the air basin and truck activity is focused at warehouses. However, since NO_x emissions spread out along an entire truck's journey to/from a warehouse and ozone is formed from secondary reactions in the atmosphere, ozone does not have as pronounced localized effects as pollutants like diesel PM.

Table 1: Population-Weighted Average CES 3.0 Scores, Ambient Concentrations of Ozone and PM_{2.5}, and Diesel PM Emissions⁷

	Population	CES 3.0 Score (percentile)	Ozone, ppm (percentile)	PM _{2.5} , µg/m ³ (percentile)	Diesel PM, kg/day (percentile)
SCAQMD - ALL	16,114,899	33.9 (67)	0.052 (72)	11.3 (66)	21.1 (65)
Within 0.5 miles of at least one PR 2305 warehouse	2,401,554	46.6 (85)	0.051 (69)	11.9 (69)	25.5 (77)
Within 1 mile of at least one PR 2305 warehouse	6,200,544	43.2 (80)	0.050 (65)	11.8 (69)	25.0 (76)
Within 2 miles of at least one PR 2305 warehouse	11,589,892	38.4 (74)	0.051 (69)	11.7 (69)	23.8 (73)

Additionally, the prevalence of preexisting health conditions is higher on average in communities near PR 2305 warehouses. See Table 2 below. Those communities within 0.5 miles have an average asthma rate of 56 per 10,000 individuals (64th percentile) and experience heart attacks at a rate of 9.2 per 10,000 individuals (65th percentile). Comparably, the district-wide percentiles for asthma and cardiovascular incidence rates are 53rd and 57th, respectively.

Tables 3 and 4 below summarize socioeconomic and ethnic characteristics of adjacent and non-adjacent communities. Warehouse-adjacent communities are 62.1% Hispanic and 7.6% African American, while the district-wide population is 45.4% Hispanic and 6.5% African American. In addition, the warehouse-adjacent communities experience poverty at a higher rate (46.7%) than non-warehouse-adjacent communities (38.2%).

⁷ Population data is from 2010 US Census. Ozone scores reported as mean of summer months (May-October) of the daily maximum 8-hour ozone concentration (ppm), averaged over three years (2012 to 2014). PM_{2.5} scores reported annual mean concentration of PM_{2.5} (average of quarterly means, µg/m³), over three years (2012 to 2014). Diesel PM scores reported as gridded diesel PM emissions from on-road and non-road sources for a 2012 summer day in July (kg/day).

Table 2: Population-Weighted Average Incidence Rates of Asthma, Cardiovascular Issues and Low Birth Weight (per 10,000 individuals) in Warehouse-Adjacent Communities

	Asthma (percentile)	Cardiovascular (percentile)	Low Birth Weight (percentile)
SCAQMD - ALL	47.6 (53)	8.5 (57)	5.1 (55)
Within 0.5 miles of at least one PR 2305 warehouse	55.5 (64)	9.2 (65)	5.4 (63)
Within 1 mile of at least one PR 2305 warehouse	55.0 (63)	9.1 (64)	5.4 (62)
Within 2 miles of at least one PR 2305 warehouse	52.3 (59)	8.8 (61)	5.3 (60)

Table 3: Poverty and Unemployment Rates in Warehouse Adjacent Communities

	Poverty Rate (percentile)	Unemployment (percentile)
SCAQMD - ALL	38.2 (57)	10.2 (58)
Within 0.5 miles of at least one PR 2305 warehouse	46.7 (69)	11.1 (64)
Within 1 mile of at least one PR 2305 warehouse	45.2 (67)	10.9 (63)
Within 2 miles of at least one PR 2305 warehouse	42.1 (63)	10.6 (61)

Table 4: Ethnicity Rates in Warehouse Adjacent Communities

	Hispanic %	White %	African American %	Native American %	Asian American %
SCAQMD - ALL	45.4	32.3	6.5	0.2	13.1
Within 0.5 miles of at least one PR 2305 warehouse	62.1	17.5	7.6	0.2	10.9
Within 1 mile of at least one PR 2305 warehouse	59.1	19.9	7.4	0.2	11.6
Within 2 miles of at least one PR 2305 warehouse	52.4	25.1	7.4	0.2	12.8

AFFECTED INDUSTRIES/FACILITIES

Affected Industries and Industry Profile

PR 2305 covers warehousing operations with greater than 100,000 square feet due to their associated emissions of nitrogen oxide and particulate matter from fossil-fuel combustion of off-site and on-site trucks. Warehouse operators are applicable to PR 2305 if their indoor warehouse floor space is 50,000 square feet or above within one of these warehouses. Examples of these operations are visitations of diesel trucks of sizes varying from light and medium Class 2b-3 trucks to larger heavy Class 8 trucks, as well as on-site usage of hostler/yard trucks.

Using CoStar data of warehousing operations within the South Coast AQMD jurisdiction, South Coast AQMD staff expects PR 2305 to affect 2,902 warehousing locations, consisting of 3,995 warehouse operators, in that they would be required to earn WAIRE Points to meet their WPCO.⁸ More operators are expected affected than warehousing locations, i.e. physical addresses of warehouses, because many warehouses host multiple tenants/businesses. An estimated additional 418 warehouses are expected to only be subject to reporting requirements of PR 2305.

Currently industry categories are recorded and reported as numerical codes coming from the North American Industry Classification System, or NAICS. NAICS codes are hierarchical, and are as long as six digits, with the first digit indicating broad industry categories, and each additional digit indicates a more refined industry within the prior digit's relative broader industry.

⁸ CoStar data provides both warehouse locations and historical operator data, which South Coast AQMD staff believes includes historical operators no longer in operation. Consequently, South Coast AQMD staff estimates the number of PR 2305 potentially affected operators as the number of single-tenant warehouses (1,777 single-tenant and 32 unknown # of tenants) plus an assumed two operators for each multi-tenant warehouse (1,093 multi-tenant warehouses, or 2,186 warehouse operators), for a total of 3,995.

Although NAICS information of all estimated 3,995 warehouse operators potentially affected by PR 2305 would ideally be presented, several factors complicate that analysis here. First, the 3,995 estimated potentially affected warehouse operators comes from 1,809 single-tenant warehouses (1,777 single-tenant and 32 unknown number of tenants) and 1,093 multi-tenant warehouses. Warehouse operator data from CoStar does not distinguish from historical and current operators, South Coast AQMD staff was therefore unable to definitively assign operators to multi-tenant warehouses. Single-tenant warehouse information is more readily available (and these facilities are more prevalent) and this report presents NAICS information of those operators below.

Using facility-specific information collected from Dun and Bradstreet, as well as South Coast AQMD staff internet searches, South Coast AQMD staff believes it has reliable industry (NAICS) information for 1,714 of the assumed 3,995 warehouse operators potentially affected by PR 2305.⁹ Table 5 presents the industries covering these identified warehouse operators potentially affected by PR 2305. Approximately 89% of these warehouse operators are associated with NAICS codes belonging to the “goods movement” sector.¹⁰

Table 6 lists the industries within the “goods movement” sector, each industry’s estimated total number of facilities potentially subject to PR 2305, and total number of facilities in each industry.^{11,12} Approximately 2.3% of all facilities in the potentially affected “goods movement” sector are expected to be affected by PR 2305, with 7.1% of all facilities in the transportation and warehousing sector expected to be affected.

⁹ South Coast AQMD staff merged CoStar warehouse owner and operator data, specifically warehouse size, with Dun and Bradstreet facility data. The number of “reliable” potentially affected warehouse operators combined with Dun and Bradstreet data was determined by using Microsoft Excel’s “Fuzzy Lookup” add-in (<https://www.microsoft.com/en-us/download/details.aspx?id=15011>), matching CoStar warehouse operator and Dun and Bradstreet warehouse operator data. “Reliable” matches are those matches occurring for single-tenant warehouses with matches found to be greater than 85% similar when matching on operator name and warehouse address. This provided 967 “reliable” matches. South Coast AQMD staff performed internet searches to determine the NAICS for the remaining single-tenant warehouse operators. This resulted in an additional 747 matches, for a total of 1,714 single-tenant warehouse operators with NAICS information.

¹⁰ Construction (NAICS 23), manufacturing (NAICS 31-33), wholesale trade (NAICS 42), retail trade (NAICS 44-45), and transportation and warehousing (NAICS 48-49) are identified by the Southern California Association of Governments (SCAG) as the industries which make up the “goods movement” sector (https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf).

¹¹ Total facilities is estimated and provided by Economic Modeling Specialists International (EMSI), accessed February 25th, 2021, <https://www.economicmodeling.com/>. This data relies on payroll information provided by facilities for the U.S. Bureau of Labor Statistics’ Quarterly Census of Employment and Wages.

¹² Total potentially affected facilities is estimated for each industry by multiplying its identified potentially affected operators by the number of total assumed potentially affected operators divided by the number of total identified potentially affected operators ($3,995/1,714 = 2.331$).

Table 5: PR 2305 Identified Potentially Affected Warehouse Operators

NAICS	Industry description	Identified potentially affected operators
11	Agriculture, Forestry, Fishing and Hunting	3
22	Utilities	1
23	Construction	33
31-33	Manufacturing	455
42	Wholesale Trade	389
44-45	Retail Trade	216
48-49	Transportation and Warehousing	425
51	Information	14
52	Finance and Insurance	9
53	Real Estate and Rental and Leasing	26
54	Professional, Scientific, and Technical Services	49
56	Administrative and Support and Waste Management and Remediation Services	61
61	Educational Services	5
62	Health Care and Social Assistance	6
81	Other Services (except Public Administration)	19
92	Public Administration	3
	Total	1,714

Note: This table presents the subset of single-tenant warehouse operators expected to earn WAIRE points to comply with PR 2305 for which South Coast AQMD staff believes reliable industry information exists from Dun and Bradstreet or South Coast AQMD staff web searches as of 03/26/2021.

Table 6: PR 2305 Estimated Potentially Affected Warehouse Operators and Regional Industry Comparison for "Goods Movement" Sector

NAICS	Industry	Estimated potentially affected operators	Total facilities in 2020	Percent of facilities potentially affected by PR 2305
23	Construction	77	34,266	0.22%
31-33	Manufacturing	1,061	21,646	4.90%
42	Wholesale Trade	907	33,596	2.70%
44-45	Retail Trade	503	48,904	1.03%
48-49	Transportation and Warehousing	991	14,272	6.94%
	TOTAL	3,538	152,683	2.32%

Note: Total potentially affected facilities is estimated for each industry by multiplying its identified potentially affected operators by the number of total assumed potentially affected operators divided by the number of total identified potentially affected operators ($3,995/1,714 = 2.331$). Data on total facilities estimated and provided by Economic Modeling Specialists International. Individual operator values may not sum to total due to rounding of estimates.

Of the 3,995 PR 2305 potentially affected warehouse operators expected to earn WAIRE Points to comply with PR 2305, 1,964 are estimated to be in Los Angeles (LA) County, 468 estimated to be in Orange (OR) County, 470 estimated to be in Riverside (RV) County, and 1,093 estimated to be in San Bernardino (SB) County.

Although detailed economic information about specific PR 2305 potentially affected warehousing operators is unavailable, economic information about the broader industries which include these facilities is available. Table 7 presents a 2018 economic profile of the “goods movement” industries potentially affected by PR 2305 located in LA, OR, RV, and SB counties. These industries consist of about 147,000 facilities; facilities which earn an average annual revenue of about \$4.9 million. These industries employ about 3,160,000 employees with an average annual salary of about \$63,000.

Table 7: PR 2305 Potentially Affected Industries - Industry Profile in LA, OR, RV, and SB counties (2018)

Approximate Number of Facilities	147,473
Approximate Number of Employees	3,161,460
Approximate Average Number of Employees per Facility	21
Approximate Annual Average Salary per Employee	\$63,010
Approximate Annual Average Revenue per Facility	\$4,868,717

Note: Data estimated and provided by Economic Modeling Specialists International for all “goods movement” industries with facilities expected to be affected by PR 2305, specifically NAICS 23, 31-33, 42, 44-45, and 48-49.

As illustrated by Figure 1, total employment in LA, OR, RV, and SB counties in the “goods movement” industries potentially affected by PR 2305 was around 2.64 million in 2009, and around 3.16 million in 2018. This indicates about a 20 percent growth in employment in the “goods movement” industries potentially affected by PR 2305 from 2009-2018, which is in line with the broader trends within California.

Figure 1: PR 2305 Potentially Affected Industries Employment 2009-2018

Small Businesses

South Coast AQMD defines a "small business" in Rule 102 as one which employs 10 or fewer persons and which earns less than \$500,000 in gross annual receipts. South Coast AQMD also defines "small business" for the purpose of qualifying for access to services from the South Coast AQMD's Small Business Assistance Office as a business with an annual receipt of \$5 million or less, or with 100 or fewer employees.

U.S. Small Business Administration (SBA) definitions of small businesses vary by six-digit North American Industrial Classification System (NAICS) code. For PR 2305 potentially affected industries, a firm is considered a "small business" by SBA if it has under a certain number of employees or a certain amount of revenue, which can be found on the SBA website.¹³

In addition to South Coast AQMD and SBA's definitions of a small business, the federal Clean Air Act Amendments (CAAA) of 1990 also provides a definition of a small business. The CAAA classifies a business as a "small business stationary source" if it: (1) employs 100 or fewer employees, (2) emits less than 10 tons per year of any single pollutant and less than 20 tons per year of all pollutants, and (3) is a small business as defined under the federal Small Business Act ([15 U.S.C. Sec. 631, et seq.](#)). Given most PR 2305 potentially affected facilities would be newly regulated by South Coast AQMD if PR 2305 is passed by the South Coast AQMD Governing Board, South Coast AQMD staff does not have readily available pollution information to present this small business classification.

Of the 1,714 PR 2305 identified potentially affected operators, revenue and employee data from the Dun and Bradstreet Enterprise Database (D&B) was available and reasonable for 904. A facility's D&B revenue data was considered unreliable if its reported/estimated annual revenue was less than expected annual rent. Expected annual rent for each single-tenant warehouse operator was estimated as warehouse rentable business area times the South Coast AQMD jurisdictional annual average rental price of \$10.56/sq. ft. (\$0.88/sq. ft. is the South Coast AQMD jurisdictional monthly average rental price).¹⁴ The number of these facilities potentially affected by PR 2305 classified as small business by classification definition are listed in Table 8 below:

Table 8: PR 2305 Potentially Affected Facilities Small Business Tabulation

Small Business Definition	# Small Businesses
South Coast AQMD (Rule 102)	0 out of 904
South Coast AQMD (Small Business Assistance Office)	197 out of 904
U.S. Small Business Administration (SBA)	292 out of 904

Note: Total number of potentially affected warehouse operators considered in each small business classification is based on those single-tenant warehouse operators with valid employee and revenue information from Dun and Bradstreet Enterprise Database.

¹³ The latest SBA definition of small businesses by industry can be found at the following website:

<http://www.sba.gov/content/table-small-business-size-standards>.

¹⁴ Industrial Economics, Inc., 2020. [http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf?sfvrsn=8](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf?sfvrsn=8).

The smallest warehouse PR 2305 could directly affect would have 100,000 square feet of warehousing space, resulting in an estimated annual rental cost of \$1,056,000. To be in operation, these facilities are expected to earn more than \$1 million in revenue, ruling them out from South Coast AQMD's Rule 102 definition of small business.

COMPLIANCE COSTS

Methods and Sources of Data

Analysis Timeframe

This analysis considers an analysis timeframe from 2022-2031, as PR 2305 would be implemented starting 2022. Although a sunset of PR 2305 is presented within its rule language, that is likely to occur beyond the 2022-2031 timeframe of this analysis and thus is not analyzed within this report.

Cost Estimate Year

All costs presented in this report are estimated 2018 dollars. The per-unit dollar figures used for any cost/benefit resulting from PR 2305 passing are either 2018 reported costs/benefits, or costs/benefits from earlier years inflated to 2018 values using the all-industry producer price index reported by the CoreLogic® Marshall & Swift® Equipment Cost Index (M&S index).

One-Time and Recurring Costs

Potentially affected facilities can meet their compliance obligation through the purchase or usage of near-zero emission (NZE) and zero emission (ZE) equipment or equipment that facilitates its use. Facilities can opt to pay a mitigation fee in lieu of the purchase and/or usage of equipment. Purchases of ZE and NZE emission equipment is modeled as a one-time capital cost. Costs/savings resulting from the subsequent use of ZE and NZE equipment is modeled as recurring operating and maintenance (O&M) costs.

The potential menu options available to facilities to meet compliance obligations are:

- ZE and NZE truck acquisitions (capital cost) and Usage (O&M cost);
- ZE and NZE truck visits from a third-party fleet (O&M);
- Electric vehicle charger acquisition (capital) and usage (O&M);
- Hydrogen filling station acquisition (capital) and usage (O&M);
- ZE and NZE yard truck acquisition (capital) and usage (O&M);
- Solar panel acquisition (capital) and usage (O&M);
- High-efficiency filter systems acquisition (capital) and replacement filters (O&M);
- Transportation refrigeration unit (TRU) plug acquisition (capital) and usage (O&M); and
- Paying mitigation fee (O&M).

Additionally, facilities are expected to incur recurring O&M costs related to notification and reporting of compliance attainment.

Below is a summary of the cost assumptions underlying this socioeconomic impact assessment. More detailed information on the analysis underlying these assumptions can be found in the WAIRE Menu Technical Report provided in Appendix B of the PR 2305 & PR 316 Draft Staff Report.

Zero and Near-Zero Emission Truck Acquisition and Usage

Table 9 below presents capital costs of Diesel and NZE trucks. These costs are assumed to remain constant across the entire compliance period.^{15,16} Per unit incremental acquisition costs of NZE Class 8 and Class 6 trucks are assumed to be \$65,000 and \$30,000, respectively. These costs are inclusive of state and local sales and federal excise taxes and based on research documented in the WAIRE Menu Technical Report.

Capital costs of ZE trucks are expected to decrease over time as a result of decreased battery costs. Projected capital costs over time for each ZE vehicle class can be found in Table 10 below.^{17,18} The incremental acquisition cost is set equal to the difference between the capital cost of each ZE truck and its diesel equivalent. An 8% sales tax and 12% federal excise tax is also applied to each ZE truck acquisition.

When the number of NZE or ZE truck purchases for a given class in any compliance year falls below the expected number of truck purchases in CARB's EMFAC 2017 projections, the incremental acquisition cost for each truck class and fuel type is used. However, if the number of truck purchases in a given year exceeds EMFAC 2017 projections, the full capital cost associated with each truck type is used for those trucks above projections.

Table 9: Capital Costs for Diesel and NZE Truck Acquisitions

Vehicle Class	Diesel	NZE
Class 2b-3	\$50,000	N/A
Class 6	\$85,000	\$115,000
Class 8	\$130,000	\$195,000

Note: Capital costs for diesel trucks listed here are pre-tax. NZE capital costs include sales taxes (Class 8 and Class 6) and federal excise taxes (Class 8 only).

¹⁵ Capital costs for diesel trucks can be found in Table C-6 of the CARB ACT Appendix C-1 – SRIA submitted to DoF: <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

¹⁶ Capital costs for NZE Class 8 trucks can be found in Table 31 of the 2018 Feasibility Assessment for Drayage Trucks: <https://cleanairactionplan.org/documents/final-drayage-truck-feasibility-assessment.pdf/>. Class 6 capital costs were calculated by taking the ratio of capital costs for NZE Class 6 and 8 trucks found in the WAIRE Menu Technical Report.

¹⁷ Capital costs for each ZE truck class (2b-3, 6, 8) for model years 2024-2030 are taken from CARB's ACT Appendix C-1 – SRIA as submitted to DoF (Table C-7): <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>.

¹⁸ To fill in missing years (2022, 2023), ZE capital costs were linearized between 2018 and 2024. 2031 costs are assumed equal to 2030 costs.

Table 10: Capital Cost by ZE Truck Class and Year

Year	ZE Class 8	ZE Class 6	ZE Class 2b-3
2022	\$292,544	\$155,055	\$71,920
2023	\$246,948	\$143,904	\$68,318
2024	\$201,351	\$133,554	\$64,896
2025	\$194,134	\$128,321	\$63,635
2026	\$188,312	\$124,112	\$62,599
2027	\$183,371	\$120,563	\$61,684
2028	\$178,870	\$117,345	\$60,829
2029	\$174,809	\$114,456	\$60,035
2030	\$170,748	\$111,568	\$59,241
2031	\$170,748	\$111,568	\$59,241

Note: Capital costs for all ZE trucks listed here are pre-tax

Recurring costs associated with the use/visits of facility-owned NZE and ZE trucks is done on a per-mile basis. Per-mile usage costs resulting from fuel consumption and other costs (including maintenance, fees, insurance, and mid-life costs) were calculated for all truck classes and fuel types.^{19,20,21} A detailed breakdown of total usage costs for Class 8, 6, and 2b-3 trucks for all relevant fuel types can be found in Tables 11, 12, and 13 below. Per-mile usage costs (not considering capital costs) of Class 6 and 8 NZE trucks is slightly lower than diesel, and results in a modest net savings to facilities. Per-mile usage costs of Class 2b-3, 6, and 8 ZE trucks is significantly lower than diesel and results in a net savings to facilities.

¹⁹ Data on maintenance costs, mid-life costs, fuel cost and fuel economy for diesel, ZE and NZE trucks is taken from the WAIRE Menu Technical Report.

²⁰ Vehicle fees for all ZE and diesel truck classes are taken from CARB's ACT Total Cost of Ownership document: <https://ww3.arb.ca.gov/regact/2019/act2019/apph.pdf>. Fees for NZE trucks are assumed to be the same as diesel trucks.

²¹ Annual insurance costs assumed to be equal to 3% of vehicle value. Vehicle value assumed to decrease by 10% in years 2-8 and an additional 5% in years 9-11. The average annual cost is included in the per mile cost analysis.

Table 11: Usage Costs for Class 8 Trucks by Fuel Type

	Diesel	ZE	NZE
Annual Miles	54,000	42,000	54,000
Fuel Cost	\$3.74	\$0.15	\$2.92
Fuel Efficiency (miles per)	5.9	0.48	5.1
\$/mile	\$0.63	\$0.31	\$0.57
Total Fuel Cost	\$34,231	\$13,125	\$30,918
Maintenance Cost (per mile)	\$0.19	\$0.14	\$0.21
Total Maintenance Cost	\$10,260	\$5,985	\$11,340
Annualized Mid-life Cost	-	\$3,579	-
Fees	\$3,112	\$2,847	\$3,112
Insurance Costs	\$1,934	\$3,950	\$2,389
Total Other Cost	\$15,306	\$16,361	\$16,841
Total Fuel + Other Cost	\$49,536	\$29,486	\$47,759
\$/mile	\$0.92	\$0.70	\$0.88

Table 12: Usage Costs for Class 6 Trucks by Fuel Type

	Diesel	ZE	NZE
Annual Miles	24,000	24,000	24,000
Fuel Cost	\$3.74	\$0.17	\$2.42
Fuel Efficiency (miles per)	7.4	1.04	6.3
\$/mile	\$0.51	\$0.16	\$0.38
Total Fuel Cost	\$12,130	\$3,923	\$9,219
Maintenance Cost (per mile)	\$0.22	\$0.17	\$0.24
Total Maintenance Cost	\$5,280	\$3,960	\$5,760
Annualized Mid-life Cost	-	-	-
Fees	\$1,300	\$1,272	\$1,300
Insurance Costs	\$1,264	\$2,006	\$1,466
Total Other Cost	\$7,844	\$7,238	\$8,525
Total Fuel + Other Cost	\$19,974	\$11,161	\$17,744
\$/mile	\$0.83	\$0.47	\$0.74

Table 13: Usage Costs for Class 2b-3 Trucks by Fuel Type

	Diesel	ZE
Annual Miles	15,000	15,000
Fuel Cost	\$3.74	\$0.18
Fuel Efficiency (miles per)	23.2	1.79
\$/mile	\$0.16	\$0.10
Total Fuel Cost	\$2,418	\$1,508
Maintenance Cost (per mile)	\$0.17	\$0.13
Total Maintenance Cost	\$2,550	\$1,913
Annualized Mid-life Cost	-	-
Fees	\$927	\$861
Insurance Costs	\$744	\$1,070
Total Other Cost	\$4,221	\$3,843
Total Fuel + Other Cost	\$6,639	\$5,351
\$/mile	\$0.44	\$0.36

ZE and NZE Emission Truck Visits from a Non-Owned Fleet

Facilities can earn points toward their compliance obligation by arranging visits from ZE or NZE trucks owned by a third-party. The cost of hiring visits from clean trucks is assumed to be based on the per mile total cost of ownership (TCO) for each truck class and fuel type. More specifically, the incremental cost resulting from third-party owned ZE and NZE trucks are assumed to be the incremental per mile TCO cost (or savings) of clean trucks when compared to the per mile TCO cost of diesel trucks.

A TCO analysis was performed for each truck class and fuel type for each compliance year using the assumed acquisition and usage costs outlined in Tables 9-13. Tables 14, 15, and 16 below include a breakdown of the total cost of ownership for all Class 8, Class 6, and Class 2b-3 trucks purchased in year 2022, respectively. A 4% financing rate is used over a five-year financing period. A 12-year useful life is assumed for all trucks and a 4% discount rate is used to discount all costs in years beyond 2022. The TCO for all diesel and NZE trucks is constant over the compliance period and does not vary based on the year purchased. Because capital costs for ZE trucks are assumed to decline over time, the TCO does vary by purchase year.

Table 14: Total Cost of Ownership for All 2022 Class 8 Trucks

	Diesel	ZE	NZE
Annual Miles	54000	42000	54000
Total Capital Cost (with Taxes + Financing)	\$162,240	\$365,095	\$202,800
Total Fuel Cost	\$334,106	\$128,106	\$301,771
Total Maintenance	\$100,142	\$58,416	\$110,684
Midlife Cost	\$0	\$34,934	\$0
Total Fees	\$30,375	\$27,786	\$30,375
Insurance Costs	\$18,874	\$38,555	\$23,317
Total Other Cost	\$149,392	\$159,692	\$164,376
Residual	-\$15,453	-\$7,727	-\$15,453
Total Cost of Ownership	\$630,285	\$645,166	\$653,494
TCO \$/mile	\$0.97	\$1.28	\$1.01

Table 15: Total Cost of Ownership for All 2022 Class 6 Trucks

	Diesel	ZE	NZE
Annual Miles	24000	24000	24000
Total Capital Cost (with Taxes + Financing)	\$95,472	\$174,158	\$119,600
Total Fuel Cost	\$118,392	\$38,291	\$89,982
Total Maintenance	\$51,535	\$38,651	\$56,220
Midlife Cost	\$0	\$0	\$0
Total Fees	\$12,684	\$12,412	\$12,684
Insurance Costs	\$12,341	\$19,582	\$14,305
Total Other Cost	\$76,560	\$70,646	\$83,209
Residual	-\$10,477	-\$5,239	-\$10,477
Total Cost of Ownership	\$279,947	\$277,856	\$282,314
TCO \$/mile	\$0.97	\$0.96	\$0.98

Table 16: Total Cost of Ownership for All 2022 Class 2b-3 Trucks

	Diesel	ZE
Annual Miles	15000	15000
Total Capital Cost (with Taxes + Financing)	\$56,160	\$80,781
Total Fuel Cost	\$23,602	\$14,723
Total Maintenance	\$24,889	\$18,667
Midlife Cost	\$0	\$0
Total Fees	\$9,053	\$8,400
Insurance Costs	\$7,259	\$10,442
Total Other Cost	\$41,201	\$37,509
Residual	-\$8,207	-\$4,104
Total Cost of Ownership	\$112,756	\$128,908
TCO \$/mile	\$0.63	\$0.72

The incremental cost analysis assumes incremental cost is absorbed over a 3-year period, instead of the full 12-year useful life. The incremental cost is therefore multiplied by four ($12 \div 3 = 4$) to determine the default cost for truck visits. Therefore, to calculate the incremental cost of visits from a non-owned fleet you begin by taking the difference in the TCO per mile cost between the clean vehicle and its diesel equivalent ($\text{TCO } \$/\text{mile}_{\text{clean}} - \text{TCO } \$/\text{mile}_{\text{diesel}}$), then multiplying by the average number of miles per visit (79.8 miles per visit for Class 8, 28.4 for Class 6, and 30.6 for Class 2b-3), and then multiplying by four. If the difference in the TCO per mile cost between the clean vehicle and its diesel equivalent is less than zero (cost savings), then we do not assume a 3-year payback and, thus, do not multiply by 4. See Table 17 below for a summary of incremental costs (in \$/visit) for visits from a non-owned fleet by fuel type, truck class, and year of purchase.

Table 17: Incremental Cost per Visit from a Non-Owned Fleet for All Truck Classes and Fuel Types by Year of Purchase

	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031
NZE Class 8	\$11.43	\$11.43	\$11.43	\$11.43	\$11.43	\$11.43	\$11.43	\$11.43	\$11.43	\$11.43
NZE Class 6	\$0.93	\$0.93	\$0.93	\$0.93	\$0.93	\$0.93	\$0.93	\$0.93	\$0.93	\$0.93
ZE Class 8	\$98.13	\$62.09	\$26.05	\$20.35	\$15.75	\$11.84	\$8.28	\$5.07	\$1.86	\$1.86
ZE Class 6	-\$0.21	-\$1.44	-\$2.59	-\$3.17	-\$3.63	-\$4.03	-\$4.38	-\$4.70	-\$5.02	-\$5.02
ZE Class 2b-3	\$10.98	\$8.23	\$5.62	\$4.66	\$3.86	\$3.17	\$2.51	\$1.91	\$1.30	\$1.30

Electric Vehicle Charger Acquisition and Usage

One-time capital costs resulting from Level 3 electric vehicle charger acquisition include the cost of the charger, as well as the construction, permitting, and charger energization costs related to charger installation. Chargers costs are calculated on a per-unit basis, where construction and permitting costs are incurred on a project basis. The cost is assumed to be \$30,000 per charger. Construction mobilization cost is assumed to be \$10,000 per project with permitting and charger energization costs are assumed to be \$70,000 per project. Costs are taken from the WAIRE Menu Technical Report Appendix B. Each charger is expected to dispense 165,000 kWh per year.

Electricity costs are accounted for in the per-mile usage costs of Class 6 and Class 8 ZE Trucks. To avoid double-counting, it is assumed no costs are incurred for charger usage in this analysis.

Hydrogen Filling Station Acquisition and Usage

The one-time cost of hydrogen station acquisition and installation and the recurring costs of subsequent usage are taken from the WAIRE Menu Technical Report. Total installed cost is \$2,000,000 per 700 kg/day project. Each Class 8 Truck is assumed to use 2,440 kg/year of hydrogen. It is assumed that hydrogen usage costs decline over time from roughly \$9.75/kg in 2020 to \$6.20/kg in 2031.²²

ZE Yard Truck Acquisition and Usage

ZE yard trucks currently cost about \$310,000 while their diesel equivalent costs about \$100,000.²³ The one-time incremental cost is assumed to be \$210,000 per truck. ZE yard truck capital costs are expected to decline over time due to projected future decreases in battery costs. However, ZE yard truck capital cost projections are not available for future years. Staff applied a yearly cost multiplier based on ZE Class 2b-3 capital costs to the incremental cost of ZE yard trucks.²⁴ Annual usage cost for ZE yard trucks is expected to be lower than their diesel equivalent. Each ZE yard truck is assumed to operate for 1,000 hours per year for a total annual usage cost of \$6,250 per yard truck based on analysis included in the WAIRE Menu Technical Report.

Solar Panel Acquisition and Usage

Based on the analysis provided in the WAIRE Menu Technical Report, the price for a rooftop solar panel system (including installation) is set \$2.80 per kW, resulting in a total installed cost of \$280,000 for a 100-kW solar panel system. Electricity generated from rooftop solar panel systems is assumed to save operators on grid power costs. Solar panel usage is assumed to result in a net savings of \$0.17 per kWh generated. Each 100-kW system has an estimated electrical generation of 165,000 kWh annually.

High-Efficiency Filter Systems Acquisition and Replacement Filters

The estimated costs analyzed for the installation of 25 air filter systems with MERV 16 air filters is \$65,000 based on the analysis provided in the WAIRE Menu Technical Report. The cost for the replacement/installation of 200 MERV 16 air filters is \$60,000.

TRU Plug Acquisition and Usage

The per unit cost of a TRU plug is assumed to be \$1,600. Associated construction and permitting costs are assumed to be \$4,700 and \$7,000 per installation project, respectively. Each installed TRU is assumed to consume 10,658 kWh of electricity annually. Assuming a rate of \$0.18/kWh, annual TRU usage cost is set to \$1,918.

²² Hydrogen cost projections can be found in CARB ACT Appendix C-1 – SRIA submitted to DoF (Figure C-5): <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

²³ <https://cleanairactionplan.org/documents/final-cargo-handling-equipment-che-feasibility-assessment.pdf/>

²⁴ A cost multiplier is generated by taking ratio of difference in capital cost in each year (2022 -2031) to the difference in capital costs in year 1 (2022).

Pay Mitigation Fee

The cost calculation for the mitigation fee scenario is straightforward. In lieu of earning WAIRE Points from equipment acquisitions and usage, all facilities choose to pay a fee of \$1,000 for each WAIRE Point in their WPCO attributed to their facility in every year of compliance (final cost is \$1,062.5 due to PR 316 6.25% addition to mitigation fees paid for administrative cost recovery).

Administrative Costs

In addition to costs expected from compliance actions outlined above, all operators are also expected to incur expenses related to fees outlined in Rule 316 for Warehouse Operations Notifications (\$29.51/submission), Initial Site Information Reports (\$140.68/submission), and Annual WAIRE Reports (\$392.50/submission).

All warehouse operators are also expected to incur costs associated with the reporting related to compiling all relevant compliance data and submitting the information as required by PR 2305. This type of reporting is expected to be similar to the kind of reporting required in CARB's ACT regulation, specifically for large entity reporting, and is estimated to be no more than 25 hours of work totaling \$1,250 per year.²⁵

To estimate truck traffic for determining compliance obligations, it is assumed that all facilities will install two cameras at a one-time cost of \$2,000 per facility. Staff time will also be required for reviewing recordings. It is estimated that 1,152 hours of video will need to be reviewed per year (48 hours per month x 2 driveways per operator x 12 months). Speeding the video up to 8x results in a total staff time of 144 hours per year (at \$50/hour) for a total annual cost of \$7,200 per facility.

It is also expected that facilities that elect to meet compliance obligations through ZE or NZE truck visits will incur additional costs related to truck tracking. For this analysis, it is assumed that tracking will be done through truck driver surveys and drivers visiting a warehouse will be required to provide basic information such as license plate and/or VIN, trucking company, and contact info.²⁶ The compilation of truck surveys is expected to take one hour of work per week (at \$50/hour) for a total annual cost of \$2,600 per facility.

Facilities that choose to meet their compliance obligations through payment of the mitigation fee are subject to an additional fee equal to 6.25% of the amount of mitigation fee paid as outlined in Proposed Rule 316(f). This fee is necessary to cover the reasonable costs incurred by South Coast AQMD staff and/or its consultants to administer the Mitigation Program.

Total annual administrative costs are expected to range from approximately \$8,900 to \$11,500 per facility per year. The lower end of the range includes Annual WAIRE Report fees, reporting costs, and costs incurred due to video review. The higher end the range those same costs plus truck survey costs only attributable to those facilities who choose to track NZE/ZE truck visits to meet

²⁵ <https://ww3.arb.ca.gov/regact/2019/act2019/isor.pdf>

²⁶ Under PR 2305, a typical 250,000 sq. ft warehouse would be expected to receive anywhere from five visits per day (for larger Class 8 trucks) up to 24 visits per day (from smaller trucks).

compliance obligations. Additionally, facilities are expected to incur one-time costs for camera purchases, a Warehouse Operations Notifications Fee, and an Initial Site Information Report Fee.

Scenario Analysis

With an estimated 3,995 warehouse operators and 32 potential compliance actions, it is not possible to determine the precise cost of PR 2305 and PR 316. In addition, due to annual compliance obligations, the potential compliance approach may vary from year to year.

Table 18: Scenario Descriptions

#	Scenario Description	Notes
1	NZE Class 8 truck acquisitions and subsequent visits from those trucks	
2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase)	One additional truck is acquired earlier than required, thus increasing WAIRE Points earned from truck visits in subsequent years.
3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks	No WAIRE Points earned for truck acquisitions. Mitigation fees paid to earn WAIRE Points in first year of compliance.
4	NZE Class 8 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions.
5	ZE Class 8 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions. ZE Class 8 trucks are assumed to not be commercially available until late 2022. Mitigation fees paid to earn WAIRE Points until then.
6	Level 3 charger installations followed by ZE Class 6 & Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers	Chargers provide ~30,000 kWh/year per Class 6 truck, and ~90,000 kWh/yr per Class 8 truck. Class 8 trucks only acquired if 25 Class 6 trucks had been previously purchased for one warehouse.
7	Pay Mitigation Fee	
7a	Pay Mitigation Fee and account for NZE trucks visiting the facility incentivized from the WAIRE Mitigation Program	Incentivized trucks earn WAIRE Points and reduce mitigation fees paid.
8	NZE Class 6 truck acquisitions and subsequent visits from those trucks	
9	NZE Class 6 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions.
10	ZE Class 6 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions.
11	Rooftop solar panel installations and usage	Solar panel coverage limited to 50% of building square footage. Mitigation fees used to make up any shortfall in WAIRE Points.
12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station	System installation in first year is followed by a truck acquisition. In subsequent years trucks are only acquired if needed to earn WAIRE Points.
13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks	
14	ZE Class 2b-3 truck visits from non-owned fleets	
15	Filter System Installations	
16	Filter Purchases	
17	TRU plug installations and usage in cold storage facilities	Scenario is only applied to cold storage warehouses. Plugs limited to 1:10,000 sq. ft. of building space.
18	ZE Hostler Acquisitions and Usage	

To estimate the potential impacts of PR 2305 and PR 316, 19 different scenarios were developed in an attempt to show the range of potential compliance outcomes. A description of the 19 scenarios analyzed is included in Table 18.

The scenarios were developed to show potential cost and emissions impacts from all 32 WAIRE Menu actions, as well as using mitigation fees. Each scenario is structured to follow a series of choices a warehouse operator may make based on compliance choices from a previous year. For example, if a warehouse operator purchased an NZE Class 8 truck in their first year complying with PR, they were assumed to use that same truck in subsequent years to meet future compliance obligations. As a bounding analysis approach, all warehouses were assumed to only comply with a single scenario approach from 2022 through 2031. No single scenario in this bounding analysis is expected to occur. Rather, they present possible extreme compliance outcomes.

For these scenario analyses, all 2,902 potentially affected facilities were modeled for every year from 2022-2031 using their square footage and the applicable average trip generation rates to determine their compliance obligation. All results presented in this section assume a rule stringency of .0025 and three-year phase-in period. The amount of warehousing space was assumed to grow 1.8% per year, consistent with analysis from SCAG.^{27,28} In addition, the scenario analysis attempts to isolate and attribute capital and O&M costs for only the equipment incremental to current CARB regulations such as CARB's ACT and Low NOx Omnibus regulations.²⁹

Tables 19 – 24 below present the total number of each compliance action for each scenario over the 2022-2031 compliance period. Table 19 presents the number of ZE and NZE truck acquisitions by scenario by year, and Table 20 presents the associated usage in vehicle miles traveled (VMT). Projected ZE and NZE truck visits from a non-owned fleet are shown in Table 21. Truck visits in Scenario 7a earn points toward compliance obligation but do not result in additional costs to facilities.

The number of equipment acquisitions in each compliance year for Scenario 6 (level 3 chargers), Scenario 12 (hydrogen stations), Scenario 17 (TRU plugs), and Scenario 18 (ZE yard trucks) are presented in Table 22. The number of equipment acquisitions for Scenario 11 (rooftop solar), Scenario 15 (filter systems), and Scenario 16 (filters) are shown in Table 23.

Table 24 presents the total annual mitigation fees paid for Scenarios 3, 5, 6, 7, 7a, 11, and 17 inclusive of the additional 6.25% Mitigation Program Fee outlined in PR 316. These mitigation fee payments represent warehouses voluntarily choosing this compliance action over a variety of other compliance actions allowed to comply with PR 2305. Table 25 lists projected administrative costs associated with PR 316 fees, reporting, camera installations, video review, and truck surveys

²⁷ For information on average trip generation rates, see PR 2305 (d)(1)(C)

²⁸ https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf

²⁹ Scenario modeling assumptions regarding the impacts of CARB regulations on facility's compliance point obligation have changed since the release of the previous PR2305 Draft Socioeconomic Impact Assessment dated March 2021. As a result of the changes, the number of compliance actions necessary has decreased, resulting in decreases in both compliance costs and emissions reductions.

for every scenario except Scenario 17. Scenario 17 applies only to cold-storage facilities and total administrative costs are proportionate to the number of facilities in each compliance year. Total annual average administrative costs across all potentially affected facilities are expected to range from \$34.7M to \$44.6M per year in all scenarios excluding Scenario 17.

Table 26 presents total annual costs by scenario. Total costs include one-time costs resulting from equipment acquisition, recurring costs associated with equipment usage, mitigation fees paid, and administrative costs and fees. Table 27 below shows a cost summary for each compliance scenario including net present value (assuming 1% and 4% discount rates), average annual cost, and the weighted average annual cost per square foot of warehouse space after taking into account equipment acquisition from CARB's ACT and Low NOx Omnibus regulations. The total costs presented here are inclusive of all administrative costs and fees related to compliance. Average annual costs range from -\$12.6M/yr. (or -\$0.02/sq. ft./yr.) for the lowest cost scenario (Scenario

10: ZE Class 6 Visits from a Non-owned Fleet) up to \$979.0M/yr. (or \$1.21/sq. ft./yr.) for the highest cost scenario (Scenario 11: Solar Panel Installations).

Scenario costs are typically highest in the initial years of the compliance period due to the fact that the scenarios assume that capital equipment acquisitions take place early in the analysis timeframe. Later in the analysis timeframe, costs are typically much lower due to the fact that compliance obligations can be met much more cheaply through equipment usage. Staff believes that the scenario cost estimates are conservative for two reasons, (1) the compliance period analyzed is shorter than the assumed useful life of the majority of equipment, and (2) fuel and maintenance savings resulting from NZE/ZE truck usage are only accrued for the mileage associated with warehouse visits. Extending the analysis timeframe further and accounting for the per mile savings of all truck mileage would result in the accrual of significant savings to warehouse operators using NZE/ZE truck acquisition and usage to meet their compliance obligations.

The costs presented here are default calculations broadly applicable to the industry, however individual warehouse operators may identify different specific costs for their operations. Warehouse operators are assumed to gravitate towards the lowest cost options for their specific situations. As such, the maximum average cost warehouse operators would be expected to incur is \$0.83/sq. ft./yr. resulting from the mitigation fee scenario. However, based on the cost analysis, it is likely that in most situations warehouse operators will identify substantially cheaper options that work within their operations.

Table 26: Total Annual Costs by Scenario (in millions)

JOBS AND OTHER SOCIOECONOMIC IMPACTS

The REMI model (PI+ v2.4.1) was used to assess the total socioeconomic impacts of the regulatory change from PR 2305.³⁰ The model links the economic activities in the counties of Los Angeles, Orange, Riverside, and San Bernardino, and for each county, it is comprised of five interrelated blocks: (1) output and demand, (2) labor and capital, (3) population and labor force, (4) wages, prices and costs, and (5) market shares.³¹

Given the uncertain nature of compliance action taken by each potentially affected warehouse operator potentially subject to PR 2305, a bounding analysis was performed in estimating jobs affects estimated due to implementation of PR 2305. This bounding analysis analyzes scenarios

³⁰ Regional Economic Modeling Inc. (REMI). Policy Insight® for the South Coast Area (160-sector model). Version 2.4.1, 2020.

³¹ Within each county, producers are made up of 156 private non-farm industries and sectors, three government sectors, and a farm sector. Trade flows are captured between sectors as well as across the four counties and the rest of U.S. Market shares of industries are dependent upon their product prices, access to production inputs, and local infrastructure. The demographic/migration component has 160 ages/gender/race/ethnicity cohorts and captures population changes in births, deaths, and migration. (For details, please refer to REMI online documentation at <http://www.remi.com/products/pi>.)

wherein all warehouse operators are assumed to comply using the same compliance action. South Coast AQMD staff modeled and presents the results of those scenarios which they believe to be high- and low-cost scenarios, along with a few additional scenarios to provide a more complete picture of the range of jobs impacts due to implementation of PR 2305.

The scenarios modeled to estimate the range of jobs impacts due to implementation of PR 2305 are scenarios 3, 6, 7, 7a, 10, and 13. Scenarios 3 and 10 are low-cost natural gas and zero-emission scenarios respectively. Scenarios 7 and 7a are high-cost scenarios from all warehouse operators complying with PR 2305 through paying a mitigation fee. Scenario 6 was included to consider a scenario involving electric vehicle charger installations. Scenario 13 is maintained for comparison to an earlier draft of this socioeconomic impact assessment, wherein Scenario 13 was the low-cost zero-emission scenario. Each scenario is described in Table 15.

Each assessment herein is performed relative to a baseline (“business as usual”) where PR 2305 would not be adopted. Adoption of PR 2305 would create a regulatory scenario under which the potentially affected facilities would incur average annual compliance costs estimated to range from about -\$13 to \$670 million for low- and high-cost scenarios respectively.

Direct effects of proposed rules/amendments must be estimated and used as inputs into the REMI PI+ model in order for the model to assess secondary and induced impacts for all actors in the four-county economy on an annual basis and across a user-defined horizon (2022 - 2031). Direct effects of PR 2305 include additional costs to the potentially affected facilities and additional sales by local vendors of equipment, devices, or services supplying the necessary goods/services to help the potentially affected facilities meet the proposed requirements of PR 2305.

While compliance expenditures may increase the cost of doing business for affected facilities, the purchase and installation of additional equipment combined with spending on operation and maintenance may increase sales in other sectors. Table 25 lists the sectors modeled in REMI PI+ which incur a cost/benefit from compliance expenditures.³²

All expected PR 2305 compliance costs are included in the REMI PI+ model as increased demand/spending in the industry categories listed in Table 25. This could substantially mute negative regional effects on employment if the REMI PI+ model assumed all spending from any industry in the South Coast AQMD jurisdiction was spent within the South Coast AQMD jurisdiction. This worry is mitigated as each industry is provided a set of “regional purchase coefficients,” which account for regional spending/final demand to be met by companies within and outside the South Coast AQMD jurisdiction.

³² Improved public health due to reduced criteria and toxic air pollution may improve worker productivity and other economic factors. Including these factors in a jobs/REMI analysis would only increase the desire of individuals to relocate or stay in the South Coast AQMD jurisdiction. Thus the jobs estimates provided are conservative estimates, and would likely be less after accounting for this improved “amenity” value.

Table 25: Industries Incurring Costs or Benefitting from PR 2305 Compliance

Compliance Cost Source	Industries Incurring Compliance Costs (NAICS in REMI)	Industries with Adjusted Demand (NAICS in REMI)
NZE and/or ZE truck purchases ^{3,6,7,7a,13}	Total annual compliance cost split amongst all industries potentially affected by PR 2305 proportional to total warehouse square footage. ³³	<i>One-time Capital:</i> Motor Vehicle Manufacturing (NAICS 3361)
Reduced purchase of diesel fuel ^{3,6,7,7a,10,13}		<i>Recurring:</i> Petroleum and Coal Products Manufacturing (NAICS 324)
Purchase of natural gas fuel ^{3,7,7a}		<i>Recurring:</i> Oil and Gas Extraction (NAICS 211)
Purchase of electricity as fuel ^{6,7,10,13}		<i>Recurring:</i> Electric Power Generation, Transmission, and Distribution (NAICS 2211)
Net change in maintenance cost ^{3,6,7,7a,10,13}		<i>Recurring:</i> Automotive Repair and Maintenance (NAICS 8111)
Net change in insurance cost ^{3,6,7,7a,10,13}		<i>Recurring:</i> Insurance Carriers (NAICS 5241)
Net change in DMV fees ^{6,7,10,13}		<i>Recurring:</i> State Government (NAICS 92)
Level 3 charger purchase ^{6,7}		<i>One-time Capital:</i> Other Electrical Equipment and Component Manufacturing (NAICS 3359)
Level 3 charger construction ^{6,7}		<i>One-time Capital:</i> Construction (NAICS 23)
Level 3 charger permitting ^{6,7}		<i>Recurring:</i> Local Government (NAICS 92)
Level 3 charger energization ^{6,7}		<i>One-time Capital:</i> Electric Power Generation, Transmission, and Distribution (NAICS 2211)
Administrative costs for reporting requirements ^{3,6,7,7a,10,13}		<i>Recurring:</i> Other professional, scientific, and technical services (NAICS 5419)

Note: Superscript values indicate scenarios including each compliance cost source and respective demand.

As presented in Figure 2, PR 2305 is expected to result in an industry-wide average of about 240 net jobs added to 11,100 net jobs foregone annually from 2022 to 2031 for the low-cost (Scenario 10) and high-cost (Scenario 7) scenarios respectively. The projected job impacts represent about a

³³ Warehouse operator NAICS and square footage used from CoStar warehouse single-tenant operators and Dun and Bradstreet data matching described in the “Affected Industries/Facilities” section of this report. Industry-by-county shares of total compliance costs were estimated from this data based on total square footage. Any industry-by-county-by-year expected compliance cost was estimated from total annual compliance cost multiplied by the industry’s respective industry-by-county square-footage share relative to total square footage of warehouse space potentially affected by PR 2305.

0.002% increase to a 0.1% decrease of total employment in the four-county region for both low- and high-cost scenarios.

Figure 2: PR 2305 Projected Regional Foregone Jobs, 2022 – 2031

Figure 3 plots predicted foregone jobs, baseline jobs, and total jobs following adoption of PR 2305 through Scenario 7 (high-cost scenario) in 2019 to 2031. Figure 3 illustrates the predicted job impacts from PR 2305 are small relative to the total predicted jobs. Moreover, job reductions estimated from PR 2305 are viewed as foregone jobs, in that the total number of jobs in the compliance period is higher than the total number of jobs before the compliance period.

Tables 26-31 present expected job impacts of PR 2305 for each scenario modeled, presenting the top 10 industries with negative job impacts, and the top three industries with expected positive job impacts, and the remaining industries grouped together. For all scenarios except Scenario 10, job losses are expected from 2022 to 2031 due to PR 2305. Retail trade (NAICS 44-45) and construction (NAICS 23) are expected to bear most of the estimated total compliance cost of PR 2305, with an estimated total 410 jobs forgone on average annually between 2022 to 2031 for the NZE low-cost scenario (Scenario 3), and an estimated total 11,100 jobs forgone on average annually between 2022 to 2031 for the high-cost scenario (Scenario 7).

Figure 3: PR 2305 Projected Regional Job Impact 2019 – 2031 (High-Cost Scenario)

Job losses in retail trade and construction are highest across all scenarios for two reasons. First, and most importantly, retail trade and construction are sectors that are highly linked to all other sectors. Since this rule imposes costs on a broad group of industries, each of those industries is expected to have less money to spend on other projects/activities, affecting to a greater proportion retail trade and construction. Historically around 10% of jobs losses predicted in many socioeconomic impact assessments performed by the South Coast AQMD come from construction, and another 10% from retail trade, even for rules not directly affecting facilities in those sectors. This same occurrence is estimated to occur for implementation of PR 2305. Second, some of the warehouse operators affected by PR 2305 are in the retail trade or construction sector.

In all scenarios warehousing and storage (NAICS 493) is also estimated to experience a reduction in jobs.³⁴ Interestingly, the automotive repair and maintenance sector (NAICS 8111) is expected to see notable job gains in scenarios where NZE vehicles are adopted to comply with PR 2305, and forgone jobs where ZE vehicles are adopted to comply with PR 2305.

For sectors experiencing job gains, two groupings are notable. First the sectors of electric power generation, transmission, and distribution (NAICS 2211) and other electrical equipment and component manufacturing (NAICS 3359).³⁵ These sectors experience job gains when there is ZE

³⁴ Although this is a rule designed to affect trucking activities going to warehouses, most businesses with warehousing activities are not classified formally as being in the “warehousing and storage” industry. Thus the largest job reductions occur from indirect effects of a large group of facilities directing funds away from projects/spending into sectors like retail trade and construction.

³⁵ Scenario 7 assumes collected mitigation fee revenue is spent 50% on electric vehicle chargers and 50% on natural-gas and electric trucks. Spending on trucks scales linearly from 100% spent on natural-gas trucks in 2022, to 100% spent on electric trucks in 2031.

infrastructure and ZE vehicle charging expected due to PR 2305. The second grouping of note is other professional, scientific, and technical services (5419). The increase in this sector represents expected job increases due to reporting and other administrative requirements of PR 2305. Admittedly these additional jobs may be seen not in the other professional, scientific, and technical services sector, but rather in the industries directly affected by PR 2305.

The foregone jobs estimates from PR 2305 implementation come about due to less investment spending and less future production, i.e. forgone output. Tables 32 and 33 present estimated forgone output by industry from the lower-cost scenario of Scenario 7a and the high-cost scenario of Scenario 7. Similar to tables presenting forgone jobs, Tables 32 and 33 show the top 10 most adversely impacted industries, and the top three most benefitting industries due to PR 2305. Relative to total economic output within the South Coast AQMD four-county region, PR 2305 may reduce average annual output between 0.02% and 0.10%.

Table 32: PR 2305 Estimated Impact on Output (Scenario 7a) (\$2018 million)

Competitiveness

PR 2305 may raise the cost of operating a warehouse in the South Coast AQMD jurisdiction relative to warehouses operating outside the South Coast AQMD jurisdiction, both near and far. South Coast AQMD staff examined the potential for warehouse operators possibly relocating their operations outside the South Coast AQMD jurisdiction, as well as warehouse operators that remain in the South Coast AQMD jurisdiction possibly losing customers due to the desire of warehouse operators to pass on some of the regulatory costs of PR 2305 to their customers.

South Coast AQMD staff is aware of two studies which consider the effects of heightened costs on the goods movement sector, and how those heightened costs might affect warehouse relocation or goods diversion from the ports of Los Angeles and Long Beach.

The first study was completed in 2020 by Industrial Economics, Inc. (IEc) on behalf of the South Coast AQMD. IEc's study investigates the likelihood warehouses within the South Coast AQMD jurisdiction may relocate due to PR 2305 implementation to other regions in southern California, southern Nevada, and western Arizona. A warehouse is estimated to relocate to another region if the estimated cost of operating within the South Coast AQMD jurisdiction is higher than the estimated cost of performing the same operations in the relocation region considered, constrained by available warehouse space.

The IEc study considers the costs of operating each warehouse in the South Coast AQMD jurisdiction for another 20 years. The IEc study includes warehouse rental, labor, power, and goods transportation costs of operating in both the South Coast AQMD jurisdiction along with each relocation region. The cost of operating in the South Coast AQMD jurisdiction is raised by the \$ per square foot cost of complying with PR 2305, conservatively assuming the annual compliance cost occurs immediately upon rule passage for all warehouses greater than 100,000 square feet. The cost of operating after relocating outside the South Coast AQMD jurisdiction is raised due to estimated moving costs, as well as a possibility of new warehouse development costs when considering a scenario where land yet to be zoned for warehousing may become zoned and built on over the next 20 years.

The IEc analysis results indicate at compliance cost ranges of \$0.00-\$1.50 per square foot, no warehouses in the South Coast AQMD jurisdiction would relocate. The IEc analysis results also indicate approximately five to six warehouses may relocate to the Bakersfield region of California if PR 2305 compliance costs were in the range of \$1.50-\$2 per square foot. South Coast AQMD staff interprets the IEc analysis as indicating no warehouses would relocate outside the South Coast AQMD jurisdiction under the currently proposed PR 2305 stringency which could result in a high end mitigation fee of about \$0.82 per square foot.

In preparation for implementing a clean truck fund rate at the Port of Los Angeles (POLA) and Port of Long Beach (POLB), POLA and POLB hired Davies Transportation Consulting Inc. to perform a study estimating the amount of goods diversion away from the POLA/POLB due to a range of clean truck fund rates, considering \$0 to \$70 per twenty-foot-equivalent unit (TEU) container. The latest draft of this report was released December 2019. Based on the results of this study, the ports of Los Angeles and Long Beach have decided to implement a \$10 per TEU clean truck fund rate.

South Coast AQMD staff's current high-cost estimate of PR 2305 is approximately \$650 million annually assuming all warehouses subject to PR 2305 complied with PR 2305 by paying a mitigation fee.³⁶ Estimates of TEUs through POLA and POLB in 2020 total approximately 17.3

³⁶ This scenario assumes a compliance cost of \$0.75 per square foot, a mitigation fee of \$1,000 per WAIRE point, and no usage of mitigation fee revenue to replace trucks visiting warehouses with near-zero-emission or zero-emission vehicles.

million annually.³⁷ Thus PR 2305 could be viewed as adding on a cost of around \$55/TEU for TEUs which move through the South Coast AQMD jurisdiction. As estimated by the POLA/POLB commissioned study, a \$55/TEU fee would likely result in about one percent of goods diverted away from POLA/POLB to other ports.

The POLA/POLB commissioned study did not allow for the possibility of warehousing goods to be performed outside the South Coast AQMD jurisdiction to avoid the cost of paying the clean truck fund rate as containers landing at the San Pedro Bay Ports would pay the fee whether the warehouse is in the South Coast AQMD jurisdiction or outside it. In contrast, warehouses and/or warehouse operators can potentially relocate in response to PR 2305 to avoid paying the costs to comply with PR 2305.

As noted in the POLA/POLB commissioned study, shipping goods to other ports, e.g. ports in Texas, the U.S. Southeast, and New York/New Jersey ports could increase shipment times by over a week. Thus, if goods suppliers wished to avoid paying the compliance costs of PR 2305, it is more likely they would relocate to a nearby air district's jurisdiction than shipping their goods to another port entirely. South Coast AQMD staff expects if any goods diversion were to occur away from POLA/POLB due to PR 2305, it would be a diversion of less than one percent.

Figure 4 below presents regional industrial property rental prices. The data in Figure 4 comes from the CoStar AnalyticsTM module's quarterly reporting only for industrial properties with more than 100,000 square feet. Industrial is the most refined category within this CoStar module which contains warehouses, and recent discussions with our consultant Industrial Economics, Inc. indicate almost all of the industrial category is likely warehousing. As Figure 4 shows, industrial rental prices in the South Coast AQMD jurisdiction have risen around 63% from 2012 to 2019, from \$5.88 per square foot to \$9.60 per square foot.³⁸

Over the same time industrial rental prices in the San Diego region rose around 31% from \$8.40 per square foot to \$11.04 per square foot. Before 2010 industrial rental prices in San Diego seem to have maintained a price premium of between \$3-\$4.

Even though rental prices have been rising in both San Diego and the South Coast AQMD jurisdiction, the rental price premium has fallen by over half to \$1.40 by 2019. The industrial rental price premium which previously existed in the coastal areas north of the South Coast AQMD jurisdiction, e.g. Santa Barbara, is now gone, and it is now costlier to rent industrial space in the South Coast AQMD jurisdiction.

³⁷ South Coast AQMD staff calculations from POLA and POLB data;

Figure 4: Annual Rental Prices for Industrial Properties (in 2019 \$)

Figure 5 below presents regional warehouse vacancy rates along with available capacity. The data in Figure 5 also comes from the CoStar Analytics™ module's quarterly reporting only for industrial properties with more than 100,000 square feet. As Figure 5 shows, available warehouse capacity in the South Coast AQMD jurisdiction has been around four percent from 2014-2019. Over the same time total warehouse capacity in the South Coast AQMD jurisdiction has grown by about 120 million square feet. Even though warehouse capacity located in the South Coast AQMD jurisdiction has grown about 20% over the past five years, available capacity has consistently maintained its lowest level observed over the past 20 years at four percent.

Figure 5: South Coast AQMD Vacant Industrial Property and Capacity

Source: CoStar Analytics™

South Coast AQMD staff interprets this combination of sizably higher increases in warehouse space rental prices over the past decade, along with a maintained low amount of available warehouse capacity while total warehouse capacity grew within the South Coast AQMD

jurisdiction, as a strong indication the South Coast AQMD jurisdiction is highly competitive for warehousing operations.³⁹

PR 2305 proposes a stringency/compliance cost of *at most* \$0.83 per square foot on warehouses with at least 100,000 square feet of space. This \$0.83 per square foot compliance cost represents an increase in the rental cost of doing business for warehouses operating in the South Coast AQMD jurisdiction that is less than 30% of the increase in rental cost this same industry has experienced over the past seven years while showing little evidence of relocation.⁴⁰

With all the above points in mind, South Coast AQMD staff believes it is highly unlikely that warehouses located in the South Coast AQMD jurisdiction would relocate outside the South Coast AQMD jurisdiction due to PR 2305. Moreover, South Coast AQMD staff believes it is highly unlikely that any goods diversion would occur away from POLA/POLB due to PR 2305.

Warehouses operating in the South Coast AQMD jurisdiction have seen rental price increases of around \$3.70 per square foot over the past decade, which has not seemed to deter expansion of warehousing operations in the South Coast AQMD jurisdiction over the past decade as indicated by vacancy and capacity data presented in Figure 2. Since PR 2305 is expected to at most raise the price of warehouse rent by 30% compared to the increases warehouses in the region have experienced over the past decade, South Coast AQMD staff believes it highly unlikely warehouse relocation and goods-movement relocation would occur due to PR 2305 implementation.⁴¹

CEQA ALTERNATIVES

Five alternatives to the proposed project have been developed for PR 2305. Alternative A – No Project, Alternative B – Decreased Emission Reductions, Alternative C – Increased Emission Reductions, Alternative D – All Natural Gas Options Only, Alternative E – All Electric Options Only. The primary components of the alternatives that have been modified are the WAIRE Program applicability in terms of warehouse size in square feet, the proposed rule stringency, the proposed initial compliance period, and the actions available on the WAIRE menu, which could make the WAIRE Program more prescriptive by including a limited number of actions that warehouse operators can select and implement.

For purposes of this document, the no project alternative assumes that the WAIRE Program would not be implemented. This means warehouse operators operating at least 50,000 square feet of warehousing activity located in existing or new warehouses in the South Coast AQMD's jurisdiction with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building would not be required to meet their WPCO. The WPCO compliance strategies in the form of WAIRE Menu actions, a Custom WAIRE Plan, and/or the payment of the optional mitigation fee would not be implemented.

³⁹ This point was also made by warehouse staff interviewed by Industrial Economics, Inc during development of PR 2305. Warehouse staff pointed out the South Coast AQMD jurisdiction has several hard to monetize benefits, specifically the very developed transportation network of multiple ports, railways, and interstate highways, along with a large labor pool that is difficult to access in more remote regions.

⁴⁰ Average rent in the South Coast AQMD jurisdiction for industrial properties from 2000-2008 and again in 2014 was around \$6.70 per square foot, while the same average rent figure was \$9.60 in 2019.

⁴¹ $\$0.75/\text{sq.ft.}/\$3.20/\text{sq.ft.} = 20.27\%$ increase.

Under Alternative B, the warehouse size requirement is increased from “greater than or equal to 100,000 square feet” to “greater than or equal to 200,000 square feet”, such that the number of affected warehouses under Alternative B would decrease. Second, the beginning of the initial compliance and reporting dates are delayed by one year, such that the regulated warehouses would have a longer time period to plan for and phase in any actions that they would need to undertake to meet their WPCO. Third, the rule stringency is relaxed, such that the rule stringency factor for the proposed project is below 0.0025 WAIRE Points per WATT and could be as low as 0.0001 WAIRE Points per WATT. The WPCO compliance strategies such as the WAIRE Menu (all of the actions), a Custom WAIRE Plan, and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD would not change.

Alternative C consists of a version of the proposed project that would result in greater emission reductions of NO_x and PM_{2.5}. To accomplish this, the rule stringency has increased, such that the rule stringency factor for the proposed project is set to 0.0050 WAIRE Points per WATT. Additionally, the three-year phase-in has been increased to a seven-year phase-in period. The WPCO compliance strategies such as the WAIRE Menu (all of the actions), a Custom WAIRE Plan, and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD would not change.

Alternative D is based on the currently proposed applicability and rule stringency factor for the proposed project 0.0025 WAIRE Points per WATT. However, this alternative limits the number of actions on the WAIRE Menu that warehouse operators could select and implement to earn WAIRE Points. Specifically, the only actions allowed to earn WAIRE Points under Alternative D are related to the use of all natural gas equipment such as the acquisition and/or use of natural gas. Alternative D limits the range of compliance actions on the WAIRE Menu as constraints. Other WPCO compliance strategies such as a Custom WAIRE Plan and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD would still be available to use by warehouse operators to comply with the proposed project.

Alternative E limits the number of actions on the WAIRE Menu that warehouse operators could select and implement to earn WAIRE Points. Specifically, the only actions allowed to earn WAIRE Points under Alternative E are related to the use of all electric equipment such as the acquisition and/or use of all electric trucks and installation and/or use of ZE fueling or charging infrastructure. Alternative E limits the range of compliance actions on the WAIRE Menu as constraints. Other WPCO compliance strategies such as a Custom WAIRE Plan and/or the payment of optional mitigation fee at a cost of \$1,000 per WAIRE Point to South Coast AQMD still be available to use by warehouse operators to comply with the proposed project.

Table 34 provides a summary of the elements of each of the alternatives and compares them to the proposed project. Assuming a 4% real interest rate, average annual compliance costs for the CEQA alternatives range from -\$670 million to \$1 billion between 2022 and 2031. Jobs forgone for the CEQA alternatives range from -240 to 16,100 between 2022 and 2031.

Table 34: Average Annual Cost and Job Impacts of CEQA Alternatives

Alternatives	Average Annual, 2022 - 2031		Cost-Effectiveness (\$/ton) ¹
	Cost	Jobs Foregone	
Proposed Amendments	-\$12,600,000 - \$670,200,000	-240 – 11,100	-\$11,000 - \$101,000
Alternative A - No Project	-	-	-
Alternative B - Decreased Emission Reductions	\$20,600,000 - \$37,300,000	150 – 490	\$139,000 - \$181,000
Alternative C - Increased Emission Reductions	-\$60,000,000 - \$1,015,000,000	-670 – 16,100	-\$35,000 - \$100,000
Alternative D - All Natural Gas Options Only	\$45,000,000 - \$670,200,000	410 – 11,100	\$32,000 - \$101,000
Alternative E - All Electric Options Only	-\$12,600,000 - \$670,200,000	-240 - 11,100	-\$11,000 - \$101,000

Note: High cost option is the highest-cost mitigation fee option (Scenario 7), as no warehouse operator is expected to comply in a costlier manner than the mitigation fee. The low-cost option in the proposed amendments, and CEQA Alternatives C and E is Scenario 10. The low-cost option in CEQA Alternatives B and D is Scenario 3.

¹ Cost-effectiveness is calculated using the discounted cash flow method (DCF) and a 4% real interest rate. This method is consistent with prior South Coast AQMD rules and the 2016 AQMP.

PUBLIC HEALTH BENEFITS

Public health benefits resulting from compliance with PR 2305 are calculated using an incidence per ton (IPT) methodology, developed by the U.S. Environmental Protection Agency (Fann et al. 2009, 2012, 2018). The IPT methodology is an approximation based on the general assumption that the relationship between emissions and adverse health outcomes is linear. In addition, the IPT methodology relies on the following assumptions, (1) changes in health incidence are proportional to ambient PM = concentrations; (2) changes in primary pollutant concentrations (PM_{2.5}) are proportional to changes in emissions (PM_{2.5}); and (3) changes in secondary pollutant concentrations (nitrate PM_{2.5}) are also proportional to changes in emissions (NO_x). This final assumption can vary for individual actions due to the complex chemical reactions that occur to create regional pollutants. However, as warehouse ISR is part of a larger emission reduction strategy, a simplifying assumption is that the health benefits for every ton of NO_x reduction in that strategy yields equal benefits.

Incidence Per Ton Methodology

Because of the assumed linear relationship between emissions and health outcomes, estimates of reductions in health endpoints resulting from PR 2305 can be found by multiplying expected

PM2.5 and NOx emission reductions by an IPT factor for each health endpoint.⁴² The IPT factors for each health endpoint were estimated using estimated control strategy emissions reductions, air quality modeling in the U.S. EPA’s Community Multiscale Air Modeling System (CMAQ), and public health benefits estimation using the U.S. EPA’s Environmental Benefits Mapping and Analysis Program – Community Edition (BenMAP-CE) from the 2016 Air Quality Management Plan (AQMP).

For example, a NOx IPT factor is calculated by dividing the estimated reduction in incidence of a given health endpoint by the total NOx emission reductions in the years 2023 and 2031.⁴³ Linear interpolation is used to generate IPT factors for the remaining years (2022, 2024-2030). IPT factors for PM2.5 are calculated similarly.⁴⁴

NOx contributes to the formation of ambient concentrations of PM2.5. For the sake of calculating contribution to ambient PM2.5 concentrations, it was assumed that each ton of NOx emitted is equivalent to 0.03 tons of directly emitted PM2.5.^{45,46}

Total emissions reductions in years 2023 and 2031 resulting from 2016 AQMP control strategies are shown in Table 35 below, while the corresponding reductions in modeled health outcomes in 2023 and 2031 are shown in Table 36 below.

Table 35: 2016 AQMP Projected Emission Reductions by Pollutant (in TPD)

	2023	2031
VOC	64	72
NOX	124	128
PM2.5	0.22	3.4

Note: Projected emission reductions are average of summer planning period (May 1 to September 30).

⁴² <https://ww2.arb.ca.gov/sites/default/files/2019-08/Estimating%20the%20Health%20Benefits%20Associated%20with%20Reductions%20in%20PM%20and%20NOX%20Emissions%20-%20Detailed%20Description.pdf>

⁴³ Reductions in health incidence were estimated for 2023 and 2031 in the 2016 AQMP.

⁴⁴ IPT factors also increase over time reflecting the projected increases in population by age class underpinning health effects modeling.

⁴⁵ U.S. EPA’s February 2018 Technical Support Document, “Estimating the Benefit per Ton of Reducing PM2.5 Precursors from 17 Sectors,” estimates the average monetary public health benefits of NOx emissions is roughly 3% of direct PM emissions (https://www.epa.gov/sites/production/files/2018-02/documents/sourceapportionmentbptsd_2018.pdf).

⁴⁶ The ratio of NOx to PM2.5 could potentially be higher than the 0.03 assumed here. Previous work done on the 2007 AQMP suggested that each ton of NOx emitted is equivalent to 0.1 tons of directly emitted PM2.5 in regards to annual PM2.5 concentrations. A higher NOx to PM2.5 ratio would lead to an increase in IPT factors for NOx and corresponding decrease in IPT factors for directly emitted PM2.5. Given that NOx emission reductions from PR 2305 are projected to be over 100 times greater than directly emitted PM2.5, an increase in the NOx IPT factor will outweigh the corresponding decrease in PM2.5 IPT factors and result in an overall increase in total benefits. In this analysis we present results assuming a ratio of 0.03 in an attempt to provide conservative estimate of public health benefits.

Table 36: 2016 AQMP Modeled Reductions in Incidence Due to PM2.5 Exposure

	2023	2031	Average Annual
Premature Deaths Avoided, All Cause			
Long-Term PM2.5 Exposure	1,394	2,716	1,512
Short-Term PM2.5 Exposure ¹	100	194	108
Reduced Morbidity Incidence			
<i>Long-Term PM2.5 Exposure</i>			
Acute Bronchitis	1,039	1,890	1,087
<i>Short-Term PM2.5 Exposure</i>			
Acute Myocardial Infarction, Nonfatal	33	71	38
Asthma Exacerbation (Wheeze, Cough, Shortness of Breath)	23,321	42,780	24,495
Asthma, New Onset (Wheeze)	2,956	5,577	3,151
HA, All Cardiovascular (less Myocardial Infarctions)	164	337	183
HA, All Respiratory (less Asthma) ²	136	290	155
HA, Ischemic Stroke	79	171	91
HA and ED Visits, Asthma	142	260	149
Lower Respiratory Symptoms	12,268	22,387	12,850
Upper Respiratory Symptoms	24,342	44,720	25,587
Minor Restricted Activity Days ³	528,869	961,248	552,809
Work Loss Days ³	91,689	166,826	95,892

* Each health effect represents the point estimate of a statistical distribution of potential outcomes. Please see Appendix 3-B of the 2016 AQMP Final Socioeconomic Report where the 95-percent confidence intervals are reported. Health effects for other years during the period 2017 to 2031 were based on interpolated, as opposed to modeled, air quality changes. The study population of each C-R function utilized can be found in Appendix 3-B of the 2016 AQMP Final Socioeconomic Report.

¹ Premature deaths avoided due to short-term exposure to PM2.5 are likely to partially overlap with those due to long-term PM2.5 exposure. Therefore, the total premature deaths associated with PM2.5 will be lower than simply summing across mortality effects from both short-term and long-term exposure (Industrial Economics and Thurston 2016a; Kunzli et al. 2001).

² This is the pooled estimate of two health endpoints: HA, Chronic Lung Disease (less Asthma) (18-64 years old) and HA, All Respiratory (65 or older).

³ Expressed in person-days. Minor Restricted Activity Days (MRAD) refer to days when some normal activities are avoided due to illness.

IPT factors for NOx and directly emitted PM2.5 were calculated using the modeled emission reductions and corresponding health outcomes in Tables 35 and 36 above. These estimated IPT factors were then used to generate estimates of the reductions in health incidence resulting from expected emission reductions resulting from PR 2305 compliance. Emission reduction estimates vary based on the modeled compliance scenario.

Projected emission reductions vary by modelled scenario, as a result a range of health impacts are presented below. Tables 37 and 38 below show NOx and diesel PM (DPM) emissions reductions in tons per day (TPD) in each compliance year for Scenario 13 (ZE Class 2b-3 Truck Acquisitions

and Subsequent Usage) and Scenario 1 (NZE Class 8 Truck Acquisitions and Subsequent Usage) net of existing CARB regulations, respectively. Scenario 13 is representative of the anticipated lower range of potential emission reductions resulting from PR 2305 compliance actions, while Scenario 1 represents the projected higher end of potential emission reductions. Scenario 13 is expected to result in approximately 3,218 cumulative tons of NO_x reductions and 48 tons of direct PM reductions over the course of the ten-year compliance periods, while Scenario 1 is expected to cumulatively reduce NO_x emissions by 8,609 tons and direct PM emissions by 64 tons.

Table 37: Estimated Modeled Emissions Reductions for Compliance Scenario 13 (Total ISR Emissions Net of Existing CARB Regulations)

	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031
NO _x Reductions (TPD)	0.150	0.487	0.889	1.165	1.230	1.177	1.075	0.973	0.878	0.791
DPM Reductions (TPD)	0.001	0.005	0.010	0.014	0.016	0.017	0.017	0.017	0.017	0.017

Table 38: Estimated Modeled Emissions Reductions for Compliance Scenario 1 (Total ISR Emissions Net of Existing CARB Regulations)

	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031
NO _x Reductions (TPD)	0.465	0.959	1.881	2.608	2.857	2.954	2.988	2.989	2.958	2.929
DPM Reductions (TPD)	0.004	0.007	0.014	0.019	0.021	0.022	0.022	0.023	0.023	0.023

Tables 39 and 40 show the corresponding reductions in health incidence derived using IPT factors for Scenario 13 and Scenario 1, respectively.⁴⁷ Emissions reductions from Scenario 13 are expected to cumulatively result in 151 fewer mortalities resulting long- and short-term PM_{2.5} exposure. Scenario 13 is also expected to result in approximately 2,500 fewer asthma attacks and nearly 9,000 fewer work loss days. Cumulatively, scenario 1 is projected to result in 341 fewer mortalities resulting from PM_{2.5} exposure, 5,800 fewer asthma attacks, and 20,000 fewer work loss days.

⁴⁷ To calculate PM_{2.5} emission reductions, DPM emission reductions are multiplied by a scaling factor (0.92). Scaling factor can be found in “Final –Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds”, [http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/particulate-matter-\(pm\)-2.5-significance-thresholds-and-calculation-methodology/final_pm2_5methodology.pdf?sfvrsn=2](http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/particulate-matter-(pm)-2.5-significance-thresholds-and-calculation-methodology/final_pm2_5methodology.pdf?sfvrsn=2)

Valuation of Public Health Benefits

Monetary valuations of all reductions in adverse health outcomes were calculated. The 2016 AQMP calculated total monetary valuation for each endpoint by multiplying the number of reduced outcomes for each endpoint by an estimate of the economic value of reducing individual outcome for each endpoint. For reductions in premature mortalities, an estimate of the value of a statistical life (VSL) was used. To generate value estimates for morbidities such as hospital admissions or emergency room visits, a cost-of-illness (COI) methodology was typically used. A detailed description of VSL and COI estimates can be found in Chapter 3 of the 2016 AQMP Final Socioeconomic Report. A summary of all monetary values and their associated reference(s) can be found in Appendix 3B of the 2016 AQMP Final Socioeconomic Report.

Staff estimated benefits per ton (BPT) factors for each health endpoint analyzed in the 2016 AQMP. BPT factors are calculated by dividing monetized public health benefits by modelled emission reductions from the AQMP. For example, a NO_x BPT factor is calculated by dividing the estimated monetized health benefits of a given health endpoint by the total NO_x emission reductions in the years 2023 and 2031. Linear interpolation is used to generate BPT factors for the remaining years (2022, 2024-2030). BPT factors for PM_{2.5} are calculated similarly.⁴⁸ Table 41 below shows total monetized health benefits for each modeled compliance scenario summed over the entire compliance period (2022-2031). All dollar figures are in millions of 2018 dollars.^{49,50}

⁴⁸ BPT factors increase over time reflecting the projected increases in population by age class and increases in VSL due to projected increases in future incomes.

⁴⁹ 2015 dollar figures presented in the 2016 AQMP Final Socioeconomic Report have been adjusted using a price inflator of 4.64% based on the October 2020 Marshall & Swift price index (average, all industries).

⁵⁰ To avoid double-counting, total monetized public health benefits do not include monetized benefits from reduced mortalities due to short-term PM_{2.5} exposure.

Projected discounted total public health benefits range from \$136M up to \$13.5B for all scenarios with appreciable emission reductions (excluding Scenario 15: Filter Systems and Scenario 16: Filter Replacements). Based on the low and high representative scenarios (Scenario 13 and Scenario 1, respectively), total discounted public health benefits are expected to range from \$1.2B to \$2.7B. Table 42 contains a comparison of discounted total costs and benefits for each modelled scenario. Estimated total public health benefits exceed total costs in 13 out of the 19 modelled scenarios. Total costs exceed expected benefits in Scenarios 6, 11, 12, 15, 16, and 18.

Uncertainty in Public Health Benefits Estimation

The IPT methodology employed in this analysis is a proven reduced-form tool to estimate public health benefits and currently utilized by CARB and the U.S. EPA. However, the linearity assumption underpinning the IPT and BPT methodologies employed here is necessarily an approximation, and does not account for complex chemistry, precursor pollutant interactions, and finer-scale geographical effects in the same way that detailed modeling can, as in the 2016 AQMP (using CMAQ and BenMAP). In addition, the relative contribution of NO_x to PM_{2.5} concentrations is subject to uncertainty and may vary by location. Actual changes in PM_{2.5} concentration may be higher or lower than what is projected in this analysis. The approximations shown here however are consistent with the detailed and holistic 2016 AQMP analysis to the extent that the proposed rule is included as a part of that overall strategy.

INTRODUCTION AND PURPOSE OF THIS STUDY

The South Coast Air Quality Management District (South Coast AQMD or District) is responsible for regulating stationary sources of air pollution in the South Coast Air Basin of Southern California, which includes Los Angeles, Orange, Riverside, and San Bernardino counties, excluding less populated portions of Los Angeles, Riverside, and San Bernardino counties. The agency has determined that a significant share of the region's emissions emanate from the goods movement sector, which consists primarily of the region's transportation and warehousing sector.

As a part of its effort to achieve compliance with federal and state clean air standards within its jurisdiction, the District has developed an indirect source rule (ISR), the goal of which is to reduce mobile-source emissions associated with the operation of warehouses and distribution centers in the South Coast AQMD region. The rule is known as Proposed Rule (PR) 2305 or the Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. If the rule is adopted, it would apply to any existing or new warehouse with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building located in the South Coast AQMD jurisdiction.

Under PR 2305, warehouse operators would be subject to an annual Warehouse Points Compliance Obligation (WPCO), which requires them to take actions to reduce NO_x and PM emissions associated with their operations, including trucks and other vehicles that operate at or visit the warehouse facilities covered under PR 2305. In general, WAIRE points may be earned only for actions which go beyond existing federal and state regulations already applicable to warehouse owners or operators earning WAIRE Points. Alternatively, operators may pay a mitigation fee used to offset emissions in communities of warehouses which paid mitigation fees.

South Coast AQMD staff has conducted a socioeconomic impact analysis of PR 2305, the results of which are contained in the report, **"Draft Socioeconomic Impact Assessment for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305,"** hereafter referred to as the Socioeconomic Impact Assessment Report or the SIA Report. The South Coast AQMD has engaged Kleinhenz Economics to serve as an independent reviewer of the SIA Report.

The present report contains the findings of the independent, third-party review of the SIA Report, as conducted by Kleinhenz Economics. The review examines the overall contents of the SIA Report with particular attention devoted to the data, assumptions, modeling, and the analytical results contained in the report.

GENERAL COMMENTS ON REPORT

The SIA Report does the following:

- Identifies affected industries, providing characteristics of these industries;
- Identifies and describes characteristics of communities within which warehouses are located;
- Evaluates the economic impact of PR 2305 on employment and the regional economy;

- Evaluates the potential impact of PR 2305 on emissions reduction and health benefits; and
- Evaluates cost-effectiveness of alternatives to PR 2305.

The SIA report describes the warehouse industry and the operators within the industry. This includes a high-level profile of warehouses in the region, as well as the operators who conduct business at warehouses. As summarized in the report, warehouse operators include firms from a number of industries, not just the narrowly defined transportation and warehousing industry. It also describes how trucks and other vehicles that are used in typical business operations of these industries are significant sources of emissions in the region. It also places the warehouse industry in the broader context of the region's goods movement sector and the overall economy.

Further, the report describes the communities in which the warehouses are located, both the socioeconomic characteristics and selected measures of adverse health outcomes in the communities, specifically those related to emissions of vehicles that are a part of the industry. The report also summarizes the legislative mandates related to PR 2305.

Given the difficulty in predicting actual behavioral responses on the part of warehouse operators to PR 2305, South Coast AQMD staff simulated a range of possible responses in the form of distinct scenarios, in terms of various compliance actions that operators may adopt as responses to PR 2305. In each scenario, operators were assumed to uniformly adopt the same response. One of the scenarios assumed that all operators would pay in lieu mitigation fees rather than seek to comply with PR 2305 through direct compliance actions. The economic impact of several scenarios on employment was modeled by using the REMI model.

In addition, health impact results were calculated and presented both in terms of improved health outcomes and the monetary value of the associated public health benefits. Finally, as required under the California Environmental Quality Act (CEQA), the report briefly describes and estimates the costs of five alternatives to PR 2305. The economic cost of each was evaluated.

The aggregate impacts described in the SIA Report imply that PR 2305 would impose minimal costs on the regional economy, yet it would generate positive net health benefits. In terms of jobs, the estimated economic impact of PR 2305 was small relative to the total number of jobs in the region, ranging between 1,700 and 11,400 or anywhere between 0.01% and 0.10% of all jobs in the four county region. By comparison, the monetary value of health benefits was estimated to range between \$2.1 and \$17.2 billion over the compliance period.

Given the difficulty of obtaining data directly from firms in the affected industries, the SIA Report relies on a combination of readily available data and proprietary data, a number of working assumptions, well-established, sophisticated economic and health benefit modeling tools, and cost estimates of various technology responses to PR 2305 to determine the overall socioeconomic impact of the rule on the affected industries, the regional economy, and its residents. As comprehensive as the analysis is, it might be improved by addressing the following concerns.

- While the net benefits justify the costs of compliance, it would be informative to compare the estimated costs and benefits of PR 2305 with the actual costs and benefits of other South Coast AQMD programs as a way of evaluating the cost effectiveness of PR 2305. On this point, if

1.

one assumes that the marginal cost of emissions reductions increases with additional emissions reduction efforts (start with “low hanging fruit” first), PR 2305 costs may very well be higher when compared with previously implemented programs. If so, then the question should be, how much higher and is that higher cost justified?

- The aggregate analysis was also used along with the results of the IEC study to establish a likely maximum compliance cost of \$0.82 per square foot of warehouse space. In practice, researchers assume individual operators will choose some combination of compliance measures that will result in actual compliance costs no higher than the estimated maximum. The validity of the analysis could be reinforced if the estimated compliance costs were related in some manner to individual warehouse operator costs, whether actual or estimates such as those contained in business pro forma reports. } 2.
- The analysis considers equity aspects of the health costs associated with warehouse-related emissions and the benefits of reducing those emissions. If possible, it may also consider the equity aspects of job losses, specifically the extent to which estimated job losses are more likely to occur among one or more disadvantaged segments of workers in the region. } 3.

STRENGTHS AND WEAKNESSES OF THE STUDY

Strengths of the Study

- The community profile in the report presents data on the number and socioeconomic characteristics of residents living in the vicinity of the warehouses potentially subject to PR 2305. This includes the incidence of asthma, cardiovascular disease, and low birth-weights within 0.5, one, and two miles, with data on the broader region provided for comparison.
- The staff report draws information on the number and characteristics of warehouses within the region from the companion IEC report, which includes a detailed assessment of the warehouse industry in the region.
- The industry impact component of the analysis is based upon an extensive number of scenarios (19) that are used to simulate extreme outcomes that would result if all warehouse operators subject to PR 2305 in the region universally and uniformly adopted a single technology. This approach was warranted because of the difficulty required to obtain actual data about business operations and operating costs for any industry, including those affected by PR 2305. In the absence of such information, the rationale behind the simulation approach was a) at least one of the simulation scenarios involving uniform adoption of a single technology may be assumed to represent the highest cost outcome from PR 2305, thereby establishing an upper bound on industry-wide compliance costs, b) in practice, an individual operator can be assumed to select the compliance option or set of options that would minimize compliance costs for that operator's operations, c) given the choices made by individual operators, the actual industry-wide compliance cost would be less than the upper bound established by the simulation.

Weaknesses of the Study

The following potential weaknesses in the study may affect the validity of its findings.

- The distinction between warehouse owners and warehouse operators is blurred throughout the report. In general, the report ought to refer to “warehouse operators” as the relocation decision makers and not “warehouses” for the benefit of the reader. } 4.
- It is difficult to critique the health outcomes based on CalEnviroScreen 3.0 (CES 3.0). There is no direct mention of the causal relationship between warehouse-related vehicle emissions adverse health outcomes. It is recommended that citations be included that affirm the validity of CES 3.0 for this study. It is also recommended that citations be included to affirm the linkage between warehouses/vehicle emissions and adverse health outcomes, thereby ruling out the possibility of a spurious relationship between the two. } 5.
- In order to evaluate PR 2305, it was necessary to develop a profile of warehouse operators in the region, including such information as the operator’s industry (NAICS code), operator size as represented by the number of employees, and operator revenues. In general, it is difficult to obtain establishment level characteristics of businesses, which tend to be proprietary.

Official government data on establishments is collected and maintained by government sources such as the California Employment Development Department (EDD) or other federal/state agencies. While the data provides information on an establishment’s industry, its employee headcount, payroll, and other details, it is generally confidential. This places limits on how the data may be used.

Dun and Bradstreet (D&B) is a proprietary data source that collects and maintains data on businesses. While the original purpose of D&B data is to determine the creditworthiness of businesses, its business data records also include details such as the formal business name, business address, its officers, business size in terms of number of employees, and some financial data. AQMD used establishment data from D&B to develop operator the profile, matching warehouse facilities and operator data from CoStar to business establishment data from D&B.

The resulting profile was based on 1,154 operators that was subsequently applied to the larger population of warehouses subject to PR 2305. This effort involves a large data collection and analysis effort and revealed important details about the collection of industries that make up the population of warehouse operators. However, using D&B data is problematic because it is known to contain incorrect or out-of-date information on a business employee count and available financial information, and to a lesser degree, the businesses industry classification. If available and if permitted for this use, it would be preferred to supplement D&B data with establishment information from the EDD. Moreover, County Business Patterns may be used as an alternative data source for certain questions such as the distribution of firms by size within and across industries. } 6.

- The above discussion is particularly important when considering the incidence of PR 2305 on small businesses. There is considerable variation in business size across the individual industries. For example, data on the transportation and warehousing sector in the four-county region (Los Angeles, Orange, Riverside, and San Bernardino counties) from the 2018 County Business Patterns show that firms in the warehousing and storage industry (NAICS 493) have a substantially higher average employee count (63.2) than firms in the truck transportation industry (NAICS 484) where the average is 9.3 workers per firm. Moreover, financial and employment data for firms in the D&B database can be out of date by several quarters or years, leading to a less-than-accurate picture of the affected industries in general and small businesses in particular.

It is recommended that South Coast AQMD staff consider the value of using other data sources to obtain better information on the sizes of the firms in the industries covered under PR 2305, and in particular, to determine how small businesses will be affected by the proposed rule. EDD data is one possible data source, but it reports annual payroll and not annual revenues. County Business Patterns data reports aggregate revenues, but not revenue per firm. Staff may consider whether there is a way to use payroll as an indirect measure of a firm's size in terms of revenues.

7.

DISCUSSION OF COMMUNITY PROFILE

The community profile section of the SIA Report presents data on selected socioeconomic and ethnic characteristics of residents living in the vicinity of the warehouses potentially subject to PR 2305. It also includes summary data on the incidence of adverse health outcomes within one-half, one, and two miles of warehouses. The health hazards cited include elevated occurrences of asthma, cardiovascular disease, and low birth-weights near warehouses when compared with data on the broader region provided for comparison. It also described the presence of higher levels of particulate matter (PM_{2.5} and diesel PM) within 0.5 miles of warehouse facilities compared to the broader region.

In simple terms, the community profile paints a picture of residents in the vicinity of warehouse facilities who are largely low income, minority residents, and who have higher incidences of adverse health outcomes that are related to emissions and air quality problems because of proximity to the facilities.

DISCUSSION OF AFFECTED INDUSTRIES

The SIA report uses available data from a number of sources to identify the affected industry groups (2-digit NAICS) and associated industries. The assembled profile showed how warehouse operators were distributed across an array of industries within the following major industry groups: construction, manufacturing, wholesale trade, retail trade, and transportation and warehousing. It also used data to estimate the likely number of facilities that would be subject to PR 2305.

Footnote 7 on page 7 states that multi-tenant facilities are assumed to be occupied by two operators. How prevalent are the multi-tenant facilities, specifically what is their share of total warehouses affected by PR 2305? If small, the working assumption may be satisfactory. If large, then it may be necessary to justify that assumption.

} 8.

As implied by the discussion above under Weaknesses of the Report, it is challenging to obtain hard data on individual firms that may be used to establish the number and size of businesses that will be affected by PR 2305. Therefore, South Coast AQMD staff used a variety of data to come up with a profile of affected industries in the aggregate, including their number, their distribution across various industries, and revenue information. Within that estimated population of affected industries, the analysis identified the subset of warehouses and warehouse operators that would fall under the jurisdiction of PR 2305.

DISCUSSION OF ECONOMIC IMPACT ANALYSIS

Using available data, the number and locations of warehouses and associated warehouse operators that would be potentially affected by PR 2305 was established. The assembled profile also showed how warehouse operators were distributed across an array of industries within the following major industry groups (2-digit NAICS): construction, manufacturing, wholesale trade, retail trade, and transportation and warehousing.

In the absence of firm-specific data that could be used to estimate the economic impact of PR 2305, South Coast AQMD staff developed estimates of aggregate compliance costs over a ten-year time period based upon a set of 19 scenarios, each of which was predicated on adoption of one or more of the available 32 compliance actions by all affected warehouse operators. Payment of mitigation fees was one of the available compliance actions. Compliance costs were estimated for each of the scenarios and summarized in Table 24 on page 22 of the SIA report. South Coast AQMD staff then used REMI to produce a bounding analysis, estimating economic impacts of the following selected scenarios:

- Scenarios 3 and 13 which were considered to be the low-cost scenarios;
- Scenarios 7 and 7a which were considered to be the high-cost scenarios; and
- Scenario 6 which involved EV charger installations.

Economic impact analysis requires the estimation of initial or so-called direct effects. Under PR 2305, the direct effect is represented by compliance costs associated with acquisition, installation, operation, and monitoring of equipment, as well as the administrative costs of compliance.

To the extent that some compliance expenditures involve purchases from local vendors, there may be a positive multiplier effect on the regional economy that can partially offset the negative economic effects of the compliance costs themselves. The modeling process accounts for this possibility. For example, a warehouse operator may incur the cost of purchasing a zero emissions truck or other piece of equipment, but if it purchases that truck or piece of equipment from a local vendor (or local manufacturer), it may trigger a positive ripple effect on the local economy depending on the capacity of the local industry. The model is calibrated to account for capacity

limits on individual industries in the region, such that purchases in excess of the region's production capacity will "leak" out of the region in the form of purchases from vendors outside of the region.

The estimates of economic impact under the selected scenarios are represented in terms of jobs. Based on the low-cost and high-cost scenarios, job losses over the ten-year period are assumed to average between 1,700 and 11,400 per year, equivalent to job losses ranging between 0.01% and 0.1% of the region's total job base. While job losses are an important aspect of evaluating the impact of PR 2305, a more complete picture can be obtained by also reporting on the impacts in terms of output and value added, and to the extent possible, relating those impacts to the overall size of the economy and individual industries.

9.

One important finding of the analysis may be the array of industries across the economy that are ultimately affected by the implementation of PR 2305. In discussing the results, footnote 31 on page 27 indicates that although the rule is intended to affect trucking activities going to warehouses, most establishments with warehousing activities are not in the narrowly-defined "warehousing and storage" industry. Moreover, because of industry linkages across the industries of the regional economy as implied by the regional economic impact model, the largest estimated job reductions occur from indirect effects, and they have substantial impacts on sectors like retail trade and construction, both of which generally experience large effects regardless of the source of the (initial) direct expenditure. Put simply, PR 2305 compliance costs have impacts that extend well beyond the target industries themselves.

10.

DISCUSSION OF PUBLIC HEALTH BENEFITS ANALYSIS

Public health benefits are based upon a well-established incidence per ton (IPT) methodology that was developed by the U.S. EPA and has been used in many applications and project evaluations. South Coast AQMD staff relied on the IPT methodology and analysis from the 2016 Air Quality Management Plan to produce emission reduction estimates from PR 2305 and associated estimated reductions in health incidence. These estimates were used to calculate the monetary value of reduced adverse health outcomes for each scenario, measured in net present value terms over the ten-year period from 2022 through 2031.

The results are presented in Table 36 on page 43 of the report, but they are not discussed in any way. At a minimum, the monetary benefits of the presumed low-cost and high-cost scenarios should be summarized in the body of the report and the Executive Summary. Looking at the presumed low cost and high cost scenarios, the monetized health benefit of PR 2305 is estimated to range between \$2.1 billion (Scenario 13) and \$17.2 billion (Scenario 7). These figures may also be discussed in the context of the estimated compliance costs for these scenarios as summarized in Table 24 of the report.

11.

12.

South Coast AQMD Responses to Kleinhenz Economics Review of South Coast AQMD PR 2305 Draft Socioeconomic Impact Assessment**Response to Comment #1**

It is not current practice to compare the expected costs and emissions reductions (cost-effectiveness) of proposed and existing rules/regulations in the Socioeconomic Impact Assessment for individual rules/regulations. Typically, the expected costs and emissions reductions for available control strategies (i.e. rules) are estimated and compared in South Coast AQMD long-term planning documents, such as in Air Quality Management Plan(s). Additionally, a comparison of PR 2305 cost-effectiveness to the cost-effectiveness of existing South Coast AQMD may be unwarranted given PR 2305 focuses on indirect sources whereas most South Coast AQMD rules focus on stationary sources. A better comparison might be to compare the cost-effectiveness of PR 2305 to California Air Resources Board (CARB) regulations. The Feasibility section in Chapter 3 of the PR 2305 & PR 316 draft staff report contains a detailed description of PR 2305 cost-effectiveness along with a comparison to the cost-effectiveness of a set of recently adopted CARB regulations, including Airport Shuttle Bus, Innovative Clean Transit, At-Berth, Low-NOx Omnibus, and Advanced Clean Trucks. The range of cost-effectiveness found for the varying scenarios for PR 2305 are consistent with those found for CARB regulations.

Response to Comment #2

The example below compares warehouse compliance costs with PR 2305 to an estimate of the underlying costs of running their operation.

Consider a hypothetical 500,000 sq. ft. warehouse operator. Further consider a low- and high-cost compliance scenario, e.g. Scenario 7a with an average annual compliance cost of \$0.14/sq. ft. and Scenario 7 with an average annual compliance cost of \$0.83/sq. ft. This warehouse is expected to incur an annual PR 2305 compliance cost between \$70,000 and \$415,000. In comparison, annual operating expenses for this warehouse are estimated to be \$13 million according to a 2015 Boyd Company report. This implies the cost of complying with PR 2305 for this example warehouse falls between 0.5% - 3.2% of average annual operating expenses.

Response to Comment #3

The analysis of jobs impacts was conducted using the REMI model as described in the SIA. South Coast AQMD staff met with REMI staff, and was reassured by REMI staff that its modeling tool did not present jobs impacts by income grouping, ethnicity, or other socioeconomic factors considered when discussing equity. South Coast AQMD staff will maintain discussion with REMI staff on this topic for future inclusion.

Response to Comment #4

The draft socioeconomic impact assessment was reviewed to ensure proper delineation of warehouse owner versus warehouse operator. Warehouse operators are the primary

decision makers/facilities modeled within the draft socioeconomic impact assessment for PR 2305. This is emphasized throughout the draft socioeconomic impact assessment, for example the introduction, industry profile, and compliance cost sections all indicate their analysis accounts for the number of warehouse operators.

Response to Comment #5

The analysis contained in the Community Profile section of the PR 2305 & PR 316 draft socioeconomic impact assessment is not intended to show a causal relationship between emissions from warehouse activities and increased CES 3.0 scores in warehouse-adjacent communities. The intent of the analysis is to summarize the current environmental burdens, prevalence of preexisting health conditions, and socioeconomic characteristics of those communities located within close proximity of PR 2305 warehouses. Additional reference to analyses that document the linkage between air pollution associated with warehouses and health effects have been added to the SIA. The emissions from warehouse activities are one of multiple likely contributors leading to increased CES 3.0 scores, including but not limited to emissions from industrial activity and non-warehouse related mobile source emissions. To further clarify this point, staff has added footnote #4 to the draft socioeconomic impact assessment:

The analysis contained in this section merely shows a correlation between proximity to PR 2305 warehouse operations and increased CES 3.0 scores, it does not attempt to demonstrate a causal relationship. Higher levels of Diesel PM have been identified around warehouses relative to other areas, due primarily to the sources of emissions associated with warehouses like trucks and TRUs (CARB 2005, 2020). In addition, trucks are the largest source of NO_x in the air basin, and some of the higher regional ozone and secondary PM levels found in communities near warehouses will therefore be attributable to truck emissions. (South Coast AQMD, 2017).

Response to Comment #6

To improve the D&B data used within the small business analysis performed within the PR 2305 draft socioeconomic impact assessment, warehouse operators were screened out if their estimated annual rent payments were more than the reported revenue values from Dun and Bradstreet (D&B).

U.S. Census County Business Patterns were considered as suggested by the commenter, however this data is not specific to the individual facilities covered by PR 2305. As a result, it's use would not be able to improve the small business analysis already performed using the D&B data.

Response to Comment #7

To the extent D&B data may be out of date, South Coast AQMD staff is unaware of formal documentation showing this reality. Moreover, revenue and employee values at larger companies, even if out of date by several quarters or years, is unlikely to change enough to

sizably affect the current small business analysis results within the draft socioeconomic impact assessment. In addition, D&B data does include revenue and employee data on parent companies which is the appropriate data for determining whether or not a firm qualifies as a small business. Of the potentially affected PR 2305 warehouse operators possible for small-business determination, South Coast AQMD staff determined about 50% had reliable revenue data to credibly perform small-business determination.

There are potential issues with using the suggested alternatives, CA EDD and County Business Patterns, for small-business determination. CA EDD data is provided just for the local site within South Coast AQMD jurisdiction and not for the entire firm. County Business Pattern data is aggregated by industry and not specific to individual facilities.

Staff believes the small-business analysis contained in the PR 2305 Second Draft Socioeconomic Impact Assessment is a sufficiently representative analysis based on the data available.

Response to Comment #8

South Coast AQMD staff estimates the number of PR 2305 potentially affected warehouses that are expected to earn WAIRE Points to comply with PR 2305 to be 1,777 single-tenant warehouses, up to 1,093 multi-tenant warehouses, and 32 warehouses with an unidentified number of tenants, for a total of 2,902 warehouses. These estimates are derived primarily from CoStar data.

As described in Appendix C of the draft staff report for PR 2305, operator data from CoStar, Dun and Bradstreet, and other data sources was reviewed, however determining highly accurate data on the number of warehouse operators proves difficult with currently available data. For example, business listings are often out of date, and it is not possible to determine if a business listing is active. These warehouse operator datasets contain many companies which upon further review are understood to be companies which historically operated at a location and have either shut down or moved.

This uncertainty in warehouse operator data will be clearer if PR 2305 is approved, as warehouse owners and operators will be required to submit reports/notifications to South Coast AQMD.

Response to Comment #9

Tables 32 and 33 have been added to the draft socioeconomic impact assessment, presenting estimated forgone output by industry from the lower-cost scenario of Scenario 7a and the high-cost scenario of Scenario 7. Similar to tables presenting forgone jobs, Tables 32 and 33 show the top 10 most adversely impacted industries, and the top three most benefitting industries due to PR 2305. Relative to total economic output within the South Coast AQMD four-county region, PR 2305 may reduce average annual output between 0.02% and 0.10%.

Response to Comment #10

This point is addressed in the draft SIA in the paragraph proceeding this footnote (footnote #34 in the updated draft socioeconomic impact assessment).

Response to Comment #11

A range of estimated total discounted monetized public health benefits has been included in the Valuation of Public Health Benefits subsection for (1) all scenarios with appreciable NO_x emission reductions (excluding Scenarios 15 and 16), and (2) those scenarios identified as representative of the expected low- and high-end of realizable NO_x emission reductions (Scenario 13 and Scenario 1).

Response to Comment #12

An additional table has been added to the end of the Valuation of Public Health Benefits subsection (Table 42) that includes estimated total discounted costs (NPV 4%) and estimated total discounted monetized public health benefits (NPV 4%) for each modelled scenario, where applicable.

Appendix II – Peer Review of Industrial Economics, Inc. (IEc) Socioeconomic Analysis of Warehouse Relocations, IEc Response to Comments, and South Coast AQMD Response to Comments

**THIRD PARTY REVIEW: SOCIOECONOMIC
ANALYSIS OF ISR RULE (PR 2305) REPORT BY
INDUSTRIAL ECONOMICS, INC. (IEc)**

Submitted to:
South Coast Air Quality Management District

Submitted by:

Robert A. Kleinhenz, Ph.D.
Kleinhenz Economics

April 2, 2021

INTRODUCTION AND PURPOSE OF THIS STUDY

The South Coast Air Quality Management District (South Coast AQMD) is responsible for regulating stationary sources of air pollution in the Southern California region that includes Los Angeles, Orange, Riverside, and San Bernardino counties, excluding less populated portions of Los Angeles, Riverside, and San Bernardino counties. The South Coast AQMD has determined that a significant share of the region's emissions emanate from the goods movement sector, which consists primarily of the region's transportation and warehousing sector.

As a part of its effort to achieve compliance with federal and state clean air standards within its jurisdiction, the South Coast AQMD has developed an indirect source rule (ISR), the goal of which is to reduce mobile-source emissions associated with the operation of warehouses and distribution centers in the South Coast AQMD region. The rule is known as Proposed Rule (PR) 2305 or the Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. If the rule is adopted, it would apply to any existing or new warehouse with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building located in the South Coast AQMD jurisdiction.

Under PR 2305, warehouse operators would be subject to an annual Warehouse Points Compliance Obligation (WPCO), which requires them to take actions to reduce NO_x and PM emissions associated with their operations, including trucks and other vehicles that operate at, or visit, the warehouse facilities covered under PR 2305. Alternatively, operators may pay a mitigation fee used to offset emissions in communities of warehouses which paid mitigation fees.

Warehouse operators may evaluate whether it is more cost-effective to avoid PR 2305 compliance costs by moving their operations outside of the South Coast AQMD region. The operator's relocation decision would presumably weigh operating costs at the current location (including PR 2305 compliance costs) against the prospective operating costs at another location (including any changes in transportation costs), plus the one-time costs of moving. The calculation would likely account for the benefits of the current and prospective location as well.

The South Coast AQMD engaged Industrial Economics, Inc. (IEc) to perform a study with the goal of estimating PR 2305's likely costs to the warehouse industry in the region. One crucial aspect of IEc's study is to assess possible responses on the part of the warehouse industry, including the potential for warehouse operators to relocate outside the South Coast AQMD region.

The South Coast AQMD has engaged Kleinhenz Economics to serve as an independent reviewer of the IEc study. This report contains the findings of the independent, third-party review of the IEc report entitled, "Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule." The review examines the IEc's analysis of:

- Warehouse markets in the South Coast AQMD's jurisdiction and in nearby areas; and

- The decision analysis framework used to model relocation decisions of warehouse operators, and the results of IEC's analysis and their implications.

GENERAL COMMENTS ON REPORT

The IEC study is intended to evaluate the relocation decisions of warehouse operators in the South Coast AQMD region in response to the implementation of PR 2305. The study consists of three main components:

- Comparative market analysis of warehouse space in the South Coast AQMD region and other nearby regions to which warehouses may relocate in response to PR 2305 (competing regions).
- Survey of stakeholders to determine factors that may affect relocation decisions.
- Development and application of a model to simulate relocation decisions. This includes a separate pathways model of transportation costs that is used to determine how transportation costs affect the relocation decision.

Technically, the IEC study is a comprehensive analysis of the relocation decisions of warehouse operators. It makes extensive use of both publicly available data and proprietary data (CoStar data on properties). It also relies on a survey of stakeholders to identify variables that are likely to enter an operator's relocation decision. The study develops and uses a complex relocation decision model which is driven in part by the above-mentioned pathways model of transportation costs. Finally, IEC uses the model to estimate the likely number of warehouse relocations that would occur under a number of PR 2305 compliance-cost scenarios.

While the analysis is generally robust, there are at least a few areas where the IEC analysis can be augmented. Moreover, thought experiments and illustrative examples can be used as a "taste test" to determine whether the assumptions, analysis, and conclusions are reasonable. Details follow below. Some of the comments here may be addressed in South Coast AQMD's socioeconomic impact analysis or staff report for PR 2305, although summarizing them in this report will provide important context for the relocation decision analysis and results.

STRENGTHS AND WEAKNESSES OF THE STUDY

Strengths of the Study

- Warehouse market assessment and analysis is a robust discussion of both the local warehouse market and those of competing regions. The assessment describes the state of the warehouse markets in each of the regions in terms of commonly used market indicators, but it also goes to great lengths to assemble inventories of individual properties in each of the regions, including current warehouse space and prospective

space. However, while the study produces forecasts of future warehouse capacity, it relies on a 2018 forecast that may be dated as discussed in the third bullet under “Weaknesses of the Study.”

- The stakeholder survey provides valuable insights regarding decisions to stay in the region or relocate. The survey results identify variables that would be taken into consideration during a relocation decision process. While the list of variables may not have been surprising, it is hoped that including the survey as part of the overall study ensures that no key decision variables would be overlooked.
- The pathway analysis used in the study is remarkable as a technical approach to simulating transportation costs and relocation decisions. In the end, relocation decisions in a regional setting must be viewed probabilistically: What is the probability that a given warehouse operator at a given warehouse will relocate? As described in the report, there is considerable variation in the types of warehouse space and their functions across the region; and there is considerable variation in the population of warehouse operators themselves. Simplifying assumptions are frequently needed to arrive at a tractable modeling methodology, but the pathway analysis goes a long way in replicating the complexity of the industry.

Weaknesses of the Study

The following potential weaknesses in the study may affect the validity of the study findings.

- The distinction between warehouse owners and warehouse operators is blurred throughout the report, yet these are two distinct groups of stakeholders whose interaction in response to PR 2305 may play a significant role in its rollout and effectiveness. Warehouse operators can quickly move in response to the new rule, but warehouses cannot. At a minimum, the report ought to explicitly identify the “warehouse operators” as the relocation decision makers and not “warehouses.” Moreover, as described below, the market response to compliance costs associated with PR 2305 may be different for warehouse owners compared to warehouse operators, and the dynamic relationship between the two may result in compliance costs being shared. 1.
- Despite the extensive discussion on the warehouse market, the report does not include a sufficient amount of background information on the broader goods movement sector of the Southern California region, including the composition of the sector, long-run trends, and competitive pressures. As described below in the “Discussion of Warehouse Market Analysis” a more complete discussion of these details will give the reader much needed context. 2.
- While the survey of stakeholders is a strength of the analysis, it should be complemented by reference to the extensive literature on the relocation decisions of firms, including the key factors that commonly trigger relocation on the part of a firm. As one would expect, firm profitability is one factor that enters a firm’s relocation decision. Relocation research shows that marginally profitable firms are more likely to 3.

- | | | |
|---|---|----|
| <p>relocate to improve profit margins, all else being equal. The literature also sheds light on the extent to which regulations and regulatory costs affect a firm’s decision to move and adds context to the findings of the stakeholder survey.</p> | } | 3. |
| <ul style="list-style-type: none"> • Even with the detailed discussion of the stakeholder survey results, there is room in the report for a more complete profile of the warehouse/fleet operators by individual industry components. This may include the number of operators, payroll employment, and distribution by size, as well as number of self-employed independent operators. These details have implications for the socio-economic characteristics and equity aspects of PR 2305 implementation for the operators, not just the communities and residents. A closer look may show that some individual industries are more sensitive to changes in regulations and compliance costs, hence more susceptible to relocation than others. | } | 4. |
| <ul style="list-style-type: none"> • The 2018 CoStar/Moody’s forecasts to drive baseline scenarios (Attachment 2, p. 25) may result in out-of-date forecasts, analyses, and conclusions. Many decisions pertaining to warehouses (planning, development and construction, and operations) are long-run decisions on the part of firms, and as such, these decisions follow a deliberate and somewhat lengthy process. As a rule, long-run trends and forecasts are likely to prevail regardless of typical cyclical fluctuations in the economy. However, the current pandemic situation is neither typical nor cyclical, but rather a singular event that has caused unprecedented disruption to the local, national, and global economies, disrupted supply chains, and potentially changed consumption patterns of households and businesses. As such, it is advisable to compare the 2018 vintage forecasts with more recent long-run forecasts, identify their differences, and address the likely implications of these differences for the conclusions of the report. | } | 5. |
| <ul style="list-style-type: none"> • The IEc report references the SCAG report entitled, “Industrial Warehousing in the SCAG Region-Final Report,” which was published in 2018. This report summarizes the structure and geographic location of the warehouse industry in the SCAG jurisdiction. While industry structure and location tend to change slowly over several years’ time, the warehouse sector in Southern California is still driven by a variety of market dynamics, not the least of which is the trend in cargo volumes passing through the region’s ports. It may be advisable to bring the SCAG report “up to date” by briefly describing qualitatively or quantitatively how the structure of the industry in 2021 compares with that described in the 2018 report, which itself contains data from as far back as 2014. | } | 6. |
| <ul style="list-style-type: none"> • The study cites the 2014 SCAQMD High Cube Warehouse Truck Trip Study. This study was based on a survey that was conducted in 2013-2014. Again, even though industry structure tends to change relatively slowly, changes do occur over a period of 5 to 7 years and may have accelerated in the wake of the pandemic. Thus, to the extent possible, it is advisable to check that the relevant contents of the 2014 report adequately represent present circumstances. | } | 7. |

- Having identified and discussed the variety of warehouse uses and warehouse operators in the report, one potential drawback of the study may be the need to make simplifying assumptions in order to move forward with simulations of relocation decision scenarios. The study’s conclusions rely heavily on the results of the simulations, which imply that there would be minimal relocation activity once PR 2305 is implemented. If the analysis is correct, compliance costs will generally be spread over the existing number of operators in the existing warehouses. However, if the analysis underestimates the effects of PR 2305 and there is a larger than predicted exodus of warehouse operators, compliance costs may have to be spread over a smaller number of operators/warehouses, possibly resulting in a higher average compliance cost per operator. One possible “taste test” would be to conduct a sensitivity analysis, independent of the scenario analysis, to evaluate the implications from hypothetical relocation shares, for example 1%, 2%, 5%, and 10%. The results may shed additional light on how compliance costs will be borne by warehouse operators and owners.

8.

DISCUSSION OF WAREHOUSE MARKET ANALYSIS

The comparative warehouse market analysis carefully lays out recent historical and current market conditions in the South Coast AQMD region (Attachment 1) and in other nearby regions to which warehouse operators may move in response to PR 2305 (Attachment 2). The report goes to great lengths to produce an inventory of warehouses and potential warehouse space, with particular attention given to warehouses of at least 100,000 square feet that would be subject to PR 2305. Relying on such measures as capacity, absorption, lease rates, and sales prices, the study describes the advantages and disadvantages of operating in the South Coast AQMD region.

It is difficult to discuss the region’s warehouse sector without including more background on the broader goods movement industry of which it is a part. A significant share of jobs and economic activity in the region are tied to the goods movement sector, which includes both transportation and warehousing. Attachment 1 in the report could improve on its discussion of recent dynamics of the region’s goods movement sector, by presenting a more complete profile of the industry. This can be accomplished by reporting the region’s total building area as shown in first two columns of Exhibit 4 on page 9 of Attachment 2 in Attachment 1, which shows a breakdown of building area by type of warehouse. This may be complemented by including the table “Goods Flow Categories Defined Based on the Commodity Flow Survey” shown in Exhibit 1 on page 8 of Attachment 4, which describes the various flow of goods, inbound and outbound, and internal.

2.

This background information provides important data that can be used to describe the local transportation and warehousing sector, including broad industry trends that may provide valuable context to the reader. This includes trends in cargo volumes at the local ports, recent investments in infrastructure, the role of labor in the industry, and so on.

It also includes a discussion of the global goods market within which the local ports operate, including the competitive pressures they face and how they affect other parts of

9.

the local industry. San Pedro ports must contend with competitive pressures in international trade as ports on the Pacific Coast and elsewhere compete for discretionary cargo, which can move through any port in the country at the discretion of the shipper. This is a major source of demand for warehouse space. Being near the largest port complex in the western hemisphere confers a considerable advantage (market power) on warehouses and operators in the region. However, the ports face competition to varying degrees from other ports on the West Coast and the Atlantic Coast. With 30% or more of the cargo passing through the San Pedro Bay ports classified as discretionary cargo, a more robust discussion of the dynamics of this situation is warranted than the brief mention in Attachment 4 on page 6.

9.

More immediately, it would describe how an already tight warehouse market became even more taut in the past year as the good movement industry handled record levels of cargo, triggering accelerated interest in real estate development of industrial/warehouse properties in the region. At the same time, it would include a discussion of how the local goods movement sector meets the needs of households and businesses in a vast region that is home to upwards of 23 million residents, depending on how the narrowly or how widely the region is defined.

2.

The report also presents dynamics of warehouse markets neighboring non-South Coast AQMD markets vis a vis the warehouse markets in the South Coast AQMD region, describing how slower net absorption in the South Coast AQMD region “is offset with an increase in non-South Coast AQMD growth, particularly in the Phoenix and Las Vegas markets. This provides suggestive evidence that warehousing activity may shift between the South Coast AQMD jurisdiction and these outlying areas” (Attachment 2, page 17). While this is a *possible* explanation, it is, at best, a partial explanation. More robust analysis would entail looking that the economic growth rates of each region, changes in local demand for industrial space as well as capacity, and discussion of variables that may be affecting all of the regions in question, such as the national economic expansion that only recently ended with the pandemic.

10.

In all, this discussion will paint a more complete picture of the goods movement at the aggregate industry level. The discussion will describe more completely the market conditions within which individual warehouse operators and warehouse owners are making their microeconomic profit maximizing decisions, a topic that is addressed in the following section.

DISCUSSION OF WAREHOUSE RELOCATION DECISION ANALYSIS AND RESULTS

As described in the IEc study, the warehouse operator relocation decision process is a function of several costs, which include real estate costs, other warehouse-related operations costs, transportation costs, labor costs, regulatory costs, and relocation costs. As a part of analyzing transportation costs, IEc provides a profile of the truck fleets that serve the South Coast AQMD region (Attachment 3) and adapts a route- or pathways-based model of goods flows to the analysis of relocation decisions (Attachment 4). The results of

the relocation decision analysis appear in Attachment 5 of the report and are summarized in the Executive Summary.

As pointed out earlier, the report should be more explicit in describing the relocation decisions as being made by warehouse operators. Assuming warehouse operators are tenants and not property owners, they can move their operations more easily than property owners, for whom the relocation decision is different, unless they both own the warehouse and conduct business as an operator. More generally, however, warehouse operators and warehouse owners may respond differently to compliance costs associated with PR 2305. For example, if PR 2305 triggers enough relocation on the part of warehouse operators to cause a sizable decline in demand, then, given the relatively inelastic supply of warehouse space in the South Coast AQMD region, property owners may see a decline in lease rates their properties can fetch, and as a result, may be willing to absorb a share of compliance costs to avoid loss of tenants.

1.

The survey of warehouse operators provided insights into operator behavior and possible responses to PR 2305. It would also have been an opportunity to obtain actual data on transportation routes (pathways). For example, the survey asks the question, “What region does your fleet typically serve?”, with *general* follow up questions about the routes used and locations they service. With properly framed questions, it might have been possible to obtain information that reflects *actual* behavior. For example, in addition to the general questions in the survey, one might ask for information on specific trips, such as: “For each vehicle in your fleet, please provide the origin, destination and path of the xth trip taken by that vehicle in the past week (or day or month).” As is known in the field of survey design, a self-reported general statement (“my usual commute is 30 minutes”) is laden with greater variability than a self-reported specific statement (“my commute today was 37 minutes).

11.

Beyond this point, while the technical approach to the relocation analysis is impressive, its validity can be bolstered by supplying additional background information, drawing comparisons with applicable knowledge and theory of the warehouse market, and using illustrative examples or thought experiments to demonstrate consistency of the relocation analysis with the likely situation for warehouse operators in real world circumstances.

12.

For example, while the report lists the set of costs that are a part of an operator’s location decision analysis, knowing the cost structure in the warehouse operator industry across the individual categories would provide valuable context. This would be particularly helpful if the relocation decision comes down to two or three cost categories such as real estate costs, regulatory costs, and transportation costs. Knowing the distribution of costs would make the relocation decision of an operator more transparent.

13.

Other assumptions of the analysis may be oversimplified and may merit more discussion than appears in the study. For example, the pathways analysis only considers transportation costs per mile of distance but does not take into consideration time costs of travel, which begs the question, if Southern California road congestion results in a higher time cost of travel compared to out of area, should differences in the time cost of travel be considered. Admittedly, if drivers are paid on an hourly basis, differences in the time cost of travel

14.

should be reflected in higher wage bills for local operators compared to non-local operators. If these differences are not incorporated into the analysis, at a minimum, IEC may outline a thought experiment that walks through such a comparison using plausible assumptions about wage costs, and per-mile costs, and then use the results of the thought experiment to shed light on the ramifications of omitting the time cost of travel from its analysis.

14.

It also appears that the process of determining which warehouse will relocate (most distant warehouse) is driven by distance and does not consider differentials in real estate costs across regions within the South Coast AQMD. While this may be a simplifying assumption, one might have more confidence in the report findings if a thought experiment or other construct is used to determine whether or not the results would be sensitive to differences in real estate costs.

15.

While the survey of stakeholders is a strength of the analysis, it should be complemented by drawing from the extensive literature on the relocation decisions of firms to describe the most important variables a firm considers when going through the relocation decision process. In particular, this would address the perception that costs of regulation drive firms to leave a given region or a given state. For example, relocation research shows that marginally profitable firms are more likely to relocate to improve profit margins, all else being equal. The literature also sheds light on the extent to which regulations and regulatory costs affect a firm's decision to move and adds context to the findings of the stakeholder survey.

3.

Even with the detailed discussion of the stakeholder survey results, there is room in the report for a more complete profile of the warehouse/fleet operators by individual industry components. This may include the number of operators, payroll employment, and distribution by size, as well as number of self-employed independent operators. These details have implications for the socio-economic characteristics and equity aspects of PR 2305 implementation for the operators, not just the communities and residents. A closer look may show that some individual industries are more sensitive to changes in regulations and compliance costs, hence more susceptible to relocation than others.

4.

INDUSTRIAL ECONOMICS, INCORPORATED

Responses to Kleinhenz Economics Review of Industrial Economics Socioeconomic Analysis of Warehouse Relocations

Response to Comment 1:

As the reviewer suggests, “warehouse operators” are the relocation decision makers modeled by IEC. Because warehouse operators can relocate in response to the rule, our focus on operator decisions provides South Coast AQMD with insights into the rule’s potential economic and emissions impacts within the AQMD’s boundaries. We agree with the reviewer’s suggestion that warehouse owners may lower the rents they charge to warehouse operators as an incentive for them to remain within the South Coast AQMD. In not capturing this effect, however, our analysis provides a conservative, high-end estimate of likely relocations.

Response to Comment 2:

We appreciate that additional background on the broader goods movement sector in the region may be useful to provide context for our analysis. Such information is available from several key sources listed below, from which we have summarized high-level findings relevant to this analysis.

The 2018 “Industrial Warehousing Study” from the Southern California Association of Governments (SCAG) catalogues the state of the industrial warehousing sector in Southern California, describes warehouse categories and functions, and interprets evolving trends in warehousing to determine the region’s ability to develop future capacity.⁵¹ This report also provides an inventory of warehousing space within the SCAG region, which though it uses different boundaries than the South Coast AQMD region and makes use of slightly older data, may be helpful context in comparison with the findings in Attachment 2 of this analysis.

Robert Leachman’s 2017 white paper “Strategic Initiatives for Inland Movement of Containerized Imports at San Pedro Bay” includes the detailed discussion of supply chain strategies IEC relied on for the development of the transport pathways in this analysis.⁵² A key trend discussed in Leachman’s paper is that fewer imported international shipping containers arriving through the San Pedro Bay are being shipped onward to inland ports via rail without first being sorted and inventoried in the Los Angeles vicinity. This growing trend results in more drayage between the ports and warehousing locations within the South Coast AQMD region to enable the disassembling and repacking of shipping containers prior to rail

⁵¹ Southern California Association of Governments (2018). Industrial Warehousing in the SCAG Region. https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf?1604268012.

⁵² Leachman, R. (2017) Strategic Initiatives for Inland Movement of Containerized Imports at San Pedro Bay. University of California at Berkeley. https://ieor.berkeley.edu/wp-content/uploads/2019/10/RCL-LA-Basin-Initiatives-Jan_13_2017.pdf.

transport. The result is a continued growth in reliance on warehousing in the area for the processing of imports.⁵³

SCAG's 2020 Regional Transportation Plan's "Goods Movement" chapter, as well as the corresponding appendix from the 2016 Regional Transportation Plan, include discussions of how national import strategies are evolving and the relevance of these changes to logistics and transportation networks in Southern California.^{54,55} A key finding is that strong growth in port traffic in other "corners" of the U.S., in addition to significant market share growth in Canadian and Mexican ports on the Pacific coast, is projected to continue to outpace growth at the Port of Los Angeles and Port of Long Beach.⁵⁶ The authors note that while not growing as quickly as other ports, sustained high demand continues at the Port of Los Angeles and the Port of Long Beach. This is driven in large part by continued anticipated growth in trade volumes from Pacific Rim nations, with a significant share of imports passing through the San Pedro Bay.⁵⁷

Response to Comment 3:

As the reviewer suggests, the literature does provide additional context for the location decision-making of firms. Targa et al. (2006) note the importance of transportation network availability and highway access as important components of firm economic success and location decision-making.⁵⁸ Similarly, Jaller et al. (2016) note the importance of transportation access and population centers in explaining warehouse and distribution center location decision-making specific to Southern California.⁵⁹ Hu et al. (2008) found that internal factors such as firm sales and employment do not play as large of a role as access to transportation options and the general economic environment.⁶⁰ Kang (2018) notes that Los Angeles warehouses built more recently (since 2000) have prioritized cheaper land and access to intermodal transport facilities relative to the labor center and port proximity of older warehousing infrastructure, though this may simply reflect the outward expansion of the Los Angeles area goods movement sector.⁶¹ Rivera et al. (2015) note the benefits realized by logistics firms of various sizes co-locating in logistics "parks," specifically increased employee training opportunities and the sharing of transportation capacity.⁶²

⁵³ Leachman (2017).

⁵⁴ Southern California Association of Governments (2020). Regional Transportation Plan Technical Report: Transportation System Goods Movement. https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf?1606001690.

With respect to policy changes specifically impacting firm relocation decisions, Pan et al. (2020) note that while traditional factors such as taxation and incentives do have a statistically significant effect on relocation decisions, individual policy changes are unlikely to influence firm relocation decisions without being inordinately large or arriving in combination with other policies or changes.⁶³ Similarly, Conroy et al. (2016) report small marginal effects of any individual factor on industrial firm relocation, stating the low likelihood of such decision-making being affected by changes to local or state-level taxes or other economic incentives.

As the reviewer mentions, firm profitability may also influence relocation decisions, and less profitable firms are more likely to consider alternatives.^{64,65} Given the low numbers of modeled relocations in our analysis, even under higher compliance cost scenarios than proposed in PR 2305, it is more likely that firm relocation decisions will be based off of transportation and goods pathway needs specific to each firm, which we capture by modeling each goods pathway separately. We also note that accounting for the financial health of individual warehouse operators in our modeling would not have been feasible with the available data.

Response to Comment 4:

South Coast AQMD staff have addressed this comment.

Response to Comment 5:

The long-term forecast in our analysis consists of projected developments plus “slack capacity,” defined as potential additional developments available on land zoned for industrial development plus projected vacancies. In calculating slack capacity, we subtract the land required for forecasted developments under the 2018 CoStar/Moody’s economic case. Projected developments represent roughly six percent of slack capacity in the outlying market areas (approximately 1,400 million square feet of estimated slack capacity versus 80 million square feet of forecasted developments). If a more recent forecast projects more warehouse development in the outlying market areas than the 2018 forecast used in our analysis, this would likely reduce the projected slack capacity available in these areas and, due to capacity constraints, potentially reduce the number of relocations (for those compliance cost scenarios where the estimated number of relocations is greater than zero). Thus, the forecast of outlying market capacity in the analysis supports the development of conservative estimates of relocations.

The reviewer also suggests that a more recent forecast could show an increase in warehouse development activity in the South Coast AQMD’s boundaries and that this development may imply more relocations than projected in our analysis. We note, however, that at the maximum average compliance cost of \$0.83 per square foot proposed in PR 2305,⁶⁶ IEC’s

⁶⁶ This value is the average annual compliance cost of the high-cost compliance scenario in which all facilities comply with PR 2305 by paying a mitigation fee every year and receive no funding to purchase equipment to aid with PR 2305 compliance.

analysis found that zero percent of warehouses in the South Coast AQMD are likely to relocate. The economics of the relocation decision would be the same for additional warehouses located in the South Coast AQMD. Thus, even if there are indeed more warehouse developments in the South Coast AQMD than we calculate in our long-term scenario, expected relocations would still likely be zero under the rule as it is proposed.

Response to Comment 6:

IEC's primary use of the 2018 SCAG report "Industrial Warehousing in the SCAG Region" is to inform the warehouse categorization used throughout the analysis.⁶⁷ Because this general categorization has not significantly evolved since 2018, the 2018 SCAG report serves as a reasonable basis for the warehouse categorization relevant to PR 2305. Although SCAG's October 2020 "Last Mile Freight Study" notes the increasing prevalence of smaller delivery fulfillment facilities oriented toward package sorting for last-mile delivery,^{68,69} most of these smaller facilities are unlikely to exceed the 100,000 square foot threshold for regulation under PR 2305.

With respect to recent trends in the flow of goods through the region's ports, 2019 and the first half of 2020 saw slight declines in imports through the San Pedro Bay ports complex relative to 2018. The second half of 2020 resulted in a strong turnaround for imports, with the Port of Los Angeles finishing with 2020 as its fourth-largest cargo volume year ever and the Port of Long Beach having its single largest cargo volume year in its history.⁷⁰ The growth trend has continued in the first part of 2021, with January and February volumes at the Port of Los Angeles tracking 21 percent above the same months in 2020, and five percent above the same months in 2019.⁷¹

Response to Comment 7:

South Coast AQMD staff have addressed this comment.

Response to Comment 8:

The reviewer suggests that the relocation of warehouse operators outside the South Coast AQMD region would increase the per-facility costs of complying with PR 2305 for those warehouses that remain. However, the costs of compliance with PR 2305 for a given facility are a function of each warehouse's size and operations (truck trips). The number of warehouses in the regulated universe does not affect the costs of compliance for any one warehouse. Therefore, if any warehouse operators leave the South Coast AQMD region in response to the rule, we do not expect compliance costs for other facilities to be affected.

South Coast AQMD staff have addressed this comment.

Response to Comment 10:

We agree with the reviewer's assertion that slower net absorption in the South Coast AQMD region coupled with growth in net absorption in some outlying markets is likely driven by a variety of factors other than warehouse operators shifting between the South Coast AQMD region and these other areas. Our intention was not to suggest warehouse operator relocation was the main driver of this pattern observed in the net absorption data but merely to highlight this pattern is consistent with relocation. Other possible factors include, as the reviewer mentions, each respective market area's economic growth and local demand for warehousing space. Cities in some areas, such as Western Arizona, actively recruit new warehousing developments. Increases in absorption in these areas cannot be specifically tied to relocations from the Los Angeles area without an understanding at the individual firm level.

Response to Comment 11:

Although it is possible that a survey of warehouse operators on the goods flow movements through their warehouses would have generated useful information, Leachman (2017) includes the most detailed analysis of goods movement in the Los Angeles area that we were able to identify from published or unpublished sources. It reflects input that Leachman obtained through industry interviews, as well as statistics for goods pathway identification from sources such as the Alameda Corridor Transport Authority, Union Pacific, and BNSF. While a few years have passed since this report's writing, we are unaware of any information to suggest that the general goods distribution shares across pathways has changed significantly in that time. Therefore, given the quality of the Leachman (2017) study and the significant resources required to obtain the detailed information necessary to update the study, we focused our efforts on applying Leachman's findings to develop a detailed understanding of the transportation cost implications of warehouse operator relocation.

Response to Comment 12:

In response to the reviewer's suggestion for illustrative examples, consider the example of two warehouse operators weighing relocation to the Phoenix market. The first operator largely supports goods bound for rail transport for national distribution (e.g., Pathway 6 in our analysis), and the second operator is on a goods flow pathway concluding in distribution within the South Coast AQMD region, such as Pathway 3. For the first operator, relocation from the South Coast AQMD region to Phoenix would entail trucking goods to Phoenix for repacking, followed by drayage to the rail terminal in Phoenix. The goods would not have to be transported significant extra distance, but the change in transportation costs would be due to truck transport being more expensive than rail (see Exhibit 1 below). Alternatively, for the second warehouse operator on Pathway 3, goods must be trucked all the way to Phoenix and then back to the South Coast AQMD region. There are also no avoided rail costs associated with the warehouse on Pathway 3, as there are for the warehouse on Pathway 6. As shown in Exhibit 1, the total change in transportation costs is almost three times higher for goods flowing through the warehouse on Pathway 3 (\$147,000 per square foot per year) versus the warehouse on Pathway 6 (\$63,000 per square foot per year). The other cost impacts associated with relocation to Phoenix are the same for the two warehouses (also shown in Exhibit 1).

As demonstrated in the above example, the end market for distribution of the goods passing through a warehouse has a significant influence on the changes in transportation costs due to potential relocation. In practice, each warehouse operator is likely to serve a unique combination of pathways that evolves over time, as opposed to serving just a single pathway as presented in our illustrative example. It is possible that changes to the goods that individual warehouse operators manage may affect decision-making around relocation. We note, however, that under the expected compliance costs for PR 2305, our analysis shows no relocations under any single pathway. Thus, a combination of pathways is unlikely to result in different decision-making.

EXHIBIT 1: SAMPLE WAREHOUSE CHANGES IN OPERATING COSTS - RELOCATION TO PHOENIX MARKET AREA

Cost Category	Warehouse Serving Pathway 3 - South Coast AQMD Distribution (\$/1000 sq. feet per year)	Warehouse Serving Pathway 6 - National Distribution (\$/1000 sq. feet per year)
Rent	\$ 4,610 - cost savings	\$ 4,610 - cost savings
Labor	\$ 1,962 - cost savings	\$ 1,962 - cost savings
Power	\$ 549 - cost savings	\$ 549 - cost savings
Transportation (Trucking and Rail)	\$ 147,211 - cost increase	\$ 62,629 - cost increase

Response to Comment 13

In response to the reviewer's suggestion that we provide data on the cost structure of warehouse operators in the Southwest region, Exhibit 2 below outlines total baseline geographically-variable operating costs for model 500,000 square foot warehouses in different locations, as reported by The Boyd Company.⁷² This is the source we primarily relied on for calculating differences in operating costs across market areas, as described in greater detail in Attachment 4. As indicated in Exhibit 2, costs considered in the Boyd report include labor, power, amortization, taxes, and shipping. These categories differ slightly from those considered in our analysis. We assume amortization and tax costs reported by Boyd are captured in rents. The shipping costs as reported by Boyd reflect only outbound shipments, do not account for differences in rail transport costs, and appear to assume a much lower truck trip rate than is expected under PR 2305.

⁷² The Boyd Company (2015). "Comparative Distribution Costs in Port and Intermodal-Proximate Cities: Distribution Warehouse Site Selection."

EXHIBIT 2: SAMPLE WAREHOUSE TOTAL OPERATING COSTS - 500,000 SQUARE FOOT
GENERAL DISTRIBUTION WAREHOUSE IN SELECT AREAS

Cost Category	Location:	Mira Loma, CA	Victorville, CA	Mesquite, NV	Kingman, AZ
	Market Area:	South Coast AQMD	Bakersfield	Las Vegas	Western AZ
Labor		\$ 6,448,562	\$ 5,759,695	\$ 5,132,061	\$ 4,802,935
Power		\$ 837,888	\$ 837,888	\$ 769,080	\$ 655,200
Amortization		\$ 4,072,557	\$ 3,922,992	\$ 3,679,813	\$ 3,121,886
Property and Sales Tax		\$ 1,260,146	\$ 1,292,371	\$ 1,105,588	\$ 1,596,576
Shipping Costs		\$ 293,772	\$ 524,815	\$ 1,803,532	\$ 1,760,047
Total Annual Geographically-Variable Operating costs		\$ 12,912,925	\$ 12,913,886	\$ 12,490,074	\$ 11,936,644

Response to Comment 14:

The available data on fully loaded trucking costs (i.e., with labor, vehicle wear and tear, etc.) are expressed on a per mile basis rather than per hour. Because labor represents a significant portion of these costs, we agree with the reviewer that congestion is likely to affect the trucking cost per mile. However, we do not believe that explicitly incorporating congestion effects into our analysis would change the conclusions of the analysis. Regardless of warehouse location, trucks must still pass through the congested Los Angeles metro area for all of the goods flow pathways included in our analysis in the baseline and under the proposed rule scenario. In addition, if a warehouse operator were considering relocation to an outlying market and serves goods flow pathways involving local distribution to the South Coast AQMD region, accounting for congestion could *increase* the estimated cost of relocation. Under this scenario, goods would flow through the congested L.A. area *en route* to the outlying area warehouse and would travel through the L.A. area again for local distribution. To the extent that this congestion effect is not represented in the unit cost values applied in our analysis, we may underestimate the transportation cost impact of relocation and overestimate the number of relocations.

Response to Comment 15:

The reviewer correctly points out that different areas within the South Coast AQMD have different average rental prices for warehousing space. Using data available at the county level, rents within the South Coast AQMD's boundaries are higher in Los Angeles county, where rental prices are \$11.19 per square foot per year, which is \$0.58 higher than the South Coast AQMD average value of \$10.61 used in the modeling. Thus, warehouse operators located in Los Angeles County could expect to see an additional \$0.58 per square foot in cost savings following relocation. Combining this with the \$0.83 per square foot maximum average compliance cost of PR 2305, this difference in rents effectively corresponds to warehouse operators saving \$1.45 per square foot due to relocation. Within the context of our analysis, this is similar to avoiding \$1.45 per square foot in compliance costs by relocating. However, because our analysis of the \$1.50-per-square-foot compliance cost scenario shows

no incremental relocations, we would not expect warehouse operators paying rent in the more expensive areas of the South Coast AQMD to relocate under the proposal.

Response to Comment #4

South Coast AQMD staff has produced a draft socioeconomic impact assessment for PR 2305 which addresses several of the reviewer's concerns. The draft socioeconomic impact assessment for PR 2305 addresses information about the number of warehouse operators, small-business considerations, and other socioeconomic characteristics of facilities with warehousing operations.

Response to Comment #5

IEc staff have addressed this comment.

Response to Comment #6

IEc staff have addressed this comment.

Response to Comment #7

The commenter is correct to note the importance of truck trip rates for PR 2305. For this reason, warehouse operators will be required to report actual truck trip data for their operations. This source of information is currently unavailable from any other data source. The 2014 SCAQMD High Cube Warehouse Truck Trip Study was a multi-year effort that concluded with the Institute of Transportation Engineers (ITE) – the preeminent national organization for transportation engineers – completing the analysis and incorporating it into their industry standard Trip Generation Manual. This manual is the basis for the vast majority of transportation engineering studies conducted for development projects in South Coast AQMD and throughout the nation, and continues to be used today. The trip rates are also incorporated into CalEEMod, the primary model used throughout the state to estimate air quality impacts from new development, including for warehousing.

While different types of warehousing will have different trip characteristics, the use of the ITE trip rates provide the most reasonable average to consider a large population of warehouses, such as those covered by PR 2305. Based on the results of that study, the actual trip rates at individual warehouses are expected to vary considerably, but considered

together should approximate the average. Importantly, each warehouse operator's compliance obligation will not be tied to the ITE trip rate. Rather it will be tied to their actual truck trip rate, and the costs they experience due to PR 2305 will be directly tied to their own activity. If PR 2305 is approved by the South Coast AQMD Board, the trip rate data collected may be able to inform future versions of ITE's Trip Generation Manual.

Response to Comment #8

IEc staff have addressed this comment.

Response to Comment #9

The commenter's emphasis on the importance of the region's goods movement industry relative to other ports is acknowledged and has been addressed elsewhere, in particular in Chapter 3 of the draft staff report in the Rule Stringency section, as well as the draft socioeconomic impact assessment for PR 2305. Discussion in Chapter 3 of the draft staff report includes an evaluation of conditions at the ports, including their own economic study of their proposed update to the Clean Truck Rate program.

EXECUTIVE SUMMARY

ES.1 INTRODUCTION

This report is in support of South Coast AQMD staff’s development of a potential indirect source rule (ISR) to reduce mobile source emissions related to the operation of warehouses and distribution centers in the South Coast AQMD’s four-county region (Los Angeles, Orange, Riverside, and San Bernardino counties).¹ Diesel truck traffic, largely related to the transport of goods passing through the Ports of Los Angeles and Long Beach and regional warehouses and distribution centers, makes up a large share of local NO_x emissions. A warehouse ISR, if adopted, may help with reducing emissions from trucks servicing warehousing facilities located within its jurisdiction.

Compliance costs to the warehousing sector could vary depending on the design of an eventual rule. If these costs are significant, the implementation of an ISR could potentially precipitate the relocation of warehousing operations outside the region—with the associated truck fleets continuing to travel to and from facilities in the South Coast AQMD jurisdiction. In the worst case scenario, the associated air quality benefits from such a rule might be greatly diminished. Accordingly, South Coast AQMD is interested in identifying and understanding the factors affecting whether warehousing operations are likely to relocate as a result of the potential rule.

Consistent with this objective, Industrial Economics, Inc. (IEc) performed an assessment of the warehousing sector in the South Coast AQMD jurisdiction and outlying markets and, based on this assessment, performed an analysis of potential warehouse relocations under varying levels of potential ISR compliance costs. This document presents the findings of IEc’s analysis, as well as the data and methods applied.

ES.2 WAREHOUSE REAL ESTATE MARKET IN THE SOUTH COAST AQMD JURISDICTION AND OUTLYING MARKETS

To inform the analysis of potential warehouse relocations from the South Coast AQMD jurisdiction, IEc assessed the warehouse real estate markets within the South Coast AQMD jurisdiction and in neighboring areas. Through analysis of a range of key market metrics and trends, we assess the capacity of neighboring areas to absorb warehousing operations that might consider relocation following the implementation of an ISR. Across all market areas, our analysis of the warehouse real estate market focuses on warehouses with at least 100,000 square feet of floor area, based on the square footage threshold in the October 6th, 2020, draft ISR text.

Using spatial information available on individual warehouses, we grouped properties into eight distinct real estate markets—the South Coast AQMD jurisdiction (or “District” in the graphics below) and seven

¹ The South Coast AQMD jurisdiction is comprised of all of Orange County and parts of Los Angeles, Riverside and San Bernardino Counties. The region is mapped and described in full in Exhibit 1 and the “Geographic Scope” section below.

neighboring areas in geographic proximity to the South Coast AQMD jurisdiction. In addition, we further sub-divided the South Coast AQMD jurisdiction into three areas, largely defined according to county boundaries. These markets, shown in the maps in Exhibit 1, are as follows:

- **Los Angeles:** The portion of Los Angeles County located within the South Coast AQMD jurisdictional boundaries, including all of the county except for the northeastern corner. This area includes the “megaports” of Los Angeles and Long Beach, the origin point for most goods passing through warehouses in the region and 40 percent of all container cargo traffic in the U.S.²
- **Orange County:** All of Orange County, which is completely contained within the South Coast AQMD jurisdictional boundaries.
- **Inland Empire:** The South Coast AQMD portions of Riverside and San Bernardino counties. This includes the most densely populated southwestern corner of San Bernardino County and all of Riverside County except for a small portion near the county’s eastern border, near the Arizona state line.
- **North of District, Bakersfield:** All of Kern County and the non-South Coast AQMD portion of Los Angeles County, including Lancaster and Palmdale.
- **North of District, Coastal:** All of Ventura County, Santa Barbara County, and San Luis Obispo County. Contains the Port of Hueneme,³ located in Ventura County.
- **East of District, Desert Areas:** All of Imperial County and the non-South Coast AQMD portions of San Bernardino County, including Victorville, and Riverside County.
- **South of District, San Diego:** All of San Diego County, which includes the Port of San Diego.⁴
- **Las Vegas:** All of Clark County, Nevada, which includes the city of Las Vegas.
- **Phoenix:** All of Maricopa County and Pinal County, Arizona.
- **Western Arizona:** All of the four Arizona counties to the west of Phoenix: Yuma, La Paz, Mohave, and Yavapai Counties.

Our primary data sources for the assessment of warehouse real estate markets in these areas is the CoStar Suite™ of data products developed and maintained by CoStar, a real estate analytics firm. The CoStar Suite™ includes information on existing properties as well as vacant parcels that may be developed.

The South Coast AQMD jurisdiction is the dominant warehouse market in the broader region. Despite relatively high rents for warehouse space, the South Coast AQMD jurisdiction’s square footage of warehouse space is by far the highest in the region and has grown dramatically over the past several years.

² “Industrial Warehousing in the SCAG Region - Final Report.” (2018) Prepared for the Southern California Association of Governments by Cambridge Systematics, Inc. with Gill V. Hicks and Associates Inc. April 2018.

³ The Port of Hueneme is substantially smaller than the Ports of L.A. and Long Beach, with annual container traffic of 84,000 containers in 2018, relative to Long Beach’s 8.8 million containers and L.A.’s 8.9 million containers. American Association of Port Authorities. “NAFTA Container Port Ranking 2017.” <https://www.aapa-ports.org/unifying/content.aspx?ItemNumber=21048>

⁴ The Port of San Diego’s annual container traffic is approximately 143,000 containers. American Association of Port Authorities. *Op cit.*

REAL ESTATE MARKETS EXAMINED

EXHIBIT ES-1B.

REAL ESTATE MARKETS EXAMINED - SOUTH COAST AQMD MARKETS FOCUS

CURRENT MARKET SNAPSHOT

Our analysis of current market conditions in the warehouse real estate markets listed above includes assessment of the total warehouse inventory in each area, vacancy rates, pricing, and potential future development. Focusing on buildings used primarily as warehouses, we identified 2,638 warehouses within the South Coast AQMD jurisdiction and 975 in the outlying markets.⁵ Similarly, we identified 662 million square feet of rentable building area within the South Coast AQMD jurisdiction and 226 million square feet in the outlying markets. Exhibits ES-2 and ES-3 show the distribution of these warehouses and square footage across market areas.

EXHIBIT ES-2. NUMBER OF WAREHOUSE PROPERTIES BY MARKET & WAREHOUSE TYPE - YEAR 2019

EXHIBIT ES-3. SQUARE FOOTAGE OF PROPERTIES BY MARKET & WAREHOUSE TYPE - YEAR 2019

⁵ We also used the CoStar data to identify manufacturing facilities with warehouses. Based on our analysis of the CoStar data, there are 49 such facilities in the South Coast AQMD jurisdiction with an estimated 8.4 million square feet of warehousing space. Because manufacturing facilities require more specialized buildings and equipment, and would likely incur much higher moving costs, we assume manufacturing facilities will not relocate and therefore exclude them from the remainder of this analysis.

For each market area, Exhibit ES-4 presents the vacancy rates for warehouses with at least 100,000 square feet of floor space as of 2019. As shown in the exhibit, the non-South Coast AQMD vacancy rates are generally higher than the South Coast AQMD rates. These values, however, are sensitive to small samples within some of the defined markets, as evidenced by the high vacancy rates in the Western Arizona and San Diego markets. One out of the two retail fulfillment properties in both Western Arizona and San Diego has availability, resulting in the high rates seen in the table.

EXHIBIT ES-4. VACANCY RATES ACROSS MARKETS AND WAREHOUSE TYPE - YEAR 2019

GEOGRAPHIC AREA	GENERAL PURPOSE	GENERAL DISTRIBUTION	RETAIL FULFILLMENT	COLD STORAGE	TOTAL
District Total	4%	5%	5%	1%	4%
Orange County	4%	8%	14%	0%	7%
Inland Empire	5%	6%	5%	2%	5%
Los Angeles	3%	2%	4%	1%	2%
Non-District Total	7%	7%	11%	2%	8%
North of District, Bakersfield	6%	5%	4%	0%	4%
North of District, Coastal	3%	14%	0%*	0%	7%
East of District, Desert Areas	16%	8%	0%*	0%*	7%
South of District, San Diego	6%	7%	38%*	7%	7%
Las Vegas	3%	2%	5%	0%*	3%
Phoenix	9%	9%	15%	5%	11%
Western AZ	0%*	0%	39%*	0%	12%
Total	2%	5%	4%	7%	

* Categories with fewer than five properties.

To provide insights on the direction of each market, we also examine net absorption for warehouse space, defined as the total amount of space tenants moved into in a given time period less the amount of space tenants vacated during the same time period. Annual net absorption values in square feet are presented in Exhibit ES-5 for 2000 through 2019 for each market area. The non-District total line represents the sum of all outlying market net absorption, both positive and negative. Based on the data shown in Exhibit ES-5, the South Coast AQMD, Phoenix, and Las Vegas markets have steadily increased total occupied space year over year since 2009. The other outlying markets have less obvious growth patterns, with annual net absorption hovering around zero. At two points, in 2012 and 2017, growth in net absorption in the South Coast AQMD jurisdiction slowed relative to the prior years.

EXHIBIT ES-5. ANNUAL NET ABSORPTION ACROSS MARKETS - 2000-2019

Note: Due to data limitations, not all market areas have net absorption data extending back to 2000.

Exhibit ES-6 summarizes the pricing for warehouse space in the South Coast AQMD jurisdiction and outlying market areas, again focusing on properties with a building area of at least 100,000 square feet. At an average of \$0.88 per square foot per month, the South Coast AQMD market overall has a higher rental price per square foot than its neighboring markets, with the exception of San Diego. This is driven by high prices in the Orange County and Los Angeles sub-markets, as rent in the Inland Empire is lower than in the other South Coast AQMD sub-markets. The Desert Areas and Coastal Santa Barbara, Ventura and San Luis Obispo (North of District, Coastal) follow closely behind the District average. Western Arizona, Bakersfield, and Phoenix have the lowest prices of \$0.50 and below.⁶

Sale prices follow a similar trend to rental prices, with higher prices in urban areas. The non-District average is much lower than the South Coast AQMD value, which is more than three times higher at \$1,087 per square foot.

⁶ Small sample size is an issue in calculating average rent and sale price by market area. The average rents for the North of District, Bakersfield, East of District, Desert Areas, and Western AZ markets all rely on five or fewer properties in the calculation of these values. For average sale price, East of District, Desert Areas has fewer than five properties with data, while the Western AZ has no data. Focusing on the Non-District Average values in Exhibit 13 avoids this issue.

EXHIBIT ES-6. MONTHLY RENT AND SALE PRICES ACROSS MARKETS FOR WAREHOUSES WITH BUILDING AREA OF AT LEAST 100,000 SQUARE FEET - YEAR 2019

MARKET	AVERAGE RENTAL PRICE PER SQUARE FOOT	AVERAGE SALE PRICE PER SQUARE FOOT
South Coast AQMD Total	\$0.88	\$1,087
Orange County	\$0.92	\$503
Inland Empire	\$0.70	\$1,164
Los Angeles	\$0.93	\$1,173
Non-District Average	\$0.58	\$344
North of District, Coastal	\$0.78	\$100
North of District, Bakersfield^	\$0.34	\$105
East of District, Desert Areas*^	\$0.81	\$27
South of District, San Diego	\$0.92	\$225
Las Vegas	\$0.63	\$574
Phoenix	\$0.50	\$307
Western AZ*^	\$0.32	No Data
Grand Average	\$0.71	\$815

*Denotes fewer than five properties with available sales data.

^Denotes fewer than five properties with available rent data.

MARKET TRENDS

Using current property data as well as forecast data included with CoStar Analytics,[™] we developed both medium- and long-term estimates of available capacity for warehousing operations. The long-term forecast estimates capacity additions and additional remaining development potential through 2028. The medium-term forecast considers capacity availability either available now or likely available within the next five years (assuming a five-year window for project approvals and construction). These estimates allow us to compare the projected capacity available in the non-South Coast AQMD areas to existing and projected inventory inside the South Coast AQMD jurisdiction.

To generate a **medium-term** capacity forecast, we examine current vacant capacity and new capacity proposed or currently under construction. Exhibit ES-7, which presents medium term available capacity alongside existing warehouse real estate capacity, shows most of the medium-term capacity available in the South Coast AQMD jurisdiction is in the Inland Empire, while most of the non-South Coast AQMD medium-term capacity is in the Phoenix; East of District, Desert Areas; Las Vegas; and North of District, Bakersfield markets.

Overall, Exhibit ES-7 shows current vacancies, new property under construction, and proposed construction are fairly limited relative to the current warehouse stock. The non-South Coast AQMD total of approximately 67 million square feet is only 10.1 percent of the size of the current capacity in the

SCAQMD jurisdiction: 662 million square feet. This indicates that in the medium term, the outlying real estate markets have the potential to absorb only a small piece of current South Coast AQMD warehousing operations.

EXHIBIT ES-7. COMPARISON OF MEDIUM-TERM AVAILABILITY FORECAST WITH CURRENT 2019 INVENTORY

To assess capacity in the **long term**, we assess what we characterize as slack capacity. This metric reflects projected vacancies plus the square footage of warehouse space that could be developed on parcels zoned for industrial development and are within two miles of a major road. Exhibit ES-8 shows projected slack capacity and existing warehouse capacity for each market area. As shown in the exhibit, non-South Coast AQMD slack capacity is over twice as large as current South Coast AQMD capacity. The Las Vegas and Western AZ markets combined have enough slack capacity to theoretically absorb approximately all current warehousing operations in the South Coast AQMD jurisdiction, while the much closer East of District, Desert Areas and North of District, Bakersfield markets each have slack capacity larger than one-half of current warehousing capacity in the South Coast AQMD jurisdiction.

Overall, the comparisons in Exhibits ES-7 and ES-8 show projected developments alone would be insufficient to absorb a large portion of the warehouse space in the South Coast AQMD jurisdiction and any mass relocation would require significant warehouse development on currently vacant parcels.

EXHIBIT ES-8. COMPARISON OF ESTIMATED SLACK CAPACITY IN 2028 WITH CURRENT INVENTORY

ES.3 FACTORS AFFECTING WAREHOUSE LOCATION DECISIONS

To inform development of our analysis of potential warehouse relocation decisions, we obtained input from stakeholders on the factors affecting such decisions. We collected this information through a series of interviews with warehouse operators, beneficial cargo owners, manufacturers, and retailers. Key findings from this process were as follows:

- Regional Advantages:** Multiple interviewees pointed to the transportation network within the South Coast AQMD jurisdiction as a major factor influencing their decisions to locate in the region. The many modes of transport within the region make it ideal for warehousing and goods movement. These include two major ports, two major railways, and extremely interconnected highways flowing through and out of California:
 - Ports: Port of Los Angeles, Port of Long Beach
 - Railways: Burlington Northern Santa Fe (BNF) Railway, Union Pacific Railway
 - Interstate Highways: I-5, I-10, I-15, and I-40.

Interviewees also indicated labor is readily available in the area. Interviewees view this availability of labor as important for ensuring the smoothness of their operations. Finally, the proximity of customers receiving the goods (e.g., BCOs) and proximity of end consumers are clear regional advantages.

- Regional Disadvantages:** Despite the advantages above, industry stakeholders also identified several disadvantages associated with locating in the South Coast AQMD jurisdiction. They mentioned the burden state and local regulations put on smaller companies. Because margins in

the logistics sector are relatively small, absorbing additional regulatory costs arising along the supply chain is a challenge. Interviewees also indicated regulatory costs, combined with the costs of real estate and labor, make it difficult for them to remain in the region. One interviewee spoke of a customer moving their warehousing across the country because electricity is 1/6th of the cost as in Southern California.

- **Locational Choices:** We specifically asked interviewees about the factors that affect their location decisions. Their responses indicated the decision to move warehousing operations outside of the South Coast AQMD jurisdiction would be determined by the overall cost rather than by one factor alone. The main components affecting cost that interviewees mentioned were:
 - **Transportation costs:** If warehousing operations were moved outside the South Coast AQMD jurisdiction (farther from their customers), the transportation costs incurred by the industry would increase. Such costs include the cost of fuel, driver time, and wear and tear on vehicles.
 - **Labor (cost & availability):** Labor costs are high in Southern California, but labor is readily available here. Labor is scarcer outside the heavily populated South Coast AQMD jurisdiction, although the degree of scarcity outside the region varies by market. Stakeholders made specific mention of a shortage of truck drivers as baby boomers retire and are not replaced by younger drivers.
 - **Real estate costs:** Real estate costs are very high in this region and were a common concern across the stakeholders interviewed. Moving outside the region would reduce real estate costs but would increase transportation costs and finding labor may be more challenging.
 - **Regulations:** As noted above, many interviewees indicated the regulatory burden associated with locating in the South Coast AQMD jurisdiction is high.

ES.4 OVERVIEW OF APPROACH FOR MODELING RELOCATION DECISIONS

To estimate the number of warehouses likely to relocate outside the South Coast AQMD jurisdiction as a result of the ISR, we compare the costs of relocation for a given warehouse with the costs of complying with the ISR and remaining in the South Coast AQMD jurisdiction. We assume a warehouse will relocate to an outlying market area if two conditions are met:

1. **Cost condition:** The annualized costs associated with relocating to at least one outlying market area are less than the annualized costs of ISR compliance, and
2. **Capacity condition:** In at least one of the market areas in which a warehouse would realize a cost savings relative to ISR compliance, sufficient capacity exists (measured in square footage of available warehouse space) to absorb the warehouse operation in question.

To determine whether the cost condition is met for a given warehouse, we consider ISR compliance costs for varying levels of stringency (as provided by South Coast AQMD staff) and the full costs associated with relocation to an outlying market area. Relocation costs include the following:

- changes in transportation costs;
- changes in rental costs for warehouse space;
- changes in labor costs;

- changes in electricity costs;
- moving costs; and
- development fees (applicable only for construction of new warehouse space in outlying markets).

We conduct the analysis based on ISR compliance costs and relocation costs annualized over 20 years, using both a four percent discount rate and one percent discount rate. We assume all costs are ultimately borne by warehouse operators.

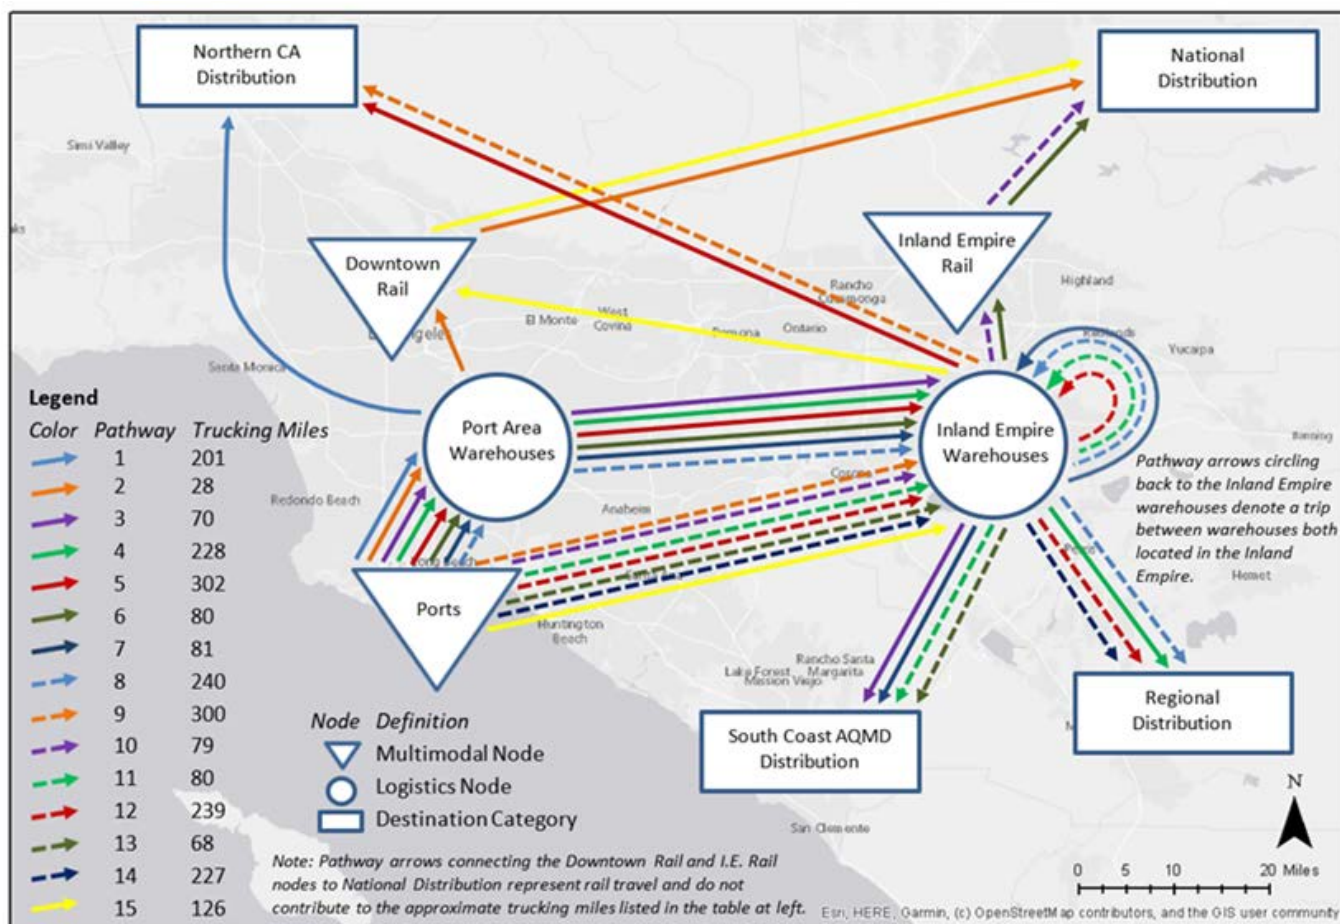

To determine whether the capacity condition described above is met, we rely on capacity data for each outlying market as obtained from CoStar and summarized in Exhibits ES-7 and ES-8 above. To ensure the analysis does not over commit capacity in the outlying markets (i.e., project relocations in an outlying market in excess of the capacity available prior to ISR implementation), our analysis simulates relocation decisions one warehouse at a time and updates the estimated capacity available in each outlying market based on these individual decisions. Thus the capacity available to the 100th warehouse examined reflects the relocation decisions of the first 99 warehouses.

Recognizing the complexity of the logistics industry and the uncertainty inherent in several key aspects of our analysis, we designed the analysis to generate low-end and high-end estimates of warehouse relocations. Specifically, our low-end and high-end estimates capture two sources of uncertainty. The first uncertainty relates to the routing of goods through the South Coast AQMD jurisdiction. Exhibit ES-9 shows the routes, or pathways, for the goods flow through the South Coast AQMD jurisdiction (excluding pathways that do not use warehouses). Although information is available on the aggregate distribution of goods across different routings through the South Coast AQMD jurisdiction, information on which warehouses serve which routes is not available. To account for this uncertainty, we conduct the analysis under two sets of routing assumptions (hereafter referred to as pathway scenarios):

1. ***Composite pathway scenario:*** Under this scenario, each individual warehouse is assumed to be representative of the warehousing sector in the South Coast AQMD jurisdiction as a whole, in terms of the goods routes (pathways) served. For example, if a given pathway accounts for five percent of the goods flow volume passing through the South Coast AQMD jurisdiction, five percent of the truck traffic through each individual warehouse is assumed to be on this pathway. Under this scenario, the change in transport distance associated with relocation to a given outlying market area is the same for all warehouses.
2. ***Specialized pathway sensitivity scenario:*** This scenario allows for the possibility that individual warehouses may specialize in pathways or serve a more limited number of pathways. Because we lack information on the specific pathway(s) a given warehouse is likely to serve, this scenario involves a series of iterative “what if” analyses. For nearly each iteration of the analysis, we assume all warehouses are on the same pathway. After running the analysis for each individual pathway, we calculate the weighted average of the resulting warehouse relocation estimates, using the goods volumes associated with each pathway as weights.⁷

⁷ The exception to this approach is the Northern California pathways. For warehouses on these pathways, we assume that 40 percent of their goods are sent to Northern California, 30 percent remain in the South Coast AQMD jurisdiction, and the remaining 30 percent are distributed nationally. For additional detail, see Attachment 4 - Indirect Source Rule Relocation Model—Methodology.

EXHIBIT ES-9. FLOW OF GOODS THROUGH SOUTH COAST AQMD JURISDICTION

Source: Derived from Robert C. Leachman, "Strategic Initiatives for Inland Movement of Containerized Imports at San Pedro Bay, University of California at Berkeley Institute of Transportation Studies, 2017.

The second source of uncertainty reflected in our low-end and high-end estimates is the capacity of outlying market areas to absorb warehouse space from the South Coast AQMD jurisdiction. Although information is available on the vacant capacity in each outlying market and new warehouse developments that have been approved, additional warehouses *could* be developed on undeveloped parcels of land zoned for industrial development. The degree to which such development will occur is uncertain. To account for this uncertainty, we conduct the relocation analysis under two capacity scenarios.

1. **Medium-term capacity scenario:** Under this scenario, capacity available for relocation is limited to capacity projected to be available in the medium term. This includes current vacant capacity and new capacity proposed or currently under construction in the outlying market areas. This scenario assumes no new construction of warehouse space beyond what is already planned in the outlying market areas. It provides a reasonable representation of capacity until such time that new capacity developments can obtain approval and complete construction. This scenario specifies the lower-bound estimate of warehouse capacity in outlying markets. Exhibit ES-7 above shows the capacity values used under this scenario for each outlying market area.
2. **Slack capacity scenario:** This scenario reflects a more expansive view of the capacity that would be available for relocation. Such capacity includes projected warehouse vacancies as well as the warehouse space that could fit on all land that is (1) zoned for industrial development in the outlying market areas and (2) is within 2 miles of a major road. This measure of capacity represents an upper-bound estimate of warehouse capacity in outlying markets. The slack capacity values assumed for each outlying market area are illustrated in Exhibit ES-8 above.

Based on the methods summarized above and for each pathway and capacity scenario, we project the square footage of warehouse space likely to relocate from the South Coast AQMD jurisdiction. We convert this estimate to an estimated number of warehouses based on the average square footage per warehouse.

ES.5 ESTIMATES OF POTENTIAL WAREHOUSE RELOCATIONS

Following the approach outlined above, we estimated the number of warehouse relocations associated with a potential ISR under six compliance cost scenarios specified by South Coast AQMD staff, summarized in Exhibit ES-10.

EXHIBIT ES-10. ISR COMPLIANCE COST SCENARIOS ANALYZED

SCENARIO	COST PER SQUARE FOOT (YEAR 2019\$)
Scenario 1	\$0
Scenario 2	\$0.50
Scenario 3	\$1.00
Scenario 4	\$1.50
Scenario 5	\$1.75
Scenario 6	\$2.00

Exhibits ES-11A through ES-11F summarize the estimated number of warehouse relocations for each of the ISR scenarios listed in Exhibit ES-10. For each ISR compliance cost scenario, the exhibits show the estimated number of relocations for each combination of pathway scenario and capacity scenario at a

discount rate of one percent.⁸ The exhibits show the total number of relocations to all outlying markets, as well as the distribution of relocations across outlying markets. For example, Exhibit ES-11E shows 16 relocations when the ISR compliance cost is \$1.75 per square foot under the specialized-pathway, slack-capacity scenario. Of the 16 relocations, six are to the North of District/Bakersfield market area.

The results in Exhibit 3ES-11 show we project up to 10 warehouse relocations when compliance costs are \$0 per square foot, suggesting up to 10 warehouses in the South Coast AQMD jurisdiction may relocate in the absence of the ISR.

This result, in part, reflects the assumptions of the specialized pathway sensitivity scenario. For some iterations of this analysis we assume several warehouses are exclusively on pathways on which relocation is advantageous, even though they may not be on these pathways at all, or may simultaneously be on other pathways on which relocation is less advantageous. For this reason, we consider the specialized pathway sensitivity scenario results to be very conservative estimates of warehouse relocation.

In practice, the warehouses projected to relocate with \$0/square foot in ISR compliance costs may be on multiple pathways that, when examined together, would not suggest warehouse relocation. This is borne out under the composite distance pathway scenario (i.e., when warehouses are assumed to serve all pathways in proportion to the goods flow on each pathway), as no warehouses are projected to relocate under this scenario when ISR compliance costs are \$0 per square foot.

⁸ We also conducted the analysis based on a discount rate of four percent, and the results, which are available upon request, are identical to those presented here.

While the 10 warehouse relocations projected under the \$0 ISR compliance cost scenario may suggest several warehouses will find it advantageous to relocate in the absence of the ISR, we do not currently observe such relocations occurring. This reflects the fact that the results in Exhibits ES-11A through ES-11F likely overstate relocations under the \$0 per square foot ICR compliance cost scenario as well as scenarios with costs greater than \$0. This overestimation of relocations is likely due to several factors we are not able to capture quantitatively in our analysis, including, but are not necessarily limited to, the following:

- ***Labor availability:*** In many of the outlying markets, the labor force is significantly smaller than in the South Coast AQMD jurisdiction. With a smaller labor pool to draw from, warehouse operators may be reluctant to commit to relocation. Thus, it might be more costly to find a capable workforce in the outlying markets.
- ***Proximity to customers:*** While our analysis captures the transportation cost impact of relocating, the value of proximity to customers may go beyond the change in transportation costs. For example, proximity is important for meeting customer expectations/demands with respect to delivery time.
- ***Risk of warehouse development in outlying markets:*** Most of the warehouse relocations projected by our analysis are under the slack capacity scenario, under which land zoned for industrial use may be developed into warehouse space. Although land is available in most outlying markets to develop warehouse space, warehouse developers may find such investments too risky to pursue.

Other than potential demand from warehouse operators relocating from the South Coast AQMD jurisdiction, warehouse owners would have limited clientele to support significant growth in the warehouse sector in these outlying markets. If market conditions were to change in the South Coast AQMD jurisdiction after development of the ISR, warehouse operators may move back after their lease ends, leaving owners of newly constructed warehouses in the outlying markets with no source of revenue. Due to this risk, investors may be reluctant to build new warehouse space in these markets.

- ***Barriers to warehouse development in outlying markets:*** Large-scale warehouse developments in the outlying market areas may encounter resistance in obtaining project approval. Local planning boards and the residents who they represent may seek to limit the number of warehouse developments due to concerns about increased truck traffic, the aesthetic impacts of multiple warehouse developments, or other concerns.

Because relocations are projected under the \$0 ISR compliance cost scenario, possibly due to the factors outlined above, we estimate relocations for each ISR compliance cost scenario as the difference between relocations for that scenario and relocations projected when ISR compliance costs are zero. For example, with ISR compliance costs of \$1.75 per square foot under the specialized pathway sensitivity scenario and the slack capacity scenario, we estimate six warehouse relocations (16 relocations as presented in Exhibit ES-11E less 10 relocations as presented in Exhibit ES-11A). Applying this approach, Exhibit ES-12 presents the number of relocations incremental to those projected with an ISR compliance cost of \$0 per square foot.

EXHIBIT ES-12. WAREHOUSE RELOCATIONS, INCREMENTAL TO RELOCATIONS WITH ISR COSTS OF \$0 PER SQUARE FOOT

PATHWAY SCENARIO	CAPACITY SCENARIO	DISCOUNT RATE	RELOCATIONS (NO. OF WAREHOUSES)							
			ALL MARKETS	BAKERSFIELD	COASTAL AREAS	DESERT AREAS	LAS VEGAS	PHOENIX	SAN DIEGO	WESTERN AZ
ISR Compliance Costs of \$0.50 per Square Foot										
Specialized Pathway Sensitivity	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0
Composite	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0
ISR Compliance Costs of \$1.00 per Square Foot										
Specialized Pathway Sensitivity	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0
Composite	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0
ISR Compliance Costs of \$1.50 per Square Foot										
Specialized Pathway Sensitivity	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0
Composite	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0
ISR Compliance Costs of \$1.75 per Square Foot										
Specialized Pathway Sensitivity	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	6	6	0	0	0	0	0	0
Composite	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0
ISR Compliance Costs of \$2.00 per Square Foot										
Specialized Pathway Sensitivity	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	6	6	0	0	0	0	0	0
Composite	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0

As shown in Exhibit ES-12, the incremental number of warehouse relocations varies from none when ISR costs are \$0.50 per square foot to as high as six when ISR costs are \$2.00 per square foot. Notably, no relocations are projected under the medium-term capacity scenario (when capacity in outlying markets is limited to current vacant capacity and new capacity proposed or currently under construction), incremental to the \$0 per square foot ISR compliance cost scenario. This reflects the more limited capacity available under this scenario.

As context for the results presented in Exhibit ES-12, we estimate that 2,687 warehouses are likely to be affected by the ISR.⁹ Thus, the projection of up to six warehouses relocating represents 0.2 percent of the universe of affected warehouses.

Our analysis also projects no warehouse relocations under the composite pathway scenario (i.e., when each warehouse is assumed to serve all 15 goods flow pathways). This finding is true both incremental to the \$0 ISR compliance cost scenario (results in Exhibit ES-12) and for each scenario individually, prior to netting out the relocations projected when ISR compliance costs are \$0 per square foot (results in Exhibits ES-11A to ES-11F).

The lack of relocations under the composite pathway scenario reflects the significant increase in transport distance for some pathways. Because the composite scenario models relocation based on the weighted average change in distance across all pathways, a significant increase in distance for a small number of pathways that account for a large portion of the goods flow drives up the weighted average change in transport distance such that the increased transportation costs associated with relocation outweigh any cost savings. For example, while relocation to the Bakersfield market area may reduce transport distance slightly for some pathways, transport distance increases by more than 130 miles one-way for pathway 2 and more than 245 miles for pathway 13; together these pathways account for approximately 39 percent of the goods flow volume.

Exhibit ES-12 shows most warehouse relocations, incremental to the \$0 per square foot ISR compliance cost scenario, are concentrated in the Bakersfield area under the specialized pathway sensitivity scenario and the slack capacity scenario. This result is driven by the lower rental costs in the Bakersfield area (\$4.03 per square foot per year) relative to the South Coast AQMD jurisdiction (\$10.61 per square foot per year).¹⁰ While transportation costs will increase if warehouses relocate to the Bakersfield area, the increase is small enough for one pathway that the rental cost savings are sufficient to yield a cost savings for this pathway.

This concentration of relocations in the Bakersfield area differs slightly from the results shown in Exhibits ES-11A through ES-11F, which are *not* incremental to the \$0 per square foot ISR compliance cost scenario. Although those results show a significant concentration of relocations in the Bakersfield area, they show a greater number of warehouses relocating to the Desert Areas. Because the relocations to

⁹ This figure reflects the sum of non-manufacturing warehouses and warehouses at manufacturing facilities as presented in Attachment 2 of this report.

¹⁰ Rent values obtained from CoStar, as summarized in Attachment 2 of this report. Additional information on the costs considered in the analysis is available in Attachment 4 of this report.

the Desert Areas are projected when ISR compliance costs are \$0 per square foot, they are netted out of the relocations reflected in Exhibit ES-12.

ES.6 LIMITATIONS AND UNCERTAINTIES

The results presented above provide a reasonable representation of the warehouse relocations that may occur in response to the ISR and reflect the best information available on the factors that are likely to affect relocation decisions. Nevertheless, we acknowledge the analysis is subject to several uncertainties, the most significant of which we are aware are summarized in Exhibit ES-13.

EXHIBIT ES-13. KEY UNCERTAINTIES AND IMPLICATIONS FOR RESULTS

DESCRIPTION OF UNCERTAINTY	IMPLICATIONS FOR RESULTS
Pathway uncertainty: This analysis relies on the concept of goods flow pathways to estimate the change in transportation distance associated with warehouse relocation. However, we do not know the pathways that individual warehouses serve. Absent such information, the pathway scenarios described above (i.e., composite pathway scenario and specialized pathway sensitivity scenario) provide a means of bounding the estimated number of relocations to account for this uncertainty.	Estimating the number of warehouse relocations under two pathway scenarios leads to a wide range of results. Whether the likely number of relocations is closer to the low end or high end of the range depends on the degree to which warehouse operations are more consistent with the composite scenario (warehouses serve all goods flow pathways) or the specialized pathway sensitivity scenario (warehouses specialize in individual pathways).
Unquantifiable factors: Our assessment of relocation decisions accounts for all factors that we are able to quantify with readily available data, specifically data related to the costs associated with remaining in the South Coast AQMD jurisdiction or relocating to an outlying market area. A number of factors that we are unable to quantify, however, may influence relocation decisions. These include (1) the degree to which labor availability in outlying markets affects the decisions of warehouse operators, (2) advantages of being in close proximity to customers, (3) financial risks associated with developing warehouse space in outlying markets, and (4) barriers to developing warehouse space in outlying market areas.	Many of these unquantifiable factors represent reasons why warehouse operators may want to remain in the South Coast AQMD. This suggests that our analysis may overestimate the number of warehouses that decide to relocate outside the area.
Assumption of no change in goods flow traffic: An implicit assumption of our analysis is that the volume of goods flowing through the South Coast AQMD jurisdiction would remain unchanged as a result of the rule. In practice it is possible the ISR could lead to a reduction in the volume of goods flowing through the region (e.g., through a reduction in import traffic at the Port of Long Beach). This reduction in volume could lead to warehouse relocation (e.g., to the port areas where goods are sent instead of the Port of Long Beach). Our analysis does not capture this effect.	To the degree goods are diverted away from the South Coast AQMD jurisdiction due to the ISR, we may underestimate the number of warehouse relocations.

DESCRIPTION OF UNCERTAINTY	IMPLICATIONS FOR RESULTS
<p>Rents held constant: For the purposes of simulating the relocation decision-making process of warehouse operators, we held warehouse rents in the South Coast AQMD jurisdiction and in outlying markets constant at current levels. To the extent rent differences between the South Coast AQMD jurisdiction and outlying markets change over time, we may not accurately capture the relocation decisions of warehouse operators.</p>	<p>Absent knowledge of the degree to which relative rents are likely to change over time, we find it highly speculative to take a stance on whether the assumption of constant rents leads to underestimation or overestimation of relocations. However, the relocation of warehouses outside the SCAQMD jurisdiction could put upward pressure on rents in outlying markets and downward pressure on rents in the South Coast AQMD jurisdiction. Combined, these effects would narrow the difference between rent in the South Coast AQMD jurisdiction and less costly outlying markets, potentially limiting the number of warehouse relocations.</p>

TECHNICAL MEMORANDUM ON WAREHOUSING AND LOGISTICS INDUSTRY IN THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT JURISDICTION

MEMORANDUM | 30 November 2020

TO Ian MacMillan, Paul Stroik, Shah Dabirian, and Victor Juan, South Coast Air Quality Management District (SCAQMD)

CC Jason Price, Industrial Economics (IEc)

FROM Jasna Tomic and Kelly Leathers, CALSTART

SUBJECT Technical Memorandum on Warehousing and Logistics Industry in the South Coast Air Quality Management District Jurisdiction

INTRODUCTION This memorandum is in support of the South Coast Air Quality Management District (South Coast AQMD) staff's development of a potential indirect source rule (ISR) to reduce mobile source emissions related to the operation of logistics and warehousing facilities in the South Coast AQMD's four-county region (Los Angeles, Orange, Riverside, and San Bernardino counties, as shown in Exhibit 1).¹

Diesel truck traffic, largely related to the transport of goods passing through the Ports of Los Angeles and Long Beach and regional warehouses and distribution centers, makes up a large share of local NO_x emissions. A warehouse ISR, if adopted, may help with reducing emissions from trucks servicing warehousing facilities located within its jurisdiction.

Compliance costs to the warehousing sector could vary depending on the design of an eventual rule. If these costs are significant, the implementation of an ISR could potentially precipitate the relocation of warehousing operations outside the region—with the associated truck fleets continuing to travel to and from facilities in the South Coast AQMD jurisdiction. In the worst-case scenario, the associated air quality benefits from such a rule might be greatly diminished. Accordingly, South Coast AQMD is interested in identifying and understanding the factors affecting whether logistics and warehousing operations are likely to relocate as a result of the potential rule.

The purpose of this document is to develop a better understanding of the logistics and warehousing sector in the South Coast AQMD jurisdiction. The first part of this document reviews the categories of warehouse and distribution center facilities found in the logistics industry and provides brief descriptions of the operations characterizing each category. The second part focuses on understanding the factors affecting the location decisions of these facilities and the trends affecting the logistics industry in this region. This information is based on interviews with several industry stakeholders identified by CALSTART and/or South Coast AQMD.

¹ The South Coast AQMD jurisdiction is comprised of all of Orange County and parts of Los Angeles, Riverside and San Bernardino Counties. The region is mapped and described in full in Exhibit 1 and the "Geographic Scope" section below.

EXHIBIT 1: SOUTH COAST AQMD JURISDICTION

This assessment of the South Coast region’s logistics and warehousing industry builds on the 2018 warehousing report released by the Southern California Association of Governments (SCAG). Similar to the SCAG report, the assessment in this document identifies and describes the various segments of the logistics and warehousing industry. This document’s additional focus on the location decisions of logistics and warehousing facilities will help South Coast AQMD better understand the likelihood of logistics and warehousing operations relocating to neighboring regions as a result of an ISR.

This assessment builds upon the High-Cube Warehouse Vehicle Trip Generation Analysis prepared for South Coast AQMD and the National Association of Industrial and Office Properties, which describes characteristics of “high-cube warehouses” (HCW) and the trips generated at each facility type. The HCW study provides insights on the traffic associated with each type of HCW.

CATEGORIES OF WAREHOUSE AND LOGISTICS FACILITIES

We define warehouse categories primarily based on the SCAG 2018 report, supplemented with additional references and confirmed by information collected during interviews with industry stakeholders. The following are the main categories of facilities:

- 1) General Purpose Warehouse
 - a. Port-Related
 - b. Non-Port-Related
- 2) Transload Facility
- 3) Cross-dock Transload Facility
- 4) Truck Terminal for Less-Than-Truckload Trucks
- 5) General Purpose Distribution Center
- 6) Manufacturing & Distribution Facility
- 7) Retail Fulfillment Center
- 8) Cold Storage

All of these categories are listed in the SCAG 2018 report. Each warehousing facility is characterized by the operations that occur within that facility and size and layout of the facility, as summarized in Exhibit 2.

General Purpose Warehouse (GPW) is the most common type of facility used to store goods. The majority of general purpose warehouses are operated by logistics service providers or third-party logistics providers (LSP or 3PL), which offer a wide array of services. While the primary function of a GPW is to store goods that usually have not been sold yet, value-added services like barcode application and scanning, ticketing and labeling, and carton packing are also provided at these facilities. Goods can stay at a GPW anywhere from several weeks to several months.

Port-related General Purpose Warehouses are in commercial and industrial clusters. Port-related import products include international manufactured or processed goods, such as textiles and apparel, footwear, electronics, and home and office supplies.

Non-Port-Related General Purpose Warehouses tend to be dispersed throughout the region. They store domestic products, which may include domestically manufactured, harvested, or processed goods, such as chemicals, minerals, pharmaceuticals, agricultural products, and other food products.

Transload Facilities are special purpose port-related facilities that mainly deal with imported products. Transloading refers to the transfer of contents from marine containers (40 ft) into domestic rail or truck containers or trailers (53 ft) near a US gateway port for onward movement to an inland destination. Cargo is transferred based on the destination, specified by the beneficial cargo owner (BCO). Transloading reduces the per-unit cost of inland transportation for importers. The turnaround time for these facilities is usually up to one week.

Crossdock Transload Facilities are a special type of transload facility that handles cargo for export, import, or domestic cargo. While structurally similar to transload facilities, they differ from transload facilities in that they are pure distribution facilities, with no storage. In addition, time from receipt to shipment at crossdock facilities is less than 24 hours, and goods generally leave these facilities in full truckloads.

Truck Terminals for Less-Than-Truckload (LTL) Trucks are facilities used to transfer mainly domestic and imported cargo in small order quantities. They are operated by a motor carrier to transfer the less-than-truckload shipments from one truck to another. Sorting and segregation of inbound cargo takes place to make one outbound LTL truck and typically cargo is not stored for long at these facilities (up to 1 week). The outbound LTL trucks contain orders meant for multiple customers within a limited geographical area, while full truckloads are filled with cargo designated for one customer.

General Purpose Distribution Centers (DCs) are warehouses operated by BCOs, or outsourced to LSPs, to manage storage and distribution of inventory for their customers. Distribution centers store product for retailers and wholesalers to be redistributed to another location or directly to the consumer. DCs are positioned strategically to maximize the range of customers they can serve and keep delivery costs low. Turnaround time varies depending on cargo type and demand but is generally shorter than in a GPW, on

the order of weeks. The flow of product is very large, and each order may contain hundreds or thousands of items.

Retail Fulfillment Centers are special-purpose DCs that have become much more common in the supply chains of large retailers. Typically, DCs replenish store stock and ship to retailer stores, while retail fulfillment centers process individual consumer orders placed through catalogs and the internet, replenish store inventory from the stock on hand, and serve local retail customers.

Manufacturing and Distribution Facilities are more complex facilities consisting of onsite manufacturing, warehousing, and distribution. At least 50 percent of the area is dedicated to manufacturing. The smallest part of the facility is dedicated for office space, no more than 10 percent, and the remaining is taken up with warehouses and distribution facilities.² Separate warehouses are dedicated for incoming raw materials and for finished goods. The raw materials or products are stored in the warehouses from 2 weeks to 90 days.

Cold Storage Facilities are functionally identical to regular distribution centers, except with two important differences: all products must be either refrigerated or frozen, and the turnaround time is very short to ensure freshness. Refrigerated facilities will produce a substantial amount of emissions compared to other facility types due to the refrigeration units. Truck refrigeration units (TRUs) also produce a substantial amount of emissions. This type of distribution center uses the same strategy as regular distribution centers, and overall reduce the number of LTL trucks driving from a vendor to a retail store.

Several additional subcategories are worth mentioning that are specialized cases of the categories above or a hybrid solution.

Parcel Hubs are a unique hybrid of a transload facility and a distribution center. Starting with either a mail carrier or the company's retail store, small packages are sent to a regional parcel hub and sorted by destination. The parcels are consolidated onto a pallet and shipped to another parcel hub near the package's destination. The pallets may pass through a dedicated transloading facility near an airport or shipped directly via a class 8 truck.

E-commerce Fulfillment Center are specialized DCs that support online orders. The facilities process a large number of individual consumer orders placed through the internet. Orders are generally small (1-3 items) and are filled and shipped within hours. Proximity and easy access to highways is important to accommodate the large number of delivery vehicles accessing the facility. E-commerce fulfillment facilities have different operations inside the facility ("each picking" vs "case picking"). Costco and Sam's Club have extremely efficient operations because they don't have to break down pallets and ship them out, instead they just ship the whole pallet and then break the pallet down in the store. E-commerce fulfillment centers are breaking down cargo into tiny individual pieces of product and shipping them out.

² Yap and Circ (2003).

EXHIBIT 2: WAREHOUSING FACILITIES^{3, 4, 5}

Warehouse Category	Description of Facility	Building Location
General Purpose Warehouse	The typical area is 25,000 to 50,000 sq. ft., with low-ceiling height, and varying width.	Not Specific
Transloading Facility	The typical area is 25,000 to 50,000 sq. ft., with low-ceilings, and a narrow rectangular shape with multiple doors on the long side. One side is meant for inbound containers and the opposite is meant for outbound containers.	Depends on Proximity to Ports
Crossdock Transload Facility	The typical area is 25,000 to 50,000 sq. ft., with low-ceilings, and a narrow rectangular shape with multiple doors on the long side. One side is meant for inbound containers and the opposite is meant for outbound containers.	Depends on Proximity to Ports
Parcel Hub	The typical area can be up to 500,000 sq. ft.	Depends on Proximity to Market
Truck Terminal for Less-Than-Truckload Trucks	The typical area is anywhere from 25,000 sq. ft. to 150,000 sq. ft., with low-ceilings. It's usually narrow and long with multiple doors to quickly and efficiently process cargo.	Not Specific
General Purpose Distribution Center	The building size can vary greatly depending on the distributor, ranging from 50,000 sq. ft. to 500,000 sq. ft. and are generally very tall.	Depends on Proximity to Market
Manufacturing & Distribution	The size can range from 200,000 sq. ft. to 1,000,000 sq. ft. or more depending if light or heavy manufacturing.	Not Specific
Retail Fulfillment Center	The area ranges from 500,000 sq. ft. to 1,000,000 sq. ft., with very high ceilings to accommodate the automated pick and pack technology.	Depends on Land Availability
E-commerce Fulfillment Center	Square footage varies.	Depends on Proximity to Market
Cold Storage Facility	The building size depend on demand and turn over time.	Depends on Proximity to Market

⁴ UC Davis Sprawl Report (2017)

⁵ High-Cube Warehouse (2016)

PRIORITIES AND TRENDS AFFECTING THE REGIONAL LOGISTICS INDUSTRY To gather input from stakeholders on the factors affecting the location decisions of facilities as well as general trends affecting the industry, we conducted a series of structured interviews of various industry stakeholders. The following section details the interview process, which included identifying industry stakeholder contacts, preparing questions designed to obtain relevant information, and the input provided by stakeholders.

IDENTIFICATION OF STAKEHOLDERS

South Coast AQMD and CALSTART first developed a list of stakeholder contacts as interview candidates. The warehousing and logistics industry is an extremely complicated and multifaceted industry with diverse stakeholders. To ensure our understanding of stakeholder priorities reflected this diversity, we specified four classifications of stakeholders to interview.

The first category encompassed warehouse operators, third-party logistics companies, and freight forwarders, described as “3PL/Warehouse Operators” in Appendix A. These stakeholders specialize in goods movement and supply chain operations.

The second category are retailers, defined as individuals or organizations that purchase products from a manufacturer or distributor and resell the goods to consumers. Retailers encompass a wide array of businesses from small corner stores to Walmart and door-to-door companies to Amazon.⁶

The third category are beneficial cargo owners (BCO), a term that refers to an importer that takes control of the cargo at the point of entry and does not utilize a third-party source like a freight forwarder or 3PL. However, the term BCO is often used much more broadly to refer to the owner of the cargo in a container or trailer.

The fourth category is manufacturing facilities with warehouse space onsite. As goods come off the production line, most manufacturers temporarily store goods in warehouse space onsite.

Exhibit 3 lists the eleven companies we have interviewed to date. Note some of the contacts fall under multiple classifications. For example, some retailers handle each operation along the supply chain, while some retailers outsource each operation.

⁶ Supply Chain and Logistics Terms and Glossary. International Warehouse Logistics Association. (2010)

Snak King	x		x	x

DEVELOPMENT OF INTERVIEW QUESTIONS

The interview questions were developed with collaboration between CALSTART, IEc, and South Coast AQMD (see Appendix B). After the questions were completed, we contacted individual stakeholders via e-mail and/or phone to schedule interviews with the willing participants. The interview process consisted of a 30- to 60-minute conversation depending on the engagement of the interviewee.

FINDINGS

Stakeholders expressed concern with the costs associated with the location of their operations but were keenly aware of the advantages and disadvantages of remaining in the South Coast AQMD jurisdiction. They also made clear to us the term “warehouse” is not an all-encompassing term for all the facilities described above. They refer to each facility specifically by the names given. Warehouse operators/3PLs were our most responsive interviewees; only one retailer was able to speak with us; two of the interviewees were manufacturers, and we were unable to interview a stakeholder that acted exclusively as a BCO.

REGIONAL ADVANTAGES

Multiple interviewees pointed to the transportation network within the South Coast region as a major factor influencing their decisions to locate in the region. The many modes of transport within the region make it ideal for warehousing and goods movement. These include two major ports, two major railways, and extremely interconnected highways flowing through and out of California:

- Ports: Port of Los Angeles, Port of Long Beach
- Railways: Burlington Northern Santa Fe (BNF) Railway, Union Pacific Railway
- Interstate Highways: I-5, I-10, I-15, and I-40

Interviewees also indicated that labor is readily available in the area. Interviewees view this availability of labor as important for ensuring the smoothness of their operations. Finally, the proximity of customers receiving the goods (e.g., BCOs) and proximity of end consumers are clear regional advantages.

REGIONAL DISADVANTAGES

Despite the advantages above, industry stakeholders also identified several disadvantages associated with locating in the South Coast region. They mentioned the burden that state and local regulations put on smaller companies. Because margins in the logistics sector are relatively small, absorbing additional regulatory costs arising along the supply chain is a challenge. Interviewees also indicated regulatory costs, combined with the costs of real estate and labor, make it difficult for them to remain in the region. One interviewee spoke of a customer moving their warehousing across the country because electricity is 1/6th of the cost as in Southern California.

LOCATIONAL CHOICES

As indicated in the interview questions shown in Appendix B, we specifically asked interviewees about the factors that affect their location decisions. Their responses indicated the decision to move warehousing operations outside of the Southern California region would be determined by the overall cost rather than by one factor alone. The main components affecting cost that interviewees mentioned were:

- **Transportation costs:** If warehousing operations were moved outside the South Coast AQMD jurisdiction (farther from their customers), the transportation costs incurred by the industry would increase. Such costs include the cost of fuel, driver time, and wear and tear on vehicles.
- **Labor (cost & availability):** Labor costs are high in Southern California, but labor is readily available here. Labor is scarcer outside of the heavily populated South Coast AQMD jurisdiction, though the degree of scarcity outside the region varies by market. Stakeholders made specific mention of a shortage of truck drivers as baby boomers retire and are not replaced by younger drivers.
- **Real estate costs:** Real estate costs are very high in this region and were a common concern across the stakeholders interviewed. Moving outside the region would reduce real estate costs but would increase transportation costs and finding labor may be more challenging.

- **Regulations:** As noted above, many interviewees indicated the regulatory burden associated with locating in the South Coast jurisdiction is high.

The bottom line that determines moving is the total cost of operations (“it’s all math”, to quote one interviewee) and the costs weighed against the benefits of moving to a new location.

Benefits of staying in the region:

- Close to customers
- Access to highways, railways, and ports
- Readily available labor

Issues with staying in the region:

- Challenging regulatory climate
- Expensive real estate
- High labor costs

Benefits of leaving the region:

- Less regulation
- Lower real estate costs
- Lower labor cost

Issues with leaving the region:

- Higher transportation cost
- Less readily available labor
- Less attractive to customers because of the distance from region

3PL/GENERAL WAREHOUSE OPERATORS

The movement of goods is an extremely complicated process and is executed by many entities working together to move goods. Due to the complexity of modern logistics, some companies outsource goods movement to freight forwarders or third-party logistics firms. The operations of warehousing and logistics facilities vary depending on the:

- characteristics of the goods – number of products, their size, and turnover rates;
- customers’ preferences;
- facility throughput and services provided; and
- type and size of facility.

Large 3PL firms offer every service along the supply chain, such as freight forwarding, delivery, storage, etc. Customers rarely choose one company to perform every service and instead look for diversity within their supply chain movement to ensure they receive the best prices.

3PLs/freight forwarders and warehouse facilities operators sometimes manage multiple types of facilities. If they have operations near the ports, they typically operate crossdock facilities. They may also have operations further inland, where they operate larger general-purpose warehouses (GPW). One interviewee described the warehouse sector as a 30 percent/30 percent/30 percent/10 percent mix of dry, refrigerated, frozen, and office space, respectively.

The 3PLs with whom we spoke indicated their decisions regarding location are complex. While location and costs are important factors when considering a warehousing facility, location requirements differ across facility types (i.e. crossdock/transloading facilities are typically near ports and railways). Facilities housing goods with longer turnover times

(e.g. goods that don't expire: electronics, toys, household items) can be farther away, but locations close to ports, highways, and railways are usually preferred. For handling imports, 3PLs typically prefer to be in Los Angeles because the goods will travel shorter distances and spend less time sitting in trucks or in warehouses. Consistent with the discussion above, 3PLs consider a variety of costs in addition to the cost of real estate (rent), such as labor costs and the costs of transporting goods.

BENEFICIAL CARGO OWNERS

As noted above, we were unable to interview any BCOs to support the development of this memo. However, because transportation costs are cited as the dominant factor accounting for more than half of total cost of logistics (followed by inventory costs at 20 percent),⁷ BCOs may favor location of distribution facilities at a higher cost if they are in close proximity to intermodal facilities and will help decrease the overall transportation costs of goods.

MANUFACTURERS

We spoke to two manufacturers, both in the food and beverage industry. For manufacturing facilities, especially larger ones, the location is determined by the proximity of rail as some raw materials are shipped by rail. The proximity to retail stores and to mega warehouses is also very important. In the past, delivery went to big stores while more recently products are delivered to mega warehouses before reaching retail and end customers. Both manufacturing facilities have been in the same locations for several decades and moving was not under consideration, as relocation would involve moving specialized manufacturing equipment, which would pose many challenges. With respect to the space at manufacturing facilities, one facility indicated that much more than 50 percent of its space is dedicated to manufacturing. Of 220,000 square feet in total, 160,000 square feet is for the manufacturing floor, 30,000 square feet is a warehouse for finished product, 15,000 square feet is for a raw material warehouse, and 15,000 square feet is the corporate office.

RETAILERS

The retailers with whom we spoke emphasized that the retail industry is changing dramatically and that these changes will affect the warehousing landscape in the region. The rise of e-commerce is leading to a boom in online shopping. Online shopping primarily occurs in two ways: the consumer orders the product online, then they either have it shipped to their home or they pick it up in store. With the rise of e-commerce, many retailers are slowly transitioning from store fronts to warehouses. Warehouses allow retailers to hold more product for the consumers at a lower cost than the storefront. This gives the consumers more choice in product than if they were shopping in a store. This is not necessarily changing the amount of product sold but is instead changing the way products are sold and delivered.

Retailers have historically chosen warehouse locations based on proximity to their retail stores, but this is changing now with the rise of e-commerce. Retailers are not only shipping to their storefronts but also to mega warehouses -warehouses larger than 1

⁷ The Geography of Transport Systems, Ch 11 - Applications and Case Studies, https://transportgeography.org/?page_id=6517

million square feet. These mega warehouses are operated by companies like Amazon, and retailers ship some of their goods to these warehouses to be sold by Amazon. Thus, retailers are now concerned not only about warehouse proximity to their retail stores, but also proximity to the “mega warehouses.” In the context of an ISR affecting the warehousing sector, this suggests retailers’ responses regarding warehouse location will depend, in part, on how mega warehouses respond to an ISR.

One stakeholder commented about regulations affecting retailers and the difficulties regulation poses for the siting and construction of warehouses in California. While the need for additional warehouse space exists, the stakeholder suggested the costs and delays associated with regulation are a significant impediment to warehouse development in the region. The stakeholder, however, did not provide details on the specific regulations that cause these costs/delays. Due to the high cost of operating in California, the stakeholder sees this industry growing in Reno.

TRANSFORMING INDUSTRY TRENDS

Multiple interviewees expressed that the industry is in flux and that over the next ten years significant changes to the logistics supply chain will occur. With the rise of e-commerce, automation, and the increased need for final mile delivery, companies are trying to plan for these changes. In addition, some of the bigger companies have sustainability goals in place, including fleet electrification and warehouse facility upgrades.

APPENDIX A - INTERVIEWEES

Interviewed	Business Type	Company Name	Name
YES	3PL/General Warehousing	Pacific Mountain Logistics	B.J. Patterson
YES	3PL/General Warehousing	NFI	James O'Leary
YES	3PL/General Warehousing	Dependable Highway Express (DHE)	Troy Musgrave
YES	3PL/General Warehousing	Allen Lund Company	Ken Lund
YES	Retail/BCO	California Retailers Association	Rachel Michelin
YES	Retail/BCO/ Manufacturing	PepsiCo	Keshav Sondhi
YES	Retail/BCO	Walmart	Jennifer Wheeler
YES	Retail/BCO/ Manufacturing	Snak King	Jeffrey Forde
YES	3PL/General Warehousing	Sysco	Eddie Tantoco
YES	3PL/General Warehousing	TForce	Richard Boyd
YES	3PL/General Warehousing	UPS	Dale Morin
YES	3PL/ General Warehousing	Dependable Highway Express (DHE)	Tom Lentz
-	3PL/General Warehousing	SC Express	Sherry Hertel
-	3PL/General Warehousing	California Cartage Company	Bob Liveley
-	3PL /General Warehousing	XPO Logistics	Tim Demczyk
-	3PL/ General Warehousing	Lineage Logistics	Dominic Dicalo
-	Consultant	Clean Future	John A. Thorton
-	3PL/ General Warehousing	Dependable Highway Express (DHE)	Tom Lentz
-	3PL/ General Warehousing	Los Angeles Customs Brokers Freight Forwarders Association	Karen Quintana
-	3PL/ General Warehousing	Transportation Intermediaries Association	Chris Burrows
-	3PL/ General Warehousing	Fedex Express	Dustin Rice
-	3PL/ General Warehousing	DHL	Chris Wessel
-	Retail/BCO	IKEA	Adolfo Kurczyn
-	Retail/BCO	Albertson's/Vons	Tim Burke
-	Retail/BCO	Walmart	Randall Sanford
-	Retail/BCO	Retail Industry Leaders Association	Brian Rose
-	Retail/BCO	Aramark	Kevin Fisher
-	Retail/BCO	Tyson	Rob Lyall

APPENDIX B- INTERVIEW QUESTIONS

Questions for Warehouse Industry Stakeholders

Background

Please read the following to every interviewee

We are working with the South Coast Air Quality Management District on a project focused on the warehousing and logistics industry. As part of this effort, we would like to obtain background information on the logistics and distribution industry and particularly the warehousing sector in LA, Orange, San Bernardino, and Riverside Counties.

If prompted:* South Coast AQMD has asked us to collect this information to inform the creation of a potential Indirect Source Rule. The rule development effort is ongoing, and we do not have information on what the eventual provisions of the rule will be.*

***From here, please read the appropriate set of questions for each type of interviewee. ***

Beneficial Cargo Owners (focused on non-retail activity).

**Is BCO classification correct?*

1) Please tell us about your company's role in goods distribution in Southern California. What is your role in moving goods from port to customer? What types of cargo do you typically deal with?

- a) What are the other types of organizations that you interact/coordinate with in your goods distribution operations? Please describe your role in logistics/distribution relative to theirs.
- b) Where are your warehouses located?
- c) If warehouses are not operated by the BCOs: What warehouses are you contracted with?
- d) ***If motor carriers or warehouse operators not mentioned, ask about them specifically, including their involvement in motor carrier dispatching decisions. ***

2) Tell us about how your cargo is moved out of the port. What factors determine your drayage operations?

- a) What factors are important when selecting a warehouse for transloading operations or cargo storage? Does this vary across different types of cargo?
- b) How important is port proximity in selecting a transloading facility or cargo storage? Do you use transloading facilities/storage near the port, or a warehouse
- c) outside of LA and Orange county? Is there a strategic reason why your company chose this location?
- d) Is your cargo's final destination typically in Southern California or elsewhere? If both, do you select the warehouses differently based on the final destination?
- e) Is there a typical turnaround time for your cargo?
- f) How do you track your cargo? Do you rely on freight forwards and 3PLs, or do you use tools/software? What information do you track?
- g) What sort of truck or freight verification is conducted at the gate for entering/exiting vehicles?
- h) ****If the interviewee has its own fleet**** Use of telematics or geo fencing to track vehicles?

3) Does your cargo require cold storage? If so:

- a) How does this affect the process you described earlier, as far as location of transloading facilities?

Question for BCOs that operate their own warehouse:

- b) What characteristics of a warehouse make it conducive to cold storage?
c) Is refrigeration infrastructure easily relocated from one warehouse to another?

4) *If relevant: Who are your customers: Where are they in the supply chain in relation to you? (Possible answers could be retailers, trucking companies, third party logistics companies, or other?)***

- a) How important is the warehouse location for meeting your customer's needs?

5) Have you ever considered using warehouses outside the urban LA, OC, Riverside, or San Bernardino Counties?

- a) If so, what prompted your consideration? (Possible answer could be operational changes, warehousing cost, business expansion, etc.)
b) *** If mentioning cost as a reason*** Do you have an idea of the cost threshold that would lead you to consider using warehouses outside the urban LA, OC, Riverside, or San Bernardino Counties?
c) Did you eventually use warehouses outside the urban LA, OC, Riverside, or San Bernardino Counties? If not, what were the principal constraints?

6) Can you identify any current trends that are affecting your industry?

- a) ***If relevant:* Are there any trends that may affect your decision to use warehouses within the urban LA, OC, Riverside, or San Bernardino Counties versus outside of these areas?
b) Are there other aspects or challenges to your industry that you think may be relevant?

7) How does online shopping impact your business?

- a) How does this change the process you described earlier?
b) What characteristics of a warehouse make it conducive to e-commerce?

8) As we understand it, warehouses may provide a range of services, including transloading, cross dock transloading, terminal services for less-than-truckload trucks, general purpose warehousing/storage, cold storage, distribution center, and retail fulfillment.

- a) Are there any other categories that you would recommend we add to this list? Also, do you have at least a rough sense of the distribution of warehouses across these services (e.g., approximately A to B percent of warehouses in the region have cold storage)? We're not expecting that you would have precise estimates but any input you can offer based on your experience would be helpful.

Retailers (Focus on distribution to individual stores)

*Is Retailer classification correct?

1) Please tell us about your company and how products end up in your retail store(s). (Question for retailers who do not import the cargo/ take control of cargo at the port)

- a) Roughly what share of your store products are shipped directly through the San Pedro ports vs. land transported from warehouses not related to port operations?

- b) How do those products get transported from the vendor to your stores? Does this vary between different types of goods?
- c) What's a typical delivery timeline from the regional distribution center to the store?
- 2) **Do you directly lease and operate warehouses, or do you hire third party logistics providers to manage aspects of your distribution? What about trucking operations?**
 - a) What are the advantages and disadvantages of handling these operations within your company versus contracting for these services?
 - b) Do you have an involvement in truck dispatching decisions? What are the advantages and disadvantages of handling these operations vs. contracting for these services?
 - c) What sort of truck or freight verification is conducted at the gate for entering/exiting vehicles?
 - d) ***If the interviewee has its own fleet*** Use of telematics or geo fencing to track vehicles?
- 3) **What kinds of warehouses do you use in Southern California?**
 - a) Does this include distribution centers, long term storage centers, and import-related warehouses?
 - b) In general, where are these warehouses located? Does the location vary between different types of cargo?
 - c) What qualities make certain warehouses more desirable? Does this vary for different types of cargo?
- 4) **Does your cargo require cold storage? If so:**
 - a) How does this change the process you described earlier?
 - b) *If the respondent indicates that their company operates warehouses:*
 - i) What characteristics of a warehouse make it conducive to cold storage?
 - ii) Is refrigeration infrastructure easily relocated from one warehouse to another?
- 5) **How does online shopping impact your business?**
 - a) How does this change the process you described earlier?
 - b) What characteristics of a warehouse make it conducive to e-commerce?
- 6) **How important is warehouse proximity to your retail stores? Does this vary across warehouse types and functions, as well as products?**
- 7) **If your company contracts with others for warehousing, have you ever considered changing service providers based on their proximity to your retail stores?**
 - a) How does your company balance transportation costs in cases where the warehouse is not in close proximity to your retail locations? Do those costs fall to you or does the contracted company accrue those costs?
- 8) **How do you handle freight tracking?**
- 9) **Can you identify any current trends that are affecting your industry? *If relevant:* Are there any associated effects on your decisions regarding where to warehouse your cargo?**
- 10) **Are there other aspects or challenges to your industry that you think may be relevant?**

Warehouse Operators (3PL, Freight Forwarders, general warehousing)

*Is warehouse operator classification correct?

- 1) Please tell us about your company.**
 - a) How many warehouses do you operate in the urban LA, OC, Riverside, or San Bernardino Counties?
 - b) Where are they located?
 - c) What kinds of warehouses or services do you provide?
 - d) What kinds of customers do you serve?
- 2) Tell us about how goods move in and out of your warehouse. Where are goods typically coming from and where are they going?**
 - a) Are there specific warehouse characteristics that are important to this process?
 - b) Does the process vary across different types of cargo? If so, how?
 - c) What's a typical delivery timeline? Do you avoid times of high traffic?
 - d) What are the other types of organizations that you interact/coordinate with in your goods distribution operations? Please describe your role in logistics/distribution relative to theirs.
 - e) What sort of truck or freight verification is conducted at the gate for entering/exiting vehicles?
 - f) ***If the interviewee has its own fleet*** Use of telematics or geo fencing to track vehicles?
- 3) When selecting a warehouse, what qualities make certain warehouses more desirable? For example, available space, cost per square foot, or location?**
 - a) Are there other facility amenities that are also important?
- 4) Do you use cold storage? If so:**
 - a) How does this change the process you described earlier?
 - b) What characteristics of a warehouse make it conducive to cold storage?
 - c) Is refrigeration infrastructure easily relocated from one warehouse to another?
- 5) What services do you outsource to other companies? For example, trucking?**
 - a) What are the advantages and disadvantages of handling these operations within your company versus contracting for these services?
- 6) How important is the warehouse location for meeting your customer's needs?**
 - a) How does the LA/OC area compare to further away in San Bernardino County?
 - b) How do locations within in the urban LA, OC, Riverside, or San Bernardino Counties areas compare to cities outside the region, i.e. Barstow, Phoenix, and Las Vegas?
- 7) Have you ever considered relocating outside the urban LA, OC, Riverside, or San Bernardino Counties?**
 - a) If so, what prompted your consideration? (Possible answer could be operational changes, warehousing cost, business expansion, etc.)
 - b) *** If mentioning cost as a reason*** Do you have an idea of the cost threshold that would lead you to consider moving to warehouses outside the urban LA, OC, Riverside, or San Bernardino Counties?
 - c) What are the principle constraints on relocation?
- 8) Can you identify any current trends that are affecting your industry? *If relevant:* Are there any associated effects on your decisions regarding the location of your operations?**

- a) Are there other aspects or challenges to your industry that you think may be relevant?
- 9) **As we understand it, warehouses may provide a range of services, including transloading, crossdock transloading, terminal services for less-than-truckload trucks, general purpose warehousing/storage, cold storage, distribution center, and retail fulfillment.**
 - a) Are there any other categories that you would recommend we add to this list? Also, do you have at least a rough sense of the distribution of warehouses across these services (e.g., approximately A to B percent of warehouses in the region have cold storage)? We're not expecting that you would have precise estimates but any input you can offer based on your experience would be helpful.

Manufacturing and Distribution Facility

- 1) **Tell us a bit about your company**
 - a. What do you manufacture?
 - b. Who are your customers?
- 2) **Tell us about your facility**
 - a. How many square feet total?
 - b. What percentage is dedicated to warehousing, manufacturing, and office space?
 - c. What qualities make a space more desirable? (available space, cost per sq ft, location) Are there facility amenities that are important?
 - d. Do you use cold storage? If so:
 - e. What characteristics of a warehouse make it conducive to cold storage?
 - f. Is refrigeration infrastructure easily relocated from one warehouse to another?
- 3) **Tell us about your operations**
 - a. Where are goods typically coming from and where are they going?
 - b. What percentage of goods that move through your facility are imports vs. exports?
 - c. What's a typical delivery timeline?
 - d. Do you try to avoid times of high traffic?
- 4) **We want to understand your place in the supply chain and how you interact with your customers and other contractors**
 - a. What are the other types of organizations do you interact/coordinate within your goods distribution operations?
 - b. What services do you outsource to other companies? For example, trucking?
 - c. What are the advantages and disadvantages of handling these operations within your company versus contracting for these services?
- 5) **Please tell us about you fleet**
 - a. Do you lease or own your vehicles? What percentage is leased vs. owned? And what are the benefits of leasing vs. owning?
 - b. How many vehicles are in your fleet? And what classes are they?
 - c. What is the average age of the vehicles in your fleet?
 - d. What fuel technology do you use?
 - e. If you operator forklifts or yard hostlers, what percentage are fossil fuel vs. electric? Are any of these fossil fuel vehicles operating indoors?

- f. Is your fleet equipped with telematics? If so, do you rely on this to track fuel usage and mileage? Do you use geofencing?
- g. What is a typical day operation for you fleet?
 - i. Average number of miles
 - ii. Average number of stops
- h. Which of the following would best describe your fleet's operations?
 - i. Regional Delivery
 - ii. Drayage
 - iii. Less than Truckload
 - iv. Over the Road
 - v. Other (please explain)
- i. Which of the following warehousing facilities does your fleet typically service? And, what characteristics of your fleet makes it suitable to serve this specific type of facility?
 - i. Distributions center
 - ii. Cross-dock facility
 - iii. Transload facility
 - iv. General Purpose Warehouse
 - v. Truck Terminal for Less than Truckload Trucks
 - vi. Retail Fulfillment Center
 - vii. Storage or Cold Storage

6) Please tell us about how vehicles interact with your facility

- a. What is the typical process for vehicles entering and exiting the facility?
- b. What information do you collect about vehicles entering and exiting the facility (i.e. vehicle type, fuel technology, model, US DOT, CA, MC #s, VIN, truck model, truck year)
- c. What method do you use to track the number of vehicles visiting your facility (inbound and outbound)? What is the typical daily number of vehicles?
- d. Do trucks need to be part of a truck registry to enter the facility? (i.e. Drayage Truck Registry OR TRUCRS)

7) We are also trying to understand how location plays a role in your business operations.

- a. How important is the warehouse location for meeting your customer's needs?
- b. How does the LA/OC area compare to further away in San Bernardino County?
- c. How do locations within in the urban LA, OC, Riverside, or San Bernardino Counties areas compare to cities outside the region, i.e. Barstow, Phoenix, and Las Vegas?
- d. Have you ever considered relocating outside the urban LA, OC, Riverside, or San Bernardino Counties?
- e. If so, what prompted your consideration? (Possible answer could be operational changes, warehousing cost, business expansion, etc.)
- f. *** If mentioning cost as a reason*** Do you have an idea of the cost threshold that would lead you to consider moving to warehouses outside the urban LA, OC, Riverside, or San Bernardino Counties?
- g. What are the principle constraints on relocation?

8) We want to understand any trends you are seeing in the industry

- a. Are there any aspects or challenges to your industry that you think may be relevant?

9) Plans for future sustainability

- a. Do you have sustainability goals/plans? Please explain.
- b. Have you thought about putting community benefit measures in place, in terms of air pollution?
- c. Have you researched into the possibility of electric fleets and/or charging and refueling stations?

ATTACHMENT 2

TECHNICAL MEMORANDUM ON REAL ESTATE MARKETS NEIGHBORING THE SOUTH COAST AQMD JURISDICTION

MEMORANDUM | 12 DECEMBER 2020

TO Victor Juan, Ian MacMillan, Paul Stroik, and Shah Dabirian, South Coast Air Quality Management District (South Coast AQMD)

FROM Derek Ehrnschwender and Jason Price, IEc

SUBJECT Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Jurisdiction

INTRODUCTION This memorandum is in support of South Coast Air Quality Management District (South Coast AQMD) staff's development of a potential indirect source rule (ISR) to reduce mobile source emissions related to the operation of warehouses and distribution centers in the South Coast AQMD's four-county region (Los Angeles, Orange, Riverside, and San Bernardino counties).¹

Diesel truck traffic, largely related to the transport of goods passing through the Ports of Los Angeles and Long Beach and regional warehouses and distribution centers, makes up a large share of local NO_x emissions. A warehouse ISR, if adopted, may help with reducing emissions from trucks servicing warehousing facilities located within its jurisdiction.

Compliance costs to the warehousing sector could vary depending on the design of an eventual rule. If these costs are significant, the implementation of an ISR could potentially precipitate the relocation of warehousing operations outside the region—with the associated truck fleets continuing to travel to and from facilities in the South Coast AQMD jurisdiction. In the worst-case scenario, the associated air quality benefits from such a rule might be greatly diminished. Accordingly, South Coast AQMD is interested in identifying and understanding the factors affecting whether warehousing operations are likely to relocate as a result of the potential rule.

Consistent with this objective, this memo analyzes the warehouse real estate markets within the South Coast AQMD jurisdiction and in neighboring areas. Through analysis of a range of key market metrics and trends, we assess the capacity of neighboring areas to absorb warehousing operations that might consider relocation following the implementation of an ISR. To inform assessment of relocation potential over time, we also assess how these neighboring markets may change over the next ten years. The specific market statistics examined in this memo include the following:

- ***Total warehouse inventory:*** To help South Coast AQMD better understand the size of the local warehousing sector, we compile information on the inventory of warehouses within the region. Similarly, to gauge the potential capacity of neighboring areas to absorb warehouse operations from the South Coast AQMD jurisdiction, we also present the inventory of warehouses in these areas.

¹ The South Coast AQMD jurisdiction is comprised of all of Orange County and parts of Los Angeles, Riverside and San Bernardino Counties. The region is mapped and described in full in Exhibit 1 and the "Geographic Scope" section below.

- ***Vacancy rates:*** Complementing the inventory data, we examine vacancy rates in the South Coast AQMD jurisdiction and in neighboring areas. This information provides insight into the *current* capacity of neighboring markets to absorb warehousing operations located in the South Coast AQMD jurisdiction.
- ***Net absorption:*** We examine net absorption of warehouse space in each area, defined as the amount of space tenants moved into in a geographic area and time period minus the amount of space tenants vacated during that same time period. Because this metric reflects changes in inventory levels for a given period, it may provide insights into the direction of the market (e.g., the capacity or lack of capacity of neighboring areas to absorb warehousing operations from the South Coast AQMD jurisdiction).
- ***Pricing:*** Because decisions regarding the relocation of warehouse operations to neighboring areas will depend on the associated cost impacts, we compile data on warehouse pricing in each market—rent per square foot for properties for lease, and sale price per square foot for properties that were bought and sold.
- ***Parcels available for warehouse development:*** To gauge the potential for expansion of the warehouse market in each area to accommodate operations currently located in the South Coast AQMD jurisdiction, we present data on vacant land in each market area with the appropriate zoning for warehouse space.

We begin the real estate market analysis by describing the data sources relied upon and outlining the structure of the analysis. Building on this information, we then present our analysis of the key market metrics identified above. Finally, we conclude with a synthesis of our key findings.

DATA SOURCES AND ANALYTIC STRUCTURE

The primary data sources for this document are contained in the CoStar Suite™ of data products developed and maintained by CoStar, a real estate analytics firm. As described in further detail below, the CoStar Suite™ includes information on existing properties as well as vacant parcels that may be developed. These data are flexible in terms of how they may be spatially aggregated, and include information on the attributes of individual properties allowing for identification of different types of warehouse space.

COSTAR DATA

The CoStar Suite™ contains a variety of databases, of which we use CoStar Property® and CoStar Market Analytics™. CoStar Property® contains a regularly maintained comprehensive list of commercial real estate properties and vacant lands, with an extensive list of descriptive fields. CoStar Market Analytics™ contains a range of historical data, metrics, and forecasts relevant to identifying trends.

For the purposes of this analysis, we limit our scope to properties meeting the following criteria:

- Properties with status labeled as existing or undergoing renovations.
- Properties within CoStar's Industrial and Flex (Industrial with some office space) categorizations.

- For buildings within the CoStar Industrial and Flex categorization, properties with secondary categorizations of Distribution, Light Distribution, Refrigeration/Cold Storage, Truck Terminal, or Warehouse.²
- Properties with a minimum 100,000 square foot rentable building area.³
- Properties with a minimum ceiling height of 15 feet.⁴

Based on these criteria, we identify 2,638 properties in South Coast AQMD’s jurisdiction and 975 properties in the neighboring areas examined in this analysis (further details below).⁵

This analysis also incorporates CoStar’s information on vacant land parcels for the purposes of assessing potential new additions to the supply of warehouses in outlying markets. We limit our scope to parcels classified for industrial use and with a minimum footprint of 200,000 square feet. We use a 200,000 square foot minimum based on our 100,000 square foot minimum building area and an assumption (based on the CoStar property data) that an acceptable lower-bound for the ratio of property area to building area is two-to-one.

GEOGRAPHIC SCOPE

For each property, the CoStar database includes detailed spatial information. Specifically, the database includes (1) latitude and longitude coordinates, (2) mailing address, and (3) size of the building footprint. Using the spatial information in the database, we grouped properties into eight distinct real estate markets—the South Coast AQMD jurisdiction (or “District” in many of the graphics below) and seven neighboring areas in geographic proximity to the South Coast AQMD jurisdiction. In addition, we further sub-divided the South Coast AQMD jurisdiction into three areas, largely defined according to county boundaries. These markets, shown in the maps in Exhibit 1, are as follows:

- **Los Angeles:** The portion of Los Angeles County located within the South Coast AQMD jurisdictional boundaries, including all of the county except for the northeastern corner. This area includes the “megaports” of L.A. and Long Beach, the origin point for most goods passing through warehouses in the region and 40 percent of all container cargo traffic in the U.S.⁶

² Facilities with the secondary type Manufacturing are also discussed in this document. Because manufacturing facilities’ decision-making processes regarding relocation are likely to differ from the decision-making process for facilities whose primary function is warehousing, these facilities are captured in a stand-alone section below rather than in the primary analysis presented in this document.

³ An earlier version of this document limited the scope of this analysis to properties greater than 25,000 square feet. Due to revisions to the proposed ISR limiting its applicability to properties 100,000 square feet and greater, this draft amends its scope and warehouse classification to focus on this group.

⁴ An exception to this is that we include properties for which building area was available but ceiling height was not in order to capture the most complete picture of the real estate landscape in each area.

⁵ Consistent with the note above, these figures do not include manufacturing facilities.

⁶ “Industrial Warehousing in the SCAG Region – Final Report.” (2018) Prepared for the Southern California Association of Governments by Cambridge Systematics, Inc. with Gill V. Hicks and Associates Inc. April 2018.

- **Orange County:** All of Orange County, which is completely contained within the South Coast AQMD jurisdictional boundaries.
- **Inland Empire:** The South Coast AQMD portions of Riverside and San Bernardino counties. This includes the most densely populated southwestern corner of San Bernardino County and all of Riverside County except for a small portion near the county's eastern border, near the Arizona state line. Driving times from both ports to destinations within the South Coast AQMD jurisdiction vary depending on traffic, but an hour and a half is expected for crossing Los Angeles and accessing the centrally located cities of Riverside and San Bernardino.⁷
- **North of District, Bakersfield:** All of Kern County and the non-South Coast AQMD portion of Los Angeles County, including Lancaster and Palmdale. Bakersfield, the largest population center in Kern County, is roughly two hours and 45 minutes from the Port of L.A.
- **North of District, Coastal:** All of Ventura County, Santa Barbara County, and San Luis Obispo County. Contains the Port of Hueneme,⁸ located in Ventura County. Driving times from the Port of L.A. to the cities of Santa Barbara and San Luis Obispo are approximately two hours and 30 minutes and four hours and 15 minutes, respectively.
- **East of District, Desert Areas:** All of Imperial County and the non-South Coast AQMD portions of San Bernardino County, including Victorville, and Riverside County. Driving times from the Port of L.A. vary from one to four hours.
- **South of District, San Diego:** All of San Diego County, which includes the Port of San Diego.⁹ The drive time to San Diego from the Port of L.A. is roughly two hours and 30 minutes.
- **Las Vegas:** All of Clark County, Nevada, which includes the city of Las Vegas. It takes roughly five hours to drive from the Port of L.A. to Las Vegas.
- **Phoenix:** All of Maricopa County and Pinal County, Arizona. The drivetime from the Port of L.A. to Phoenix is approximately six hours.
- **Western Arizona:** All of the four Arizona counties to the west of Phoenix: Yuma, La Paz, Mohave, and Yavapai Counties. Driving times from the Port of L.A. vary from four to six hours.

⁷ We calculate driving times based on expected departures from the Port of L.A. at 6:00 AM on a weekday, a time with relatively low traffic.

⁸ The Port of Hueneme is substantially smaller than the Ports of L.A. and Long Beach, with annual container traffic of 84,000 containers in 2018, relative to Long Beach's 8.8 million containers and L.A.'s 8.9 million containers. American Association of Port Authorities. "NAFTA Container Port Ranking 2017." <https://www.aapa-ports.org/unifying/content.aspx?ItemNumber=21048>

⁹ The Port of San Diego's annual container traffic is approximately 143,000 containers. American Association of Port Authorities. *Op cit.*

EXHIBIT 1-A. REAL ESTATE MARKETS EXAMINED

EXHIBIT 1-B. REAL ESTATE MARKETS EXAMINED - DISTRICT MARKETS FOCUS

WAREHOUSE CLASSIFICATION

Our analysis of warehouse real estate markets in the areas identified above distinguishes between different types of warehouses. We make this distinction because different types of warehouses (or warehousing operations) may respond differently to an ISR. As a starting point for defining warehouse categories, we examined the Southern California Association of Governments' (SCAG's) 2018 report on warehousing activity in Southern California.¹⁰ As summarized in Exhibit 2, the SCAG report identifies eight categories of warehouses, the definitions for which include building area and ceiling height.¹¹

While useful, the SCAG classification system in many cases describes warehousing *services* rather than physical warehouse *structures*. Because a given warehouse may be suitable for more than one type of warehousing service, the full SCAG classification system may not be appropriate for this analysis. For instance, there is no structural difference between warehouses that provide port-related general purpose warehousing services and those that provide non-port-related general purpose warehousing services. Similarly, warehouses that perform transload services are physically similar to warehouses that perform crossdock services.

Thus, for the purposes of segmenting the warehousing real estate market in this analysis, we specify warehouse categories based on the suite of warehousing services that a warehouse may provide or on its capacity to accommodate a warehousing service with specific needs (e.g., refrigeration). We also define the classification scheme so that it fully captures and categorizes the property data from CoStar. Additional considerations in our classification of warehouses include the following:

- We exclude ceiling height as a parameter in our classification scheme. Because ceiling height is missing for many properties in the CoStar data, the exclusion of these properties would provide an incomplete picture of the market.
- Our classification is unable to account for the “long and narrow” building shape unique to transload and crossdock facilities due to data limitations. For this reason, we combine transload and crossdock warehouses with the general purpose category, due to similarities in building size.
- We find properties with the CoStar secondary classifications of Refrigeration/Cold Storage and Truck Terminal have a wide variety of building areas and do not fit neatly into one building category. We therefore identify cold storage facilities as a separate category due to their unique facility characteristics. We fit truck terminals into all of the other categories as their building area can range considerably from 25,000 to 330,000 square feet.

Based on the above, Exhibit 3 outlines our classification scheme for the market analysis.

¹⁰ “Industrial Warehousing in the SCAG Region – Task 4: Understanding Facility Operations.” (2018) Prepared for the Southern California Association of Governments by Cambridge Systematics, Inc. with Gill V. Hicks and Associates Inc. April 2018.

¹¹ Two additional categories of warehouses—parcel hubs and e-commerce facilities—are included in the warehousing and logistics technical memorandum prepared in support of this analysis. Due to limitations in the specificity of the CoStar secondary classification field, we do not identify these categories in this analysis. These facilities, depending on their respective size, are captured within the categorization we outline in Exhibit 3. For the characterization of parcel hubs and e-commerce facilities, see Jasna Tomic and Kelly Leathers, “Technical Memorandum on Warehousing and Logistics Industry in the South Coast Air Quality Management District Jurisdiction,” prepared for South Coast AQMD, November 30, 2020.

EXHIBIT 2. SCAG WAREHOUSE CLASSIFICATION

WAREHOUSE TYPE	TYPICAL BUILDING AREA	TYPICAL BUILDING WIDTH	TYPICAL CEILING HEIGHT	SITE COVERAGE (BUILDING FOOTPRINT/PROPERTY SIZE)	CARGO TURNAROUND TIME
Port-Related General Purpose Warehouse	25,000-50,000 sq. Ft.	Not specific	>22 ft.	0.5	Varies
Non-Port-Related General Purpose Warehouse	25,000-50,000 sq. Ft.	Not specific	>22 ft.	0.5	Varies
Trans-load Facility	>25,000 sq. Ft	Long and narrow	>22 ft.	0.5	Up to one week
Cross-dock Facility	>25,000 sq. Ft	Long and narrow	>22 ft.	0.5	1-2 days
Truck Terminal for Less-Than-Truckload Trucks	25,000 to 150,000 sq. Ft.	Not specific	<25 ft.	0.3	Up to one week
General Distribution Center	50,000 to 500,000 sq. Ft.	Not specific	<25 ft.	0.4	Varies
Retail Fulfillment Center	500,000 to 1,000,000 sq. Ft.	Not specific	>28 ft.	0.4	Up to one week
Cold Storage	>25,000 sq. Ft.	Not specific	>22 ft.	0.5	Up to one week

EXHIBIT 3. WAREHOUSING REAL ESTATE CLASSIFICATION SCHEME

PROPERTY CLASSIFICATION	APPLICABLE SCAG WAREHOUSE CATEGORIES	BUILDING AREA	COSTAR PRIMARY CATEGORIZATION	COSTAR SECONDARY CATEGORIZATION
General Purpose	General Purpose, Transload, Crossdock	100,000-200,000 sqft	Industrial or Flex	Distribution, Light Distribution, Truck Terminal, Warehouse
General Distribution	General Distribution Centers	200,000-500,000 sqft	Industrial or Flex	Distribution, Light Distribution, Truck Terminal, Warehouse
Retail Fulfillment	Retail Fulfillment Centers	500,000+ sqft	Industrial or Flex	Distribution, Light Distribution, Truck Terminal, Warehouse
Cold Storage ¹	Refrigeration/Cold Storage Facility	25,000+ sqft	Industrial or Flex	Refrigeration/Cold Storage
Notes: 1. In addition to cold storage warehouses greater than 100,000 square feet, we include cold storage warehouses between 25,000 and 100,000 square feet for additional insights on these facilities.				

In addition to the warehouse types shown in Exhibit 3, which apply to buildings whose main function is warehousing, we also examine warehousing space at manufacturing facilities in the South Coast AQMD jurisdiction. For these facilities, however, decisions regarding relocation are likely to differ from the decision-making process for warehouse facilities. As supported by conversations with manufacturing warehouse operators for the technical memo on the warehousing and logistics industry, manufacturing facilities often have specialized equipment that would be more costly to move.¹² In addition, the pool of buildings to which manufacturing facilities could relocate may differ from the buildings that warehouses would consider. Due to these differences, our assessment of manufacturing warehouses in the South Coast AQMD jurisdiction is presented separately from our assessment of other warehouses.

ANALYSIS

Our analysis of the real estate markets in the South Coast AQMD jurisdiction and neighboring areas examines the current state of these markets and recent projections extending 10 years into the future. This analysis will help South Coast AQMD better understand the capacity of neighboring markets to absorb warehousing operations from its jurisdiction.

CURRENT MARKET SNAPSHOT

In this section, we compile a set of market metrics from the CoStar property database to compare warehousing real estate in the South Coast AQMD jurisdiction with real estate

¹² Jasna Tomic and Kelly Leathers, "Technical Memorandum on Warehousing and Logistics Industry in the South Coast Air Quality Management District Jurisdiction," prepared for South Coast AQMD, November 30, 2020.

in outlying markets. We compare the markets according to total inventory, vacancy rates, tenancy growth rates, net absorption, pricing, and potential future development.

Total Inventory (Warehousing Facilities)

We assess the total inventory of warehousing properties along two metrics: the number of total properties and the rentable building area of those properties, measured in square feet. Exhibits 4, 5, and 6 present these values by market area and property type. We identify 3,613 properties with the CoStar categorizations of Industrial and Flex (Industrial with some office space), the CoStar secondary categorizations of Distribution, Light Distribution, Refrigeration/Cold Storage, Truck Terminal or Warehouse, and with a minimum rentable building area of 100,000 square feet. Of these properties, 2,638 (73 percent) are located within the South Coast AQMD jurisdiction, while 975 (27 percent) are located in the outlying markets. Similarly, we identify 888 million square feet of rentable building area meeting the same criteria, with 662 million square feet (75 percent) located within the South Coast AQMD jurisdiction, and the remaining 226 million (25 percent) located in the outlying markets. The South Coast AQMD jurisdiction contains more warehousing space across each of the real estate categories, as highlighted in Exhibits 4 and 6. These exhibits also show the distribution of warehousing space across warehouse categories is fairly consistent across the geographic areas examined.

EXHIBIT 4. TOTAL BUILDING AREA - YEAR 2019: DISTRICT AND NON-DISTRICT

PROPERTY CLASSIFICATION	DISTRICT AREA	SHARE OF TOTAL DISTRICT AREA	NON-DISTRICT AREA	SHARE OF TOTAL NON-DISTRICT AREA
General Purpose	191.4 million sq. ft.	28.9%	72.6 million sq. ft.	32.1%
General Distribution	249.7 million sq. ft.	37.7%	79.5 million sq. ft.	35.2%
Retail Fulfillment	209.6 million sq. ft.	31.7%	66.9 million sq. ft.	29.5%
Cold Storage	11.5 million sq. ft.	1.7%	7.3 million sq. ft.	3.2%
Total	662.2 million sq. ft.	100%	226.3 million sq. ft.	100%

EXHIBIT 5. NUMBER OF WAREHOUSE PROPERTIES BY MARKET AND REAL ESTATE CLASSIFICATION - YEAR 2019

EXHIBIT 6. SQUARE FOOTAGE OF PROPERTIES BY MARKET AND REAL ESTATE CLASSIFICATION - YEAR 2019

Exhibit 7 compares the growth of warehouse property capacity within the South Coast AQMD jurisdiction and in the surrounding market areas over time. Because these historical data are from the CoStar Market Analytics™ module, they may present slight differences relative to the data in Exhibits 4-6, which are based on data from CoStar Property™.¹³ Over the last decade, capacity has increased by approximately 170 million

¹³ The historical data from the CoStar Market Analytics™ module are filtered using the same four industrial secondary classifications used to identify warehouses from the CoStar Property™ data: Warehouse, Distribution, Light Distribution, and Truck Terminal. Cold Storage facilities are not included in the historical data. Additionally, the filter for ceiling height was not possible to apply in the historical data. For these reasons, as well as slight differences in the vintage of the respective

square feet in the South Coast AQMD jurisdiction and 70 million square feet in the surrounding market areas. From 2009-2019, average annual capacity additions within the South Coast AQMD jurisdiction were 16.7 million square feet per year, while the average annual additions for all outlying market areas combined was less than half that amount, at 6.9 million square feet per year.

EXHIBIT 7. HISTORICAL SQUARE FOOTAGE OF WAREHOUSE PROPERTIES GREATER THAN 100,000 SQUARE FEET WITHIN THE SOUTH COAST AQMD JURISDICTION AND SURROUNDING MARKET AREAS

Exhibit 8 compares the growth of warehouse property capacity between the surrounding market areas over time. Similar to the data in Exhibit 7, the historical data in Exhibit 8 are from the CoStar Market Analytics™ module and may differ somewhat from the data reflected in Exhibits 4-6. As shown in Exhibit 8, growth in recent years is most significant in the Las Vegas and Phoenix markets. Of the markets closer to the South Coast AQMD jurisdiction, the Bakersfield market shows the largest increase in capacity. Data are not available for all market areas prior to 2008.

We assess properties based on their distance from major roads, defined as either a primary or secondary road. These roads include interstate highways, U.S. routes, state routes, and major urban streets. Distances were calculated along a straight line from property location to the nearest major road point.

underlying property data, there may be slight differences in the historical data as compared with the values reported from the CoStar Property™ module.

EXHIBIT 8. HISTORICAL SQUARE FOOTAGE OF WAREHOUSE PROPERTIES GREATER THAN 100,000 SQUARE FEET WITHIN THE SOUTH COAST AQMD JURISDICTION AND SURROUNDING MARKET AREAS - ADDITIONAL DETAIL

Exhibit 9 shows the square footage of property at different distances from major roads (e.g., 0 to 0.5 miles from a major road). As shown in the exhibit, roughly one-third of warehousing square footage in the South Coast AQMD jurisdiction is located within a half mile of a major road, while the share is closer to one-fifth for the outlying markets. Less than one percent of warehousing real estate is located farther than five miles from a major road.

EXHIBIT 9. SQUARE FOOTAGE OF PROPERTIES BY DISTANCE FROM MAJOR ROAD (MILES) - YEAR 2019

Inventory (Manufacturing Facility Warehouses)

As noted above, manufacturing facilities may include warehousing space in addition to assembly/manufacturing space. To complement the profile of warehousing facilities included in this document, we also examine the scale of relevant manufacturing facilities in the South Coast AQMD jurisdiction using CoStar data.

Assuming an average of 25 percent of a manufacturing facility's floor area is devoted to warehousing, we limit the scope of properties considered to those greater than 400,000 square feet, resulting in 100,000 square feet of warehousing space.¹⁴ Based on the CoStar categorizations of Industrial and Flex (Industrial with some office space) and secondary categorizations of Manufacturing and Light Manufacturing, we identify 49 manufacturing properties in the South Coast AQMD jurisdiction that may have 100,000 square feet or more of warehousing space. The total warehousing space across these facilities is 8.4 million square feet. This represents an additional 1.3 percent increase over the 662 million square feet of warehousing space identified within the South Coast AQMD above.

Because manufacturing facilities require more specialized buildings and equipment, and would likely incur much higher moving costs, we exclude manufacturing facilities from the remainder of this analysis. As we show in our memo estimating potential warehouse relocations due to a possible warehouse ISR for non-manufacturing warehouses,¹⁵ few warehouses are expected to relocate. Thus, we expect manufacturing facilities with warehouses on site to be highly unlikely to relocate due to a possible ISR.

Vacancy Rates (Warehousing Facilities)

We calculate vacancy rates as the percentage of total rentable building area currently vacant and available for lease (Exhibit 10). These rates are sensitive to small samples within some of the defined markets, as evidenced by the high vacancy rates in the Western Arizona and San Diego markets. One out of the two retail fulfillment properties in both Western Arizona and San Diego has availability, resulting in the high rates seen in the table. The non-South Coast AQMD totals for vacancy rates are generally higher than the South Coast AQMD rates.

¹⁴ Manufacturing space takes up an average of 70 percent of floor space in properties classified as manufacturing. The remaining space is taken up by warehousing space and office space (though office space is rarely larger than 10 percent of the total, and often less in larger facilities). For this reason, we select 25 percent as a simplified estimate of total warehousing space within manufacturing facilities. Figures from: Yap, Johansson L., and Rene M. Circ. *Guide to classifying industrial property*. Urban Land Institute, 2003.

¹⁵ Jason Price, Derek Ehrnschwender, and Nick Manderlink, "Results of ISR Warehouse Relocation Analysis", prepared for South Coast AQMD, December 12, 2020.

EXHIBIT 10. VACANCY RATES ACROSS MARKETS AND REAL ESTATE CLASSIFICATION - YEAR 2019

GEOGRAPHIC AREA	GENERAL PURPOSE	GENERAL DISTRIBUTION	RETAIL FULFILLMENT	COLD STORAGE	TOTAL
District Total	4%	5%	5%	1%	4%
Orange County	4%	8%	14%	0%	7%
Inland Empire	5%	6%	5%	2%	5%
Los Angeles	3%	2%	4%	1%	2%
Non-District Total	7%	7%	11%	2%	8%
North of District, Bakersfield	6%	5%	4%	0%	4%
North of District, Coastal	3%	14%	0%*	0%	7%
East of District, Desert Areas	16%	8%	0%*	0%*	7%
South of District, San Diego	6%	7%	38%*	7%	7%
Las Vegas	3%	2%	5%	0%*	3%
Phoenix	9%	9%	15%	5%	11%
Western AZ	0%*	0%	39%*	0%	12%
Total	2%	5%	4%	7%	

* Categories with fewer than five properties.

In addition to the data presented in Exhibit 10, we examined the difference in vacancy rates for properties closer and farther from major roads, as grouped into three bins: properties within a half mile, a half mile to one mile, and greater than one mile from a major road. Based on this analysis, we did not identify a systematic relationship between vacancy rates and property distance from a major road.¹⁶

Exhibit 11 shows historical vacancy rates across market areas from 2008 to 2019. Because these historical data are from the CoStar Market Analytics™ module, they differ somewhat from the data snapshot in Exhibit 10, which is based on the CoStar Property™ data. Western AZ is excluded from Exhibit 11 due to a small sample of properties. The vacancy rate in the South Coast AQMD jurisdiction is consistently among the lowest throughout the timeframe, while the Phoenix market tends to have the highest vacancy rate.

¹⁶ We do note the average vacancy rate for retail fulfillment properties located between one and five miles from a major road is much higher outside the District (25 percent) than in the District (five percent). This difference is driven entirely by properties within the Phoenix market.

EXHIBIT 11. HISTORICAL VACANCY RATES ACROSS MARKETS - 2008-2019.

We also compare vacancy rates with the percentage of property for sale across the markets. To avoid double counting, when a property is both vacant and for sale, we include it only in the for-sale category. Due to this, the vacancy rates shown in Exhibit 12 are slightly lower than those listed in Exhibit 10. For the most part, the share of property area listed for rent exceeds the percentage for sale, with the exception of the East of District, Desert Areas and North of District, Coastal markets.

EXHIBIT 12. VACANCY AND FOR SALE RATES ACROSS MARKETS - YEAR 2019

Net Absorption

To provide insights on the direction of each market, we also examine net absorption for warehouse space, defined as the total amount of space tenants moved into in a given time period less the amount of space tenants vacated during the same time period. Exhibit 13 shows annual net absorption as a share of total capacity has been positive and, for the most part, growing in both the South Coast AQMD jurisdiction and outlying markets since 2010.¹⁷ Annual net absorption values in square feet are presented in Exhibit 14 for 2000 through 2019 for each market area. The non-District total line represents the sum of all outlying market net absorption, both positive and negative.

EXHIBIT 13. NET ABSORPTION AS A PERCENT OF OVERALL CAPACITY - 2010-PRESENT

Note: Due to data limitations, the Non-District total does not include net absorption totals for the Coastal Areas and Western AZ markets prior to 2007 and 2008, respectively.

¹⁷ The net absorption and historical rents (Exhibit 17) analyses rely on the same outputs from the CoStar Market Analytics™ module. While the historical rents analysis relies on slightly revised market areas (defined in that section) due to incomplete data, the net absorption analysis uses the same market area geographies as defined in Exhibit 1-A and used elsewhere in this memo.

EXHIBIT 14. ANNUAL NET ABSORPTION ACROSS MARKETS - 2000-2019

Note: Due to data limitations, not all market areas have net absorption data extending back to 2000.

Based on the data shown in Exhibit 14, the South Coast AQMD, Phoenix and Las Vegas markets have steadily increased total occupied space year over year since 2009. The other outlying markets have less obvious growth patterns, with annual net absorption hovering around zero. At two points, in 2012 and 2017, growth in net absorption in the South Coast AQMD jurisdiction slowed relative to the prior years. Reduced net absorption growth in 2017 in the South Coast AQMD jurisdiction, however, is offset with an increase in non-District growth, particularly in the Phoenix and Las Vegas markets. This provides suggestive evidence that warehousing activity may shift between the South Coast AQMD jurisdiction and these outlying areas.

Exhibit 15 examines this activity from 2016 to the present in quarterly timesteps. Time periods such as Q4 2016, Q1 2017, Q4 2017, Q2 2018, and Q1 2019 indicate dips in the growth of South Coast AQMD tenant occupancy directly coincide with increases in the Phoenix and Las Vegas markets' net absorption. Conversely, growth in net absorption in the South Coast AQMD jurisdiction in Q2 2016, Q2 2017, Q1 2018, Q3 2018, and Q2 2019 align with reduced growth in the non-District markets.

For the most part, non-District growth appears to be focused in the Phoenix and Las Vegas markets, though in some instances Bakersfield (Q2 2018) and Desert Areas (Q3 2019) see spikes in net absorption coinciding with declines in net absorption the South Coast AQMD jurisdiction. In recent years, the quarterly data indicate all markets do not see simultaneous increases or decreases in growth of tenant absorption. Tenant absorption instead appears to shift, a finding not captured as clearly in the annual data in Exhibit 14. Whether this reflects actual competition between markets or other factors, such as differences in the typical leasing calendar across geographies, is unclear.

EXHIBIT 15. RECENT QUARTERLY NET ABSORPTION ACROSS MARKETS, 2016-PRESENT

Pricing

Our assessment of the pricing for warehousing space in the South Coast AQMD jurisdiction and outlying areas considered both monthly rental prices and sale prices, focusing on properties with a building area of at least 100,000 square feet. For rental prices in each area, we calculated the average monthly triple net rent values for the advertised rent per square foot as reported in the CoStar data.¹⁸ The data has available rents for 212 properties, or six percent of the total 3,613 warehousing properties greater than 100,000 square feet and fitting the other criteria for the sample of properties.

We used values reported in the CoStar data to calculate the average sale price per square foot. We limited our scope to sales that occurred from 2017 to the present to avoid underestimating this value due to appreciation in property values over time. We dropped the lowest and highest five percent of sales prices that occurred within this timeframe to avoid outliers due to coding errors or sales intentionally below market value (e.g., transfers of property between members of the same family). This resulted in a sales data sample of 338 properties, or nine percent of the total 3,613 warehousing properties greater than 100,000 square feet and fitting the other criteria for the sample of properties. Exhibit 16-A tabulates the rental and sale price per square foot across markets. Exhibit 16-B illustrates the differences in monthly rent across market area.

At an average of \$0.88 per square foot per month, the South Coast AQMD market overall has a higher rental price per square foot than its neighboring markets, with the exception

¹⁸ CoStar reports triple net rent values, which exclude property taxes, building maintenance, and insurance premiums. On a triple net lease, these expenses are typically paid by the tenant in addition to rent.

of San Diego. This is driven by high prices in the Orange County and Los Angeles sub-markets, as rent in the Inland Empire is lower than in the other South Coast AQMD sub-markets. The Desert Areas and Coastal Santa Barbara, Ventura and San Luis Obispo (North of District, Coastal) follow closely behind the District average. Western Arizona, Bakersfield, and Phoenix have the lowest prices of \$0.44 and below.¹⁹

Sale prices follow a similar trend to rental prices, with higher prices in urban areas. The non-District average is much lower than the South Coast AQMD value, which is more than three times higher at \$1,087 per square foot.

EXHIBIT 16-A. MONTHLY RENT AND SALE PRICES ACROSS MARKETS FOR WAREHOUSES WITH BUILDING AREA OF AT LEAST 100,000 SQUARE FEET - YEAR 2019

MARKET	AVERAGE RENTAL PRICE PER SQUARE FOOT	AVERAGE SALE PRICE PER SQUARE FOOT
South Coast AQMD Average	\$0.88	\$1,087
Orange County	\$0.92	\$503
Inland Empire	\$0.70	\$1,164
Los Angeles	\$0.93	\$1,173
Non-District Average	\$0.58	\$344
North of District, Coastal	\$0.78	\$100
North of District, Bakersfield^	\$0.34	\$105
East of District, Desert Areas*^	\$0.81	\$27
South of District, San Diego	\$0.92	\$225
Las Vegas	\$0.63	\$574
Phoenix	\$0.44	\$307
Western AZ*^	\$0.32	No Data
Grand Average	\$0.71	\$815

*Denotes fewer than five properties with available sales data.

^Denotes fewer than five properties with available rent data.

¹⁹ Small sample size is an issue in calculating average rent and sale price by market area. The average rents for the North of District, Bakersfield, East of District, Desert Areas, and Western AZ markets all rely on five or fewer properties in the calculation of these values. For average sale price, East of District, Desert Areas has fewer than five properties with data, while the Western AZ has no data. Focusing on the Non-District Average values in Exhibit 16 avoids this issue.

EXHIBIT 16-B. MONTHLY RENT AND SALE PRICES ACROSS MARKETS FOR WAREHOUSES WITH BUILDING AREA OF AT LEAST 100,000 SQUARE FEET - YEAR 2019

We also examined recent historical rents across the geographic markets. In order to examine these prices, we relied on data from the CoStar Analytics™ module’s quarterly reporting filtered for Industrial properties greater than 100,000 square feet. The markets defined in this tool differ slightly from those we define for the purposes of this analysis, in that they at times follow county lines while ours account for South Coast AQMD’s more idiosyncratic jurisdictional boundaries. Additionally, for some areas data are not available in this module. We describe below the resulting altered markets and any methods we used to reconcile the differences with the markets used in Exhibit 16 and elsewhere in this memo.

- **North of District, Bakersfield:** Data is not available for the portion of Los Angeles County located outside of the District. We use historical rent data for Kern County, which accounts for 84.0 percent of the current existing square footage considered in this analysis.
- **East of District, Desert Areas:** Data is available at the county level for both Imperial County and the non-District portions of Riverside and San Bernardino Counties. We calculate weighted average historical rents by applying the current share of property square footage for Imperial County (19.3 percent) and the non-District portions of Riverside and San Bernardino counties (80.7 percent).
- **North of District, Coastal:** The historical rent we estimate for this area is the weighted average of rents for San Luis Obispo and Santa Barbara counties. CoStar Analytics™ data are not available for Ventura County. Taken together, San Luis Obispo and Santa Barbara counties account for just 20.5 percent of the total relevant square footage in the North of District, Coastal market considered elsewhere in this document.
- **South of District, San Diego; Las Vegas; and Phoenix:** These markets, following county lines and with available data, are unchanged from those considered elsewhere in this document.

- **Western AZ:** Of the four counties included in the Western Arizona area examined elsewhere in this document, Yuma County, which contains 52.9 percent of the relevant properties considered in this market, is the only county for which historical rent data are available.

The pricing information in Exhibit 16 above reflects the 2019 snapshot of CoStar's property-level data filtered according to the criteria described earlier in this document.

Because CoStar's historical data does not allow for filtering by secondary type, the historical rent data for all properties are classified as Industrial (i.e., not only those with secondary categorizations of Distribution, Light Distribution, Refrigeration/Cold Storage, Truck Terminal, or Warehouse). Additionally, historical rent data is restricted to properties greater than 100,00 square feet. This difference results in discrepancies relative to the 2019 pricing information gathered from the property data.

Exhibit 17 shows the average monthly triple net rent price for each of the adapted markets described above at the end of the stated year. Following a dip in rents related to the 2008 financial crisis, we see prices steadily rise across markets, in most cases beginning in 2012. Similar to what we see above in the property data snapshot, prices are highest in California's coastal markets. Inland urban and rural markets form a second pricing tier significantly lower than the coastal markets.

EXHIBIT 17. RECENT HISTORICAL MONTHLY RENT PRICES ACROSS MARKETS - 2000-2019 (RENTAL PRICE PER SQUARE FOOT, 2019\$²⁰)

MARKET	2000	2002	2004	2006	2008	2010	2012	2014	2016	2018	2019
South Coast AQMD Jurisdiction	\$0.55	\$0.55	\$0.55	\$0.56	\$0.57	\$0.45	\$0.49	\$0.56	\$0.59	\$0.68	\$0.80
North of District, Coastal Areas					\$0.71	\$0.60	\$0.55	\$0.52	\$0.46	\$0.63	\$0.63
North of District, Bakersfield					\$0.38	\$0.28	\$0.28	\$0.33	\$0.35	\$0.43	\$0.45
East of District, Desert Areas						\$0.51	\$0.30	\$0.31	\$0.35	\$0.39	\$0.36
South of District, San Diego	\$0.79	\$0.74	\$0.81	\$0.84	\$0.84	\$0.68	\$0.70	\$0.67	\$0.76	\$0.87	\$0.92
Las Vegas				\$0.57	\$0.73	\$0.51	\$0.47	\$0.48	\$0.54	\$0.50	\$0.57
Phoenix					\$0.51	\$0.41	\$0.39	\$0.40	\$0.44	\$0.45	
Western AZ					\$0.55	\$0.43	\$0.25	\$0.34	\$0.39	\$0.37	\$0.35

Note:

- Due to data limitations, historical rents are not reported for some market areas.
- Historical values are adjusted to 2019 dollars. See footnote 14 for indexing information.

Parcels

In order to capture the potential for future warehouse development, we assessed land parcels in the CoStar data tagged with CoStar's Industrial categorization. We limited our search to parcels located less than two miles from a major road and organized the parcels according to the classes in Exhibit 4 based on area, assuming a land parcel will be at a minimum twice as large in area as the building's square footage.²¹ The resulting parcel size categories are 200,000 to 400,000 square feet, 400,000 to one million square feet, and parcels greater than one million square feet. We also examined the feasibility of grouping parcels according to their access or proximity to electric and water infrastructure, but such information was not available from CoStar or other data sources we consulted.

²⁰ We use annual gross domestic product implicit price deflators to inflate prices to the current dollar year (2019). These values were obtained from the Federal Reserve Bank of St. Louis Economic Research Division (FRED) and are indexed to 2012 (2012 = 100.00). The values are as follow: 2000=78.08, 2002=81.05, 2004=84.78, 2006=90.07, 2008=94.29, 2010=96.11, 2012=100.00, 2014=103.64, 2016=105.80, 2018=110.42, 2019=112.35.

²¹ We arrive at this assumption from calculating the average ratio of rentable building area to land area for both District and non-District markets. For District properties this ratio was much higher, at 0.54, relative to 0.42 for non-District properties. We use a broader population of buildings to calculate this ratio than those included in this analysis.

Exhibits 18 and 19 show the number of properties and estimated building square footage that could be constructed for each of the parcel categories specified in the previous paragraph across the various markets. To estimate building square footage, we applied the average ratios of building area to land area in the South Coast AQMD and non-District markets, 0.54 and 0.42 respectively. Multiplying these values by parcel land area gave an estimate of potential building area. Exhibit 18 shows the number of parcels available while Exhibit 19 shows the square footage of parcels available.

EXHIBIT 18. NUMBER OF PROPERTIES ZONED FOR INDUSTRIAL DEVELOPMENT - YEAR 2019

EXHIBIT 19. SQUARE FOOTAGE OF PROPERTIES PROPOSED, UNDER CONSTRUCTION, AND POTENTIAL BUILDING AREA OF PROPERTIES ZONED FOR INDUSTRIAL DEVELOPMENT - YEAR 2019

Exhibit 18 reveals a variety of property sizes spread across the various markets, while Exhibit 19 shows most of the total land area located in properties over one million square feet. Eventual parcel development could involve subdividing parcels or developing multiple smaller warehouse facilities on one larger parcel.

MARKET TRENDS

In this section we use current property data as well as the forecast data included with CoStar Analytics™ to identify both medium- and long-term estimates of available capacity for warehousing operations. The long-term forecast estimates capacity additions and additional remaining development potential through 2028. The medium-term forecast considers capacity availability either available now or likely available within the next five years (assuming a five-year window for project approvals and construction). These estimates allow us to compare the projected capacity available in the non-South Coast AQMD areas to existing and projected inventory inside the South Coast AQMD jurisdiction. These forecasts are not available by individual warehouse type, as CoStar's forecast data do not differentiate between differently sized properties.

Medium-term capacity forecast

To generate a medium-term capacity forecast, we examine current vacant capacity and new capacity proposed or currently under construction. Exhibit 20 shows that most of the medium-term capacity available in the South Coast AQMD is in the Inland Empire, while most of the non-South Coast AQMD medium-term capacity is in the Phoenix; East of District, Desert Areas; Las Vegas; and North of District, Bakersfield markets.

EXHIBIT 20. CURRENT VACANCIES, CAPACITY UNDER CONSTRUCTION AND PROPOSED CAPACITY - YEAR 2019

Exhibit 21 compares the medium-term forecast introduced in Exhibit 20 to existing warehousing real estate capacity. As shown in the exhibit, current vacancies, new property under construction, and proposed construction are fairly limited relative to the current warehouse stock. The non-South Coast AQMD total of approximately 67 million square feet is only 10.1 percent of the size of the current District capacity: 662 million

square feet. This indicates that in the medium term, the outlying real estate markets have the potential to absorb only a small piece of current South Coast AQMD warehousing operations.

EXHIBIT 21. COMPARISON OF MEDIUM-TERM AVAILABILITY FORECAST WITH CURRENT 2019 INVENTORY

Long-term capacity forecast

For a long-term forecast of available warehousing space, we identify two key metrics: expected developments and projected “slack” capacity. Expected developments are those projected under the CoStar real estate forecast associated with CoStar’s Base Case economic scenario. The base case forecast reflects Moody’s Analytics “Baseline” Scenario from July 2018, which assumes a conservative average 1.2 million job additions per year. The forecast applies the future economic estimates to the real estate market, which we limit to properties classified by CoStar as Industrial and falling under the Logistics secondary category.²²

As with the information on historical rents, the CoStar forecasts of expected developments are, in many cases, based on different geographic markets than those we define above. Though CoStar’s forecast areas are based on county boundaries, they do not always align with our market areas. This is largely due to the irregular boundary of the South Coast AQMD region. We reconcile these differences through the following methods,²³ which differ across our markets:

²² CoStar’s secondary classifications in their forecast tools are different than those used in the normal property data. It is not possible to narrow down to Warehouse, Refrigeration/Cold Storage, etc.

²³ Note that these methods are similar to those described for Exhibit 17 and the associated discussion on historical rents.

- ***District Markets:*** The CoStar forecast includes projections for all of Los Angeles County and the Inland Empire (i.e., all of Riverside and San Bernardino counties). We use the current snapshot of the relevant property data to determine the share of projected developments in Los Angeles, Riverside and San Bernardino counties located within and outside of the South Coast AQMD jurisdiction. We multiply those percentages by CoStar's estimated growth in properties for each of those counties, then sum the relevant portions within the South Coast AQMD jurisdiction to obtain the total for each of the Los Angeles and Inland Empire markets' projected developments. As mentioned below, Orange County's projections did not need any additional modifications.
- ***North of District, Bakersfield:*** This area includes the non-District portion of Los Angeles County as well as all of Kern County. Building on the approach described above for the South Coast AQMD markets, we use the remaining share of projected capacity growth in the Los Angeles County market added to the projection for Kern County.
- ***East of District, Desert Areas:*** This area includes the non-South Coast AQMD portions of Riverside and San Bernardino counties as well as Imperial County. Building on the approach described above, we use the remaining share of projected capacity growth in Riverside and San Bernardino counties not included in the South Coast AQMD jurisdiction. The CoStar projections, however, do not include data for Imperial County. In the absence of such data, we apply the forecasted ten-year growth rate for Riverside and San Bernardino counties to the existing stock in Imperial County, then sum the properties in the three counties to obtain an estimate for the whole East of District, Desert Areas market.
- ***North of District, Coastal:*** CoStar's forecast includes data for San Luis Obispo and Santa Barbara counties, but not Ventura County. We apply the average growth rate across the included two counties to Ventura County's current capacity, then sum across all three counties to obtain an estimate for the whole Coastal market.
- ***Western Arizona:*** Data are available only for Yuma County, but CoStar forecasts zero developments over the 2018-2028 time period in the base case scenario. We apply this growth rate of zero percent to Yavapai, La Paz, and Mohave counties, expecting no growth in capacity in the next ten years.
- The remaining markets (Orange County, San Diego, Las Vegas, Phoenix) all use the same forecast markets as our analysis, so no reconciliation is necessary.

Based on this spatial reconciliation between the CoStar forecasts and the market areas we defined for this analysis, Exhibit 22 shows expected warehousing real estate capacity developments. Because these forecasts do not distinguish between properties of different sizes, we multiply the values by the proportion of property stock greater than 100,000 square feet to estimate the share of developments relevant to warehouses considered in this analysis.²⁴ Developments in the South Coast AQMD market exceed those elsewhere,

²⁴ This ratio is 0.67 for the South Coast AQMD and 0.58 for the non-South Coast AQMD market areas, calculated as the share of warehousing square footage associated with properties greater than 100,000 square feet. This ratio is based on the scope

while the vast majority of non-South Coast AQMD developments are expected in the Phoenix and Las Vegas markets.

EXHIBIT 22. EXPECTED INDUSTRIAL-LOGISTICS DEVELOPMENTS, 2019-2028

Projected slack capacity reflects parcels available for development (as measured at present) as well as projected vacancies. However, because at least a portion of projected vacancies may be on parcels developed in the next several years, summing parcels available with vacancies would lead to overestimation of the total capacity available. To account for this we net out expected developments from the estimated parcels available. Based on this adjustment, we specify projected slack capacity as follows:²⁵

$$S = [(P_i - F) * C_{iw}] + V$$

Where S is slack capacity (square feet);

P_i is the total area of land parcels currently available for industrial development (square feet);

F is the land area required to meet forecasted development of industrial land parcels (square feet);

of all properties we have access to via the CoStar database, which is limited to properties greater than 25,000 square feet. The forecasted property additions are with respect to all property sizes, but we expect the share attributable to properties smaller than 25,000 square feet to be small.

²⁵ This specification of slack capacity is similar but not identical to the long-term measure in the statement of work (SOW), which defines capacity as projected vacancies plus land available for the construction of warehousing facilities. For the reasons described here, the measure in the SOW likely overstates capacity because it does not account for the fact that some projected vacancies may be new construction on parcels now available for construction.

C_{iw} is the building area to land area ratio, as specified above (0.54 for properties in the South Coast AQMD jurisdiction, and 0.42 for non-District properties); and V is projected vacancies (square feet).

This equation, in effect, specifies slack capacity as the parcels expected to be undeveloped without an ISR plus projected vacancies. In applying this equation, we restrict again our search of available vacant land parcels to those larger than 200,000 square feet and those located less than two miles from a major road.

Exhibit 23 shows projected slack capacity, which we calculate following the same reconciliation of the markets' differing geography as above. Projected slack capacity, which may be interpreted as projected vacancies plus potential additional developments not currently forecasted, is approximately three times larger in the non-South Coast AQMD markets than in the South Coast AQMD market. Slack capacity in the South Coast AQMD market, however, is higher than in any single non-District market.

While the projected developments shown in Exhibit 22 reflect additions to total capacity, we expect most of this capacity to be filled in accordance with the base case economic scenario. For this reason, the estimates of slack capacity shown in Exhibit 23 are a more appropriate measure of the capacity available or developable over the next ten years than the projected developments shown in Exhibit 22.

EXHIBIT 23. ESTIMATED SQUARE FOOTAGE OF PROJECTED SLACK CAPACITY, 2028

Similar to Exhibit 21's comparison of the medium-term forecast of capacity additions with existing capacity, Exhibits 24 and 25 compare the long-term forecast's metrics with current capacity.

Forecasted developments in the non-South Coast AQMD markets represent approximately one-eighth of current South Coast AQMD capacity, while forecasted developments within the South Coast AQMD jurisdiction are expected to be almost twice as large over the same ten-year time period. Non-South Coast AQMD slack capacity, on the other hand, is over twice as large than current South Coast AQMD capacity. The Las Vegas and Western AZ markets combined have enough slack capacity to theoretically absorb approximately all current warehousing operations in the South Coast AQMD jurisdiction, while the much closer East of District, Desert Areas and North of District, Bakersfield markets each have slack capacity larger than one-half of current warehousing capacity in the South Coast AQMD jurisdiction.

Because mass departures from the South Coast AQMD jurisdiction's warehousing capacity would inevitably drive down prices, we do not expect a largescale development of slack capacity to absorb all warehousing operations in the South Coast AQMD market. It is also unrealistic that all slack capacity would be developed specifically for warehousing capacity, as the Industrial property classification also includes other types of potential developments.

Overall, the comparisons in Exhibits 24 and 25 show projected developments alone would be insufficient to absorb a large portion of the warehouse space in the South Coast AQMD jurisdiction and any mass relocation would require significant warehouse development on currently vacant parcels. In addition, many vacant land parcels available for development may also need utility infrastructure improvements.

EXHIBIT 24. COMPARISON OF EXPECTED DEVELOPMENTS THROUGH 2028 WITH CURRENT INVENTORY

EXHIBIT 25. COMPARISON OF ESTIMATED SLACK CAPACITY IN 2028 WITH CURRENT INVENTORY

CONCLUSIONS

The analysis presented above provides several important insights related to the warehousing real estate markets in the South Coast AQMD jurisdiction and neighboring areas. Focusing on the potential for warehousing operations in the South Coast AQMD jurisdiction to relocate to neighboring areas, the main conclusions we draw from this analysis include the following:

- The market for warehousing within the South Coast AQMD jurisdiction is significantly larger than any of the surrounding market areas considered in this analysis. The South Coast AQMD jurisdiction currently has nearly three times as much warehousing capacity as the outlying markets, with 662 million square feet in the South Coast AQMD jurisdiction versus 226 million square feet across all outlying markets combined. In the last ten years, warehousing capacity additions within the South Coast AQMD jurisdiction are over two times the size of additions in all surrounding market areas combined.
- The outsized demand for warehousing capacity within the South Coast AQMD jurisdiction is despite significantly higher property prices. Rental prices per square foot are on average 34 percent lower in the non-South Coast AQMD markets than within the South Coast AQMD jurisdiction. Of the outlying markets, prices are highest in urban areas and lower outside of California.
- Annual net absorption tends to be much larger within the South Coast AQMD jurisdiction than the surrounding market areas, though the rates are similar when adjusted based on the share of total warehousing capacity. Based on the comparison of net absorption across markets, it appears changes in the growth in warehousing in the South Coast AQMD jurisdiction coincides with changes to growth in the opposite direction in the outlying markets. On at least one occasion,

the Phoenix and Las Vegas markets appear to have absorbed more warehousing growth when growth in the sector declined in the South Coast AQMD jurisdiction. This could suggest a willingness on the part of new or relocating warehouse operators to choose outlying areas over the South Coast AQMD jurisdiction, despite the locational advantages of the latter. We note, however, that the decline in net absorption in the South Coast AQMD jurisdiction (in 2017) may coincide with the increase in the Phoenix and Las Vegas markets due to several factors that we were unable to account for in this analysis (e.g., differential growth rates in state or city economies).

- Because the total warehousing capacity in the South Coast AQMD jurisdiction so exceeds available capacity in the surrounding market areas, additional developments would be necessary to absorb a significant amount of potential warehouse relocations from the South Coast AQMD. With the exception of the North of District, Coastal and Phoenix markets, the potential for significant warehousing capacity developments from vacant land parcels exists in the South Coast AQMD jurisdiction and outlying markets. The non-South Coast AQMD total for estimated potential capacity on undeveloped parcels is more than two times the amount in the South Coast AQMD jurisdiction, at over 1,500 million square feet.
- Focusing on our metric of medium-term capacity, current vacancies and near-term capacity additions are more than 25 percent larger in the South Coast AQMD jurisdiction than in outlying markets. The vast majority of non-South Coast AQMD near-term capacity is located in the Phoenix and Desert Areas markets. Total non-South Coast AQMD medium-term capacity developments represent less than 15 percent of current capacity in the South Coast AQMD jurisdiction.
- With respect to long-term capacity, forecasted capacity additions in the next ten years are around 150 million square feet in the South Coast AQMD jurisdiction and 80 million square feet across outlying markets. While total forecasted capacity additions are highest in the South Coast AQMD jurisdiction, the ten-year forecasted growth rate is higher outside of the South Coast AQMD jurisdiction. The potential for additional development and absorption, or “slack capacity,” is over twice as large in the non-District markets as current capacity in the South Coast AQMD jurisdiction. Thus, in the long term, any significant shifts in warehousing operations from the South Coast AQMD jurisdiction to outlying areas will require much greater warehouse development than is currently expected.

TECHNICAL MEMORANDUM ON TRUCK FLEETS THAT SERVE WAREHOUSES IN SCAQMD JURISDICTION

MEMORANDUM | 12 DECEMBER 2020

TO Ian MacMillan, Paul Stroik, Shah Dabirian, and Victor Juan, South Coast Air Quality Management District (SCAQMD)

CC Jason Price, Industrial Economics (IEc)

FROM Jasna Tomic and Kelly Leathers, CALSTART

SUBJECT Technical Memorandum on Truck Fleets that Serve Warehouses in South Coast AQMD Jurisdiction

INTRODUCTION This memorandum is in support of the South Coast Air Quality Management District (South Coast AQMD) staff's development of a potential indirect source rule (ISR) to reduce mobile source emissions related to the operation of logistics and warehousing facilities in the South Coast AQMD's four-county jurisdiction (Los Angeles, Orange, Riverside, and San Bernardino counties, as shown in Exhibit 1).¹ The purpose of this document is to develop a better understanding of the fleets that serve the logistics and warehousing sector in the South Coast AQMD jurisdiction.

In the first part of this document we review the characteristics of fleets serving the Ports of Los Angeles and Long Beach, the four counties that make up the South Coast AQMD jurisdiction, and the broader ten-county Southern California region. The second portion of this document provides insights on fleet characteristics and operations, as obtained from CALSTART interviews with industry stakeholders.

EXHIBIT 1: SOUTH COAST AQMD JURISDICTION

¹ The South Coast AQMD jurisdiction is comprised of all of Orange County and parts of Los Angeles, Riverside, and San Bernardino Counties. The area is presented in Figure 1.

TRUCK FLEET CHARACTERISTICS

In this section, we present summary data on the characteristics of fleets potentially affected by the ISR. We conduct this analysis for three categories of fleets at different spatial levels. We first examine fleets with access to the Ports of Los Angeles and Long Beach. We then expand the coverage of our assessment to include fleets in the four counties that make up the South Coast AQMD jurisdiction.² Finally, we assess the characteristics of fleets in California more broadly.

DATA SOURCES

In order to describe truck fleets and identify the number of trucks that operate in the region, we principally relied on IHS Automotive data from 2018 as well as data from the San Pedro Bay Ports (Port Drayage Truck Registry). The IHS database includes a record of trucks registered with the California Department of Motor Vehicles (DMV). Trucks that operate in California, however, can be registered in other states and operate under the International Registration Plan (IRP), which allows for interstate operation. These trucks are not included in the IHS database but may be important for understanding fleets operating in California, especially for larger companies that have a national presence. At the state level, we therefore examine both DMV registration data and IRP data, as reported in the California Vehicle Inventory and Use Survey (CA VIUS).

POPULATION OF TRUCKS SERVING THE SAN PEDRO BAY PORTS

SAN PEDRO BAY PORTS

We start with analysis of the Port Drayage Truck Registry, which includes the trucks registered to have access to the Ports of Los Angeles and Long Beach, collectively known as the San Pedro Bay Ports. These are generally Class 7 and 8 trucks. Exhibit 2 below presents the total number of trucks in the Port Drayage Truck Registry and the average number of active trucks per month at the San Pedro Bay Ports over the last three years. Exhibit 3 contains the total number of fleets as well as the number of small (less than 6 trucks), medium (6-10 trucks), and large fleets (more than 10 trucks).

EXHIBIT 2: NUMBER OF TRUCKS THAT ACCESS THE SAN PEDRO BAY PORTS

	2020	2019	2018
No. Trucks	18,556	18,280	18,188
Average Active Trucks Per Month	13,080	13,139	12,737

Source: Port Drayage Truck Registry, 2020.

EXHIBIT 3: NUMBER AND SIZE OF FLEETS ACCESSING SAN PEDRO BAY PORTS

	2020	2019	2018
Fleets	2,348	2,162	1,985
Small Fleets (<6 trucks)	1,006	949	854
Medium Fleets (6-10 trucks)	408	363	348
Large Fleets (>10 trucks)	943	850	783

Source: Port Drayage Truck Registry, 2020.

² This includes fleets in all of Los Angeles, Riverside, and San Bernardino Counties, including portions of these counties not located in the South Coast AQMD jurisdiction.

The number of trucks in the Port Truck Registry has been steadily increasing over the last three years from 18,188 in 2018 to 18,556 in 2020. The number of average active trucks per month has increased as well. The small drop in 2020 (which included data through September 2020) may have been caused by the drop in goods movement from the ports during the COVID-19 pandemic. The second observation with respect to the size of the fleets is that, as of 2020, the largest proportion, or 43 percent, are small fleets, followed by 40 percent large fleets, and only 17 percent of medium-size fleets.

We analyzed the age of the trucks currently accessing the ports. Exhibit 4 shows the distribution of trucks by model year. Overall, 38 percent of trucks are MY 2010 or older, another 39 percent are MY 2011-2015, and 23 percent are MY 2016-2021.

EXHIBIT 4: AGE DISTRIBUTION OF TRUCKS ACCESSING THE SAN PEDRO BAY PORTS

Source: Port Drayage Truck Registry, 2020

POPULATION OF TRUCKS IN THE SOUTH COAST AQMD COUNTIES

TRUCK POPULATION IN LOS ANGELES, ORANGE, RIVERSIDE, AND SAN BERNARDINO COUNTIES

In this section we analyze the number of trucks in the four counties that make up the South Coast AQMD jurisdiction – Los Angeles (LA), Orange (OR), Riverside (RV), and San Bernardino (SB) Counties³. We relied on IHS Markit data which include registrations from the California Department of Motor Vehicles (DMV). Exhibit 5 summarizes these data by vehicle class (Class 3 – Class 8) and by vocation.

³ These data include the full area of these four counties.

EXHIBIT 5: POPULATION OF TRUCKS BY CLASS IN LA, OR, RV, AND SB COUNTIES

TRUCK VOCATION	CLASS 8	CLASS 7	CLASS 6	CLASS 5	CLASS 4	CLASS 3	TOTAL
Long Haul Truck	63,299	1,550	0	0	0	0	64,849
Regional Truck	44,598	12,901	33,598	10,541	17,238	29,631	148,507
Drayage Truck	27,527	702	206	14	8	13	28,470
Terminal Tractor	794	86	0	0	0	0	880
Step Van	0	32	8,677	3,254	4,668	706	17,337
Cargo Van	0	0	0	0	0	5,439	5,439
Total	136,218	15,271	42,481	13,809	21,914	35,789	265,482

Source: IHS Automotive MD and HD Vehicle Data, 2018.

It should be noted that the vocation assignments in Exhibit 5 were made using codes available in the IHS Markit database and additional descriptions of the truck models. This approach introduces some uncertainty into the characterization of the truck population due to overlapping codes. One example is the relatively small number of drayage trucks observed as Class 3 trucks. Normally drayage trucks are only Class 7 and 8 trucks.

Drawing on the IHS data, Exhibits 6 and 7 include the distribution of the trucks by type and class owned by individuals and larger fleets respectively. In 2018 there were more than 265,000 trucks registered in LA, OR, RV, and SB counties, with 36 percent of those belonging to individuals and the remainder to larger fleets. The largest proportion of trucks (more than 50 percent) is Class 8 for both individual owners and for larger fleets.

EXHIBIT 6: NUMBER OF TRUCKS IN LA, OR, RV, AND SB COUNTIES OWNED BY INDIVIDUALS (OWNER-OPERATORS)

Truck Vocation	Class 8	Class 7	Class 6	Class 5	Class 4	Class 3	Total
Long Haul Truck	18,990	564	0	0	0	0	19,554
Regional Truck	21,492	3,635	9,271	2,976	5,780	15,491	58,645
Drayage Truck	11,839	184	115	0	1	11	12,150
Terminal Tractor	50	7	0	0	0	0	57
Step Van	0	14	327	306	1,630	55	2,332
Cargo Van	0	0	0	0	0	3,259	3,259
Total	52,371	4,404	9,713	3,282	7,411	18,816	95,997

Source: IHS Automotive MD and HD Vehicle Data, 2018.

EXHIBIT 7: NUMBER OF TRUCKS IN LA, OR, RV, AND SB COUNTIES OWNED BY LARGER FLEETS

TRUCK VOCATION	CLASS 8	CLASS 7	CLASS 6	CLASS 5	CLASS 4	CLASS 3	TOTAL
Long Haul Truck	44,309	986	0	0	0	0	45,295
Regional Truck	23,106	9,266	24,327	7,565	11,458	14,140	89,862
Drayage Truck	15,688	518	91	14	7	2	16,320
Terminal Tractor	744	79	0	0	0	0	823
Step Van	0	18	8,350	2,948	3,038	651	15,005
Cargo Van	0	0	0	0	0	2,180	2,180
Total	83,847	10,867	32,768	10,527	14,503	16,973	169,485

Source: IHS Automotive MD and HD Vehicle Data, 2018.

We also analyzed truck ages, in years, and fuel types across the four counties that make up the South Coast AQMD jurisdiction. The age distribution of trucks in this area is presented in Exhibit 8 and 9. Exhibit 8 shows these data for Class 3-8 trucks, whereas Exhibit 9 focuses exclusively on Class 8. This age distribution represents a broader universe of trucks than the age distribution shown in Exhibit 4, which focuses only on trucks serving the San Pedro Bay Ports.⁴ As shown in Exhibits 8 and 9, long haul and drayage trucks seem relatively younger compared to regional delivery trucks. The exhibits also show that drayage trucks in the area are less than 13 years old. This reflects the prohibition against pre-2007 trucks at the San Pedro Bay Ports.

EXHIBIT 8: AGE DISTRIBUTION OF TRUCKS IN LA, OR, RV, AND SB COUNTIES

Source: IHS Automotive MD and HD Vehicle Data, 2018.

⁴ This is observable in Exhibit 8 through drayage trucks being at most 12 years old.

EXHIBIT 9: AGE DISTRIBUTION OF CLASS 8 TRUCKS IN LA, OR, RV, AND SB COUNTIES

Source: IHS Automotive MD and HD Vehicle Data, 2018.

Exhibit 10 shows the distribution of trucks across fuel types for each truck vocation - the data is also available in Appendix C. The dominant fuel type is diesel (84 percent) followed by gasoline (13 percent); all other alternative fuels add up to approximately 3 percent.

EXHIBIT 10: FUEL TYPES IN THE TRUCK POPULATION IN LA, OR, RV, AND SB COUNTIES

**POPULATION OF
TRUCKS IN
GREATER
SOUTHERN
CALIFORNIA**

TRUCK POPULATION IN THE GREATER SOUTHERN CALIFORNIA REGION

In this section we analyze and discuss the population of trucks in the ten counties making up the greater Southern California region. We conducted this analysis to include trucks domiciled and registered in the counties outside the South Coast AQMD jurisdiction but serve warehouse and distribution centers there. The ten counties include:

- Imperial
- Kern
- Los Angeles
- Orange
- Riverside
- San Bernardino
- San Diego
- San Luis Obispo
- Santa Barbara
- Ventura

Exhibit 11 presents the number of trucks by vocation and class size for the greater Southern California region. Overall, the total number of trucks in the region is approximately 31 percent greater than the corresponding population for LA, OR, RV, AND SB counties. The distribution among the different classes and different vocations however is very much the same, with Class 8 as the largest truck class.

EXHIBIT 11: POPULATION OF CALIFORNIA-REGISTERED TRUCKS BY CLASS AND VOCATION IN THE GREATER SOUTHERN CALIFORNIA REGION

TRUCK VOCATION	CLASS 8	CLASS 7	CLASS 6	CLASS 5	CLASS 4	CLASS 3	TOTAL
Long Haul Truck	86,048	2,249	0	0	0	0	88,297
Regional Truck	60,362	18,195	43,429	13,076	21,616	39,972	196,650
Drayage Truck	33,776	836	281	23	14	17	34,947
Terminal Tractor	818	93	0	0	0	0	911
Step Van	0	43	9,031	3,569	5,678	754	19,075
Cargo Van	0	0	0	0	0	8,151	8,151
Total	181,004	21,416	52,741	16,668	27,308	48,894	348,031

Source: IHS Automotive MD and HD Vehicle Data, 2018.

DMV AND IRP DATA

The analysis above relies on IHS Markit data based on California DMV registrations. These data, however, do not include other trucks that operate in the state. To obtain a more comprehensive view of trucks operating in California, we compiled data from the most recent (2018) California Vehicle Inventory and Use Survey (CA VIUS), which includes both DMV data and data from the International Registration Plan (IRP), the latter of which captures trucks registered outside California. Exhibit 12 includes the number of trucks operating in California that are in the DMV or IRP data.

EXHIBIT 12: NUMBER OF TRUCKS BY CLASS IN DMV AND IRP IN CALIFORNIA⁵

Class	DMV	IRP, NON-CALIFORNIA REGISTRATIONS	Total
Class 3	69,723	5,129	74,852
Class 4	47,505	2,167	49,672
Class 5	44,914	6,655	51,569
Class 6	73,170	10,644	83,814
Class 7	44,822	18,707	63,530
Class 8	192,297	243,965	436,261
Total	472,431	287,267	759,698

Source: California Vehicle Inventory and Use Survey, Volume I Truck Survey, 2018.

The total number of trucks reported by the CA VIUS truck survey for 2018 was just below 760,000. The majority of these trucks were identified in the DMV data for all truck classes, with the exception of Class 8. For Class 8 the number of IRP trucks is larger than DMV trucks. This is an important finding, as it indicates the DMV numbers for Class 8 trucks likely undercount the number of active Class 8 trucks operating in the state and potentially the South Coast AQMD jurisdiction.

STAKEHOLDER INTERVIEWS To gather additional information on the fleets serving warehouses in the South Coast AQMD jurisdiction, we conducted a series of structured interviews of various fleet owners and operators. This section details the process for identifying industry stakeholder contacts, the questions designed to obtain relevant information, and the input provided by stakeholders.

IDENTIFICATION OF FLEET STAKEHOLDERS

South Coast AQMD and CALSTART first developed a list of fleet stakeholder contacts as interview candidates. The warehousing and logistics industry is a complicated and multifaceted industry with diverse stakeholders. To ensure our understanding of fleet stakeholder priorities reflected this diversity, we specified three classifications of stakeholders to interview. These categories included (1) organizations that operate both truck fleets and warehouse facilities, (2) organizations that operate fleets only, (3) and organizations that operate warehouse facilities but not the fleets that serve those facilities. Exhibit 13 includes additional details on the fleets and facilities operated by the stakeholders interviewed.

⁵ California Vehicle Inventory and Use Survey, Volume I Truck Survey, Cambridge Systematics (2018).

EXHIBIT 13: INTERVIEWEE CLASSIFICATIONS

STAKEHOLDER INTERVIEWEE NUMBER	CATEGORY	FACILITY TYPE OPERATED	FLEET OPERATIONS
1	Fleet & Facility	General Purpose Warehouse	Drayage
2	Fleet & Facility	General Purpose Distribution Center	Regional Delivery Final Mile
3	Fleet & Facility	Truck Terminal LTL	Drayage, LTL, Over the Road
4	Fleet & Facility	Cold Storage	Regional Delivery Final Mile
5	Fleet & Facility	Cold Storage	Final Mile
6	Fleet & Facility	Transload	Drayage Regional delivery
7	Fleet & Facility	Crossdock Transload	Drayage
8	Fleet & Facility	Retail Fulfillment Center	Final mile logistics provider
9	Fleet	-	Drayage, mail
10	Fleet	-	Regional Delivery
11	Facility only	General Purpose Warehouse	-

DEVELOPMENT OF INTERVIEW QUESTIONS

The interview questions were developed with collaboration between CALSTART, IEC, and South Coast AQMD (see Appendix B). After the questions were completed, we contacted individual stakeholders via e-mail and/or phone to schedule interviews with the willing participants. The interview process consisted of a 30- to 60-minute conversation depending on the engagement of the interviewee.

FINDINGS FROM INTERVIEWS

Based on the interviews conducted, we describe the characteristics and operations of fleets that serve each of the warehouse categories previously described in CALSTART's Technical Memorandum on the Warehousing and Logistics Industry in the South Coast Air Quality Management District jurisdiction.⁶ Exhibit 14 summarizes these findings.

⁶ "Technical Memorandum on Warehousing and Logistics Industry in the South Coast Air Quality Management District Jurisdiction", prepared by Jasna Tomic and Kelly Leathers, CALSTART, for the South Coast Air Quality Management District, November 30, 2020.

EXHIBIT 14: FLEET CHARACTERISTICS AND OPERATIONS AT DIFFERENT WAREHOUSE FACILITIES

WAREHOUSE CATEGORY	FLEET CHARACTERISTICS AND OPERATIONS
General Purpose Warehouse (GPW)	Mostly Class 7 and 8 trucks that are either drayage or LTL. The drayage trucks operations are 50-100 miles per day with 4 stops. LTL operations make ~10 stops per day and serve warehouse and distribution centers across the region.
Transload Facility	The fleets at a transload facility are involved in drayage and regional delivery operations. Freight is moved into the facility in the morning by rail and the outbound operations start in the afternoon. The facility has about 50-60 Class 8 vehicles entering the facility each day. The fleet serves multiple types of locations throughout the region including, truck/container yards, distribution centers, crossdock transload facilities, and railroads. The vehicles serving the ports only log about 13,000 - 14,000 miles per year due to the proximity to the ports. These trucks make about 8 trips per day.
Crossdock Transload Facility	Exclusively served by Class 8 with 53 ft trailers. Freight leaving the facility goes to distribution centers, other crossdock facilities, and warehouses. Like the transload facility, outbound freight is taken in the morning and bound freight is brought in the evening and sorted. Congestion is a significant issue at these facilities and is addressed by requiring strict appointment times for pick-up and drop-offs. One of the interviewed fleets serving these facilities is involved in regional delivery, specifically final mile logistic operations. This fleet reports approximately 120-180 miles per day with 13-20 pickup locations.
Truck Terminals for Less-Than-Truckload Trucks (LTL)	Primarily a Class 8 LTL fleet which moves goods between drayage and other distribution centers in the region. Outbound freight leaves in the morning, and trucks return in the afternoon with all inbound freight. That freight is then broken down and organized based on the final destination. Daytime truck operations range from 50 to 200 miles. At night the trucks are used for longer haul. These facilities also have yard tractors and forklifts.
General Purpose Distribution Center	It is difficult to generalize the fleet operations at these facilities as they are serviced by many types of fleets. These distribution centers handle many types of products and goods coming from multiple companies. The fleets servicing these facilities are performing regional delivery, drayage, last mile delivery, and over-the-road operations. Trucks move product between the ports, other distribution centers, crossdock transload facilities, and warehouses.
Retail Fulfillment Center	These facilities are serviced by many types of fleets as well. The fleets interviewed move freight from LTL facilities where the product is broken down and then taken to retail fulfillment centers. From the fulfillment center, fleets also conduct last mile delivery using Class 4-6 trucks.
Cold Storage Facilities	Operate Class 5 - 8 trucks all equipped with truck refrigeration units (TRUs). These trucks drive about 150 miles per day making stops between the cold storage facility and final customers such as restaurants and grocery stores. The trucks make 10-15 stops on the route. Some deliveries are made to other cold storage facilities in the region as well. TRUs operate in the yard about 3 hours each day.

WAREHOUSE CATEGORY	FLEET CHARACTERISTICS AND OPERATIONS
Parcel Hubs	Fleet performs regional delivery operations, driving about 300-400 miles per day using Class 8 trucks. Each vehicle makes about 4-6 stops per day between the parcel hub and general-purpose warehouses. One interviewed fleet operator fuels its alternative fuel trucks (CNG) at an offsite fueling station.

In general, goods are delivered to warehouse facilities by Class 8 tractors by different fleets. Some of the vehicles may belong to the facility itself while others belong to fleets that the facility does not directly control. Verification of the vehicle, order, and trailer occurs at the point of entry. The carrier that delivers is sometimes known, but not always. Carriers that pick-up goods are always known in advance. The vehicle make and model are generally not tracked at entry. However, as most scheduling is done through brokerage firms, the brokerage firm does verify the vehicle requirements, for example, that the truck is pre-approved for Smart Way, satisfies emission standards, etc.

The types of trucks that depart from warehouse facilities varies depending on the facility type, and goods may leave on Class 8 or 7 trucks for regional delivery or smaller medium-duty Class 4-6 trucks. Trucks used by the fleet operators interviewed are primarily fueled by diesel and gasoline, with some fleets reporting a small proportion of CNG fueled trucks. In addition to the trucks, yard tractors, forklifts, and pallet jacks operate at warehouse facilities. Forklifts are often fueled by propane and are being replaced by electric units more recently. Similarly, few of the interviewees mentioned that they have or are obtaining electric yard tractors to replace the diesel units. Electric yard tractors have been commercially available since 2013. Information on available models can be found from the Clean Off-road Voucher Incentive Project (CORE).⁷

TRANSFORMING INDUSTRY TRENDS

As part of the interviews, we asked interviewees questions about trends that affect their operations and the industry more broadly, as well as how they might respond to the Indirect Source Rule when it is implemented.

Several interviewees mentioned a trend toward fleets using smaller trucks that will make more frequent deliveries to big box stores. This is a change from tractor trailers making big deliveries to multiple stores per trip. Relying on smaller trucks for more deliveries seems to be a response to customers wanting faster and more frequent deliveries.

The rise of e-commerce has increased both daily shipping requirements and the number of locations to which goods are shipped. Lead time is being changed by the e-commerce business. In the past, products may have stayed on warehouse shelves for a few weeks prior to delivery. Now product is arriving and leaving the facility within a few days. One interviewee described it as the effect of the “Amazon’s conveyor system” – product coming in and being loaded on the truck rapidly after arriving. Relatedly, companies are looking for smaller facilities in metropolitan areas because they do not need a significant

⁷ Eligible Equipment Catalog, Clean Off-road Voucher Incentive Project, CORE, 2020.
<https://californiacore.org/resources/#Equipment>

amount of space for storage, and they want to be closer to the customers. Most final mile providers are looking for “cross-dock scenarios” where the residence time of the freight at the facility is short.

Interviewees’ responses varied when asked about relocating their operations outside of the Southern California region. Some interviewees cited over-regulation and its effect on cost as reasons they might consider relocating, but none have considered it seriously. Interviewees whose customers are located in Southern California have not considered leaving. Drayage fleets are concerned with cargo being rerouted through other ports if the cost of operation at the San Pedro Bay Ports become sufficiently high to motivate companies to ship their goods to different ports.

We asked specifically about ISR and whether they would invest in WAIRE points (Warehouse Actions & Investments to Reduce Emissions) or pay the mitigation fee.⁸ In response to this question, fleets indicated that they were concerned with the upfront cost of earning WAIRE points. A few, however, indicated they already have been investing in some of the menu items. Overall, responses on questions regarding the ISR suggest that larger firms are working on sustainability planning across their warehouse and fleet operations, or that firms (or BCOs) are passing on their sustainability goals to the fleets with whom they work and are collaborating to achieve these goals.

⁸ WAIRE points are based on the menu-based system and proposed regulatory concept. See the draft ISR rule text dated 6 October 2020.

APPENDIX B- INTERVIEW QUESTIONS

Questions for Fleet and Facility Industry Stakeholders

Background

Please read the following to every interviewee

We are working with the South Coast AQMD on a project focused on the warehousing and logistics industry. As part of this effort, we would like to obtain background information on the operations of fleets and how they interact with the warehousing sector in LA, Orange, San Bernardino, and Riverside Counties.

If prompted:* South Coast AQMD has asked us to collect this information to inform the creation of a potential Indirect Source Rule. The rule development effort is ongoing, and we do not have information on what the eventual provisions of the rule will be. *

***From here, please read the appropriate set of questions for each type of interviewee. ***

Questions for Warehouse Operators that Operate Their Own Fleets

- 1. Please describe the general operations at your facility.**
 - a. What types of cargo do you typically deal with?
 - b. How many off-road vehicles and what type are you operating at the facility?
 - c. Can you estimate the number of vehicles entering and exiting the facility each day?
 - d. Describe the vehicles entering and exiting by **type** (i.e. tractor trailer/step van)/class (i.e. 4-8)/**size** (GVWR)/**vocation** (i.e. regional delivery/drayage/LTL)
 - e. How long do vehicles typically stay at the facility?
- 2. What is the typical process for vehicles entering and exiting the facility?**
 - a. What information do you collect about vehicles entering and exiting the facility (i.e. vehicle type, fuel technology, model, US DOT, CA, MC #s, VIN, truck model, truck year)
 - b. What sort of freight or trailer number verification is conducted at the gate when entering/exiting?
 - c. What method do you use to track the number of vehicles visiting your facility (inbound and outbound)? What is the typical daily number of vehicles?
 - d. Do you operate multiple facility types? If so, how do the number of vehicles vary based on facility?
 - i. Is this process different based on the facility type? If so, please describe some differences.
 - e. Do trucks need to be part of a truck registry to enter the facility? (i.e. Drayage Truck Registry OR TRUCRS)
 - f. What is the cost for the truck logging/tracking program?
- 3. Can you describe your fleet based on the following criteria?**
 - a. Total number of vehicles in fleet
 - b. Describe your fleet's vehicles by **type** (i.e. tractor trailer/step van)/class (i.e. 4-8)/**size** (GVWR)/**vocation** (i.e. regional delivery/drayage/LTL)
 - c. Average age of truck in fleet (and range oldest to newest)?
 - d. Vehicle technology (diesel, NG, other fuel or technology and % each). If it's a mix, what is the approximate distribution across technologies?
- 4. Information and data**
 - a. Is your fleet equipped with telematics? If so, what is the product's name?

- b. Do you use geofencing? If so, what is the product's name?
 - c. How do you track mileage and fuel use?
 - d. What is the typical lifetime of your vehicles? (i.e. miles and years)
 - e. What is the cost for this logging/tracking program?
- 5. Do you lease or own the vehicles in your fleet?**
- a. What percentage is leased vs. owned? If leasing, how long are the typical leases?
 - b. What are the benefits of leasing vs. owning?
 - c. Do you have sustainability goals/plans? Please explain.
 - d. Have you researched into the possibility of electric fleets and/or charging and refueling stations?
 - e. If you operator forklifts or yard hostlers, what percentage are fossil fuel vs. electric? Are any of these fossil fuel vehicles operating indoors?
- 6. Which of the following would best describe your fleet's operations?**
- a. Regional Delivery
 - b. Drayage
 - c. Less than Truckload
 - d. Over the Road
 - e. Other (please explain)
- 7. Are all the vehicles registered in California?**
- a. If not, where are they registered?
- 8. Which of the following warehousing facilities does your fleet typically service? And, what characteristics of your fleet makes it suitable to serve this specific type of facility?**
- a. Distributions center
 - b. Cross-dock facility
 - c. Transload facility
 - d. General Purpose Warehouse
 - e. Truck Terminal for Less than Truckload Trucks
 - f. Retail Fulfillment Center
 - g. Storage or Cold Storage
- 9. Please describe a vehicle's typical daily operations.**
- a. Vehicle class (i.e. Class 4-8)
 - b. Number of miles per day
 - c. Number of destinations per day
- 10. What region does your fleet typically serve?**
- a. Do the fleets go to multiple locations in a day to deliver goods?
 - b. Does the facility provide or recommend any particular route?
- 11. What percentage of your fleet is carrying inbound vs. outbound freight from warehousing facilities in the region?**
- 12. What are your most common types of customers?**
- a. Please describe your relationship with your customers (i.e. long-term contracts, short term contracts)
- 13. Have you ever considered relocating outside the urban LA, OC, Riverside, or San Bernardino Counties?**
- a. If so, what prompted your consideration? (Possible answer could be operational changes, warehousing cost, business expansion, etc.)

- b. *** If mentioning cost as a reason*** Do you have an idea of the cost threshold that would lead you to consider moving to warehouses outside the urban LA, OC, Riverside, or San Bernardino Counties?
 - c. What are the principle constraints on relocation?
 - d. Have you thought about putting community benefit measures in place, in terms of air pollution?
- 14. Can you name some trends affecting the trucking industry?**
- a. What is affecting operations in the region?
 - b. In the next 5-10 years, what do you see on the horizon that will affect your operations?
 - c. Any obstacles your company is facing?
 - d. Any new requirements customers are asking for?
- 15. How will you respond to the indirect source rule when it is implemented?**
- a. Invest in menu items to upgrade your facility or pay the mitigation fee?

Exclusively Fleet Operator Questions

1. **Can you describe your fleet based on the following criteria? (all vehicles operating under your interchange)**
 - a. Total number of vehicles in fleet
 - b. Describe your fleet's vehicles by **type** (i.e. tractor trailer/step van)/class (i.e. 4-8)/**size** (GVWR)/**vocation** (i.e. regional delivery/drayage/LTL)
 - c. Average age of truck in fleet (and range oldest to newest)?
 - d. Vehicle technology (diesel, NG, other fuel or technology and % each). If it's a mix, what is the approximate distribution across technologies?
 - e. If operating alternative fuel vehicles, how are you fueling them?
 - f. If you operator forklifts or yard hostlers, what percentage are fossil fuel vs. electric? Are any of these fossil fuel vehicles operating indoors?
2. **Which of the following would best describe your fleet's operations?**
 - a. Regional Delivery
 - b. Drayage
 - c. Less than Truckload
 - d. Over the Road
 - e. Other (please explain)
3. **Please describe a vehicle's typical daily operations by vehicle class.**
 - a. Number of miles per day
 - b. Number of stops per day
 - c. Number of miles per year?
 - d. How does that relate to your type of operations?
 - e. Is this fixed?
4. **Which of the following warehousing facilities does your fleet typically service? And, what characteristics of your fleet make it suitable to serve this specific type of facility?**
 - a. Truck/container yard
 - b. Distribution Center
 - c. Cross-dock facility
 - d. Transload facility
 - e. General Purpose Warehouse
 - f. Truck Terminal for Less than Truckload Trucks

- g. Retail Fulfillment Center
- h. Storage or Cold Storage
- 5. **What region does your fleet typically serve?**
 - a. Do the fleets go to multiple locations in a day to deliver goods?
- 6. **What types of moves does your fleets do? (Import vs export, % of each)**
- 7. **What are your most common types of customers?**
 - a. Describe the types of customers your fleet serves (i.e. direct customers, freight forwarders, railroad carrier, ocean carrier, long-term contracts, short term contracts)
 - b. Describe your fleet's relationship with its customers (term contract or spot rate)
- 8. **Information and data**
 - a. Is your fleet equipped with telematics? If so, what is the product's name?
 - b. Do you use geofencing? If so, what is the product's name?
 - c. How do you track mileage and fuel use?
 - d. If charging /fueling is available at the warehouse, how long do trucks usually stay?
 - e. What is the typical lifetime of your vehicles? (i.e. miles and years)
 - f. Can you provide the cost for the logging/tracking program?
- 9. **Do you lease or own the vehicles in your fleet?**
 - a. What percentage is leased vs. owned? If leasing, how long are the typical leases?
 - b. What are the benefits of leasing vs. owning?
 - c. Do you have sustainability goals/plans? Please explain.
 - d. Have you researched into the possibility of electrifying your fleet?
- 10. **Are all the vehicles registered in California?**
 - a. If not, where are they registered and why?
- 11. **Can you name some trends affecting the trucking industry?**
 - a. What is affecting operations in the region?
 - b. In the next 5-10 years, what do you see on the horizon that will affect your operations?
 - c. Do you plan on adopting alternative fuel vehicles? If so, what fuel(s)? Why? How do you plan on fueling them?
 - d. Any obstacles your company is facing?
 - e. Any new requirements customers are asking for?
- 12. **How would you respond if warehouses try to get fleets to use clean trucks for at least a portion of their trips to/from warehouses in the District?**

Exclusively Facility Operator Questions

- 1. **Which category best describes your facility?**
 - a. Distributions center
 - b. Cross-dock facility
 - c. Transload facility
 - d. General Purpose Warehouse
 - e. Truck Terminal for Less than Truckload Trucks
 - f. Retail Fulfillment Center
 - g. Storage or Cold Storage
- 2. **Please describe the general operations at your facility.**
 - a. What is the typical process for vehicles entering and exiting the facility? What types of cargo do you typically deal with?

- b. Can you estimate the number of vehicles entering and exiting the facility each day? What classifications of trucks?
 - c. How long do vehicles typically stay at the facility?
- 3. What is the number of off-road vehicles at the facility and the type? (i.e. yard tractor, forklift)**
 - a. If you operator forklifts or yard hostlers, what percentage are fossil fuel vs. electric? Are any of these fossil fuel vehicles operating indoors?
- 4. What is the typical process for vehicles entering and exiting the facility?**
 - a. What information do you collect about vehicles entering and exiting the facility (i.e. vehicle type, fuel technology, model)?
 - b. What sort of freight verification is conducted at the gate when entering/exiting vehicles?
 - c. Is this process different based on the facility type? If so, please describe some differences.
 - d. Do trucks need to be part of a truck registry to enter the facility? (i.e. Drayage Truck Registry OR TRUCRS)
- 5. Do you have longer-term relationships or contracts with the fleets serving your facility?**
- 6. Do you know if all the fleets/vehicles are registered in California?**
 - a. If not, where are they registered?
- 7. Have you ever considered relocating outside the urban LA, OC, Riverside, or San Bernardino Counties?**
 - a. If so, what prompted your consideration? (Possible answer could be operational changes, warehousing cost, business expansion, etc.)
 - b. *** If mentioning cost as a reason*** Do you have an idea of the cost threshold that would lead you to consider moving to warehouses outside the urban LA, OC, Riverside, or San Bernardino Counties?
 - c. What are the principle constraints on relocation?
 - d. Have you thought about putting community benefit measures in place, in terms of air pollution?
- 8. Can you name some trends in the trucking industry? What's effecting operations in the region? In the next 5-10 years, what do you see on the horizon that will affect your operations?**
 - a. Any obstacles your company is facing?
 - b. Any requirements customers are asking for?
- 9. How will you respond to the indirect source rule when it is implemented?**
 - a. Invest in menu items to upgrade your facility or pay the mitigation fee?

ATTACHMENT 4

INDIRECT SOURCE RULE RELOCATION MODEL - METHODOLOGY

MEMORANDUM | 12 DECEMBER 2020

TO Victor Juan, Shah Dabirian, Paul Stroik, and Ian MacMillan; South Coast Air Quality Management District

FROM Derek Ehrnschwender, Jason Price & Nick Manderlink, IEc

SUBJECT Indirect Source Rule Relocation Model – Methodology

INTRODUCTION

This memorandum is in support of South Coast AQMD staff's development of a potential indirect source rule (ISR) to reduce mobile source emissions related to the operation of warehouses and distribution centers in the South Coast AQMD's four-county region (Los Angeles, Orange, Riverside, and San Bernardino counties).¹ Diesel truck traffic, largely related to the transport of goods passing through the Ports of Los Angeles and Long Beach and regional warehouses and distribution centers, makes up a large share of local NO_x emissions. A warehouse ISR, if adopted, may help with reducing emissions from trucks servicing warehousing facilities located within its jurisdiction.

Compliance costs to the warehousing sector could vary depending on the design of an eventual rule. If these costs are significant, the implementation of an ISR could potentially precipitate the relocation of warehousing operations outside the region—with the associated truck fleets continuing to travel to and from facilities in the South Coast AQMD jurisdiction. In the worst case scenario, the associated air quality benefits from such a rule might be greatly diminished. Accordingly, South Coast AQMD is interested in identifying and understanding the factors affecting whether warehousing operations are likely to relocate as a result of the potential rule.

Consistent with this objective, Industrial Economics, Inc. (IEc) developed a model that estimates the number of warehouse operations likely to relocate outside the South Coast AQMD jurisdiction as a result of the ISR. For a given warehouse, this model weighs the costs of ISR compliance against the costs of relocation. Based on the lesser of these two costs and on the availability of warehouse space in other market areas, the model simulates the decision-making process related to relocation at the warehouse level. The analysis considers potential warehouse relocation to seven alternative market areas outside the South Coast AQMD jurisdiction in California, Nevada, and Arizona.

This memo is organized into three general sections. First we discuss the relocation decision-making process as represented in the model. Second we outline the estimation of costs associated with ISR compliance if warehouse operations choose to remain within the South Coast AQMD jurisdiction. And third we introduce the various costs associated

¹ The South Coast AQMD jurisdiction is comprised of all of Orange County and parts of Los Angeles, Riverside and San Bernardino Counties. The region is mapped and described in full in Exhibit 1 and the "Geographic Scope" section below.

with potential warehouse relocation, including both relocation to existing vacant properties and the development of new warehousing stock. While changes in transportation costs associated with relocation are a key element of these costs, we also account for a variety of other cost changes, including changes in rent, energy costs, labor costs, development fees (for new warehouse developments only), and the cost of moving.

OVERVIEW OF APPROACH FOR MODELING RELOCATION DECISIONS

To estimate the number of warehouses likely to relocate outside the South Coast AQMD jurisdiction as a result of the ISR, we compare the costs of relocation for a given warehouse with the costs of complying with the ISR and remaining in the South Coast AQMD jurisdiction. We assume a warehouse will relocate to an outlying market area if two conditions are met:

1. **Cost condition:** The annualized costs associated with relocating to at least one outlying market area are less than the annualized costs of ISR compliance,² and
2. **Capacity condition:** In at least one of the market areas in which a warehouse would realize a cost savings relative to ISR compliance, sufficient capacity exists (measured in square footage of available warehouse space) to absorb the warehouse operation in question.

We model the relocation decision based on these conditions for all warehouses affected by the rule, with two exceptions: cold storage warehouses and warehouses at manufacturing facilities. For these facilities, decisions regarding relocation are likely to differ from the decision-making process for more conventional warehouse facilities. Both of these facility types have specialized equipment that would be more costly to move. In addition, the pool of buildings to which these facilities could relocate may differ from the buildings that conventional warehouses would consider.

To determine whether the cost condition is met for a given warehouse, we consider ISR compliance costs for varying levels of stringency and the full costs associated with relocation to an outlying market area. Relocation costs include the following:

- changes in transportation costs;
- changes in rental costs for warehouse space;
- changes in labor costs;
- changes in electricity costs;
- moving costs; and
- development fees (applicable only for construction of new warehouse space in outlying markets).

² Our approach for assessing potential warehouse relocations considers potential changes in costs but not potential changes in revenues. Warehouse operations that relocate outside the South Coast AQMD jurisdiction might be able to pursue new revenue opportunities, but may also experience revenue losses if cargo owners prefer to work with warehouses in the South Coast AQMD jurisdiction. In addition, any pass through of increased costs associated with relocation would also affect revenues. Given the uncertainty related to all of these factors, our approach does not consider potential changes in revenues.

We conduct the analysis based on ISR compliance costs and relocation costs annualized over 20 years, using four percent and one percent discount rates.³ We assume all costs are ultimately borne by warehouse operators.

To determine whether the capacity condition described above is met, we rely on capacity data for each outlying market as obtained from CoStar. In addition, to ensure the analysis does not over commit capacity in the outlying markets (i.e., project relocations in an outlying market in excess of the capacity available prior to ISR implementation), our analysis simulates relocation decisions one warehouse at a time and updates the estimated capacity available in each outlying market based on these individual decisions. Thus, the capacity available to the 100th warehouse examined reflects the relocation decisions of the first 99 warehouses.

Recognizing the complexity of the logistics industry and the uncertainty inherent in several key aspects of our analysis, we designed the analysis to generate low-end and high-end estimates of warehouse relocations. Specifically, our low-end and high-end estimates capture two sources of uncertainty.

The first uncertainty relates to the routing of goods through the South Coast AQMD jurisdiction. Although information is available on the aggregate distribution of goods across different routings through the South Coast AQMD jurisdiction, information on which warehouses serve which routes is not available. To account for this uncertainty, we conduct the analysis under two sets of routing assumptions (hereafter referred to as pathway scenarios):

1. ***Composite pathway scenario:*** Under this scenario, each individual warehouse is assumed to be representative of the warehousing sector in the South Coast AQMD jurisdiction as a whole, in terms of the goods routes (pathways) served. For example, if a given pathway accounts for five percent of the goods flow volume passing through the South Coast AQMD jurisdiction, five percent of the truck traffic through each individual warehouse is assumed to be on this pathway. Under this scenario, the change in transport distance associated with relocation to a given outlying market area is the same for all warehouses.
2. ***Specialized pathway sensitivity scenario:*** This scenario allows for the possibility that individual warehouses may specialize in pathways or serve a more limited number of pathways. Because we lack information on the specific pathway(s) a given warehouse is likely to serve, this scenario involves a series of iterative “what if” analyses. For nearly each iteration of the analysis, we assume all warehouses are on the same pathway. After running the analysis for each individual pathway, we calculate the weighted average of the resulting warehouse relocation estimates, using the goods volumes associated with each pathway as weights. Weighting by the goods volumes associated with each pathway ensures that the warehouse space projected to relocate for a given iteration does not

³ We annualize costs to put them on a consistent temporal basis, given that some costs are annual and other costs are one-time expenditures. We chose a 20-year timeframe to minimize the annualized value of any one-time costs associated with relocation and ensure we do not overestimate relocation costs and underestimate the number of relocations.

exceed the amount of warehouse space that actually serves the pathway in question.⁴

The second source of uncertainty reflected in our low-end and high-end estimates is the capacity of outlying market areas to absorb warehouse space from the South Coast AQMD jurisdiction. Although information is available on the vacant capacity in each outlying market and new warehouse developments that have been approved, additional warehouses *could* be developed on undeveloped parcels of land zoned for industrial development. The degree to which such development will occur is uncertain. To account for this uncertainty, we conduct the relocation analysis under two capacity scenarios:

1. **Medium-term capacity scenario:** Under this scenario, capacity available for relocation is limited to capacity projected to be available in the medium term. This includes current vacant capacity and new capacity proposed or currently under construction in the outlying market areas. This scenario assumes no new construction of warehouse space beyond what is already planned in the outlying market areas. It provides a reasonable representation of capacity until such time that new capacity developments can obtain approval and complete construction. This scenario specifies the lower-bound estimate of warehouse capacity in outlying markets.
2. **Slack capacity scenario:** This scenario reflects a more expansive view of the capacity that would be available for relocation. Such capacity includes projected warehouse vacancies as well as the warehouse space that could fit on all land that is (1) zoned for industrial development in the outlying market areas and (2) is within 2 miles of a major road. This measure of capacity represents an upper-bound estimate of warehouse capacity in outlying markets.

We estimate the square footage of warehouse space likely to relocate from the South Coast AQMD jurisdiction for each pathway and capacity scenario based on the methods summarized above. We convert this estimate to an estimated number of warehouses based on the average square footage per warehouse.

ISR COMPLIANCE COSTS

For the purposes of estimating the number of warehouse relocations, we rely on estimates of ISR compliance costs per square foot as provided by South Coast AQMD staff. As described in the 6 October 2020 draft rule text released to the public, the ISR will give warehouse operators flexibility in how they meet the requirements of the rule. Specifically, warehouse operators may choose from combinations of multiple emission reduction measures identified in the ISR or pay a mitigation fee that will finance efforts within the South Coast AQMD jurisdiction to reducing trucking-related NO_x emissions.

Due to the flexibility afforded by the ISR, the compliance strategy that would be implemented by a given warehouse is highly uncertain and would likely depend on warehouse-specific factors that we are not able to account for in this analysis. Such

⁴ For example assume that all 2,518 warehouses modeled in this analysis are projected to relocate when examining a given pathway but that this pathway accounts for 1 percent of the goods flow. Under our approach, this pathway's contribution to the expected number of relocated warehouses is $2,518 \times 1$ percent, or 25 warehouses.

factors may include the physical configuration of a warehouse, space available for electric vehicle charging infrastructure onsite, or whether the warehouse operator owns its own fleet of trucks.

Due to our inability to account for these and other site-specific factors that may influence compliance decisions, we analyze compliance-cost scenarios specified as an annual cost per square foot of warehouse space. These values, which ranged from \$0 per square foot to \$2 per square foot, were provided to IEc by South Coast AQMD staff.

RELOCATION COSTS

As described above, the costs associated with relocation include (1) changes in transportation costs, (2) changes in rent, (3) changes in labor costs, (4) changes in electricity costs, (5) moving costs, and (6) development fees (when relocation involves the construction of new warehouse space). We describe our approach to estimating each of these costs in the following sections.

TRANSPORTATION COSTS

This analysis estimates the average increase in transportation costs for a warehouse relocating to each of the seven outlying market areas in Southern California, Southern Nevada, and Western Arizona described in our technical memo on regional warehouse real estate markets.⁵

The first step in this process is to estimate the increased distance per truck trip associated with relocating to each outlying market area. We then translate these increases in distance to increases in costs per truck trip. To obtain a *per-warehouse* expected increase in trucking costs, the increased cost per truck trip is applied to the expected number of truck trips for a warehouse, based on estimates of the number of truck trips per thousand square feet of warehouse area and the square footage of individual warehouses.

Because increased trucking distances may reduce the distance freight is shipped via rail (e.g., if warehouses sorting goods bound for distribution in the Eastern U.S. relocate to Arizona, those goods will be loaded for rail transport closer to their final destination than had they loaded in the L.A. area), our approach accounts for the reduction in rail shipment costs associated with warehouse relocation.

To estimate the change in transport distance, we rely on published data characterizing the flow of goods through the South Coast AQMD jurisdiction based on origin and destination pairs. These data include information on the following:

- The directional flow of goods through the South Coast AQMD jurisdiction (e.g., imports arriving at the San Pedro Bay Ports bound for national distribution versus

⁵ Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Jurisdiction, prepared by Derek Ehrnschwender and Jason Price, Industrial Economics, for South Coast AQMD. December 12, 2020.

goods shipped into the South Coast AQMD jurisdiction for consumption by local households);⁶ and

- Goods flow pathways, or routing, for goods entering the United States through the Port of Los Angeles (POLA) and the Port of Long Beach (POLB). These pathways outline the share of goods visiting different types of warehouses in different locations within the South Coast AQMD jurisdiction before heading to their final destinations.⁷

For each pathway, we consider an alternate pathway with warehouse relocation from the South Coast AQMD jurisdiction to an outlying market area. While these pathways are specific to imports, we adapt them to characterize the flow of other goods transported through the South Coast AQMD jurisdiction.

We perform the same exercise for each pathway considering warehouse relocation to each of the outlying market areas. The transportation cost impacts associated with relocation depend on the pathway(s) a given warehouse serves. Some warehouses may serve a few pathways, while others serve several. In the absence of information on the pathway(s) associated with a given warehouse, we estimate the transportation cost impacts of warehouse relocation under two pathway scenarios: one in which each warehouse is assumed to serve all pathways and a second in which we examine relocation one pathway at a time and calculate the weighted average of the pathway-specific results.

The methodology presented here is designed to estimate the incremental change in travel costs resulting from the average warehouse's relocation. This estimate reflects the current warehouse environment and does not account for potential future trends in port use for imports or exports or changes in the final destination for goods entering the South Coast AQMD jurisdiction. As pointed out by a recent analysis by the POLA and POLB, more national distributors may begin to favor a "four corners" supply-chain strategy, increasing the share of goods entering the South Coast AQMD jurisdiction that are consumed locally or regionally.⁸ This effect could alter the share of goods ascribed to each goods pathway, as discussed later in this memo.

Change in Trucking Distance

The estimated change in trucking distance is central to understanding the transportation cost implications of relocating warehouses from the South Coast AQMD jurisdiction to the outlying market areas. We estimate the change in trucking distance based on two data sources: the U.S. Bureau of Transportation Statistics Commodity Flow Survey and a goods flow pathways analysis published by Robert Leachman at the University of California, Berkeley. We describe our use of these data sources below.

⁶ Together, the Port of Los Angeles and the Port of Long Beach are referred to as the ports of the San Pedro Bay.

⁷ These warehouse classifications are based on warehouse size and building categorization, as detailed in Exhibit 3 of: Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Jurisdiction, prepared by Derek Ehrnschwender and Jason Price, Industrial Economics, for South Coast AQMD. December 12, 2020.

⁸ Port of Long Beach & Port of Los Angeles. 2019. "Economic Study for the Clean Truck Fund Rate."

U.S. Bureau of Transportation Statistics Commodity Flow Survey (CFS): The CFS includes multimodal freight flow data for shipments of goods within the U.S. We use the CFS to characterize (1) goods that originate in the South Coast AQMD jurisdiction and are transported outside the South Coast AQMD jurisdiction or to buyers within the South Coast AQMD jurisdiction and (2) goods that originate elsewhere but also travel through the South Coast AQMD jurisdiction.

Exhibit 1 defines these goods flow categories, according to their origin and destination, and the relative size of each category. To derive the size of each goods flow category shown in Exhibit 1, we relied on CFS data for retail, wholesale, and warehousing industries.⁹

The CFS data does not include a clear identifier for imported goods. Also, based on the CFS documentation, the data does not capture imports until they are shipped onward from the importer's initial domestic location. This suggests any imports reflected in the CFS would show a domestic location as the point of origin. To estimate the import volume separate from goods produced in the South Coast AQMD jurisdiction, we obtained the ratio of imports to exports, 1.97 for 2015, from the Los Angeles Almanac and multiplied it by the export-related tonnage derived from the CFS data.¹⁰

A key uncertainty with estimating import tonnage in addition to the captured CFS goods flows is whether the resulting import tonnage estimated is already reflected in the CFS (with a LA/Long Beach Metro area origin). While the CFS documentation suggests this is the case, the import estimate we derived would account for 94 percent of the tonnage of goods in the CFS originating from the LA/Long Beach metro area (i.e. that import tonnage would account for 94 percent of all tonnage flowing from the South Coast AQMD jurisdiction).¹¹ Given the size of the LA metro area economy, this value seems unrealistically high. We suspect some imports may not be captured by the CFS until their arrival in a different location. To address this issue, we have treated the derived import tonnage as additive with the CFS data.¹²

Of the six goods flow categories shown in Exhibit 1, we consider potential changes in distance for three. Specifically, we examine potential changes in transport distance for imports, goods produced in the South Coast AQMD jurisdiction and consumed locally, and goods produced in the South Coast AQMD jurisdiction and bound for national distribution.

We assume goods bound for export, regardless of whether produced inside the South Coast AQMD jurisdiction or at national origin points are shipped directly to transload and cross-dock warehouses located in the port vicinity for packing into marine containers.

⁹ A broader query of the CFS data across more industries would capture many shipments unlikely to rely on warehouses.

¹⁰ "Waterborne Freight Tonnage in California Ports," (2015) The Los Angeles Almanac.

¹¹ While the South Coast AQMD jurisdiction and the L.A./Long Beach metropolitan area are not perfect matches, limitations in the CFS data require using the metro area as a proxy for the jurisdiction.

¹² We also conducted a sensitivity analysis in which we assumed the imports were fully reflective in the CFS data. Under this assumption the average change in trucking distance associated with warehouse relocation is approximately seven percent higher across the outlying market areas than presented in this document.

These warehouses, due to their location and function, are unlikely to relocate due to a potential ISR.

While it is possible goods bound for export may be sent to other warehouses in the South Coast AQMD jurisdiction prior to transload or cross-dock warehouses, the Southern California Association of Governments (SCAG) warehousing report notes limited warehousing capacity devoted to managing exports relative to imports (approximately one-tenth of total port-related warehousing space, despite the fact that the ratio of import to export tonnage is roughly two-to-one).¹³ This suggests less intensive use of warehouse space in the South Coast AQMD jurisdiction for exports than for imports. For this reason, we assume the export-related goods flow relies on limited additional warehousing space beyond transload and cross-dock facilities that directly serve the ports.

EXHIBIT 1. GOODS FLOW CATEGORIES DEFINED BASED ON THE COMMODITY FLOW SURVEY¹

GOODS FLOW CATEGORY	ORIGIN	DESTINATION	PERCENT OF TOTAL	PERCENT OF GOODS FLOW SUBJECT TO RELOCATION ²
1	National	South Coast AQMD	5.61%	-
2	National	Export	3.23%	-
3	South Coast AQMD	Export	15.40%	-
4	Imports	All	36.68%	48.42%
5	South Coast AQMD	South Coast AQMD	26.43%	34.89%
6	South Coast AQMD	National	12.65%	16.70%
Notes: 1. The goods flow categories and percentage estimates in this table are derived from the Bureau of Transportation Statistics' Commodity Flow Survey (CFS) which includes freight flow data for retail, wholesale, and warehousing industries. The CFS does not appear to capture imports, so calculation of the relative share of imports relied on CFS export data and the ratio of imports to exports for the San Pedro Bay ports, as obtained from the following report: "Waterborne Freight Tonnage in California Ports," (2015) The Los Angeles Almanac. 2. The percent of affected goods flow was calculated by scaling the "Percent of Total" values for categories 4, 5, and 6 to sum to 100 percent.				

We assume goods with national origin points (i.e., produced domestically but outside the South Coast AQMD jurisdiction) with destinations inside the South Coast AQMD jurisdiction (category 1 in Exhibit 1) are distributed directly to their final destination from outside the South Coast AQMD jurisdiction. The transportation costs for these goods would therefore be unaffected by warehouse relocation.

Goods Flow Pathways Study: To assess the change in trucking distance associated with goods flow categories 4 through 6 in Exhibit 1 (the assumed change in distance is zero for categories 1 through 3), we rely on a set of goods pathways derived from a 2017 paper by

¹³ "Industrial Warehousing in the SCAG Region - Task 4: Understanding Facility Operations." (2018) Prepared for the Southern California Association of Governments by Cambridge Systematics, Inc. with Gill V. Hicks and Associates Inc. April 2018.

Robert Leachman,¹⁴ which outlines the flow of goods entering the South Coast AQMD jurisdiction through the San Pedro Bay ports. This flow of goods is illustrated in Exhibit 2.

Goods entering the ports of San Pedro Bay are categorized into pathways depending on (1) their final destination (i.e., truck to Northern California, truck to distribution within the South Coast AQMD jurisdiction, truck to areas in the Southwest outside the South Coast AQMD jurisdiction, or rail transport for national distribution) and (2) the warehouses they make use of while traveling along each pathway. We use these pathways to estimate baseline trucking distances for imports (category 4 in Exhibit 1) as well as for goods that originate in the South Coast AQMD jurisdiction and are bound for local consumption or national distribution (Categories 5 and 6 in Exhibit 1).

Of the goods pathways illustrated in Leachman (2017), we derive 18 distinct geographic pathways, 15 of which make use of warehouses within the South Coast AQMD jurisdiction and are relevant to this analysis.¹⁵ These pathways are listed in Exhibit 3. As shown in Exhibit 3, these pathways involve freight passing through one to three warehouses in the South Coast AQMD jurisdiction before shipment outside or distribution within the South Coast AQMD jurisdiction. To estimate the travel distance along each of these pathways, we calculate the driving distance between each pathway “node”—either warehouses, rail terminals, or approximate distribution locations—and sum for a total travel distance for each pathway.¹⁶ The estimated distances, by pathway, are shown in the last column of Exhibit 3.

¹⁴ Leachman, R. 2017. “Strategic Initiatives for Inland Movement of Containerized Imports at San Pedro Bay.” Institute for Transport Studies, University of California, Berkeley.

¹⁵ The three pathways that do not make use of warehouses in the South Coast AQMD jurisdiction are those that use direct inland point intermodal (IPI) handling from the ports to rail terminals (On-Dock at the ports, or at the port vicinity or Downtown terminals). IPI transport services leave goods intact in their marine containers for maximized speed in onward transport.

¹⁶ We cut off travel distance to Northern California at Kettleman Station, California, along interstate highway 5. We do this because goods sent to Northern California from any origin market in this study all must travel through Kettleman Station. Thus, the distance between Kettleman, California and the Northern California locations would be the same under the baseline as under any relocation scenario to be considered in our analysis.

	Goods with Origin in South Coast AQMD Jurisdiction and National Distribution Total:						100%	16.70%
Weighted Average Baseline Pathway Miles:								95
Notes: 1. The pathways shown in this exhibit reflect the goods flow pathways as represented in Leachman (2017). 2. This table shows pathways for each of the goods flow categories outlined in Exhibit 2. Because the categories with origin inside the South Coast AQMD jurisdiction are assumed to follow similar pathways to imported goods, they draw from the same pathways as the imported goods. The associated pathway share is scaled according to each goods category's share of the total analyzed goods, as shown in Exhibit 2. 3. Each pathway has 1-3 warehouses in its distribution chain, labeled by its location either near the ports of the San Pedro Bay or in the Inland Empire. To approximate the location of the average warehouse located in Los Angeles County near the ports, we use the location of the intermodal container transfer facility (ICTF). In the Inland Empire, we use a point halfway between the cities of Riverside and San Bernardino. 4. Because different warehouses fulfill different distributional functions, some goods visit multiple warehouses in the Inland Empire before leaving for their next destination.								

To estimate the change in trucking distance associated with the relocation of a warehouse to an outlying market area, we follow an approach similar to the baseline. For each of the 15 pathways shown in Exhibits 2 and 3, we specify alternate pathways where a warehouse in that pathway relocates to each outlying market. Exhibit 4 maps the seven outlying markets considered in our analysis: North of District, Coastal Areas; North of District Bakersfield; South of District, San Diego; East of District, Desert Areas; Las Vegas; Western AZ; and Phoenix. For example, Exhibit 5 shows how pathways 1, 5 and 9 would change if warehouses on those pathways were to relocate from the South Coast AQMD jurisdiction to the Bakersfield area.

EXHIBIT 4. SOUTH COAST AQMD JURISDICTION AND RELOCATION MARKETS

EXHIBIT 5. ILLUSTRATION OF PATHWAYS 1, 5, AND 9 GOODS FLOW WITH WAREHOUSE RELOCATION

Due to complexities inherent in the routing of goods through warehouses, we make several simplifying assumptions to estimate the trucking distance associated with relocation of a warehouse to each outlying market area. These include the following:

- **Only final warehouse in pathway chain relocates:** Estimation of travel distance associated with warehouse relocation is complicated since a given warehouse may represent one of many stops on a shipment's transit to its ultimate destination. Thus, the increase in distance associated with warehouse relocation may depend, in part, on where the warehouse sits along a pathway.¹⁷

For example, it seems unlikely the first warehouse in Exhibit 6 (just north of the San Pedro Bay ports) would relocate to Phoenix, resulting in much higher transportation costs due to its goods routing from the San Pedro Bay ports to Arizona and then back to the Inland Empire, then back out for distribution outside the South Coast AQMD jurisdiction. It is more likely the *second* warehouse in the baseline pathway would relocate to Phoenix, having a more modest effect on total travel distance.

¹⁷ Each warehouse's location within the supply chain may also affect whether it is likely to relocate. For example, warehouses serving transloading functions based on proximity to the port area may be unlikely to relocate.

For the purposes of estimating the distance associated with alternate good pathways for those pathways involving multiple warehouses, we only estimate the change in distance based on relocation of the last warehouse located inside South Coast AQMD jurisdiction in the pathway. This approach assumes it is unlikely goods would be trucked outside the South Coast AQMD jurisdiction to an intermediary warehouse and then back into the South Coast AQMD jurisdiction to another warehouse due to the increase this would have on transportation costs. For imported goods, warehouses earlier in the chain are more likely to serve functions directly relevant to goods processing from the ports or firm in the South Coast AQMD jurisdiction and would be less likely to relocate further from the ports.

EXHIBIT 6. SAMPLE GOODS PATHWAY WITH RELOCATION ALTERNATIVE

- ***Impact of multiple warehouses on a goods pathway relocating:*** If multiple warehouses from a given pathway relocate to the same outlying market, the net change in distance traveled is not likely to be significantly different than one warehouse relocating. In each scenario, the goods are trucked from the South Coast AQMD jurisdiction to the outlying market one time, and distances between warehouses within each market area are assumed marginal. We do not consider how travel distance associated with one warehouse relocating is affected by the relocation of other warehouses on the same goods pathway.

- ***No splitting of pathways between multiple outlying market areas:*** We do not account for multiple warehouses from a given pathway relocating to different outlying markets because the transportation costs of doing so are likely to be prohibitive.
- ***Warehouse locations:*** To approximate the change in travel distance between the baseline and each alternate pathway, we make use of common warehouse locations to estimate transportation distances:
 - For goods pathways using warehouses in the ports vicinity, we use the intermodal container transfer facility (ICTF) as an approximate warehouse location.¹⁸
 - For goods pathways using warehouses in the Inland Empire, we use a point halfway between the cities of Riverside and San Bernardino as an approximate warehouse location.
 - For alternate goods pathways using warehouses in each outlying market area, we use the geographic centroid of existing warehouses in that market area as the approximate warehouse location.

While these assumptions do not provide the most precise estimate of the change in distances for each individual warehouse, they provide a reasonably accurate representation of the magnitude of this change for a typical warehouse.

- ***Re-orientation of goods pathways:*** We do not consider any re-orientation of goods pathways (or the share of goods that follow each pathway) due to warehouse relocation or other effects resulting from implementation of the ISR.

Based on these assumptions, we estimated the distance associated with each combination of pathway and outlying market area, as presented in Exhibit 7. For example, consider pathway 10 in goods flow category 4 (imported through the ports) and category 6 (produced locally within the South Coast AQMD jurisdiction). In each instance, the baseline version of pathway 10 has the goods stop once at a warehouse in the Inland Empire, then trucked to the Inland Empire intermodal rail terminal where they are loaded for national distribution. In each alternate version of pathway 10, the Inland Empire warehouse is replaced with a warehouse in each outlying market area, and the goods are trucked onward to the appropriate local intermodal rail terminal from there. The net change in total truck miles traveled for each market area is captured in the row for pathway 10 in Exhibit 7 as the difference between the value for each outlying market and the baseline value.

¹⁸ The ICTF is located approximately five miles north of the ports of the San Pedro Bay, near the intersections of the 405 and 710 Freeways at 2401 East Sepulveda Boulevard in Long Beach, California. 90810.

Notes: <ol style="list-style-type: none"> Each percentage value in this column represents a pathway's share of the goods flow for a given goods flow category. For example, pathway 1 accounts for 2.99 percent of the goods flow for goods flow category 1. Each percentage value in this column represents that category and pathway's combined share of the goods flow across all goods subject to alternate routing to different warehouses under the ISR. For example, goods that are imported and follow pathway 1 make up 1.1 percent of the goods subject to potential re-routing. 											

Using the baseline distances in Exhibit 3 with the distances associated with outlying markets in Exhibit 7, it is possible to estimate the change in trucking distance associated with warehouse relocation. The change in distance for a given warehouse, however, would depend on the pathway(s) the warehouse in question serves. Some warehouses may serve a single pathway only, while others may serve several. Because warehouse-specific pathway information is unavailable, the change in distance for a given warehouse is uncertain. To account for this uncertainty, we specify two pathway scenarios designed to yield low-end and high-end estimates of the change in warehouse relocations associated with the ISR:

1. ***Composite pathway scenario:*** Under this scenario, we assume each warehouse is representative of the entire South Coast AQMD jurisdiction's warehousing sector and serves all 15 pathways shown in Exhibits 2 and 3 in proportion to the goods flow associated with each pathway. Thus the change in trucking distance associated with relocating to a given outlying market area is the difference between the weighted average of the weighted average trucking distance across all 15 pathways for the outlying market area in question (shown near the bottom of Exhibit 7) and the baseline trucking distance across all 15 pathways (shown in the bottom of Exhibit 3). For both the baseline and outlying markets, we weight the pathway-specific distances by the percentage share of goods volume as derived from Leachman (2017) (column H in Exhibit 3).¹⁹ Following this approach, the weighted average baseline distance is 95 miles (see Exhibit 3), and the weighted average distance for the outlying markets ranges from 170 miles for the Desert Areas to 574 miles for the Phoenix area.
2. ***Specialized pathway sensitivity scenario:*** This scenario is designed to account for the possibility that some warehouses may specialize in any one pathway, with the exception of a limited number of pathways. Rather than using the weighted distance across all pathways for a given outlying area, we conduct the analysis iteratively one pathway at a time, assuming all warehouses are on a given pathway for each iteration of the analysis. After running the analysis for all pathways, we calculate the weighted average of the resulting warehouse relocation estimates, using the goods volumes associated with each pathway as weights. For example, based on the distances in Exhibit 7 associated with the Bakersfield market area, we conduct the relocation analysis iteratively based on one-way distances of 160 miles (pathway 2), 316 miles (pathway 3), etc. and calculate the weighted average of the resulting number of relocations.

This scenario models specialization for most, but not all, pathways. A number of sources suggest warehouses in the South Coast AQMD jurisdiction are unlikely to specialize in the pathways that route goods to Northern California (pathways 1, 5, and 9 in Exhibits 2 and 3 above). Specifically, a 2013 survey of warehouses in the South Coast AQMD jurisdiction found among the warehouses that ship goods to Northern California, goods on this route accounted for no more than 40 percent

¹⁹ This excludes goods included in categories 1 through 3 in Exhibit 1 since those goods flows are assumed to be unaffected by changes in warehouse relocation.

of the goods handled.²⁰ This 40 percent value represented the highest percentage among all survey respondents.

Furthermore, unlike the other outlying market areas considered in this analysis, Northern California is located in close proximity to another major port, the Port of Oakland. To minimize transportation costs, it is likely most cargo owners with goods bound for Northern California would ship them through the Port of Oakland rather than the San Pedro Bay ports in Southern California. This would suggest warehouses in the South Coast AQMD jurisdiction would not find specialization in Northern California goods pathways to be economically viable. The fact that most cargo ships that visit the San Pedro Bay ports also visit the Port of Oakland (see Exhibit 8) further supports this conclusion, as it suggests the costs of distributing goods to Northern California are lower via the Port of Oakland than through the San Pedro Bay ports.

EXHIBIT 8. OVERLAP BETWEEN VESSELS VISITING SAN PEDRO BAY PORTS AND THE PORT OF OAKLAND

YEAR	% OF SHIPS VISITING SAN PEDRO BAY PORTS THAT VISIT OAKLAND
2019	77%
2018	72%
2017	74%
2016	78%

Source: South Coast AQMD staff analysis of the IHS-Seaweb data.

Based on this information, we include a single Northern California composite pathway in the iterative analysis conducted for the specialized pathway sensitivity scenario. Drawing on the results of the South Coast AQMD warehouse survey described above, the specialized pathway sensitivity scenario assumes 40 percent of the goods flow handled by warehouses that serve Northern California are bound for Northern California. These are allocated across the Northern California pathways (1, 5, and 9) in proportion to the percentages shown in Exhibit 3 for these pathways.²¹

Of the remaining 60 percent of the goods handled by these warehouses, we assume 30 percent remains in the South Coast AQMD jurisdiction and 30 percent is distributed nationally. These figures are also based on the South Coast AQMD

²⁰ South Coast AQMD, SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results, June 2014, available at <http://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/business-survey-summary.pdf?sfvrsn=2>.

²¹ For example, pathways 1, 5, and 9 cumulatively account for account for 4.84 percent of the goods flow potentially affected by the warehouse ISR in Exhibit 3 above. Pathway 1 accounts for 2.04 percent, which is 42.1 percent of the 4.84 percent across all three pathways ($2.04/4.84=42.1$ percent). Therefore, given that we assume 40 percent of the goods flow is on Northern California pathways under this scenario, we assume that 16.9 percent follows pathway 1 ($0.421 \times 0.40=16.9$ percent).

warehouse survey. For those warehouses that reported more than 30 percent of goods distributed to Northern California, the highest percentage reported for out of state distribution was 23 percent. Because our modeling shows warehouses specializing in national distribution are more conducive to relocation than warehouses distributed locally, we view 30 percent for national distribution as a reasonable conservative estimate. This leaves the remainder, 30 percent for local distribution.

We allocate both the 30 percent distributed nationally and 30 percent distributed locally proportionately to the goods flow pathways associated with each category. Based on these assumptions, Exhibit 9 shows the assumed allocation across pathways for those warehouses that serve the Northern California market. Note that the pathways in Exhibit 9 are organized by destination region (i.e., Northern California, national distribution, and local distribution).

EXHIBIT 9. ALLOCATION OF GOODS ACROSS PATHWAYS FOR WAREHOUSES IN THE SOUTH COAST AQMD JURISDICTION THAT SERVE NORTHERN CALIFORNIA

PATHWAY	PATHWAY DESCRIPTION	PATHWAY REGION	PATHWAY PERCENT
1	Truck to Northern California Distribution	Northern California	16.9%
5	Truck to Northern California Distribution	Northern California	3.5%
9	Truck to Northern California Distribution	Northern California	19.7%
2	Downtown Rail to National Distribution	National	10.0%
6	Inland Empire Rail to National Distribution	National	1.8%
10	Inland Empire Rail to National Distribution	National	17.7%
15	Downtown Rail to National Distribution	National	0.5%
3	Truck to South Coast AQMD Regional Distribution	Local	3.7%
4	Truck to Non-District Regional Distribution	Local	1.0%
7	Truck to South Coast AQMD Regional Distribution	Local	0.9%
8	Truck to Non-District Regional Distribution	Local	0.2%
11	Truck to South Coast AQMD Regional Consumption	Local	5.1%
12	Truck to Non-District Regional Consumption	Local	1.4%
13	Truck to South Coast AQMD Regional Consumption	Local	14.1%
14	Truck to Non-District Regional Consumption	Local	3.8%

Within the framework of the specialized pathway scenario analysis, the iteration of the analysis conducted for warehouses that serve Northern California is given a weight equal to the sum of the goods flow percentages across the Northern California pathways, as presented in Exhibit 3 (or 4.8 percent).

Trucking Cost Impacts

The estimated change in trucking distance derived from the methods outlined above is a key input into our analysis of the trucking cost impacts associated with warehouse

relocation. The following equation details our approach for estimating these trucking cost impacts.

$$(1) \Delta T_r = (2 \times \Delta D_r) \times cpm \times (p \times s) \times cf$$

Where ΔT_r is the change in trucking costs associated with relocating a warehouse from the South Coast AQMD jurisdiction to outlying market area r ;

ΔD_r is the change in one-way goods pathway trucking distance associated with relocating a warehouse from the South Coast AQMD jurisdiction to outlying market area r ;

cpm is the trucking cost per mile;

p is the number of truck trips per 1000 square feet of warehouse space;

s is the warehouse square footage divided by 1000;²² and

cf is a conversion factor for converting warehouse truck trips to pathway trips.

Below we describe our approach for specifying each of these analytic elements.

Two-Way Trucking Distance

The change in trucking distance is critical in the estimation of the trucking cost impacts associated with warehouse relocation. The distance estimates presented in the previous section, however, reflect the one-way distance impacts associated with warehouse relocation. In practice, warehouse relocation would also increase the distance trucks travel going in the other direction (i.e., back toward the South Coast AQMD jurisdiction). To account for this effect, we multiply the one-way distances presented above to estimate the two-way trucking distance impact associated with warehouse relocation. This two-way distance is represented as $(2 \times \Delta D_r)$ in Equation 1.

Trucking Cost Per Mile

The results of the travel distance calculations are used in conjunction with per-mile costs for trucking transport. We use per-mile trucking costs for the West region from the American Transportation Research Institute's 2019 annual report on trucking costs.²³ This value is \$1.84 per mile for Class 8 trucks, adjusted for inflation from 2018 to 2019 dollars using the GDP implicit price deflator.²⁴ To approximate the value for Class 4-7 trucks, we use the ratio of per-mile costs for straight trucks reported by ATRI in 2017 with the 2019 annual report's data. This value is \$1.77 per mile for Class 4-7 trucks. As a

²² The term $(p \times s)$ therefore represents the number of truck trips for a warehouse.

²³ Murray, D. & Glidewell, S. 2019. "An Analysis of the Operational Costs of Trucking: 2019 Update." American Transportation Research Institute.

²⁴ We use annual gross domestic product implicit price deflators to inflate prices to the current dollar year (2019). These values were obtained from the Federal Reserve Bank of St. Louis Economic Research Division (FRED) and are indexed to 2012 (2012 = 100.00). The values are as follow: 2018=110.42, 2019=112.35.

U.S. Bureau of Economic Analysis, Gross domestic product (implicit price deflator) [A191RD3A086NBEA], retrieved from FRED, Federal Reserve Bank of St. Louis; <https://fred.stlouisfed.org/series/A191RD3A086NBEA>, October 11, 2020.

sensitivity analysis on this value, we also consider data from Freightwaves (2020), which reports lower- and upper-bound estimates of \$1.16 and \$3.05 per mile, respectively.²⁵

We note two caveats regarding these trucking cost values. First, we do not consider potential differences in traffic between driving inside and outside the South Coast AQMD jurisdiction. We apply the trucking costs per mile, which do not rely on driving time. Second, we do not account for changes in the number of truck trips possible in a single driver's day as a result of warehouse relocation. This exclusion could underestimate the true cost of warehouse relocation, as drivers would have more downtime that they would prefer to spend transporting goods.

Number of Trips

As shown in Equation 1 above, we calculate the number of trips relative to each warehouse by multiplying the trip rate (trips per 1,000 square feet) by the square footage of each warehouse. We use South Coast AQMD's trip rates per 1,000 square feet of warehousing space included as default rates in the current draft ISR text.²⁶ These values are presented in Exhibit 10.

EXHIBIT 10. TRUCK TRIP RATES PER 1000 SQUARE FEET OF WAREHOUSE SPACE

WAREHOUSE TYPE	CLASS 8	CLASS 4-7
High Cube Transload & Short-Term Storage ($\geq 200k$ sf) ¹	0.33	0.12
Warehouse (100k – 200k sf) ^{1,2}	0.21	0.14
Cold Storage ($\geq 100k$ sf) ¹	0.75	0.29
Trip rates adapted by South Coast AQMD based on the following studies: ¹ "Truck Trip Generation Study," 2003. City of Fontana, San Bernardino County. ² "High Cube Warehouse Vehicle Trip Generation Analysis," 2016. Prepared for South Coast Air Quality Management District and National Association of Industrial and Office Properties by the Institute of Transportation Engineers.		

To apply the trip rates presented in Exhibit 10 in the relocation analysis, we adjust them in two ways. The first adjustment relates to the difference between a truck trip to or from a single warehouse versus a trip over an entire goods flow pathway. Because our analysis relies upon the distance along goods flow pathways, it must also use estimates of the total number of pathway trips (i.e., trips over the entire pathway). Because one full trip along a goods flow pathway may involve stops at several warehouses, a pathway trip may include truck trips to/from individual warehouses. In other words, one pathway trip may include more than one truck trip to/from warehouses. To convert the warehouse level truck trips

²⁵ Henry, C. "What is the Total Cost Per Mile for truckload carriers?" January 13, 2020. Freightwaves.com.

²⁶ "Draft WAIRE Menu Technical Report" March 3, 2020. South Coast Air Quality Management District.

in Exhibit 10 to pathway trips, we divide the number of truck trips by the number of warehouses per pathway.

The second adjustment reflects how truck trips are defined in the data presented in Exhibit 10. Specifically, a truck trip means the one-way trip a truck or tractor makes to or from a site with at least one warehouse to deliver or pick up goods stored at that warehouse for later distribution to other locations. Based on this definition, a truck or tractor entering a warehouse site and then leaving that site counts as two trips.

Putting this accounting practice in the context of a single warehouse situated along a goods flow pathway, the trip values in Exhibit 10 would lead to overestimation of the number of trips along a pathway. For example, consider a pathway that includes a single warehouse between the Port of Long Beach and the Inland Empire Rail Terminal. If a shipment of goods is transported to the one warehouse on this pathway and subsequently shipped from that warehouse to the rail terminal, the trip data for the warehouse in question would count that shipment as two separate truck trips: one inbound to the warehouse from the port and one outbound from the warehouse to the rail terminal. This results in double counting of trips through the warehouse. To avoid double counting, we divide the trip rates presented in Exhibit 10 by two.

These two adjustments together constitute the conversion factor cf shown in Equation 1 above. Specifically, the conversion factor is calculated as follows:

$$(2) \quad cf = \frac{1}{w_p} \times \frac{1}{2}$$

Where cf is the factor converting warehouse truck trips to pathway trips; and

w_p is the number of warehouses along a given goods flow pathway.

Based on Equation 2, we derived the values of cf shown in the right-most column in Exhibit 11. The final row of the exhibit includes the weighted average value across pathways, using the proportion of the goods flow associated with each pathway as weights.

EXHIBIT 11. DERIVATION OF CONVERSION FACTORS

PATHWAY NUMBER [A]	PATHWAY DESCRIPTION [B]	NUMBER OF WAREHOUSES ON PATHWAY [C]	CONVERSION FACTOR [D]=1/(C×2)
1	Truck to Northern California Distribution	1	0.50
2	Downtown Rail to National Distribution	1	0.50
3	Truck to South Coast AQMD Regional Distribution	2	0.25
4	Truck to Non-District Regional Distribution	2	0.25
5	Truck to Northern California Distribution	2	0.25
6	Inland Empire Rail to National Distribution	2	0.25
7	Truck to South Coast AQMD Regional Distribution	3	0.17
8	Truck to Non-District Regional Distribution	3	0.17
9	Truck to Northern California Distribution	1	0.50
10	Inland Empire Rail to National Distribution	1	0.50
11	Truck to South Coast AQMD Regional Consumption	2	0.25
12	Truck to Non-District Regional Consumption	2	0.25
13	Truck to South Coast AQMD Regional Consumption	1	0.50
14	Truck to Non-District Regional Consumption	1	0.50
15	Downtown Rail to National Distribution	1	0.50
Weighted Average Across Pathways		1.27	0.39

Rail Cost Impacts

In addition to changes in trucking costs, the cost of rail transport is also affected by alternate goods pathways involving warehouse relocation to outlying market areas. Our assessment of the change in rail costs is based on a similar equation as specified above for trucking costs:

$$(3) \Delta R_r = \Delta D_r \times cpm_r \times (p \times s) \times cf$$

Where ΔR_r is the change in rail costs associated with relocating a warehouse from the South Coast AQMD jurisdiction to outlying market area r ;

ΔD_r is the change in rail goods pathway distance associated with relocating a warehouse from the South Coast AQMD jurisdiction to outlying market area r ;

cpm_r is the rail cost per mile;

p is the number of *truck* trips per 1000 square feet of warehouse space, and

s is the warehouse square footage divided by 1000.²⁷

cf is a conversion factor for converting warehouse truck trips to pathway trips.

Although this equation is based on the number of *truck* trips (p), we use this equation because we derive the *rail* cost per mile from the ratio of rail costs per ton mile to

²⁷ The term $(p \times s)$ therefore represents the number of truck trips for a warehouse.

trucking costs per ton mile, as reported by the Congressional Budget Office.²⁸ This source reports per-ton-mile freight costs for rail of \$0.051 and corresponding per-ton-mile freight costs by truck of \$0.156. Based on these values, we calculate a *rail* cost per mile using the following equation:

$$(4) \quad cpm_r = \left(\frac{cptm_r}{cptm_t} \right) \times (cpm_t)$$

Where cpm_r is the rail cost per mile;

$cptm_r$ is the rail cost per ton-mile;

$cptm_t$ is the trucking cost per ton-mile;

cpm_t is the trucking cost per mile used in the Trucking Costs section, \$1.84 per mile.

In effect, applying the estimate of cpm_r as specified in Equation 4 to the specification of costs in Equation 3 provides an estimate equivalent of scaling trucking costs estimated from Equation 1 by the ratio of rail costs per ton mile to trucking costs per ton mile, approximately one-third. This estimate excludes other costs relevant to rail travel, such as added time and changes in reliability.

Change in Rail Distance

Following the potential relocation of a warehouse to an outlying market, some goods pathways that result in rail transport for national distribution will make use of different rail terminals than they do currently within the South Coast AQMD jurisdiction. The result is a change in rail miles traveled for some goods pathways, in addition to the change in truck miles traveled.

For example, if a warehouse serving national distribution via rail were to relocate from the South Coast AQMD jurisdiction to Las Vegas, the result would be an increase in trucking miles and a decrease in total rail miles traveled. This is because goods trucked the initial stretch of the journey east would have been on a train in the baseline for that portion of their journey.

To accomplish this, we identify the relevant intermodal rail facilities in each outlying market area using maps from the National Transportation Atlas Database (NTAD) and the Burlington Northern Santa Fe Railway Company (BNSF), outlined in Exhibit 12 and mapped in Exhibit 13.

EXHIBIT 13. MAP OF RELEVANT INTERMODAL FACILITIES

Exhibit 14 shows the baseline rail distance per relevant pathway, as well as the pathway-specific rail distance for each outlying market area. The difference between the pathway-specific values for each outlying market area and the pathway-specific values for the baseline are used for the specialized pathway sensitivity scenario described above. For the Composite pathway scenario, we use the weighted average of the rail distance values shown in Exhibit 14, using the proportion of the goods flow associated with each pathway as weights. The change in weighted average distance for each outlying market area is shown at the bottom of Exhibit 14. The weighted average change in rail distance is negative for some market areas and positive in others.

EXHIBIT 14. RELOCATION SCENARIOS, RAIL TRAVEL

Notes: <ul style="list-style-type: none"> The change in rail travel distance only affects the four pathways with national rail distribution as their destination, as listed in Exhibit 3. Rather than unloading the goods at either the Downtown Los Angeles or Inland Empire (San Bernardino) rail terminals, the warehouse relocation necessitates unloading goods at rail terminals in the outlying markets. We assume relocated warehouses in both the Coastal Areas and Bakersfield outlying markets will continue to use the in-District rail terminals due to the lack of alternate rail terminals. The resulting increase in truck travel distance is accounted for in the truck travel distance calculations. 											

Number of Trips

As with trucking, we use South Coast AQMD's trip rates per 1,000 square feet of warehousing space included as default rates in the current draft ISR text (see values in Exhibit 10).²⁹ We calculate the number of trips relative to each warehouse by multiplying the trip rate by the square footage of each warehouse. We also apply the conversion factor described in the trucking cost section above (*cf*) to convert warehouse level trips to pathway trips.

Total Transportation Cost Impacts

To obtain a value for the total effect on transportation costs due to warehouse relocation, we sum the effects on trucking costs and rail costs:

$$\Delta TC_r = \Delta T_r + \Delta R_r$$

Where $\Delta TC_{d,r}$ is the total change in transportation costs associated with relocating a warehouse from the South Coast AQMD jurisdiction to outlying market area r ;

$\Delta T_{d,r}$ is the change in trucking costs associated with relocating a warehouse from the South Coast AQMD jurisdiction to outlying market area r ;

$\Delta R_{d,r}$ is the change in rail costs associated with relocating a warehouse from the South Coast AQMD jurisdiction to outlying market area r ;

This value represents the incremental effect on transportation costs resulting from relocating a warehouse to a given market.

Transportation Cost Impacts Limitations

While the data sources and methods described in this analysis provide reasonable estimates of the transportation cost impact associated with warehouse relocation from the South Coast AQMD jurisdiction, it is important to expand on several limitations which may affect the accuracy of the analysis:

- The goods pathway framework for the analysis is a parsimonious representation of a complex supply chain ecosystem, as exists in the South Coast AQMD jurisdiction. While analyzing the shipment of goods and the location of logistics nodes in this way was necessary to develop this analysis, it is important to note it does not capture every nuance of logistics in the South Coast AQMD jurisdiction.
- The CFS data used to estimate the allocation of goods across different goods flow categories (e.g., imports, locally source goods consumed locally, etc.) is ambiguous regarding the inclusion or exclusion of imports. For the purposes of this analysis, we assumed the CFS data does not reflect imports as they arrive at the San Pedro Bay ports. If we were to assume all imports are reflected in the CFS data upon their arrival at the San Pedro Bay ports, the estimated change in trucking distance would, on average, be seven percent higher than estimated here. To the extent that we underestimate the change in trucking distance, we may

²⁹ "Draft WAIRE Menu Technical Report" March 3, 2020. South Coast Air Quality Management District.

underestimate the costs of relocation and overestimate the degree to which warehouses relocate outside the South Coast AQMD jurisdiction.

- While the per-mile cost estimates we include for both trucking and rail are relatively comprehensive in what they include, they do not capture all cross-medium differences between the two methods. Differences in travel time or reliability between trucking and rail are not considered in these applications.
- This analysis is meant to capture incremental changes in travel cost due to the relocation of an individual warehouse. It does not capture other cost effects, e.g. a logistics company reorienting its business organization away from the San Pedro Bay ports, making changes to warehousing operations to decrease required floor space, or increasing full-truckload shipments.

RENTAL COSTS

This analysis estimates the average change in annual rents for a warehouse relocating to an outlying market area. Based on rental cost data from CoStar, we calculate an average annual rental price per square foot specific to warehouses likely to relocate (excluding cold storage facilities, which we assume will not relocate).³⁰ We then take the difference from the value for the South Coast AQMD jurisdiction to obtain the expected change in annual rent per square foot due to the typical warehouse relocating to each of the outlying market areas. Exhibit 15 illustrates the expected cost changes due to differences in rent.

EXHIBIT 15. DIFFERENCES IN RENTAL PRICES ACROSS MARKETS - YEAR 2019

MARKET	AVERAGE YEARLY RENTAL PRICE PER SQUARE FOOT	DIFFERENCE FROM DISTRICT BASELINE (\$/SQUARE FOOT)
South Coast AQMD Jurisdiction Average	\$10.61	-
Non-District Average	\$6.99	(\$3.62)
Bakersfield	\$4.03	(\$6.57)
Coastal Areas	\$9.32	(\$1.29)
Desert Areas	\$9.75	(\$0.86)
San Diego	\$11.07	\$0.46
Las Vegas	\$7.54	(\$3.07)
Phoenix	\$5.99	(\$4.62)
Western AZ	\$3.84	(\$6.77)

³⁰ The CoStar data are summarized in "Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Jurisdiction", prepared by Derek Ehrnschwender and Jason Price, Industrial Economics, for South Coast AQMD. December 12, 2020.

LABOR COSTS

This analysis estimates the average change in warehouse labor costs associated with operating a warehouse in the outlying markets rather than in the South Coast AQMD jurisdiction. This analysis is based upon a cross-geographic comparison of the typical employment required for a distribution warehouse developed by The Boyd Company.³¹

This report measures differences in warehouse labor costs for several cities in the Southwestern U.S. for a model 500,000 square foot distribution warehouse. Where the cities considered in the Boyd report align with the market areas considered in this analysis, we rely on the labor cost values included in the report.

Some California market areas, specifically the South Coast AQMD jurisdiction, Coastal Areas, Bakersfield, and San Diego markets, do not align with the geographic areas captured in the Boyd report. In these cases, we use the Boyd estimate for the Inland Empire as a starting point and scale this value based on county-level wage rates available in California's 2014 Occupational Employment Statistics survey and the mix of occupational categories employed by a warehouse (as specified in the Boyd report).^{32,33} For example, to derive an estimate for the Bakersfield area, we multiplied the Inland Empire cost value from the Boyd report by the ratio of the Kern County warehouse wage rate to the Riverside County warehouse wage rate. The estimated labor costs for each market area are captured in Exhibit 16. All labor rates have been adjusted to 2019 dollars.

EXHIBIT 16. DIFFERENCES IN COST OF LABOR ACROSS MARKETS - 2019\$

MARKET	ESTIMATED ANNUAL LABOR COSTS, MODEL 500,000 SQUARE FOOT WAREHOUSE (2015)	ESTIMATED ANNUAL LABOR COSTS PER 1,000 SQUARE FEET	DIFFERENCE FROM DISTRICT BASELINE (\$/1000sqft)
South Coast AQMD Jurisdiction*	\$6,689,241	\$13,378	\$-
Bakersfield*	\$6,733,087	\$13,466	\$87.69
Coastal Areas*	\$6,690,483	\$13,381	\$2.48
San Diego*	\$6,324,682	\$12,649	\$(729.12)

Phoenix	\$5,707,995	\$11,416	\$(1,962.49)
Western AZ	\$5,153,621	\$10,307	\$(3,071.24)
*Denotes market areas not fully captured in Boyd (2015). To obtain estimates for these market areas, we adjust the Boyd estimates using a representative sample of county-level labor rates available in California's 2014 Occupational Employment Statistics survey.			

³¹ The Boyd Company (2015). "Comparative Distribution Costs in Port and Intermodal-Proximate Cities: Distribution Warehouse Site Selection."

³² State of California Employment Development Department (2015). Occupational Employment Statistics and Wages.

³³ This mix of personnel includes one first-line supervisor of helpers, laborers, and material movers; one first-line supervisor of transportation and material-moving machine operators, two heavy and tractor-trailer truck drivers; one light truck or delivery service driver; and five laborers and freight, stock, and material movers.

POWER COSTS

We also consider differences in electricity cost across market areas. Boyd (2015) reports power costs for a model 500,000 square foot distribution warehouse across several cities in the Southwestern U.S. Boyd (2015) applies the same power costs to all of the California areas included in the report. We assume these values apply to all market areas in California, regardless of whether they are included in the Boyd report. These estimates are reported in Exhibit 17.

EXHIBIT 17. DIFFERENCES IN COST OF POWER ACROSS MARKETS - YEAR 2019

Western AZ	\$703,039	\$1,406	\$(392.05)

MOVING COSTS

This analysis accounts for the costs of physically moving warehouse operations to a new site. We rely on a one-time moving cost of \$160,000 per facility, derived from moving cost estimates from Petersen and Aase (2016).³⁴ This estimate takes into account several cost categories, including transportation, labor, and inventory storage costs, across one-week, two-week and three-week moving scenarios. We calculate the average of these three scenarios' costs to obtain our moving cost estimate.

DEVELOPMENT FEES

In the slack capacity scenario we account for the development of potential new warehouse capacity to meet potential new demand for warehouses relocated from the South Coast AQMD jurisdiction. Developers that undertake such projects will incur a number of one-time development or impact fees charged by the various jurisdictions in outlying market areas, including fire and rescue fees, transportation mitigation fees, etc. For the purposes of estimating the costs of relocation, we assume such costs will ultimately be borne by warehouse operators who pay rent to the building owner. We annualize these costs over the full 20-year time horizon of our analysis, using discount rates of 1 percent and 4 percent. Although development fees may be reflected in current

³⁴ Petersen, Charles G., and Gerald R. Aase (2016). "Issues in Distribution Center Relocation." Open Journal of Business and Management 4, No. 01.

rents for outlying markets where warehouse capacity could be developed, these fees may not be fully reflected in current rents if no warehouse development has occurred since the development fees were last revised.

Due to the lack of comprehensive data on impact fees related to development of warehousing properties in the Southwest, IEc conducted a review of applicable fees across the seven outlying market areas included in this analysis. This review relied on a selection of sources, including municipal government websites, reports commissioned by governmental associations, and city council ordinances. After compiling the relevant impact fees for each of the seven markets, IEc then converted the estimates to 2019 dollars per square foot. The results of this analysis, outlined in Exhibit 18, show a range of development fees per 1000 square feet by market area.

MODELING OF RELOCATION DECISIONS

Based on the costs of ISR compliance and the costs of relocation calculated, we estimate the number of warehouses that relocate from the South Coast AQMD jurisdiction to the outlying market areas. We develop estimates for different analytic scenarios designed to capture uncertainty regarding the capacity available in each outlying market area (i.e., the medium term capacity area and slack capacity scenario) and uncertainty regarding the goods pathways served by individual warehouses (i.e., the composite pathway scenario and specialized pathway sensitivity scenario).

For each scenario, our modeling of the preferences of an individual warehouse is based on the annualized cash flows associated with ISR compliance and the annualized cash flows associated with relocation, over a 20-year time horizon. For a given analytic scenario, we assume that a warehouse operator's square footage is relocated to an outlying market if the cost condition and capacity condition described in the overview section are met (i.e., if relocation costs for at least one outlying area are less than ISR compliance costs and the available capacity in that area is sufficient to absorb that warehouse's square footage).

Our modeling of this decision accounts not only for the capacity available in each outlying market area prior to introduction of the ISR but also how the relocation decisions of individual warehouses dynamically affect the capacity available in a specific market area and the ability of other warehouses to relocate to that area. The procedure that we follow to capture these dynamics and estimate the number of warehouse relocations is as follows:

- ***Step 1 - Identify the hierarchy of relocation preferences for each warehouse:***
Based on the costs of ISR compliance and relocation, the analysis determines not only whether a given warehouse operation would realize a cost savings by relocating, but also determines the ranking of outlying market areas in terms of the net cost savings that would be realized by relocating.

EXHIBIT 18. DEVELOPMENT IMPACT FEES

MARKET	IMPACT FEE CATEGORY									
	Transportation	Fire & Rescue	Police	School	Water & Sewer	Library	Park	Other	Total (Impact)	Total (\$/1000 sqft)
Bakersfield	\$0.09/sqft	\$0.55/sqft	\$0.14/sqft	\$0.61/sqft	-	\$0.13/sqft	-	\$0.07/sqft	\$1.59/sqft	\$ 1590
Coastal Areas	\$1.48/sqft	\$0.43/sqft	\$0.25/sqft	\$ 0.63/sqft	-	\$ 0.79/sqft	-	\$0.44/sqft	\$ 4.02/sqft	\$ 4020
San Diego	\$ 4.9/sqft	\$ 0.1/sqft	\$ 0.19/sqft	-	-	-	-	-	\$ 5.19/sqft	\$ 5190
Desert Areas	\$0.16/sqft	\$0.39/sqft	-	-	-	-	-	-	\$ 0.55/sqft	\$ 550
Las Vegas	\$0.94/sqft	-	-	-	-	-	-	\$0.01/sqft	\$ 0.95/sqft	\$ 950
Phoenix	\$0.85/sqft	\$0.22/sqft	\$ 0.15/sqft	-	-	\$ 0.02/sqft	\$ 0.27/sqft	\$0.38/sqft	\$ 2.23/sqft	\$ 2230
Western AZ	\$0.26/sqft	\$ 0.4/sqft	\$ 0.14/sqft	-	-	-	-	\$0.01/sqft	\$ 0.81/sqft	\$ 810

- **Step 2 – Array warehouses from largest to smallest:** To account for the degree to which the relocation decision of a given warehouse affects capacity in the outlying market areas and the potential capacity available for other warehouses considering relocation, we model the warehouses sequentially from largest to smallest. The rationale for this ordering is that the cost impacts of the ISR would likely be more significant for larger warehouses and they would therefore have the greatest motivation to relocate.
- **Step 3 – Model relocations to most preferred outlying market area:** Focusing on the most preferred outlying market area for each warehouse operation for which relocation would yield a cost savings, we model the relocation of warehouses in sequence from largest to smallest. The decision of the first warehouse wishing to relocate affects the capacity available in its chosen market area for the second warehouse. The decision of the second warehouse similarly affects capacity available in its chosen market area for the third, and so on. After modeling relocations to individual market areas, we tally the warehouse square footage relocated to each area. Exhibit 19 shows the assumed capacity available as the starting point for the analysis.
- **Step 4 – Model relocations to second most preferred outlying market area:** For those warehouses that were unable to relocate to their most preferred outlying market area due to capacity constraints, we move on to modeling relocations for the second most preferred market area. Starting with the largest of these warehouses, the decision of the first such warehouse affects the capacity available in its chosen market area for the second largest of these warehouses. The decision of the second largest of these warehouses similarly affects the capacity available in its chosen market area for the third largest, and so on. After modeling relocations to individual market areas, we tally the warehouse square footage relocated to each area.
- **Step 5 – Repeat Step 4 for the third, fourth, and fifth most preferred outlying market areas:** After modeling relocations to the second most preferred market area, we move on sequentially to the third, fourth, and fifth most preferred areas. After modeling relocations to individual market areas, we tally the warehouse square footage relocated to each area. Consideration of the sixth and seventh most preferred outlying market areas was not necessary to avoid capacity constraints.
- **Step 6 – Sum warehouse square footage relocated to each market area:** Based on the decisions modeled in the previous steps, we sum the total square footage relocated to each outlying market area.

The process outlined above yields the estimated square footage of warehouse space relocated to each outlying market area. To estimate the number of warehouse operations relocated to each market area, we divide these square footage values by the average square footage per warehouse modeled in this analysis (258,409 square feet). As noted above, the warehouses modeled include all warehouses affected by the ISR, excluding

cold storage warehouses and warehouses at manufacturing facilities. We follow this approach rather than reporting results for individual warehouses due to the uncertainties inherent in individual warehouse costs and relocation decisions. Because our analysis is based on average unit costs applied to all warehouses rather than costs data specific to individual warehouses and because relocation decisions at the individual warehouse level will be based on factors that we have not quantified here, results focused on relocations of individual warehouses would introduce a false sense of precision into the analysis.

EXHIBIT 19. AVAILABLE WAREHOUSE CAPACITY BY MARKET AREA AND CAPACITY SCENARIO (SQUARE FEET)

MARKET	CAPACITY SCENARIO	
	MEDIUM TERM	SLACK CAPACITY
Bakersfield	6,993,909	339,982,129
Coastal Areas	1,083,385	29,361,532
Desert Areas	12,469,835	328,554,568
Las Vegas	7,023,141	460,719,182
Phoenix ¹	35,764,196	28,756,628
San Diego	3,014,243	120,694,750
Western AZ	475,023	164,244,225
Notes: 1. Estimated medium term capacity for the Phoenix market exceeds slack capacity. This reflects CoStar's reporting of the square footage of parcels available for industrial development in the Phoenix area and CoStar's forecast of industrial development in the Phoenix area. As described in the source memo cited below, our slack capacity estimates are based on the former less the latter, plus projected vacancies. For the Phoenix area, the first part of this expression (i.e., the former less the latter) is a negative number, implying that future industrial developments exceed land zoned for industrial use. This could reflect an implicit assumption in the CoStar forecast that land not currently zoned for industrial development will be converted to industrial. It may also be due to the approach described in the source document below to adjust for the fact that CoStar does not distinguish between future developments on large parcels that can accommodate a 100,000 square foot warehouse and development on other parcels.		

Source: Values derived from CoStar data, as analyzed and reported in Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Jurisdiction, prepared by Derek Ehrnschwender and Jason Price, Industrial Economics, for South Coast AQMD. December 12, 2020.

RESULTS OF INDIRECT SOURCE RULE WAREHOUSE RELOCATION ANALYSIS

MEMORANDUM | 12 DECEMBER 2020

TO Victor Juan, Ian MacMillan, Paul Stroik, and Shah Dabirian, South Coast Air Quality Management District (South Coast AQMD)

FROM Jason Price, Derek Ehrnschwender, and Nick Manderlink; IEc

SUBJECT Results of Indirect Source Rule Warehouse Relocation Analysis

INTRODUCTION

This memo presents the results of IEc's analysis of potential warehouse relocations that might occur in response to the South Coast Air Quality Management District's (South Coast AQMD's) warehouse indirect source rule (ISR). The relocation results presented in this memo are based on the methods described in IEc's November 30, 2020 memo entitled "ISR Relocation Model – Methodology." Drawing on the approach presented in that memo, this analysis assumes a warehouse operator will relocate if the net costs of ISR compliance exceed the net costs of relocating outside the South Coast AQMD jurisdiction, as long as warehouse capacity is available in areas outside the South Coast AQMD.

The potential destination markets considered for warehouses located in the South Coast AQMD jurisdiction in this analysis include the following:

- **North of District, Bakersfield:** All of Kern County and the non-South Coast AQMD portion of Los Angeles County, including Lancaster and Palmdale.
- **North of District, Coastal:** All of Ventura County, Santa Barbara County, and San Luis Obispo County. Contains the Port of Hueneme, located in Ventura County.
- **East of District, Desert Areas:** All of Imperial County and the non-South Coast AQMD portions of San Bernardino County, including Victorville, and Riverside County.
- **South of District, San Diego:** All of San Diego County, which includes the Port of San Diego.
- **Las Vegas:** All of Clark County, Nevada, which includes the city of Las Vegas.
- **Phoenix:** All of Maricopa County and Pinal County, Arizona.
- **Western Arizona:** All of the four Arizona counties to the west of Phoenix: Yuma, La Paz, Mohave, and Yavapai counties.

SPECIFICATION OF ANALYTIC SCENARIOS

Our estimates of relocation depend on several factors, most significantly on our assumptions regarding the following:

- Each outlying market's capacity to absorb warehouses from the South Coast AQMD jurisdiction.

- The transportation distance implications of relocating to each outlying market.

To account for the uncertainty in these parameters, we estimate relocation under different analytic scenarios defined according to each of these parameters, as detailed below. Together these scenarios enable the estimation of low-end and high-end relocation estimates that bound our estimates of warehouse relocations. Scenarios that assume lower warehousing capacity in outlying markets will yield relocation estimates lower than scenarios that assume relatively high capacity availability. Similarly, scenarios that assume less specialization in the routing of goods will yield lower relocation estimates than scenarios that assume more routing specialization.

CAPACITY SCENARIOS

A key uncertainty in the relocation analysis is the capacity of outlying markets to absorb warehousing activity operating in the South Coast AQMD jurisdiction. Existing capacity in these outlying markets is fairly limited relative to the square footage of warehouse space in the South Coast AQMD jurisdiction, though warehouse space could be constructed on land zoned for industrial development in these areas. Whether and to what degree such development would occur in response to an ISR is a key question for the purposes of our analysis. To address this uncertainty, we estimate relocations under two capacity scenarios:

- **Medium-term capacity:** This measure of capacity includes current vacant capacity and new capacity proposed or currently under construction in the outlying market areas. This scenario, in effect, assumes no new construction of warehouse space beyond what is already planned in the outlying market areas. It provides a reasonable representation of capacity until such time that new capacity developments can obtain approval and complete construction.
- **Slack capacity:** This measure of capacity includes projected warehouse vacancies and also assumes all land that is (1) zoned for industrial development in the outlying market areas and (2) is within 2 miles of a major road is developed into warehouse space. Because it is unlikely that all this land would be developed into warehouse space, this measure of capacity represents an upper bound estimate of warehouse capacity in outlying markets.

For both capacity scenarios, we account for capacity constraints such that the warehouse square footage relocated to a given area does not exceed available capacity in that area.

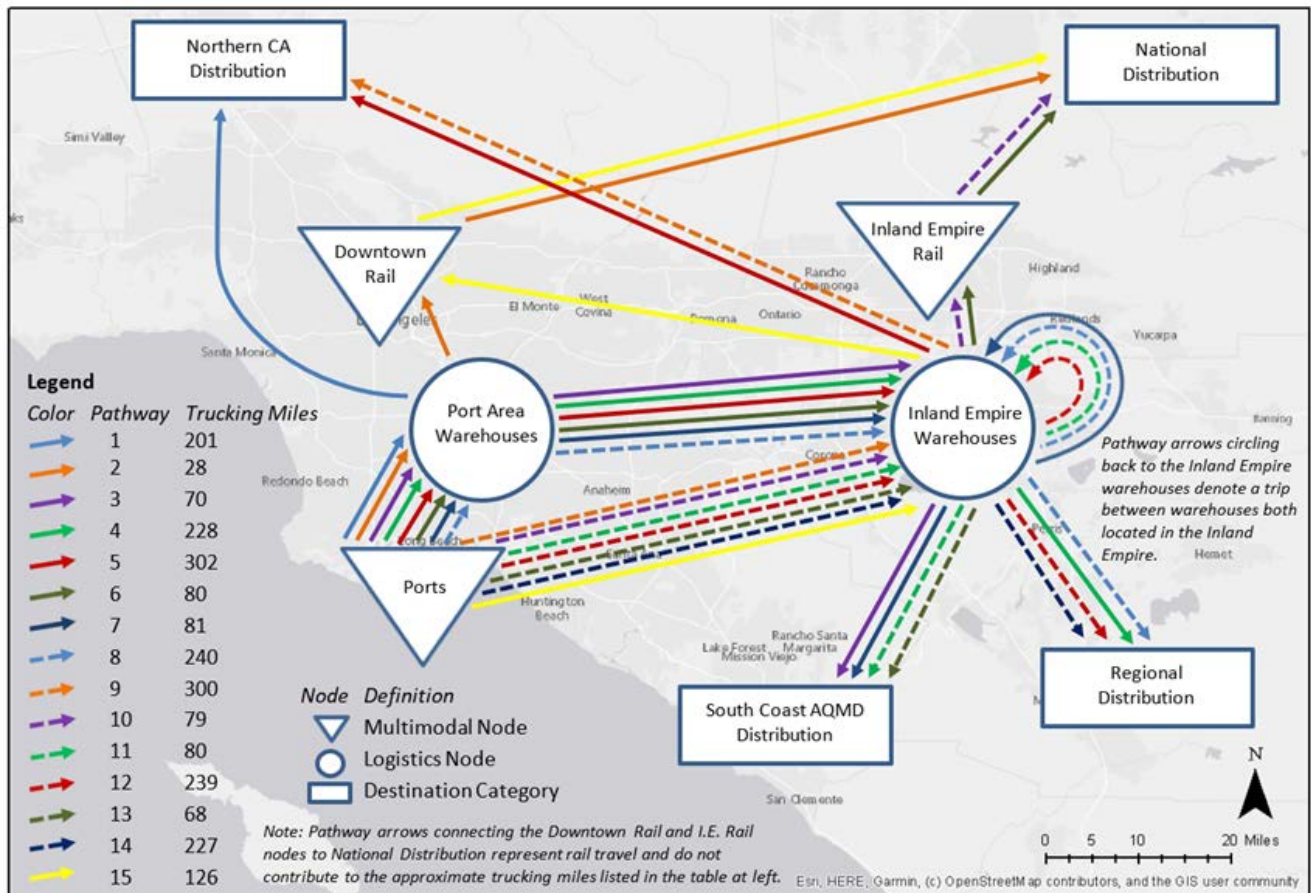

PATHWAY SCENARIOS

The single most important variable in estimating the transportation cost impacts of relocation is the change in transport distance. The change in distance depends on both the route goods follow through the South Coast AQMD jurisdiction and the specific outlying market area to which a warehouse might relocate. To account for the routing of goods, we rely on a series of goods flow pathways derived from Leachman (2017) and the Bureau of Transportation Statistics' Commodity Flow Survey.¹ Shown in Exhibit 1, each of these goods-flow pathways represents a routing of goods through the South Coast AQMD jurisdiction. If a warehouse were to relocate outside of the area, the flow of goods

¹ Leachman, R. 2017. "Strategic Initiatives for Inland Movement of Containerized Imports at San Pedro Bay." Institute for Transport Studies, University of California at Berkeley.

handled by that warehouse would deviate from one or more of the pathways shown in Exhibit 1, potentially leading to an increase in transport distance (and costs).

EXHIBIT 1. GOODS FLOW PATHWAYS

PATHWAY	SOUTH COAST AQMD LOGISTICS NODE 1	SOUTH COAST AQMD LOGISTICS NODE 2	SOUTH COAST AQMD LOGISTICS NODE 3	DESTINATION
1	Port Area	-	-	Truck to Northern California Distribution
2	Port Area	-	-	Downtown Rail to National Distribution
3	Port Area	Inland Empire	-	Truck to South Coast AQMD Regional Distribution
4	Port Area	Inland Empire	-	Truck to Non-District Regional Distribution
5	Port Area	Inland Empire	-	Truck to Northern California Distribution
6	Port Area	Inland Empire	-	Inland Empire Rail to National Distribution
7	Port Area	Inland Empire	Inland Empire	Truck to South Coast AQMD Regional Distribution
8	Port Area	Inland Empire	Inland Empire	Truck to Non-District Regional Distribution
9	Inland Empire	-	-	Truck to Northern California Distribution
10	Inland Empire	-	-	Inland Empire Rail to National Distribution
11	Inland Empire	Inland Empire	-	Truck to South Coast AQMD Regional Consumption
12	Inland Empire	Inland Empire	-	Truck to Non-District Regional Consumption
13	Inland Empire	-	-	Truck to South Coast AQMD Regional Consumption
14	Inland Empire	-	-	Truck to Non-District Regional Consumption
15	Inland Empire	-	-	Downtown Rail to National Distribution

The change in transport distance associated with relocating to each of the outlying market areas identified above depends on the distribution of goods (and truck trips) across each of the pathways shown in Exhibit 1. Thus, the transportation cost implications associated with a warehouse's relocation depend on the pathway(s) in Exhibit 1 that the warehouse serves. Any given warehouse could, theoretically, serve all 15 pathways, a single pathway, or any combination of the pathways shown in Exhibit 1.

To capture the uncertainty associated with the pathway(s) a given warehouse serves, we estimate relocation under two pathway scenarios:

- **Composite pathway:** Under this scenario, we assume each warehouse is representative of the warehousing sector as a whole in the South Coast AQMD jurisdiction and serves all 15 pathways shown in Exhibit 1 in proportion to the goods flow associated with each pathway. Under this approach the change in transport distance associated with relocating to a given outlying market area is the weighted average of the change in distance for all 15 pathways, using the goods volumes associated with each pathway as weights.
- **Specialized pathway sensitivity:** The specialized pathway sensitivity scenario allows for the possibility of pathway specialization, with the exception of a limited number of pathways. To assess relocations with specialization, we conduct the analysis iteratively one pathway at a time, assuming all warehouses are on a given pathway for each iteration of the analysis. After running the analysis for all pathways, we calculate the weighted average of the resulting warehouse relocation estimates, using the goods volumes associated with each pathway as weights.

This scenario models specialization across most pathways. Based on a survey of warehouses conducted by South Coast AQMD, it is unlikely warehouses in the South Coast AQMD jurisdiction specialize in the pathways on which goods are routed to northern California. Among the surveyed warehouses that ship goods to northern California, goods on this route accounted for no more than 40 percent of the goods handled.² Given that Oakland is a major port city and that approximately 75 percent of the cargo ships that deliver goods to the San Pedro ports also stop at the Port of Oakland,³ this finding is not surprising. Based on this information, the specialized pathway sensitivity scenario assumes that 40 percent of the goods flow handled by warehouses that serve northern California are bound for northern California and that the remaining 60 percent remains in the South Coast AQMD jurisdiction or is distributed nationally.

As indicated above, the pathway and capacity scenarios, together, yield varying estimates of warehouse relocations associated with the ISR. These scenario combinations, listed in increasing number of warehouse relocations, are as follows:

- Composite pathway, medium term capacity

² South Coast AQMD, SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results, June 2014, available at <http://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/business-survey-summary.pdf?sfvrsn=2>.

³ South Coast AQMD staff analysis of the IHS-Seaweb data.

- Composite pathway, slack capacity
- Specialized pathway sensitivity, medium term capacity
- Specialized pathway sensitivity, slack capacity

The results below provide additional insights on the number of relocations associated with these scenarios.

ISR SCENARIOS ANALYZED The scenarios analyzed by IEC represent different levels of rule stringency under a potential ISR. As described in the 6 October 2020 draft rule text released to the public, the ISR will give warehouse operators significant flexibility in how they meet the requirements of the rule. For example, warehouse operators may choose combinations of various emissions reduction measures to accumulate a required number of Warehouse Actions and Investments to Reduce Emissions (WAIRE) points, or they may pay a mitigation fee that will finance efforts within the South Coast AQMD jurisdiction to reduce trucking-related NO_x emissions. In both cases, the costs incurred by a warehouse operator will depend, in part, on the number of truck trips to and from the warehouse. If warehouse operators lack information on the number of trips to and from a warehouse, they may estimate the number of annual truck trips based on the warehouse's square footage and the truck trip rates stipulated in the rule itself.

Due to the significant flexibility afforded by the ISR, the compliance strategy that would be implemented by a given warehouse is highly uncertain and would likely depend on warehouse-specific factors that we are not able to account for in this analysis. Such factors may include the physical configuration of a warehouse, space available for onsite electric vehicle charging infrastructure, and whether the warehouse operator owns its own fleet of trucks. Because we are not able to account for these and other site-specific factors that may influence compliance decisions, we analyze scenarios specified as an annual cost per square foot of warehouse space, at different levels of regulatory stringency. These values, as provided to IEC by South Coast AQMD staff, reflect what the mitigation fee would potentially be at different levels of stringency, based on the truck trip rates included in the ISR. Exhibit 2 lists each of these scenarios. For each of the scenarios shown in Exhibit 2, we compare the costs of relocation to the costs of compliance to determine the number of warehouses likely to relocate.

EXHIBIT 2. ISR COMPLIANCE COST SCENARIOS ANALYZED

SCENARIO	COST PER SQUARE FOOT (YEAR 2019\$)
Scenario 1	\$0
Scenario 2	\$0.50
Scenario 3	\$1.00
Scenario 4	\$1.50
Scenario 5	\$1.75
Scenario 6	\$2.00

RESULTS

Exhibits 3A through 3F summarize the estimated number of warehouse relocations for each of the ISR scenarios listed in Exhibit 2. For each ISR compliance cost scenario, the exhibits show the estimated number of relocations for each combination of pathway scenario and capacity scenario at a discount rate of one percent. We also conducted the analysis based on a discount rate of four percent, and the results, which are available upon request, are identical to those presented here. In addition, the exhibits show the total number of relocations to all outlying markets, as well as the distribution of relocations across outlying markets. For example, Exhibit 3E shows 16 relocations when the ISR compliance cost is \$1.75 per square foot under the specialized pathway sensitivity, slack-capacity scenario. Of the 16 relocations, 6 are to the North of District/Bakersfield market area.

The results in Exhibit 3A show we project up to 10 warehouse relocations when compliance costs are \$0 per square foot, suggesting up to 10 warehouses in the South Coast AQMD jurisdiction may relocate in the absence of the ISR.

This result, in part, reflects the assumptions of the specialized pathway sensitivity scenario. As described above, we examine warehouse relocation iteratively for individual pathways under the specialized pathway sensitivity scenario. For individual iterations of the analysis, all warehouses are assumed to be on just one of the pathways shown above in Exhibit 1. After estimating relocations associated with individual pathways, we calculate the weighted average of the warehouse relocations projected across each of the iterations of the analysis, using the volume of goods on each pathway as weights.

Therefore, for some iterations of the analysis, we assume several warehouses are exclusively on pathways on which relocation is advantageous, even though they may not be on these pathways at all, or may simultaneously be on other pathways on which relocation is less advantageous. For this reason, we consider the specialized pathway sensitivity scenario results to be very conservative estimates of warehouse relocation.

In practice, the warehouses projected to relocate with \$0/square foot in ISR compliance costs may be on multiple pathways that, when examined together, would not suggest warehouse relocation. This is borne out under the composite distance pathway scenario (i.e, when warehouses are assumed to serve all pathways in proportion to the goods flow on each pathway), as no warehouses are projected to relocate under this scenario when ISR compliance costs are \$0 per square foot.

While the 10 warehouse relocations projected under the \$0 ISR compliance cost scenario may suggest several warehouses will find it advantageous to relocate in the absence of the ISR, we do not currently observe such relocations occurring. This reflects the fact that the results in Exhibits 3A through 3F likely overstate relocations under the \$0 per square foot ICR compliance cost scenario as well as scenarios with costs greater than \$0. This overestimation of relocations is likely due to several factors we are not able to capture quantitatively in our analysis, including, but are not necessarily limited to, the following:

- ***Labor availability:*** In many of the outlying markets, the labor force is significantly smaller than in the South Coast AQMD jurisdiction. With a smaller labor pool to draw from, warehouse operators may be reluctant to commit to relocation.
- ***Proximity to customers:*** While our analysis captures the transportation cost impact of relocating, the value of proximity to customers may go beyond the change in transportation costs. For example, proximity is important for meeting customer expectations/demands with respect to delivery time.
- ***Risk of warehouse development in outlying markets:*** Most of the warehouse relocations projected by our analysis are under the slack capacity scenario, under which land zoned for industrial use may be developed into warehouse space. Although land is available in most outlying markets to develop warehouse space, warehouse developers may find such investments too risky to pursue.

Other than potential demand from warehouse operators relocating from the South Coast AQMD jurisdiction, warehouse owners would have limited clientele to support significant growth in the warehouse sector in these outlying markets. If market conditions were to change in the South Coast AQMD jurisdiction after development of the ISR, warehouse operators may move back after their lease ends, leaving owners of newly constructed warehouses in the outlying markets with no source of revenue. Due to this risk, investors may be reluctant to build new warehouse space in these markets.

- ***Barriers to warehouse development in outlying markets:*** Large-scale warehouse developments in the outlying market areas may encounter resistance in obtaining project approval. Local planning boards and the residents who they represent may seek to limit the number of warehouse developments due to concerns about increased truck traffic, the aesthetic impacts of multiple warehouse developments, or other concerns.

Because relocations are projected under the \$0 ISR compliance cost scenario due to the factors outlined above, we estimate relocations for each ISR compliance cost scenario as the difference between relocations for that scenario and relocations projected when ISR compliance costs are zero. For example, with ISR compliance costs of \$1.75 per square foot under the specialized pathway sensitivity scenario and the slack capacity scenario, we estimate 6 warehouse relocations (16 relocations as presented in Exhibit 3E less 10 relocations as presented in Exhibit 3A). Applying this approach, Exhibit 4 presents the number of relocations incremental to those projected with an ISR compliance cost of \$0 per square foot.

EXHIBIT 4. WAREHOUSE RELOCATIONS, INCREMENTAL TO RELOCATIONS WITH ISR COSTS OF \$0 PER SQUARE FOOT

PATHWAY SCENARIO	CAPACITY SCENARIO	DISCOUNT RATE	RELOCATIONS (NO. OF WAREHOUSES)

	Slack Capacity	1%	6	6	0	0	0	0	0	0
Composite	Medium Term	1%	0	0	0	0	0	0	0	0
	Slack Capacity	1%	0	0	0	0	0	0	0	0

As shown in Exhibit 4, the incremental number of warehouse relocations varies from none when ISR costs are \$0.50 per square foot to as high as 6 when ISR costs are \$2.00 per square foot. Notably, no relocations are projected under the medium-term capacity scenario (when capacity in outlying markets is limited to current vacant capacity and new capacity proposed or currently under construction), incremental to the \$0 per square foot ISR compliance cost scenario. This reflects the more limited capacity available under this scenario.

As context for the results presented in Exhibit 4, we estimate that 2,687 warehouses are likely to be affected by the ISR.⁴ Thus, the projection of up to 6 warehouses relocating represent 0.2 percent of the universe of affected warehouses.

Our analysis also projects no warehouse relocations under the composite pathway scenario (i.e., when each warehouse is assumed to serve all 15 goods flow pathways). This finding is true both incremental to the \$0 ISR compliance cost scenario (results in Exhibit 4) and for each scenario individually, prior to netting out the relocations projected when ISR compliance costs are \$0 per square foot (results in Exhibits 3A to 3F).

The lack of relocations under the composite pathway scenario reflects the significant increase in transport distance for some pathways. Because the composite scenario models relocation based on the weighted average change in distance across all pathways, a significant increase in distance for a small number of pathways that account for a large portion of the goods flow drives up the weighted average change in transport distance such that the increased transportation costs associated with relocation outweigh any cost savings. For example, while relocation to the Bakersfield market area may reduce transport distance slightly for some pathways, transport distance increases by more than 130 miles one-way for pathway 2 and more than 245 miles for pathway 13; together these pathways account for approximately 39 percent of the goods flow volume.

Exhibit 4 shows most warehouse relocations, incremental to the \$0 per square foot ISR compliance cost scenario, are concentrated in the Bakersfield market area under the specialized pathway sensitivity scenario and the slack capacity scenario. This result is driven by the lower rental costs in the Bakersfield Area (\$4.03 per square foot per year) relative to the South Coast AQMD (\$10.61 per square foot per year).⁵ While transportation costs will increase if warehouses relocate to the Desert Areas, the increase is small enough for some northbound pathways that the rental cost savings are sufficient to yield a cost savings for these pathways.

This concentration of relocations in the Bakersfield market area differs slightly from the results shown in Exhibits 3A through 3F, which are *not* incremental to the \$0 per square foot ISR compliance cost scenario. Although those results show a significant concentration of relocations in the Bakersfield area, they show a greater number of

⁴ This figure reflects the sum of non-manufacturing warehouses and warehouses at manufacturing facilities as presented in "Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Jurisdiction", prepared by Derek Ehrnschwender and Jason Price of Industrial Economics, prepared for the South Coast AQMD, 12 December 2020.

⁵ Rent values obtained from CoStar, as summarized in "Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Jurisdiction", prepared by Derek Ehrnschwender and Jason Price of Industrial Economics, prepared for the South Coast AQMD, 12 December 2020. Additional information on the costs considered in the analysis is available in "Indirect Source Rule Relocation Model - Methodology", prepared by Derek Ehrnschwender, Jason Price, and Nick Manderlink of Industrial Economics, prepared for the South Coast AQMD, 12 December 2020.

warehouses relocating to the Desert Areas. Because all of these relocations to the Desert Areas are projected when ISR compliance costs are \$0 per square foot, they are netted out of the relocations reflected in Exhibit 4.

RELOCATIONS BY GOODS PATHWAY

For additional insights on projected warehouse relocations under the specialized pathway sensitivity scenario, the appendix to this memo shows warehouse relocations by goods pathway and outlying market. The appendix presents these results individually by ISR compliance cost scenario, without netting relocations under the \$0 ISR compliance cost scenario. As shown in the appendix pathway 15 accounts for all projected warehouse relocations (under the slack capacity scenario). On this pathway, goods are trucked to an intermodal rail terminal for national distribution.

SENSITIVITY ANALYSIS

The results presented above reflect average trucking costs of \$1.84 per mile for Class 8 trucks and \$1.77 per mile for Class 4-7 trucks, based on costs data published by the American Transportation Research Institute.⁶ To assess the sensitivity of our results to alternative trucking unit cost values, we also conducted sensitivity analyses based on truck cost data from Freightwaves, which reports lower- and upper-bound estimates of \$1.16 and \$3.05 per mile, respectively.⁷

For the composite pathway scenario, we project no warehouse relocations when using either of these alternative trucking cost values, consistent with the primary results presented above. When we assess potential warehouse relocations under the specialized pathway sensitivity scenario, however, we find the use of alternative trucking cost assumptions has a significant effect on the estimated number of warehouse relocations.

Focusing on relocations incremental to the \$0 ISR compliance cost scenario, we project no relocations under the high trucking cost assumptions. This reflects the significant increase in transportation costs associated with relocating warehouses to the outlying market areas.

When using the low trucking cost assumptions, we project more relocations than when using the central trucking cost value. Across all five ISR compliance cost values, we estimate that 22 warehouses will relocate, compared to six warehouses based on our primary trucking cost assumptions. Exhibit 5 graphically illustrates the degree to which the assumed trucking cost affects the estimated number of warehouse relocations (under the specialized pathway sensitivity scenario).

EXHIBIT 5. COMPARISON OF ESTIMATED WAREHOUSE RELOCATIONS UNDER ALTERNATIVE TRUCKING COST ASSUMPTIONS (SLACK CAPACITY, SPECIALIZED PATHWAY SENSITIVITY SCENARIO, 1% DISCOUNT RATE)

LIMITATIONS AND UNCERTAINTIES

The results presented above provide a reasonable representation of the warehouse relocations that may occur in response to the ISR and reflect the best information available on the factors that are likely to affect relocation decisions. Nevertheless, we acknowledge that the analysis is subject to a number of uncertainties, the most significant of which are summarized in Exhibit 6.

EXHIBIT 6. KEY UNCERTAINTIES AND IMPLICATIONS FOR RESULTS

DESCRIPTION OF UNCERTAINTY	IMPLICATIONS FOR RESULTS
Pathway uncertainty: This analysis relies on the concept of goods flow pathways to estimate the change in transportation distance associated with warehouse relocation. However, we do not know the pathways that individual warehouses serve. Absent such information, the pathway scenarios described above (i.e., composite pathway scenario and specialized pathway sensitivity scenario) provide a means of bounding the estimated number of relocations to account for this uncertainty.	Estimating the number of warehouse relocations under two pathway scenarios leads to a wide range of results. Whether the likely number of relocations is closer to the low end or high end of the range depends on the degree to which warehouse operations are more consistent with the composite scenario (warehouses serve all goods flow pathways) or the specialized pathway sensitivity scenario (warehouses specialize in individual pathways).
Unquantifiable factors: Our assessment of relocation decisions accounts for all factors that we are able to quantify with readily available data, specifically data related to the costs associated with remaining in the South Coast AQMD jurisdiction or relocating to an outlying market area. A number of factors that we are unable to quantify, however, may influence relocation decisions. These include (1) the	Many of these unquantifiable factors represent reasons why warehouse operators may want to remain in the South Coast AQMD. This suggests that our analysis may overestimate the number of warehouses that decide to relocate outside the area.

DESCRIPTION OF UNCERTAINTY	IMPLICATIONS FOR RESULTS
<p>degree to which labor availability in outlying markets affects the decisions of warehouse operators, (2) advantages of being in close proximity to customers, (3) financial risks associated with developing warehouse space in outlying markets, and (4) barriers to developing warehouse space in outlying market areas.</p>	
<p>Assumption of no change in goods flow traffic: An implicit assumption of our analysis is that the volume of goods flowing through the South Coast AQMD jurisdiction would remain unchanged as a result of the rule. In practice it is possible the ISR could lead to a reduction in the volume of goods flowing through the region (e.g., through a reduction in import traffic at the Port of Long Beach). This reduction in volume could lead to warehouse relocation (e.g., to the port areas where goods are sent instead of the Port of Long Beach). Our analysis does not capture this effect.</p>	<p>To the degree goods are diverted away from the South Coast AQMD jurisdiction due to the ISR, we may underestimate the number of warehouse relocations.</p>
<p>Rents held constant: For the purposes of simulating the relocation decision-making process of warehouse operators, we held warehouse rents in the South Coast AQMD jurisdiction and in outlying markets constant at current levels. To the extent rent differences between the South Coast AQMD jurisdiction and outlying markets change over time, we may not accurately capture the relocation decisions of warehouse operators.</p>	<p>Absent knowledge of the degree to which relative rents are likely to change over time, we find it highly speculative to take a stance on whether the assumption of constant rents leads to underestimation or overestimation of relocations. However, the relocation of warehouses outside the SCAQMD jurisdiction could put upward pressure on rents in outlying markets and downward pressure on rents in the South Coast AQMD jurisdiction. Combined, these effects would narrow the difference between rent in the South Coast AQMD jurisdiction and less costly outlying markets, potentially limiting the number of warehouse relocations.</p>

APPENDIX.

PROPOSED RULE 2305 - WAREHOUSE INDIRECT SOURCE RULE - WAREHOUSE ACTIONS AND INVESTMENTS TO REDUCE EMISSIONS (WAIRE) PROGRAM AND PROPOSED RULE 316 - FEES FOR RULE 2305

SOUTH COAST AQMD GOVERNING BOARD MEETING
MAY 7, 2021

WAREHOUSE ISR DEVELOPMENT BACKGROUND

- 2016 AQMP introduced the Facility Based Mobile Source Measures
 - Warehouses are largest source of NOx of five facility sectors
- Staff initiated year-long process to identify potential for voluntary approach
- Pivot to regulatory approach following Board direction May 2018
 - Proposed Rules 2305 and 316
- Warehouse ISR also included in four AB 617 Community Emission Reduction Plans

Extensive Public Outreach

- 12 working group meetings
- 7 updates to Mobile Source Committee
- 2 updates to Board
- 1 public workshop, 1 community meeting, and 1 CEQA scoping meeting
- Many additional presentations to South Coast AQMD advisory groups, AB 617 Community Steering Committees, industry associations, etc.

NEED FOR PR 2305 - FEDERAL AIR QUALITY STANDARDS

Baseline Ozone in 2023 (from 2016 AQMP)

- Ozone control strategy requires 45% and 55% NO_x reduction by 2023 and 2031
 - Trucks are largest source of NO_x
- Failure to carry out the 2016 AQMP can result in federal sanctions
 - PR 2305 satisfies control measure commitment & contributes to emission reductions needed to reach attainment

NEED FOR PR 2305 - LOCAL & CUMULATIVE IMPACTS

- About 1,040 public/private schools and daycares within 0.5 miles of a warehouse

OVERVIEW OF PR 2305

Applicability

- Owners and operators of warehouses $\geq 100,000$ sf
- Owners are only subject to reporting, but they can voluntarily earn points

Phase-In

- Starting Jan. 1 2022, warehouses introduced into program over 3 years
- Largest are first
- Once in, stringency increases over 3 years

Requirements

Annually Earn WAIRE Points

Warehouse Actions and Investments to Reduce Emissions (WAIRE) Menu

Mitigation Fee

Custom WAIRE Plan

Limited transferring/banking with early or over-compliance

Funds projects in communities near warehouses that paid the mit. fee

Reporting

Warehouse Operations Notification

Use Charger MWh (Points)	0	0 (0)	45 (12)	165 (42)	270 (69)
Points in the Bank for Following Year	0	(58)	(41)	(130)	(101)
Cost of Compliance	0	\$107,564	\$113,431	\$56,716	\$50,848

EXAMPLES: NZE YARD TRUCK ACQUISITION AND USAGE

Median warehouse size (phase 3) in Riverside County

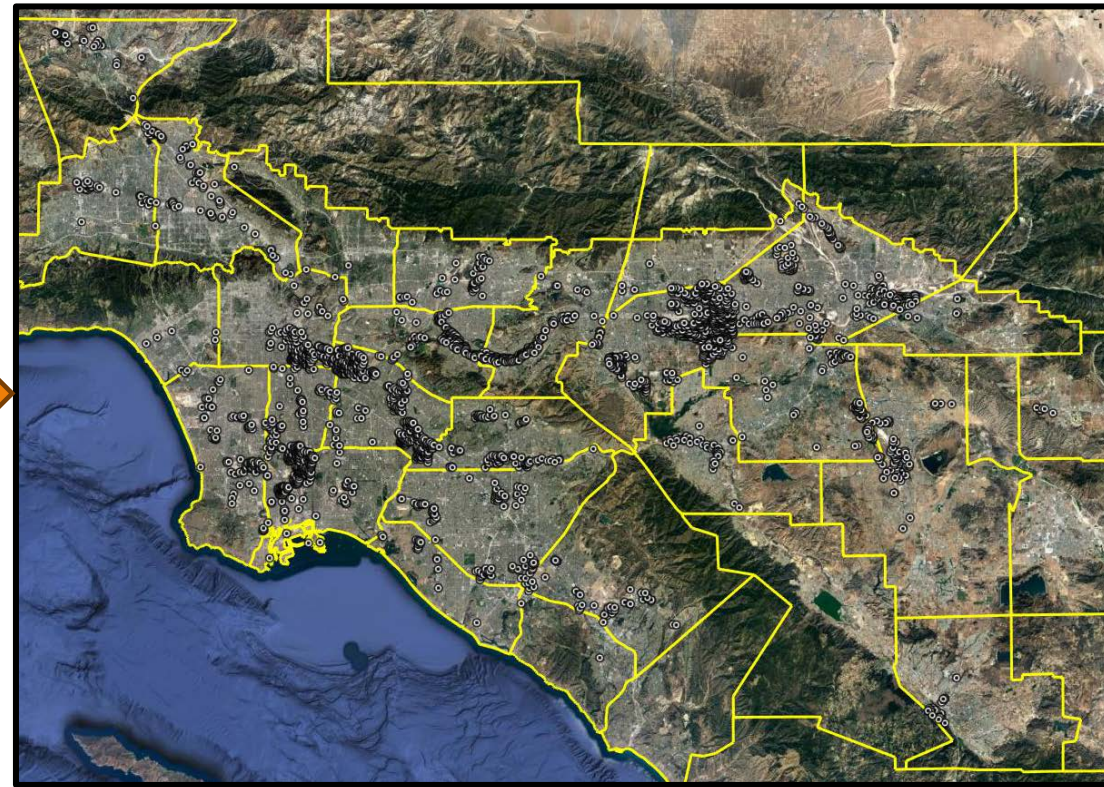

NZE

	Year 1 (2022)	Year 2 (2023)	Year 3 (2024)	Year 4 (2025)	Year 5 (2026)
<i>WAIRE Points Compliance Obligation</i>	0	0	26	51	76
Acquire NZE Yard Trucks (Points)	0	0	1 (42)	0 (0)	0 (0)
Use NZE Yard Trucks hrs/yr (Points)	0	0	500 (144)	1,000 (288)	1,000 (288)
Points in the Bank for Following Year	0	0	(160)	(397)	(609)
Cost of Compliance	0	0	\$62,138	\$11,093	\$11,093

SPENDING APPROACH FOR WAIRE MITIGATION PROGRAM

- WAIRE Mitigation Program would be funded by mitigation fees paid by warehouse operators
 - Leverage extensive South Coast AQMD experience with incentive programs
- Key elements of proposed program
 - Funding supports local projects around warehouses that paid the fee
 - Within SRAs and counties
 - Funds held in separate South Coast AQMD Special Revenue Fund
 - Funding for NZE/ZE trucks and ZE charging and fueling infrastructure
 - Require skilled and trained workforce for infrastructure
 - Public process during solicitations and prior to awarding funds to receive local community feedback
- Commitment on WAIRE Program elements in Board Resolution

PR 2305 Warehouses and Source Receptor Areas

NOx Emissions Associated with PR 2305 Warehouses

Effect of PR 2305 with Recent CARB Regulations

- Baseline (2016 AQMP)
- Baseline (with CARB's ACT, Low NOx, HD I&M)
- PR 2305

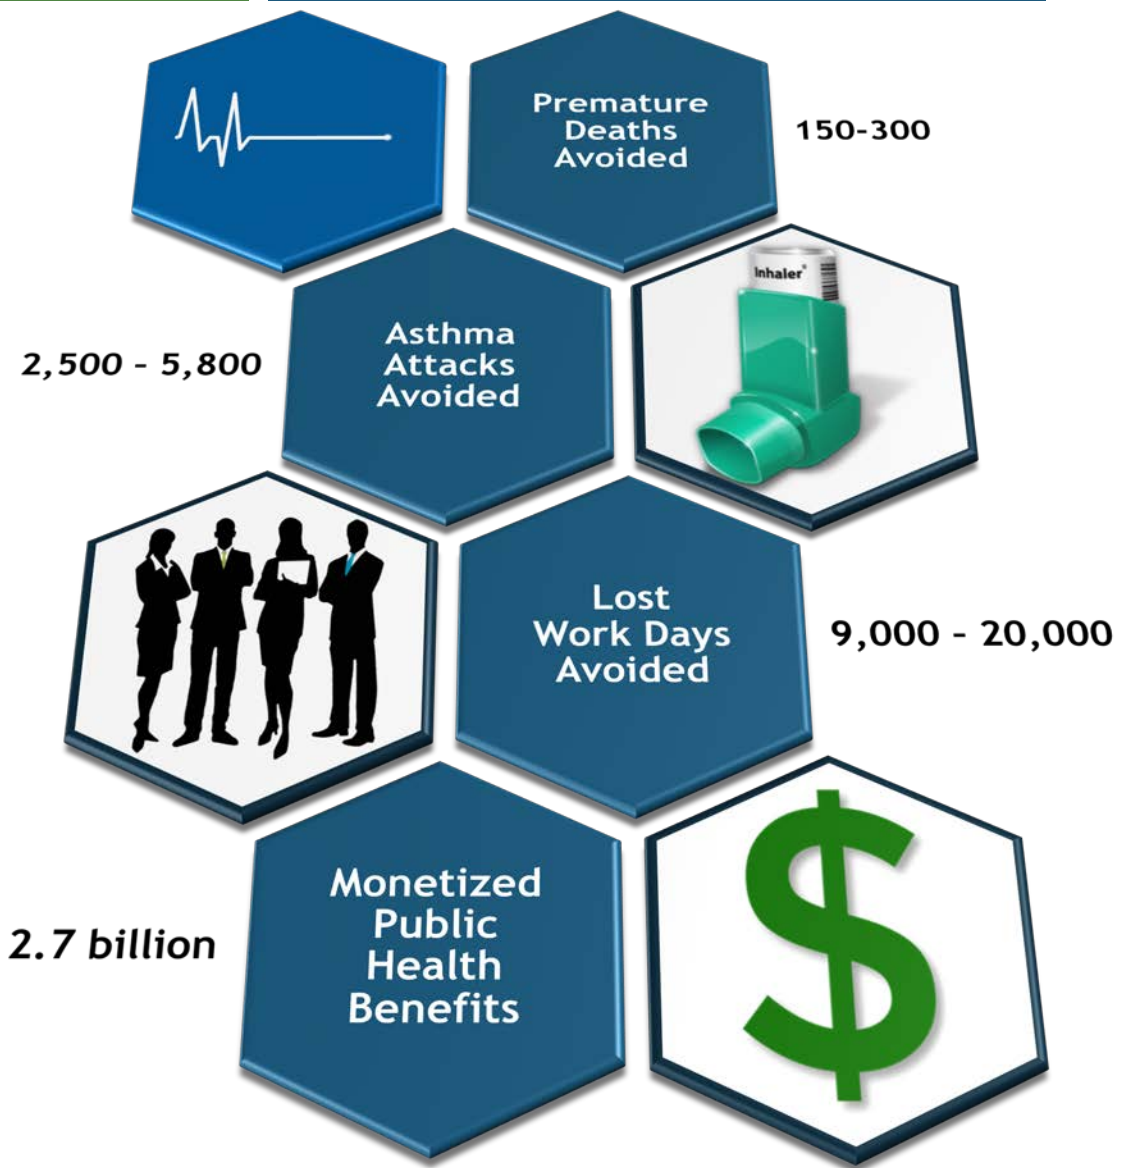

WAREHOUSE ISR COSTS & PUBLIC HEALTH BENEFITS

Example Costs for a Warehouse Operator

PR 2305 could potentially increase cost of goods by about 0.05%

- Public health benefits exceed compliance costs by about 3:1
- Benefits from reducing regional pollution are ~20-25% greater per capita in EJ communities

Expected Benefits Through 2031

KEY CONCERNS RAISED BY STAKEHOLDERS

Issue	Staff Response
<ul style="list-style-type: none"> ➤ Legal authority to adopt PR 2305 (existing vs. new sources, federal pre-emption, mitigation fee perceived as a tax) 	<ul style="list-style-type: none"> ➤ South Coast AQMD has clear authority to adopt PR 2305 in state and federal law for existing and new sources ➤ Case law strongly supports PR 2305 approach ➤ In-lieu mitigation fee is not a tax, and does not need to be paid if other options chosen
<ul style="list-style-type: none"> ➤ Feasibility (warehouses don't control all trucks) 	<ul style="list-style-type: none"> ➤ Warehouse operators don't need to choose a truck option ➤ About 40% of warehouse operators own trucks, and others contract directly with trucking companies <ul style="list-style-type: none"> ➤ Warehouse operators can work with trucking companies and/or goods owners to arrange for NZE or ZE trucks ➤ If operators choose truck options, only about 10-15% of truck visits need to be NZE/ZE
<ul style="list-style-type: none"> ➤ Overlap with CARB regulations 	<ul style="list-style-type: none"> ➤ PR 2305 would achieve surplus emission reductions as soon as 2022. CARB rules targeting 2035-2045.
<ul style="list-style-type: none"> ➤ Stringency of rule is too high/low 	<ul style="list-style-type: none"> ➤ Recommended stringency balances many competing factors (air quality need, public health, cost, feasibility, etc.)

STAFF RECOMMENDATION

- Adopt Board Resolution:
 - Certify Final Environmental Assessment for PR 2305 and PR 316
 - Adopt PR 2305 and PR 316
 - Direct Executive Officer to submit PR 2305 for inclusion into the SIP
- Establish Rule 2305 Mitigation Fee Alternate Compliance Fund
- Authorize the Executive Officer to recognize mitigation fees paid by warehouse operators upon receipt into Rule 2305 Mitigation Fee Alternate Compliance Fund

SUPPLEMENT TO AGENDA ITEM #27

Board Meeting of May 7, 2021

The South Coast AQMD has continued to receive numerous public comment letters for Item No. 27 Certify Final Environmental Assessment and Adopt Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305, Submit Rule 2305 for Inclusion Into the SIP, and Approve Supporting Budget Action, since the release of the Governing Board agenda package last week. Based on the comments received, this supplement has been prepared to provide additional information to the Governing Board and the public.

This supplement does not involve any changes to Proposed Rule 2305 or Proposed Rule 316. *See*, Health and Safety Code section 40726. Instead, the first supplement is a clarification to the WAIRE Implementation Guidelines to specifically identify a type of action that may be permissible in a Custom WAIRE Plan. The remaining two supplements provide clarifying responses to issues raised in comment letters received on May 4, 2021 from Airlines for America and the law firm of Holland & Knight, representing the California Trucking Association (letters attached). An agency may choose to provide written responses to comments provided outside of the public comment period even though written responses are not required. *See*, e.g., 14 Cal. Code Regs. section 15088(a).

Supplement Number One-Clarification to the WAIRE Mitigation Plan Guidelines [Agenda Item No. 27, Attachment I, Staff Report, Appendix A, page 103, second paragraph, add:

“A Custom WAIRE Plan allows for local hire to be counted as points towards compliance with the rule by reducing employee commute emissions. Use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component can help demonstrate those emission reductions.”

Supplement Number Two-Response to Letter from Airlines for America, dated May 4, 2021 (Attachment A)

I. PR 2305 is not preempted by federal law.

A. PR 2305 is not preempted by the federal Clean Air Act.

The letter makes several arguments that PR 2305 is preempted by the federal Clean Air Act (“CAA” or “Act”). As explained previously in our responses to the California Trucking Association letter of March 2, 2021 (“CTA Letter”), these arguments lack merit.

First, the letter suggests that PR 2305 is preempted by the provisions relating to indirect source regulation (“ISR”) in CAA section 110. 42 U.S.C. § 7410(a)(5). It contends that section 110 preempts any ISR programs other than those applicable to new sources. This argument is

precluded by section 116 of the CAA, which expressly disclaims any preemption of state law beyond that effected by several enumerated sections of the Act. 42 U.S.C. § 7416. Except as specified in the enumerated sections, “nothing in this chapter shall preclude or deny the right of any State or political subdivision thereof to adopt or enforce (1) any standard or limitation respecting emissions of air pollutants or (2) any requirement respecting control or abatement of air pollution.” *Id.* The enumerated sections do not include section 110.¹ The savings provision in section 116 thus makes clear that section 110 cannot preempt PR 2305.

Even putting aside section 116, the ISR provisions in section 110 were clearly not intended to preempt state regulation of indirect sources. The language in section 110(a)(5) was adopted as part of the 1977 Clean Air Act Amendments to limit EPA’s authority to require ISR in SIPs, not to restrict states’ authority to develop their own programs under state law. The legislative history confirms this interpretation. *See* H.R. Rep. No. 95-294 (1977), *reprinted in* 1977 U.S.C.C.A.N. 1077; H.R. Conf. Rep. No. 95-564, *reprinted in* 1977 U.S.C.C.A.N. 1502; *see also Nat’l Ass’n of Home Builders v. San Joaquin Valley Unified Air Pollution Control Dist.*, 627 F.3d 730, 737-38 (9th Cir. 2010) (“*NAHB*”). Indeed, the comment letter in section 2 emphasizes that the 1977 amendments were adopted to curtail EPA’s authority to require ISR programs in SIPs in response to rules proposed by EPA to require review of new indirect sources. The reference to states’ ability to develop their own programs was included merely to clarify that the statutory language was intended only to limit EPA’s authority to *mandate* inclusion of ISR requirements in SIPs, not to limit the requirements that states could choose to adopt.² *See also NAHB*, 627 F.3d at 738 (the 1977 amendments “‘left largely to the states’ the matter of ‘whether and how to regulate’ indirect sources”) (quoting *Sierra Club v. Larson*, 2 F.3d 462, 467 (1st Cir. 1993)).

Second, the letter contends that CAA section 209(e) preempts the proposed rule. The letter adopts the comments provided by CTA on section 209 preemption, to which District counsel has already responded. However, the CTA letter did not assert preemption under section 209(e), which addresses emission standards for off-road vehicles and engines, but rather argued that PR 2305 is preempted by section 209(a), which applies to on-road vehicles and engines. Regardless, the same analysis applies to both provisions, which, as noted in District counsel’s response to the CTA Letter, are not meaningfully different. *See* Response to CTA Letter at 5 n.5. As explained in the response to the CTA Letter, both arguments are precluded by the Ninth

¹ Counsel for the District noted this in responding to the CTA Letter. *See* Response to CTA Letter at 3 n.2.

² The original version of section 110 adopted by the 1970 CAA amendments provided that SIPs must “include[] emission limitations, schedules, and timetables for compliance with such limitations, and such other measures as may be necessary to insure attainment and maintenance of such primary or secondary standard, including, but not limited to, land-use and transportation controls.” Pub. L. No. 91-604, § 4(a) (1970) (adding section 110(a)(2)(B)). Because this language would certainly include ISR programs of all kinds, the comment’s position necessarily implies that Congress intended in 1977 to *strip* states of their preexisting authority to adopt their own regulation of existing indirect sources. The comment offers no explanation or support for that implausible proposition.

Circuit’s decision in *NAHB*, which rejected a similar challenge to an ISR program adopted by the San Joaquin District.

Finally, the comment implies in a footnote (n. 22) that PR 2305 is preempted by both the CAA and state law because it allegedly regulates land use. But the comment does not explain how PR 2305 supposedly interferes with local land use regulation. It only obliquely states that “*to the extent* PR 2305 infringes on city and county land use authority” it would be preempted. (Emphasis added.) In fact, PR 2305 does nothing to interfere with local governments’ ability allow, disallow, or control the use of land for warehouse purposes or dictate where warehouses may be built. Like every other air district rule, it merely limits emissions from particular sources—here, indirect sources. As described by the Supreme Court, “Land use planning in essence chooses particular uses for the land; environmental regulation, at its core, does not mandate particular uses of the land but requires only that, however the land is used, damage to the environment is kept within prescribed limits.” *Cal. Coastal Comm’n. v. Granite Rock Co.*, 480 U.S. 572, 587 (1987). PR 2305 neither mandates nor prohibits any particular use of land and thus does not interfere with land use authority.

B. PR 2305 is not preempted by the Airline Deregulation Act or the Federal Aviation Administration Authorization Act.

Airlines for America asserts that PR 2305 is preempted by the Airline Deregulation Act (“ADA”) and the related Federal Aviation Administration Authorization Act (“FAAAA”). As explained in our prior responses to the CTA Letter, the Scopelitis, Garvin, Light, Hanson & Feary letter of April 22, 2021, the Los Angeles World Airports (“LAWA”) letter of March 2, 2021, and the United Airlines letters of March 2, 2021 and April 23, 2021, these contentions lack merit.

The FAAAA preempts state and local laws “related to a price, route, or service of any motor carrier . . . with respect to the transportation of property.” 49 U.S.C. § 14501(c)(1). While the FAAAA may preempt state laws “having a connection with, or reference to” prices, routes, or services, *Rowe v. N.H. Motor Transp. Ass’n*, 552 U.S. 364, 370-71 (2008), state laws affecting prices, routes, or services “in only a ‘tenuous, remote, or peripheral . . . manner’ with no significant impact on Congress’s deregulatory objectives” are not preempted. *Cal. Trucking Ass’n v. Su*, 903 F.3d 953, 960 (9th Cir. 2018) (quoting *Rowe*, 552 U.S. at 371); *see also Cal. Trucking Ass’n v. Bonta*, — F.3d —, 2021 WL 1656283, at *7 (9th Cir. Apr. 28, 2021) (stating that “the Supreme Court’s decisions about F4A preemption . . . have tended to construe the F4A narrowly.”).³ Courts apply the same preemption analysis under the ADA that they apply under the FAAAA. *Ward v. United Airlines, Inc.*, 986 F.3d 1234, 1243 n.2 (9th Cir. 2021); *see also* 49 U.S.C. § 41713(b)(1) (providing that a State may not enact or enforce a rule “related to a price, route, or service of an air carrier.”). While the FAAAA preemption provision includes the additional phrase “with respect to the transportation of property” that is not found in the ADA, the ADA nevertheless only preempts those regulations that would have a “significant impact” on

³ The recent decision in *Bonta* also explains that the language from *American Trucking Associations v. City of Los Angeles*, 559 F.3d 1046, 1053 (9th Cir. 2009), cited in footnote 35 of the letter, is dictum, and the issue discussed was not on appeal in that case. 2021 WL 165283, at *11.

airline prices, routes, or services, and not those that affect routes, rates, or services in a tenuous or peripheral manner. *Id.* at 1243.

Airlines for America asserts that PR 2305 directly regulates carrier routes and services because the WAIRE Points Compliance Obligation (“WPCO”) is determined based on the number of truck trips to warehouses, which the letter terms “routes,” and the types and emissions of trucks making those trips, which the letter terms “services.” As an initial matter, the WPCO does not directly regulate trucks or airlines. A warehouse’s WPCO is based on the total emissions related to a warehouse facility. While it is calculated based on truck trips, those trips serve as a proxy for total warehouse emissions, because the number of truck visits is representative of the total activity at, and emissions associated with, a warehouse. Moreover, the WPCO does not require warehouse operators to take any specific action, let alone any action related to prices, routes, or services of airlines or motor carriers. Instead, operators may select their preferred compliance actions from a menu containing many options that are wholly unrelated to transportation (e.g., installing renewable energy systems on buildings, installing air filters for sensitive receptors, or adopting a custom plan).

Further, contrary to the letter’s assertion, the WPCO does not directly regulate routes or services. The term “routes” in the FAAAA and ADA refers to “courses of travel.” *Air Transport Ass’n of Am. v. City & Cty. of San Francisco* (9th Cir. 2001) 266 F.3d 1064, 1071. Neither the WPCO specifically nor PR 2305 as a whole regulates courses of travel—neither binds any airline or motor carrier to a particular route or makes a specific route necessary. *See Dilts v. Penske Logistics, LLC*, 769 F.3d 637, 649 (9th Cir. 2014). Similarly, the types of trucks used and their emissions do not constitute “services.” Thus, for example, even a direct regulation of emissions-control equipment in trucks is not preempted by the FAAAA. *See Cal. Dump Truck Owners Ass’n v. Nichols*, No. 2:11-cv-00384, 2012 WL 273162 at *4-8 (E.D. Cal. Jan. 30, 2012); *see also Bedoya v. Am. Eagle Express*, 914 F.3d 812, 821 (explaining that “[t]he FAAAA’s focus on prices, routes, and service[s] shows that the statute is concerned with the industry’s production outputs,” and not “resource inputs,” including “labor, capital, and technology, which may be regulated by various laws.”); *S.C. Johnson & Son, Inc. v. Transp. Corp. of Am., Inc.*, 697 F.3d 544, 558 (7th Cir. 2012) (same).

The letter next asserts that PR 2305’s requirement that warehouse operators tally truck trips to facilitate the WPCO calculation requires motor and air carriers to adopt a new system of services similar to that required in the regulation held preempted in *Rowe*. Here, too, the comment mistakes the scope of the term “services.” For example, in *Rowe*, the preempted law required carriers to offer a new “recipient-verification service” that obliged them to verify the age and identity of individuals receiving shipped tobacco products, 552 U.S. at 368, which presumably benefitted customers by making it less likely that tobacco products would fall into the hands of minors. Here, however, unlike the regulation in *Rowe* that effectively obligated motor carriers to offer new services, the requirement to tally truck trips does not oblige motor carriers to offer any new service or alter any existing service—it merely requires warehouse operators to count truck arrivals. This requirement has nothing to do with the services a motor carrier offers to a customer.

The letter also asserts that PR 2305 directly regulates cargo services by establishing applicability thresholds based on warehouse size. The letter, however, does not provide any

explanation as to how excluding warehouses below a certain capacity bears any relation to the prices, routes, or services of motor carriers or airlines.

The letter next argues that the principle in *Ray v. Atlantic Richfield Co.*, 435 U.S. 151 (1978)—that an ordinance with an alternative compliance option that would be preempted if applied independently is not preempted where it is accompanied by a non-preempted alternative—does not apply. The letter contends that this principle does not apply to PR 2305 because the WPCO effectively compels warehouse operators to reduce the number of truck trips or to switch to lower-emissions vehicles. As stated above, however, the WPCO itself does not require warehouse operators to take any specific action—it is merely a calculation of the warehouse’s effective emissions. And the compliance options available include actions wholly unrelated to transportation. The principle in *Ray* therefore applies here.

The letter next asserts that the mitigation fee compliance option cannot save PR 2305 from preemption because it is the only option available to warehouse operators that do not operate their own fleet of trucks and cannot purchase lower-emissions vehicles. This assertion is incorrect. First, the mitigation fee option is not needed to “save” PR 2305 from preemption because the proposed rule is not preempted, as explained above. Second, the mitigation fee option is not the only available option for warehouse operators that do not operate their own fleet of trucks. Warehouse operators in that position may, for example, install renewable energy systems, install charging equipment, install air filters for sensitive receptors, or contract with motor carriers using ZE or NZE vehicles, or they may develop their own custom compliance plans. As noted above, many of these options have nothing to do with transportation by motor carriers or airlines, and no single option is required.

Finally, the letter asserts in two footnotes (numbers 36 and 45, respectively), with no analysis, that PR 2305 is preempted by two additional statutes. These footnotes are incorrect. First, PR 2305 is not preempted by the Anti-Head Tax Act, 49 U.S.C. § 40116, because the mitigation fee is not required, nor is it a direct head tax or a fee on the sale of air transportation. *See Alaska Airlines, Inc. v. Dept. of Food & Ag.*, 33 Cal. App. 4th 506, 513-14 (1995). Second, the letter asserts that PR 2305 is preempted by the Federal Aviation Act of 1958 “insofar as it interferes with the FAA’s exclusive jurisdiction over aviation, including the movement and/or operation of aircraft.” PR 2305 does not interfere with the movement or operation of aircraft and thus is not preempted by the Federal Aviation Act of 1958.

II. The District has authority to regulate emissions associated with existing warehouses.

The comment also contends that the District lacks authority to adopt an ISR program that covers existing, as opposed to new, sources. District counsel previously addressed this argument in detail in response to the CTA Letter. *See* Response to CTA Letter at 1-4.

Indeed, for many years, the District has implemented ISR for large employers, Rule 2202, which applies to existing sources and requires the source to select from several options, including reducing commute trips, reducing emissions through other projects, or paying an air quality improvement fee, which is used to obtain emission reductions.

Further, the comment's characterization of Health and Safety Code ("HSC") section 40440(b)(3) is simply incorrect. That section imposes a mandate; it does not limit authority. It requires the District to provide for "indirect source controls in those areas of the south coast district in which there are high-level, localized concentrations of pollutants or with respect to any new source which will have a significant effect on air quality in the South Coast Air Basin." Only the second half of the sentence refers to new sources; the first half refers to all sources, whether or not new, demonstrating that "indirect source controls" are not inherently limited to new sources.

Moreover, neither the comment, the CTA Letter, or any other comments received by the District have explained *why* the Legislature would supposedly prohibit the District from applying ISR to existing sources. The District routinely regulates a wide variety of both new and existing sources. Indeed, section 40440(b) demonstrates that the District's regulatory authority under section 40440(a) fully extends to existing sources, as it mandates "the use of best available retrofit control technology for existing sources." HSC § 40440(b)(1); *see also Am. Coatings Ass'n v. S. Coast Air Quality Mgmt. Dist.*, 54 Cal. 4th 446 (2012) (upholding the District's regulation of emissions from coatings as an existing source under section 40440(b)(1)). Accordingly, in the absence of a prohibition or limitation on the District's regulation of existing sources, the District may regulate such sources. As explained in response to the CTA Letter, neither section 40716 nor section 40440(b)(3) imposes such a limitation.

The comment again emphasizes the ISR provisions in CAA section 110. As noted in response to the CTA Letter, CAA section 110 is irrelevant to the question whether the District has statutory authority to adopt PR 2305. The District's authority derives from state, not federal, law. Section 110 is relevant only insofar as it *preempts* the South Coast AQMD's otherwise existing authority. As explained above and in response to the CTA Letter, section 110 does not preempt any state law. The comment does not explain how section 110 could be relevant beyond the context of preemption. Accordingly, the comment's reliance on section 110 is misplaced.⁴

Supplement Number Three-Response to Letter from Holland & Knight Representing the California Trucking Association, dated May 4, 2021 (Attachment B)

I. The South Coast AQMD has authority to regulate emissions associated with existing warehouses.

The comment argues again that the District lacks authority to adopt ISRs for existing indirect sources. As explained above in response to the Airlines letter and previously in response to the previous CTA Letter, this is incorrect. The new letter largely reiterates arguments made in CTA's prior letter.

The comment argues that the District lacks authority to regulate existing indirect sources because the HSC includes no provision that specifically refers to "existing indirect sources." As

⁴ The comment letter submitted by the California Air Resources Board similarly concludes that the CAA does not restrict the District's authority to adopt ISR for existing sources.

noted in response to CTA's prior letter that there is no principle of law that requires such specific authorization. The comment does not and cannot grapple with the point made in the prior responses that the Legislature also did not specifically enumerate the vast number of other sources that the District regulates, such as lead smelters, pharmaceutical manufacturing facilities, or fluidized catalytic cracking units. The letter fails to explain why a specific authorization is not required for those sources but should be required for regulation of existing indirect sources. Regulation of all of these sources is authorized by the several provisions expressly granting rulemaking authority to the District in furtherance of attaining state and federal air quality standards.

The letter contends that the rule is outside the District's "implied authority." But the rule is authorized by the District's ample express authority provided by the statutory sections cited in the prior responses. No authority need be implied. Again, the Legislature was not obligated to specifically authorize regulation for each type of source that the District may regulate.

The letter contends that the phrase "indirect source program" in the HSC must be given the same meaning as that phrase is given by the ISR provisions in federal CAA section 110. The glaring defect in this argument is that the HSC does not use that phrase at all. Rather, in section 40716 it refers to "regulations to . . . [¶] [r]educe or mitigate emissions from indirect and areawide sources of air pollution" and in section 40440(b)(3) it refers to "indirect source controls." The only commonality between these provisions and section 110 are the words "indirect source." That phrase is defined in CAA section 110 *without* any limitation to new or modified sources, and in fact it expressly includes existing sources:

[T]he term 'indirect source' means a facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution. Such term includes parking lots, parking garages, and other facilities subject to any measure for management of parking supply (within the meaning of subsection (c)(2)(D)(ii)), including regulation of *existing* off-street parking but such term does not include new or existing on-street parking.

42 U.S.C. § 7410(a)(5)(C) (emphasis added). Accordingly, if section 110 provides a guide to interpretation of the HSC, it suggests that the state law should *not* be read as precluding regulation of existing indirect sources.

Further, as explained above in response to the Airlines letter, the implication that section 110 should be read as a limit on the scope of authority under California law fundamentally mistakes the purpose of the ISR provisions in section 110. They were adopted to limit EPA's authority to compel states to include ISR requirements in their SIPs. The letter fails to provide legislative history or other indicia of legislative intent to support the notion that the California Legislature intended to incorporate similar limitations on the otherwise broad authority of air districts to regulate indirect sources.

II. PR 2305 is not preempted by federal law.

The letter again contends that PR 2305 is preempted under CAA section 209 because it is allegedly a "purchase mandate." This is incorrect, as explained in the response to the prior CTA

Letter, and was explicitly rejected by the Ninth Circuit in its decision upholding the San Joaquin ISR program in *NAHB*. See *NAHB*, 627 F.3d at 735-36. Nothing in the current letter changes that analysis.

The letter repeats the contention from the prior letter that the San Joaquin ISR truly regulated total site emissions whereas PR 2305 is supposedly limited to truck emissions. Neither is true. The portion of the San Joaquin program challenged in *NAHB* was limited to emissions from construction equipment. Direct regulation of those emissions would have been preempted, and yet the court upheld the program because it involved regulation of an *indirect* source. See Response to CTA Letter at 6. The court upheld the program even though “*NAHB* correctly observe[d] that Rule 9510 is ultimately directed at emissions that come from construction equipment.” 627 F.3d at 736. Moreover, as noted in the prior responses, PR 2305 does not regulate truck emissions. Truck trips are used to establish the WPCO for warehouses as a proxy for total facility emissions. Response to CTA Letter at 6. The new letter emphasizes that the WPCO calculation takes into consideration the emissions associated with those truck trips, but fails to explain how that fact demonstrates that those weighted truck trips are not representative of total facility emissions. The District has not denied that the majority of emissions associated with warehouse operations are emissions from truck trips. But that does not convert the rule into an emission standard preempted by section 209, just as the fact that the San Joaquin rule was “ultimately directed at emissions that come from construction equipment” did not cause it to be a preempted emission standard for construction equipment.

The letter further argues that *NAHB* does not control here because the San Joaquin program involved regulation of new, rather than existing, indirect sources. The letter fails to explain how that distinction could be relevant for purposes of section 209 preemption, which does not address indirect sources. Nor does *NAHB* rely in any respect on the fact that the San Joaquin program involved new construction as opposed to existing sources.

But more fundamentally, the letter misconstrues the indirect source provisions in section 110. As noted above, those provisions were adopted to restrict *EPA’s ability* to implement rules that it had proposed which would have required states to undertake review of new indirect sources. If the letter’s interpretation of section 110 were correct, EPA would be prohibited from requiring states to include in their SIPs ISR programs for new sources, but would be *entirely free* to require states to include such programs to regulate existing sources. If it were not obvious, the legislative history confirms that this was not Congress’s intent: “An indirect source review program is one which provides for the review of new, *existing* or modified indirect sources.” H.R. Conf. Rep. 95-564, at 126 (1977), *reprinted in* 1977 U.S.C.C.A.N. 1502, 1507 (emphasis added). Because section 110’s ISR provisions are not limited to new sources, they cannot provide a basis for treating control of new indirect sources as preserved from preemption but control of existing indirect sources as preempted.

III. PR 2305 can be included in the SIP.

The letter also makes a new argument that PR 2305 cannot be included in the SIP because, supposedly, only ISR programs that target new sources can be included in the SIP. As just noted, this is a misreading of the ISR provisions in section 110(a)(5). But moreover, it is inconsistent with the structure of section 110. Section 110 does not itemize the sorts of control

measures that states may include in their SIPs. Accordingly, a state need not point to some provision of that section as “authorizing” the inclusion of a measure in the SIP. Rather, the statute directs states to “include enforceable emission limitations *and other control measures, means, or techniques* (including economic incentives such as fees, marketable permits, and auctions of emissions rights), . . . as may be necessary or appropriate to meet the applicable requirements of this chapter.” 42 U.S.C. § 7410(a)(2)(A) (emphasis added). It leaves the formulation of those “measures, means, or techniques” to the states; that is why they are called *state* implementation plans. As noted above, the ISR provisions were designed solely to restrict the authority of EPA to compel states to include ISR programs among those “measures, means, or techniques,” not to limit a state’s voluntary choice of such programs.⁵

Finally, the letter contends that the District views PR 2305 as authorized by CARB and EPA’s approval of the MOB-3 control measure in the SIP. The District does not contend that approval of MOB-03 authorizes the rule. The authority for the rule comes from state law, as discussed above.

IV. The Project Description In The CEQA Analysis Is Not Deficient.

The EA’s project description adequately described the proposed project, including the mitigation fee component. At page 2-17, the Draft EA explains what these mitigation fees could be used for: “Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option. Therefore, the environmental impacts associated with the mitigation program are similar to implementation of measures to earn WAIRE Points and are analyzed in this EA.” See also Draft EA at page 2-5 (describing the mitigation fee and noting that it would “allow facilities to pay mitigation fees if other others are not chosen and apply collected funds to subsidize the purchase and use of ZE/NZE equipment or the installation of fueling/charging infrastructure”); Draft EA at page 2-6 (noting that the “Mitigation Fee” option was carried forward to PR 2305).

Because the mitigation fees would be used to implement measures similar to the other WAIRE Points compliance options, the Draft EA reasonably concluded that the environmental impacts would also be the same, i.e., if the South Coast AQMD uses mitigation fees to purchase new ZE trucks, the impacts will be the same as if a warehouse operator purchased new ZE trucks pursuant to the proposed rule.

California Unions for Reliable Energy v. Mojave Desert Air Quality Management District (2009) 178 Cal.App.4th 1225 (*CURE*) does not suggest otherwise. In that case, the air district adopted a road paving rule without conducting any environmental review. Thus, the court was not considering the adequacy of a project description, but rather whether there was substantial evidence to support the air district’s conclusion that the project would “assure the maintenance,

⁵ The letter also contends that the District will be unable to show that it has authority under state law to adopt PR 2305. That argument has been refuted above and in prior responses.

restoration, enhancement, or protection of the environment” and therefore would be exempt under CEQA. *Id.* at 1231.

The Draft EA did not omit analysis of the effects of the mitigation measures, but rather stated that the effects would be essentially the same as those of other WAIRE Points compliance options. Because the proposed rule allows warehouse operators to choose their compliance method, it is uncertain at this time how many would select the “mitigation fee” option. Moreover, although the mitigation fees must be expended on projects that achieve or facilitate reductions in emissions comparable to those associated with regulated warehouses, the specifics of the particular mitigation projects to be funded are presently unknown. As a result, it would be speculative to attempt any more detailed analysis of the effects of specific projects that may be funded with mitigation fees. See *Friends of the Sierra Railroad v. Tuolumne Park and Recreation District* (2007) 147 Cal.App.4th 643, 657-58 (CEQA review premature where no concrete plans for development had been proposed). The District will determine whether further CEQA compliance is required as it develops the WAIRE Mitigation Program that will govern the expenditure of mitigation fees.

Lastly, the EA did address the proposed project’s indirect impacts to grid infrastructure, agricultural and biological resources, geology and hydrology, water supply, wastewater treatment, storm water drainage, energy, and solid waste services (see Section 4.2.3.2.5, *Impacts to Electricity Providers*, Section 4.3.5, *Operational Impacts in Excess of the Capacity of Local Landfills*, and Chapter 4.5, *Other Impact Areas*). The indirect environmental analysis is discussed in Chapter 1.2.2, *Other CEQA Documents*, Chapter 4.0.1.5, *Indirect Impacts Associated with New Facility Construction*, and Chapter 4.5.1, *Indirect Impacts*, of the Draft EA. As stated in Response to Comments 1.9 and 1.10, these impacts were analyzed qualitatively, as the CARB ACT Regulation EA did, because it is impossible to determine at this time where the potential grid improvements and other new facilities will be located. Because the indirect impacts from projects funded by mitigation fees will be the same as those resulting from implementation of other compliance options, the draft EA did analyze the indirect impacts of actions funded by the mitigation fees.

V. Changes to the Proposed Rules Do Not Necessitate Recirculation Under CEQA

After the Draft EA was circulated for public review, and in response to comments received and stakeholder input, PR 2305 was modified in the following ways:

- (a) A sunset provision was added, ending the proposed rule’s requirements once state and federal air quality standards have been reached.
- (b) “Low use” warehouse operators were exempted from compliance with the rule.
- (c) NZE yard trucks that use renewable fuels were added as an allowable option under Custom WAIRE Plans.
- (d) The compliance period was shifted by 6 months, starting January 1, 2022.

There were no changes made to PR 316.

None of these revisions requires recirculation of the EA pursuant to CEQA. See Pub. Res. Code § 21092.1; CEQA Guidelines § 15088.5. A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review ... but before certification.” CEQA Guidelines § 15088.5(a). “Significant new information” includes information disclosing (1) that a new significant environmental impact would result from the project or from a new mitigation measure; (2) there will be a substantial increase in the severity of an environmental impact unless new mitigation measures are adopted; (3) a feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project’s proponents decline to adopt it; or (4) the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. CEQA Guidelines § 15088.5(a).

CEQA does not require recirculation “unless the [EA] is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect.” CEQA Guidelines § 15088.5(a). Recirculation also is not required “where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR.” CEQA Guidelines § 15088.5(b).

The minor changes to the proposed rule would not result in significant new impacts, nor in a substantial increase in the severity of an impact already identified. Including a sunset provision would reduce the potential environmental impacts of the proposed rule by eliminating all compliance obligations after the standards are achieved. “Low use” operators are those with a WPCO score of less than 10, meaning they receive approximately two Class 8 truck visits/day. There are not expected to be many “low use” warehouses. Exempting them from the rule would reduce the adverse environmental impacts of the proposed project because the exempt facilities would not be required to implement any compliance options, such as constructing new charging stations. The “low use” exemption could reduce the benefits of the proposed rule, but any reduction in benefit would be negligible, because there are not expected to be many “low use” warehouses and their compliance obligations would have been small to begin with. Similarly, including a sunset provision could reduce the benefits of the proposed rule, but the sunset provision is triggered only when state and federal air quality standards have been met and the need for the project benefits has therefore been reduced or eliminated. Including NZE yard trucks under the Custom WAIRE Plans could decrease air quality and GHG benefits when compared with allowing only ZE yard trucks as a compliance option, but would still result in an air quality and GHG benefit with respect to baseline conditions. Additionally, allowing NZE yard trucks would also lessen the impacts of battery disposal associated with ZE yard trucks. Lastly, shifting the compliance period would result in the same impacts occurring at a later date.

The Final EA reflects revisions, clarifications, and corrections to the Draft EA as a result of changes to the proposed rule language subsequent to the public review and comment period.

South Coast AQMD staff has reviewed the modifications to PR 2305 and PR 316 and has updated the CEQA analysis in the Final EA accordingly.

Airlines for America®

We Connect the World

May 4, 2021

submitted electronically to:
South Coast Air Quality Management District
Clerk of the Boards: cob@aqmd.gov
Mr. Victor Juan: vjuan@aqmd.gov

Re: Comments on Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and PR 316 – Fees for Rule 2305

On behalf of our members, Airlines for America® (“A4A”)¹ thanks the South Coast Air Quality Management District (“AQMD” or “District”) for providing this opportunity to comment on its Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (“WAIRE”) Program (“PR 2305”) and PR 316 – Fees for Rule 2305 (“PR 316” or “Proposed Fees Rule”), which will be the subject of a public hearing before the District Governing Board to consider adoption of the proposed rules on May 7, 2021.

As an initial matter, A4A and our members want to commend the District Staff – particularly Ian McMillian – for their efforts to engage with stakeholders and to listen to and address concerns with the proposed rules. Specifically, in our view a number of issues in the original draft of PR 2305 highlighted the need to clarify the intended scope of the WAIRE program and particular requirements. To their credit, Staff worked very hard to engage stakeholders to ensure they understood these issues and provide clarifying language. As a result, a number of potential practical issues have been addressed, obviating the need to comment here.²

We also want to emphasize at the outset that A4A and its members fully support the District’s efforts to achieve National Ambient Air Quality Standards (“NAAQS”) and recognize the unique challenges the District faces as an extreme nonattainment area for the federal NAAQS Ozone standards and serious nonattainment area for the federal fine Particulate Matter (PM 2.5) standards. A4A and our members have a long history of working with the District to address this pressing concern and remain committed to doing so. We do, however, have very significant remaining concerns regarding PR 2305 and PR 316. In particular, as detailed below, in our view the District (and the State) does not have authority to impose the Indirect Source Rule as a general matter and, specifically, does not have the authority to impose such a rule on facilities located at airports or apply them to air carriers. Accordingly, we oppose these rules and respectfully urge the Board to decline to adopt them.

¹ A4A is the principal trade and service organization of the U.S. airline industry. A4A members are Alaska Airlines, Inc.; American Airlines Group; Atlas Air, Inc.; Delta Air Lines; Federal Express Corp.; Hawaiian Airlines; JetBlue Airways Corp.; Southwest Airlines Co.; United Airlines Holdings, Inc.; and United Parcel Service Co. Air Canada is an associate member.

² For example, addressing our concern that as originally drafted PR 2305 § (d)(7)(C) could be read to apply to warehouse owners and operators even if they were not required to earn WAIRE points under § (d)(1), Staff has added language clarifying § (d)(7)(C) only applies to entities that are required to earn WAIRE points.

BACKGROUND

Again, A4A and its members fully support the District's efforts to attain the NAAQS and ensure public health. Commercial airlines are dedicated to providing air transportation services to the public that, above all, ensure the safety of our passengers, crew and the larger public. Accordingly, we view responsible environmental stewardship as essential to our business and have embraced the need to work proactively to address environmental concerns and achieve concomitant public health objectives.

Indeed, we are proud of the role we took in working with the District to implement measures in accordance with its 2016 Air Quality Management Plan ("2016 AQMP") to reduce emissions of oxides of nitrogen ("NOx") associated with aviation activity. Specifically, we worked for many months with our airport partners and the District to develop voluntary measures that were eventually incorporated into five memoranda of understanding ("MOUs") between each of the South Coast airports³ and the District. All of these MOUs included a voluntary measure to achieve reductions in emissions of ozone precursors from airport ground support equipment ("GSE") more rapidly than would otherwise be achieved under State regulations. As reported to the District's Mobile Source Committee at its January 22nd meeting this year, despite the extraordinary challenges airports and airlines have faced in the wake of the COVID-19 pandemic, together with our airport partners we have successfully implemented this voluntary program and achieved real NOx reductions that have brought the District closer to attainment.

Our effort to work with the District to ensure the viability and effectiveness of its 2016 AQMP is not unique. A4A and our members, despite continuing concerns regarding the State's authority to adopt and enforce such regulations, have worked for almost two decades with the California Air Resources Board ("CARB") to develop reasonable regulations to address GSE emissions. These rules include the Large-Spark Ignition, In-Use Off-Road Diesel, Portable Equipment Registration Program and Air Toxics Control Measure for Diesel Particulate Matter from Portable Engines. In addition, A4A and its members have committed to working with CARB to develop a new "Zero-Emission GSE" regulation consistent with the State's Mobile Source Strategy. We also continue our long-standing record of working with the District (and the State) to adopt reasonable measures to achieve attainment of the Ozone NAAQS as it develops its 2022 AQMP through active participation in and support of its Aviation Working Group.

In addition, A4A and our members have committed the time and resources needed to support the development of economically reasonable, technologically feasible and environmentally beneficial international standards for aircraft engines and aircraft governing noise, NOx, PM, and CO₂ (carbon dioxide), through the International Civil Aviation Organization / Committee on Aviation Environmental Protection ("ICAO/CAEP"). Last year, the ICAO Council adopted emissions standards for non-volatile particulate matter ("nvPM") for both mass and number applicable to both in-production and new type aircraft engines. This culminated a years-long process to supersede ICAO's smoke standard and set the foundation for continued progress in the future. A4A strongly supports the incorporation of the nvPM standards into U.S. law. In addition, A4A worked for years in the ICAO/CAEP process to support development of a CO₂ Certification Standard for aircraft which ICAO adopted in 2017 and strongly supported the U.S. Environmental Protection Agency's ("EPA") recent adoption of GHG emissions standards for

³ These airports are: Hollywood-Burbank Airport (BUR), Long Beach International Airport (LGB), Los Angeles International Airport (LAX), Ontario International Airport (ONT), and John Wayne Santa Ana Airport (SNA).

aircraft engines pursuant to Section 231 of the federal Clean Air Act (“CAA”)⁴ that are equivalent to the ICAO CO₂ Certification Standard. ICAO/CAEP has focused a great deal of effort on NO_x and we have strongly supported this effort – as is noted in the *Draft 2020 Mobile Source Strategy*, significant progress has been made and as a result of successive, increasingly stringent NO_x standards, aircraft engines produced today must be about 50% cleaner than under the initial standard adopted in 1997.⁵

The COVID-19 health crisis afflicting the world has, in turn, crippled our nation’s economy, hitting the aviation sector particularly hard. In the most recent week for which data is available, nationally, U.S. passenger volumes were down 43% from year-ago levels, with passenger airline departures down 32%.⁶ The effect of the pandemic on aviation activity at the five major commercial airports in the South Coast has been severe. Total commercial aircraft operations at these airports declined 53% in 2020 compared to 2019 and, although there has been some recovery in the region, total commercial carrier operations in the first quarter of 2021 are down 39% compared to the first quarter of 2019.⁷ At LAX, in 2020 commercial operations plunged 57% from pre-pandemic levels⁸; operations have recovered only modestly in the first two months of 2021 and remain down 45% compared to pre-pandemic levels.⁹ The decline in aircraft operations has resulted in a similar proportional decline in fuel consumption (and so, associated emissions). Despite the magnitude of the challenge ahead, we have every expectation that our sector will be critical to helping the economy revive and thrive, eventually returning it to pre-COVID levels. However, at present, we believe air passenger volumes are unlikely to return to pre-COVID levels before 2023.¹⁰ Cargo activity has been a relative bright spot in the industry, with volumes up 9% in 2020 compared to 2019.¹¹ From an environmental perspective, it is also important to note that the pandemic has accelerated the retirement of less fuel-efficient aircraft – as many as 862 in the U.S. passenger airline fleet since the end of 2019.¹² As a result, when air transportation demand returns to pre-COVID levels, it will be served by more efficient aircraft fleets, thus very likely lowering associated emissions.

Our record demonstrates that our industry can grow and help the country, California and the South Coast Basin prosper even as we continue to improve our environmental performance. Before COVID-19 struck, U.S. airlines were transporting a record 2.5 million passengers and 58,000 tons of cargo per day, helping drive \$1.7 trillion in annual economic activity and 10 million jobs. According to the Federal Aviation Administration (“FAA”), in 2016 aviation drove over 4% of the California’s gross domestic product, providing over 1,164,000 jobs and \$194

billion in economic activity in the State.¹³ Commercial airlines alone contributed over 141,000 jobs with a payroll of over \$8.7 billion and drove \$37.4 billion in economic activity.¹⁴ At the same time, U.S. airlines have relentlessly pursued and implemented technology, operational and infrastructure measures to minimize our environmental impacts. In particular the U.S. airlines have been and remain keenly focused on fuel efficiency and GHG emissions savings. For the past several decades, the U.S. airlines have dramatically improved fuel efficiency and reduced GHG emissions by investing billions in fuel-saving aircraft and engines, innovative technologies like winglets (which improve aerodynamics) and cutting-edge route-optimization software. As a result, the U.S. airlines have improved their fuel efficiency over 135 percent since 1978, saving over 5 billion metric tons of CO₂, which is equivalent to taking more than 27 million cars off the road on average in each of those years. Taking a more recent snapshot, data from the Bureau of Transportation Statistics confirm that U.S. airlines improved their fuel- and CO₂-emissions efficiency by 40 percent between 2000 and 2019.

But the U.S. airlines are not stopping there. Since 2009, we have been active participants in a global aviation coalition that committed to 1.5 percent annual average fuel efficiency improvements through 2020, with goals to achieve carbon-neutral growth beginning in 2020 and a 50 percent net reduction in CO₂ emissions in 2050, relative to 2005 levels. On March 30, 2021, A4A and our carriers strengthened our commitment to address climate change by committing to net-zero carbon emissions by 2050, and pledging to work with the federal government, state and local governments, and other stakeholders to rapidly expand the production and deployment of sustainable aviation fuel (“SAF”) so 2 billion gallons of cost-competitive SAF are available for U.S. aircraft operators in 2030. These new goals were adopted in the midst of the most severe economic crisis the commercial aviation sector has ever faced, demonstrating the strength of our commitment to the environment and depth of our recognition that environmentally responsible growth is essential to the vitality of our sector.

As we continue to recover from the current economic and social crisis induced by the COVID-19 virus, our commercial airlines look to the future with the belief that our sector will continue to thrive on the condition we continue to improve our environmental performance. It is in this spirit that we offer the comments below. We continue to unequivocally support progress towards attainment of the Ozone and PM NAAQS in the South Coast Air Basin, however, we cannot support these proposed regulations because they exceed the District’s (and the State’s) regulatory authority.

COMMENTS

1. The District’s Authority to Adopt an Indirect Source Rule (“ISR”) is Limited by the Federal CAA (42 U.S.C. § 7401 et seq.)

Congress adopted CAA Section 110(a)(5)(A),¹⁵ as part of the Clean Air Act Amendments of 1977, reacting to strong opposition to U.S. EPA’s attempts to impose controls on indirect

¹³ FAA, *The Economic Impact of Civil Aviation on the U.S. Economy – State Supplement* (November 2020) at 35.

¹⁵ 42 U.S.C. § 7410(a)(5)(A).

sources. The provision prohibits U.S. EPA from requiring states to incorporate ISRs in their State Implementation Plans (“SIPs”) but allows states to include an “indirect source program” in their SIPs.¹⁶ However, this did not empower states to enact ISRs of any scope or effect whatever. Rather CAA Section 110(a)(5)(A) permits states to incorporate ISRs into their SIPs as long as those ISRs are consistent with limitations established by the CAA and other federal law.

The District itself recognizes its authority to promulgate this rule is limited by and subject to federal law, including the CAA. District staff affirms that the purpose of PR 2305 is to achieve reductions in NOx emissions that will contribute to its efforts to attain the Ozone and PM NAAQS, as required by the CAA. The Draft Staff Report acknowledges that the CAA requires the State to submit a SIP for nonattainment areas that do not meet NAAQS and PR 2305 is put forward to implement the SIP. The District is the entity required under State law to develop a plan to demonstrate compliance with NAAQS and, in March 2017, the District approved its 2016 AQMP, which was subsequently incorporated into the State SIP by CARB and approved by U.S. EPA in 2019. The 2016 AQMP included “MOB-03 – Emissions Reductions at Warehouse Distribution Centers,” which called for a process to consider various strategies to achieve such reductions. Subsequently, in May 2018, the District Governing Board directed staff to develop an ISR applicable to warehouses, leading to PR 2305. In short, the central purpose of PR 2305 is to achieve compliance with the CAA. Indeed, District staff affirms:

There are six key reasons why PR 2305 and PR 316 are needed. *First and foremost*, the SCAB region continues to experience ozone and fine particulate matter levels that exceed federal air quality standards. . . . NOx is the primary pollutant that needs to be reduced to meet federal air quality standards, and mobile sources associated with goods movement make up about 52% of all NOx emissions in the SCAB. Trucks are the largest source of NOx emissions in the air basin and also for the emissions associated with warehouses. Any diesel PM reductions brought about by PR 2305 and PR 316 will also help meet federal air quality standards for fine PM.¹⁷

In other words, the primary reason PR 2305 has been proposed for adoption is to induce reductions in NOx emissions – overwhelmingly from trucks – required to enable the District to attain the Ozone NAAQS. As stated in its legal analysis:

By approving MOB-03 into the 2016 AQMP, the South Coast AQMD and CARB have committed to, and the U.S. EPA has authorized, the development [18] of an indirect source rule to achieve emission reductions from mobile sources attributed to warehouse activities, in order to assist attaining the federal ozone NAAQS in 2023 and 2031.¹⁹

In order for PR 2305 to achieve its objective (i.e., “assist attaining the federal ozone NAAQS”) it will have to be submitted as a revision to the State SIP and approved by U.S. EPA. EPA has explicitly acknowledged that it cannot approve an ISR (or any other SIP measure) unless the District/State has demonstrated it has “legal authority to carry out SIPs and SIP revisions” and

¹⁶ Importantly, Congress did not authorize states to promulgate ISRs applicable to airports and other “major federally assisted indirect sources” allocating that authority to EPA. CAA Section 110(a)(5)(B).

¹⁷ *Second Draft Report: Proposed Rule 2305 - Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305* (April 2021) (“*Second Draft Report*”) at 14 (emphasis added) (footnotes omitted).

¹⁸ It is the development of the ISR that, at this stage, has been authorized by EPA. EPA has not considered and has not authorized the Warehouse ISR as proposed in PR 2305.

¹⁹ *Second Draft Report* at 18.

such legal authority does not exist where a proposed ISR is preempted by federal law, including the CAA.²⁰

A comment letter from the District's outside law firm contends "[t]he [federal Clean Air Act] is irrelevant to the District's authority to adopt the proposed rule" because "[t]he District's regulatory authority represents an exercise of the State's police power . . . as delegated by the Legislature; the CAA is not the source of the District's authority."²¹ This analysis is inapt. Under the CAA, a State must always have underlying legal authority conferred by its Legislature to adopt an enforceable regulation in order for that regulation to be eligible for incorporation into a SIP. CAA Section 110(a)(2)(E) (SIP "shall . . . provide (i) necessary assurances that the State . . . will have adequate . . . authority under State (and as appropriate, local) law to carry out such implementation plan"). This provision, which conditions the authority of a state to adopt a SIP measure on obtaining the power to adopt an ISR from the source of that power (the Legislature) is itself a limitation on a state's authority to adopt an ISR and an affirmation that the CAA limits that power.²² Indeed, it defies common sense to assert that the purpose of the ISR is to assist in achieving compliance with the CAA but whether the ISR itself complies with the CAA is "irrelevant." The District's lawyers concede the point by affirming the ISR "is expressly authorized by the CAA in Section 110(a)(5)."²³

²⁰ *Revisions to the California State Implementation Plan, San Joaquin Valley Unified Air Pollution Control District – Final Rule*, 76 Fed. Reg. 26609, 26609-10 (May 9, 2011). See also, *Id.* at 26614 ("in reviewing SIP submissions, EPA's role is to approve State choices, provided that they meet the criteria of the Clean Air Act") (emphasis added).

²¹ *Letter from Zinn et al to Bayron Gilchrist and Barbara Baird, SCAMQD: Responses to Comments Submitted by the California Trucking Association* (April 1, 2021) (hereinafter "Zinn Letter") at 2 (citations omitted) (emphasis added).

²² Certainly, an exercise of the "State's police power" is subject to limitations imposed by federal law. See *City of Burbank v. Lockheed Air Terminal, Inc.*, 411 U.S. 624 (1973) (exercise of police power preempted by federal law); *San Diego Unified Port District v. Giantruco*, 651 F.2d 1306, 1316 (9th Cir. 1981) (imposition of land use permit preempted by federal law; "The observation that a state has a power in no way implies any doubt about equally well-settled limits to that power, such as federal preemption"). In fact, state and federal law further limit the District's authority to promulgate ISRs by explicitly providing it may not encroach on the land use powers of cities and counties. The Clean Air Act Amendments of 1990 provide that "[n]othing in this Act constitutes an infringement on the existing authority of counties and cities to plan and control land use, and nothing in this Act provides or transfers authority over such land use." Pub. L. 101-549 § 131, U.S. Code Cong. & Admin. News (104 Stat.) 2399, 2689 (emphasis added). Section 40716(b) of the CA Health & Safety Code ("H&SC") incorporates the equivalent language into state law, providing that a district's authority, as set out in § 40716(a), cannot infringe on the land use authority of cities and counties. See *Att. Gen. Opin. 92-519* (1993) at 5 ("While subdivision (b) of section 40716 ensures that a regulatory program for indirect sources may legally coexist with the traditional land use planning and control prerogatives exercised by cities and counties . . . it also indicates an intent to uphold the authority of cities and counties to plan and control land use"). The California Legislature took pains to make it especially clear that the South Coast District's authority to promulgate indirect source rules is constrained and preempted by the land use authority vested in the State's cities and counties. Specifically, H&SC § 40440(b)(3) provides that the District's authority to promulgate indirect source rules is limited to those actions that are "[c]onsistent with Section 40414;" Section 40414 provides: "No provision of this chapter shall constitute an infringement on the existing authority of counties and cities to plan or control land use, and no provision of this chapter shall be interpreted as providing or transferring new authority over such land use to either the south coast district, the Southern California Association of Governments, or the state board." Thus, to the extent PR 2305 infringes on city and county land use authority, it is preempted by both the CAA and the CA H&SC. See also, *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning - A Reference for Local Governments Within the South Coast Air Quality Management District* at p. 1-13 (May 6, 2005) ("**Local governments have the flexibility to address air quality issues through ordinances, local circulation systems, transportation services, and land use. No other level of government has that authority, including the AQMD.**") (bold original; underlining added).

²³ Zinn Letter at 5. To be clear, we agree with both assertions in the Zinn Letter that (1) the CAA is not the source of state/district power to promulgate ISRs and (2) the CAA "authorizes" the exercise of that power to help attain NAAQS. Section 110(a)(5) "authorizes" states/district to promulgate ISRs, not in the sense that it creates the power for them to

California law also subjects the District's authority to adopt ISRs to the limitations imposed by state and federal law. Under California law, "[b]efore adopting, amending, or repealing a rule or regulation, the district board shall make findings of . . . authority . . . and consistency" H&SC § 40727(a) (emphasis added). H&SC Section 40727(b) defines "authority" to mean "a provision of law or of a state or federal regulation permits or requires the regional agency to adopt . . . the regulation"; "consistency" is defined to mean "that the regulation is in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, or state or federal regulations." H&SC § 40440(a) repeats these limitations and specifically applies them to the District, providing that the "south coast district board shall adopt rules and regulations that carry out the plan and are not in conflict with state law and federal laws and rules and regulations." H&SC § 40440(b) makes clear these limitations apply to "indirect source rules." Just as CAA Section 110(a)(5) limits the District's authority to promulgate ISRs to those consistent with the CAA and other federal law, California law provides the District cannot adopt an ISR if it is "in conflict with or contradictory to" federal law and regulations.

2. PR 2305 Exceeds the District's Authority Because it Applies to Existing Warehouses

The CAA defines an "indirect source program" as a "the facility-by-facility review of indirect sources of air pollution" that includes "measures as are necessary to assure, or assist in assuring, that a new or modified indirect source will not attract mobile sources of pollution" that would cause or contribute to an exceedance of or prevent the maintenance of a NAAQS. CAA Section 110(a)(5)(D) (emphasis added). The history of the development of the "indirect source" concept in EPA's regulatory actions and the amendments of the CAA make clear that Section(a)(5)(D) means precisely what it says.

In 1973, the EPA Administrator declared it was his "judgment [that] it is necessary to review, and where necessary prevent, the construction of facilities which may result in increased emissions from motor vehicle activity or emissions from stationary sources that could cause or contribute to violation of [NAAQS]. Such facilities are generally designated 'complex sources.'"²⁴ EPA announced the Administrator would "require all States to adopt and submit to him a legally enforceable procedure for reviewing the impact of the construction and modification of a 'complex source' and for preventing the construction or modification of complex source where necessary to attain and maintain a national standard."²⁵ In a separate action taken that day, EPA issued an advance notice of proposed rulemaking stating the Administrator "has determined that it is necessary for State [implementation] plans to contain, at a minimum, procedures whereby the State can review prior to construction or modification, the location of sources of pollution and of other facilities which may cause an increase in air pollution because of activities associated with such facilities" and provided notice that the Administrator would

do so (that is done – if at all – under State law), but in the sense that it permits them to do so (subject to the CAA and other superseding federal law).

²⁴ 38 Fed. Reg. 6279 (March 8, 1973) (emphasis added). We also note that EPA understood the underlying power to regulate an indirect source – even if EPA were to require states/districts to do so under the CAA – must come from the States themselves. 38 Fed. Reg. 6279, 6280 ("States will be required to have the authority to disapprove the construction or modification [of indirect sources] . . . States should begin now to determine their legal authority . . . and to obtain such authority where it is lacking.")

²⁵ *Id.* (emphasis added).

propose regulations requiring “States . . . to have legally enforceable procedures reviewing prior to construction or modification, the location of such facilities and for preventing such construction or modification where it would interfere with the attainment or maintenance of a national standard.”²⁶ Later that year, EPA issuing a notice of proposed new “guidelines” (in the form of proposed amendments to its regulations), explaining:

It is generally recognized, however that not only the types of facilities generally known as stationary sources but also facilities such as airports, amusement parks, highways, shopping centers and sport complexes also affect or may affect air quality by indirect means, primarily by means of the mobile source activity associated with them. . . . [This] proposal . . . would require, with respect not only with respect to ‘stationary sources’ in the traditional sense, but also certain other types of facilities, as assessment of both direct and indirect effects on air quality prior to their construction²⁷

EPA finalized these “guidelines” (in the form of final amendments to its regulations) referring to them as “requirements for the review of the indirect impact of new or modified sources, i.e., the impact arising from associated mobile source activity,” explaining that “[i]n the Administrator’s judgment, indirect impact of new or modified sources” was necessary to attaining NAAQS.²⁸ In February the following year, EPA promulgated final regulations requiring “Review of Indirect Sources” in which it explained that the regulations expanded new source review procedures “to cover not only stationary sources but ‘complex’ or ‘indirect’ sources of air pollution – facilities which do not themselves emit pollutants, but which attract increased motor vehicle activity”²⁹ These regulations were “applicable only to facilities commencing construction on or after January 1, 1975.”³⁰ In the face of intense opposition from state and local governments over EPA’s assertion of its authority to regulate “indirect sources” the Agency suspended its “Review of Indirect Sources” regulations and, as part of the Clean Air Act Amendments of 1977, Congress enacted CAA Section 110(a)(5)(A) explicitly denying EPA the authority to require states to include “indirect source review programs” in their SIPs but permitting them to do so. In doing so, Congress made clear in CAA Section 110(a)(5)(D) that such programs, which – as is clear from the extensive history above – had never included existing indirect sources, were to be defined as limited to those including “measures as are necessary to assure, or assist in assuring, that a new or modified indirect source” would not cause or contribute to exceedance of a NAAQS.³¹

Accordingly, it is clear that the CAA limits any ISR adopted pursuant to the CAA to new and modified indirect sources. It is also clear under California law that the District has authority to regulate only “new sources” using an indirect source rule. CA H&SC § 40440(b) provides (emphasis added) that the District must “provide for indirect source controls in those areas of the south coast district in which there are high-level, localized concentrations of pollutants or

²⁶ 38 Fed. Reg. 6290, 6291 (March 8, 1973) (emphasis added).

²⁷ 38 Fed. Reg. 9599 (April 18, 1973) (emphasis added).

²⁸ 38 Fed. Reg. 15834, 15835 (June 18, 1973) (emphasis added).

²⁹ 39 Fed. Reg. 7270 (Feb. 25, 1974).

³⁰ 39 Fed. Reg. 7270, 7272 (Feb. 25, 1974).

³¹ Pub. L. 95-95 § 108(e), 1977 U.S. Code Cong. & Admin. News (91 Stat.) 685, 695-696 (emphasis added). See *NRDC, Inc., v. USEPA*, 725 F.2d 761, 765 (DC Cir., 1984) (“Congress . . . was not so accepting of EPA’s actions. Congress reacted negatively and immediately to EPA’s attempt to regulate indirect sources of pollution . . . [and] amended the Act to make clear that states could not be required, though they were permitted, to regulate indirect sources of pollution.”).

with respect to any new source that will have a significant effect on air quality in the South Coast Air Basin.” Because PR 2305 applies to existing warehouses it plainly exceeds the District’s (and the State’s) authority.³²

In addition, the CAA expressly provides that EPA “shall have” the authority to establish “indirect source review programs which apply only to federally assisted highways, airports, and other major federally assisted indirect sources and federally owned or operated indirect sources.” CAA Section 110(a)(5)(B). Thus, any ISR promulgated by the District – whether otherwise consistent with the CAA or other federal law – cannot regulate on-airport facilities. As such, PR 2305 also exceeds the District’s jurisdiction insofar as it applies to on-airport facilities.

3. PR 2305 is Preempted by Federal Law

Under the Supremacy Clause, U.S. CONST. art. VI, cl. 2, state laws that “interfere with, or are contrary to,” federal law are invalid and preempted. *Gibbons v. Ogden*, 22 U.S. 1, 211 (1824). As pointed out above, the District’s proposed ISR (PR 2305) “represents an exercise of the State’s police power” and as such is subject to limitation by Congress’ exercise of its superseding power through federal law.

Federal legislation may expressly preempt state law, or it may do so implicitly in at least two ways – where Congress intends federal law to “occupy the field,” and where state law conflicts with federal law. *Crosby v. Nat’l Foreign Trade Council*, 530 U.S. 363, 372 (2000). Conflict preemption exists “where it is impossible for a private party to comply with both state and federal law,” or where the challenged law “stands as an obstacle to the accomplishment and execution of the full purposes and objectives of Congress.” *Id.* at 372-73 (quoting *Hines v. Davidowitz*, 312 U.S. 52, 67 (1941)). “[T]he purpose of Congress is the ultimate touchstone in every pre-emption case.” *Wyeth v. Levine*, 555 U.S. 555, 565 (2009) (citation and internal quotation marks omitted); *Cippollone v. Liggett Group, Inc.* 505 U.S. 504, 516 (1992) (purpose of Congress is “ultimate touchstone” of preemption analysis).

As discussed above, CAA Section 110(a)(5)(D) is an example of such a limitation, preempting any regulation of existing (as opposed to “new or modified”) sources. As explained in footnote 22 above, to the extent the District proposed Warehouse ISR infringes on city and county land

³² The Attorney General Opinion cited by staff in the *Second Draft Report* is not contrary. In fact, the Opinion supports the conclusion that an ISR adopted under the CAA may only apply to new or modified sources. That opinion asserts “a district’s regulations may require the developer of an indirect source to submit the plans to the district for review and comment prior to the issuance of a permit for construction by a city or county. A district may also require the owner of an indirect source to adopt reasonable post-construction measures to mitigate particular indirect effects of the facility’s operation.” Atty. Gen. Opinion 92-519 at 6. This language nowhere asserts that an “indirect source” includes an existing indirect source or that an “indirect source review program” may – contrary to the express language of CAA Section 110(a)(5)(D) – include measures other than those “necessary to assure . . . that a new or modified source will not attract mobile sources of air pollution.” In fact, the Opinion clearly affirms “[t]he federal administrative regulation, referred to as ‘indirect source review,’ entailed requiring such facilities to obtain federally-controlled permits before construction or significant modification” and this led to Congress to enact “the 1977 amendments to the Clean Air Act” pertaining to “[i]ndirect source reviews.” Atty. Gen. Opinion 92-519 at 6 (emphasis added) (citation omitted). To be valid – and consistent with the Opinion’s understanding of the origin of “indirect source reviews” – the statement that district regulations may require owners of indirect sources to adopt post-construction measures to mitigate emissions must be interpreted to mean such measures can only be applied prospectively to entities that will operate indirect sources that are either newly constructed or after their modification.

use authority, it also is preempted by both the CAA and the CA H&SC. Below we address the preemptive effect of other federal statutes.

a. PR 2305 is Preempted by the CAA Section 209(e)

The opinion of the United States Court of Appeals for the Ninth Circuit in *National Assn. of Home Builders v. San Joaquin Valley Unified Air Pollution Control Dist.* (2010) 627 F.3d 730 (“*NAHB*”) makes clear that an indirect source rule may be subject to preemption by CAA Section 209(e).³³ The legal and factual arguments as to whether PR 2305 is preempted by Section 209(e) have been set forth at length in the comments of Holland & Knight submitted on behalf of the California Trucking Association and the District’s response (the Zinn Letter). We agree with the analysis presented in the Holland & Knight comment letter that Proposed 2305 effectively creates a purchase mandate that is preempted by CAA Section 209(e). *Engine Manufacturers Assn. v. South Coast Air Quality Management Dist.* (2004) 541 U.S. 246, 252, 255 (“*EMA*”).³⁴

b. PR 2305 is Preempted by Other Federal Statutes

Under the Airline Deregulation Act (“*ADA*”) “a state [or] political subdivision of a state . . . may not enact or enforce a law, regulation, or other provision having the force or effect of law related to a price, route, or service of an air carrier . . .” 49 U.S.C. § 41713(b)(1). The Federal Aviation and Administration Authorization Act (“*FAAAA*”) contains similar language precluding states and local governmental entities from “enact[ing] or enforce[ing] a law, regulation, or other provision having the force and effect of law related to a price, route, or service of any motor carrier ... with respect to the transportation of property.” 49 U.S.C. § 14501(c)(1). The “*FAAAA*” language is “borrowed language from the Airline Deregulation Act of 1978” (*Rowe v. N.H. Motor Transp. Ass’n*, 552 U.S. 364, 368 (2008)) and “analysis from . . . Airline Deregulation Act cases” is viewed as “instructive for our *FAAAA* analysis as well.” *Dilts v. Penske Logistics, LLC*, 769 F.3d 637, 644 (9th Cir. 1974). However, “the *FAAAA* formulation contains one conspicuous alteration — the addition of the words ‘with respect to the transportation of property.’ That phrase massively limits the scope of preemption ordered by the *FAAAA*.” *Dan’s City Used Cars, Inc. v. Pelkey*, 569 U.S. 251, 261 (2013) (internal quotation and citation omitted).

³³ While we agree with the *NAHB* court in this aspect of its opinion, we strongly disagree with its fundamental analysis of the preemption issue. In short, the *NAHB* court appears to conclude that as long as a state/district adopts an ISR that “targets emissions, and requires emissions reductions, from [an indirect source] as a whole” [at 739] it may effectively pierce Section 209(e). The court’s observations that “Section 110(a)(5) . . . is a grant of power to the states,” [at 739, n.8], “[i]t would be odd if the Act took away from the states with one hand what it granted with the other” and “[p]reemption would be an especially strange result given the history of the Act” [at 737] reflect a fundamental misunderstanding of the effect of CAA Section 110(a)(5) and the history of the Act. As explained at length above, CAA Section 110(a)(5) did not “grant” the underlying power upon which states/districts must rely to promulgate ISRs; that power is granted by a state Legislature. Because the source of a district’s/state’s power to adopt an ISR is state law it remains subject to preemption by federal law. In short, federal preemption is not an “odd” effect or a “strange result” of CAA Section 110(a)(5): it is carefully preserved in the statute.

³⁴ See also 76 Fed. Reg. 26609, 26611 (May 9, 2011) (“an ISR rule otherwise authorized under CAA section 110(a)(5) . . . could be preempted if it creates incentives so onerous as to be in effect a purchase mandate”); US EPA Region IX Air Division, *Technical Support Document for EPA’s Rulemaking for the California State Implementation Plan as submitted by the California Air Resources Board Regarding San Joaquin Valley Unified Air Pollution Control District Rule 9510, ‘Indirect Source Review (ISR)’* at 12 (“If the in-use control either 1) acted to compel the manufacturer or user of a nonroad engine to change the emission control design or equipment of the nonroad engine, or 2) created incentives so onerous as to be in effect a mandate to manufacture or use one engine over another, the in-use control could fall within the scope of preemption under section 209”).

In *Morales v. TWA*, 504 U.S. 374, 383, 384 (1992), the Supreme Court explained that the "related to" phrase "express[es] a broad pre-emptive purpose" and means that a state law that "has a connection with, or reference to," a carrier's price, route, or service is preempted. In *Morales* the Court held a state law may be preempted even if its effect on prices, routes or services "is only indirect" (*Id.* at 386), observing that where a state law affects airline prices "in too tenuous, remote, or peripheral a manner" it might not be preempted (*Id.* at 390). In *Rowe* the Court made clear "less direct" state laws – even one that "tells shippers what to choose rather than carriers what to do" – are preempted where the "effect is that carriers will have to offer . . . services that differ significantly from those that, in the absence of regulation, the market might dictate." *Rowe* at 372.³⁵ *Rowe* held that the FAAAA preempted a Maine law that forbade licensed tobacco retailers from using "a 'delivery service' unless that service follows particular delivery procedures." *Id.* at 371. The Court noted that the Maine law would have "a 'significant' and adverse 'impact' in respect to the federal Act's ability to achieve its preemption-related objectives," because it would "require carriers to offer a system of services that the market does not now provide (and which the carriers would prefer not to offer)." *Id.* at 371-72. As other circuits have explained, *Rowe* thus "necessarily defined 'service' to extend beyond prices, schedules, origins, and destinations." *Air Transp. Ass'n v. Cuomo*, 520 F.3d 218, 223 (2d Cir. 2008). *Accord DiFiore v. Am. Airlines*, 646 F.3d 81, 88 (1st Cir. 2011).

Federal Express Corp. v. California Public Utilities Comm'n, 936 F.2d 1075 (9th Cir. 1991) is also instructive in evaluating the ISR as it applies to air carriers. There the California Public Utilities Commission ("PUC") had issued several "general orders" that regulated, among other things the "terms of the terms of the bills of lading, the freight bills and 'accessorial services' documents issued by the carriers" subject to "a procedure by which carriers may obtain variances from its orders" as part of what the PUC claimed was a "flexible" and "adaptive" regulatory program. *Id.* at 1077. The court observed:

trucking operations of Federal Express are integral to its operation as an air carrier. The trucking operations are not some separate business venture; they are part and parcel of the air delivery system. Every truck carries packages that are in interstate commerce by air. The use of the trucks depends on the conditions of air delivery. The timing of the trucks is meshed with the schedules of the planes.

Id. at 1078.³⁶ The court ruled that even "regulations which are not patently economic — the rules on claims and bills of lading, for example — relate to the terms on which the air carrier offers its services. Terms of service determine cost. To regulate them is to affect the price. The

³⁵ See also *American Trucking Associations v. City of Los Angeles*, 559 F.3d 1046, 1053 (9th Cir. 2009). There, although it reversed the district court's decision on other grounds, the Ninth Circuit "fully agree[d] with the district court" that plaintiffs had demonstrated a likelihood of succeeding on the merits of their claim that concession agreements required by city ordinance were preempted by the FAAAA, commenting "[t]hat the Concession agreements relate to prices, routes or services of motor carriers can hardly be doubted." The Ninth Circuit thus "fully agreed" with District Court finding that "the concession agreements here directly regulate the carriers themselves, at least to the extent that they wish to access the Ports. Therefore, the effect of the concession agreements on 'price, route, or service,' would likely be sufficiently non-tenuous and direct to warrant preemption." *Am. Trucking Ass'ns, Inc. v. City of Los Angeles*, 577 F. Supp.2d 1110, 1117 (citations omitted).

³⁶ The Federal Aviation Act of 1958 also preempts PR 2305 insofar as it interferes with the FAA's exclusive jurisdiction over aviation, including the movement and/or operation of aircraft. See *Burbank v. Lockheed Air Terminal, Inc.*, 411 U.S. 624, 633 (1973) ("[f]ederal control [over aviation] is intensive and exclusive") (quoting *Northwest Airlines, Inc. v. Minnesota*, 322 U.S. 292, 303 (1944)).

terms of service are as much protected from state intrusion as are the air carrier's rates." *Id.* Accordingly, the Court determined the ADA preempted the PUC from applying its regulations to air carriers.

PR 2305 will undoubtedly increase the costs of operating warehouses and for airline cargo operations. But the effects of the proposed regulation go far beyond mere economic effects to directly affect carrier routes and services. In fact, the central obligation imposed under PR 2305 (d)(1) establishes a "WAIRE Points Compliance Obligation (WPCO)" that is a function of two parameters: "Weighted Annual Truck Trips (WATT)" and "Stringency."³⁷ This WATT parameter depends on the "number of truck trips" and the type of trucks making those trips, weighted by truck class according to the relative level of emissions associated with that class.³⁸ The regulatory obligation imposed under the ISR is thus literally a direct function of the routes (here termed "trips") and services provided (types of trucks used). This is a textbook case of a regulatory measure that is preempted under the ADA and FAAAA. This is reenforced by Staff's explicit affirmation that the Stringency parameter of the WPCO is set at a level designed to do far more than impose economic costs: "as demonstrated in the 'Compliance Cost' section . . . there will be financial impacts to industry to implement PR 2305, and it will also require many warehouse operators and cargo owners to change their business practices to implement actions required by PR 2305."³⁹ The proposed rule also directly regulates cargo services provided by motor carriers and air carriers by establishing applicability thresholds based on warehouse size.⁴⁰ Moreover, to demonstrate compliance with the regulation, PR 2305, "[w]arehouse operators are required to submit truck data . . . for the amount of warehouse activity during the compliance period" which must be "contemporaneous" with the truck trips themselves (e.g., recorded at least daily) in a manner "verifiable by South Coast AQMD staff."⁴¹ This level of intrusion into the business practices of motor and air carriers and the requirements to adopt a new system of service far exceed those considered by the Supreme Court in *Rowe* and the

³⁷ Second Draft Report at 27; PR 2305 (d)(1)(A).

³⁸ Second Draft Report at 28; PR 2305 (d)(1)(B).

³⁹ Second Draft Report at 58 (emphasis added). District staff all but directly affirms the ISR is specifically designed to require warehouse owners/operators to provide services and operate routes using low-emitting trucks. The "first and foremost reason" the District identifies for adopting PR 2305 is that the "SCAB region continues to experience ozone and fine particulate matter levels that exceed federal air quality standards," a circumstance that cannot be realistically addressed without reducing emissions from trucks because they "are the largest source of NOx emissions in the air basin . . ." Second Draft Report at 14. In describing the rationale for setting the WPCO "Stringency" parameter, District staff discuss the need to ensure the truck fleet in the SCAB becomes cleaner at length:

Even [under] the most aggressive modeling in [CARB's Draft Mobile Source Strategy], in 2023 more than 95% of heavy-duty trucks will be no cleaner than 2010 engine standards assumed for all trucks in the baseline emissions inventory from the 2016 AQMP. This scenario projects these trucks will still make up about 57% of the truck fleet in 2031. Since the 2016 AQMP requires a 45% and 55% reduction in NOx by 2023 and 2031 respectively, the continued presence of large fractions of 2010 MY trucks in the fleet will hamper efforts to meet these deadlines.

Second Draft Report at 52-53 (footnote omitted). The District goes on to affirm: "Because of the pressing need to meet federal air quality standards in 2023 and 2031, both from a public health perspective and from a public policy perspective . . . the stringency of the rule should be set at a level that achieves emission reductions beyond what other regulations will require." *Id.*

⁴⁰ See, e.g., PR 2305 (b), (d)(1).

⁴¹ Second Draft Report at 28, 91.

Ninth Circuit in *Federal Express v. PUC* and determined to be preempted by the FAAAA and ADA.⁴²

The contention that PR2305 is not preempted because it does not “*require* any particular action at all” and “flexibility and choice [is] built into the proposed rules”⁴³ is not correct. In *Ray v. Atl. Richfield Co.*, 435 U.S. 151 (1978) the Court held a Washington State statute mandating certain design criteria for ocean going vessels was preempted by federal law. The Court also held that a separate provision, requiring vessels to be escorted by a tug but waiving that requirement if the vessel met certain design criteria was not preempted because the provision did not “exert pressure on tanker owners to comply with the design standards.” 435 at 173 n.25. See also *United States v. Massachusetts*, 493 F.3d 1, 23 (1st Cir. 2007) (finding a state financial assurance requirement would be preempted if it “placed strong pressure on the industry” to conform to preempted design criteria). PR 2305 does not present a case of whether an “alternative” means of compliance is preempted because it creates sufficient pressure to indirectly compel a regulated entity to use a compliance alternative that is preempted. Here, the compliance obligation is explicitly and purposefully designed to ensure that the only means available to a regulated entity to reduce its compliance obligation are to reduce the number of truck trips or change the type of trucks making those trips. In addition, the applicability thresholds are explicitly tied to the size and extent of cargo services provided. The District is preempted by the FAAAA and the ADA from dictating such business practices. Even if it were conceded that the “alternatives” for achieving compliance are not preempted, the District is directly regulating – through the compliance obligation and applicability thresholds – business practices that *Rowe* and other cases discussed above clearly establish the District is preempted from regulating under the FAAA and ADA.⁴⁴

Finally, we emphasize that the “option” of allowing regulated entities to meet their WPCO by simply paying a mitigation fee could not save PR 2305 from preemption. As an initial matter, we reject the contention that a governmental entity that does not have the power to compel a particular action can extract a fee or other payment from a regulated entity for failing to take that action. Moreover, the mitigation fee is arguably created not to provide a means for warehouse owners/operators to choose more “efficient” actions, but because for many warehouse owners/operators it is the only means available for achieving compliance with the WPCO. Some operators (like many predominately passenger air carriers) do not operate their own fleet of trucks and therefore cannot purchase trucks, by far the most effective means of generating WAIRE points, leaving such carriers in the position of being unable to achieve compliance without paying the mitigation fee. In other words, the mitigation fee is not an option available to

⁴² We note that *Rowe* contradicts the claim in the Zinn Letter (at 11) that “[r]egulations concerning pollution-control technology fall into the category of regulation of resource inputs that are generally not preempted.” *Rowe* at 373 (“Despite the importance of the public health objective, we cannot agree with Maine that the federal law creates an exception on that basis, exempting state laws that it would otherwise pre-empt. The Act says nothing about a public health exception”). In addition, the distinction drawn between laws that regulate “inputs” and “outputs” only reinforces the conclusion that PR 2305 is preempted: the regulation’s compliance obligation is a function of “outputs,” i.e., number of truck trips and types of trucks used. Moreover, cases drawing such a distinction involve laws or regulations of “general applicability,” not regulations like PR 2305 that directly regulate carrier operations.

⁴³ Zinn Letter at 9-10 (emphasis original).

⁴⁴ Using the *Ray* parlance, PR 2305 applies regulatory “pressure” directly through the WPCO and applicability thresholds. The *Ray* analysis, which is applied to determine whether indirect regulatory pressure is “direct enough” to establish preemption, proceeds from the unquestionable premise that direct regulation of preempted matters is forbidden.

carriers “in lieu” of other compliance options, but rather the only compliance option available. In this circumstance, the ISR is effectively a purely economic regulation of the carrier’s business that is directly related to the prices, routes and services the carrier provides. This is a clear case of a regulatory measure that is preempted under the FAAA and ADA.⁴⁵

4. PR 316 Also Exceeds the District’s Authority

Because the District lacks authority to adopt PR2305, it cannot adopt the fee rule – PR 316 – intended to support it.

CONCLUSION

We appreciate the opportunity to comment.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Tim", with a stylized flourish extending from the end.

Timothy A. Pohle
Senior Managing Director, Environmental Affairs

⁴⁵ In this circumstance, the ISR also is preempted by the Anti-Head Tax Act, 49 U.S.C. § 40116 because it imposes a “fee” or “charge” on the sale of air transportation and transportation of property by aircraft. See 49 U.S.C. § 40102(a)(5) (definition of “air transportation”) and See 49 U.S.C. § 40102(a)(25) (definition of “interstate air transportation”).

Re: Comments for Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse
Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316
– Fees for Regulation XXIII

Dear Mr. Bañuelos and Mr. Juan:

Our client, the California Trucking Association (“CTA”), appreciates the opportunity to submit supplemental comments on the South Coast Air Quality Management District’s (“SCAQMD” or “District”) Second Draft Staff Report (“DSR or Staff Report”)¹ and Draft Environmental Assessment (“EA”) for the Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII (collectively, the “Proposed Rules”).

Many members of the CTA will be directly regulated by the Proposed Rules and many others will be compelled to assist the covered warehouses in achieving compliance with the Proposed Rules. This will require substantial capital investment by CTA members and will have far reaching environmental and economic effects. We continue to believe that the Proposed Rules as drafted are preempted by federal law and extend beyond the authority granted to the District by the state Legislature. Nothing in the proposed changes affects our previous comments and we provide further comments on these issues below.

I. Statement of Interest.

The CTA is the largest state trade association representing trucking in the United States. Its 1800 members include both large and small fleets with an average fleet size of 20 trucks. CTA members

are actively participating in the development, piloting, and demonstration of alternative fuel and electric-drive capable vehicles. In fact, some member fleets have been working to bring electric-drive vehicles to market for nearly ten years. The CTA continues to support a coordinated and measured transition to alternative fuel and electric-drive capable vehicles.

II. The District Does Not Have Authority to Adopt an Indirect Source Rule that Applies to Existing Warehouses.

As explained in our March 2, 2021 comment letter, the District lacks authority to adopt an ISR that applies to existing sources. While the District attempts to argue otherwise in a memorandum requested from Shute Mihaly & Weinberger (hereinafter, “Shute Memorandum”), the arguments are not compelling.² As explained previously, “[a]n air pollution control district, as a special district, has only such powers as are given to it by statute and it is an entity, the powers and functions of which are derived entirely from the Legislature.” 74 Cal. Atty. Gen. Op. 196 (1991) (citing *People ex rel. City of Downey v. Downey County Water Dist.* (1962) 202 Cal.App.2d 786, 795).

Though the memorandum cites to Health & Safety Code (“HSC”) sections 40001(a)³, 40440(a)⁴, 40703⁵, and 40000⁶ as authority for the District to adopt an ISR for existing warehouses, none of these sections even mention indirect sources, let alone existing ones. That an agency has been granted some authority to act within a given area does not mean that it enjoys plenary authority to act in that area. *Railway Labor Exec. Ass’n v. National Mediation Bd.* (D.C. Cir. 1994) 29 F.3d 655, 670 (en banc). Thus, a general grant of authority to address “emission sources” does not authorize the District to impose control measures on existing indirect sources.

While administrative officials “may exercise such additional powers as are necessary for the due and efficient administration of powers expressly granted by statute, or as may fairly be implied from the statute granting the powers” (*Dickey v. Raisin Proration Zone No. 1* (1944) 24 Cal.2d

² See Shute, Mihaly, & Weinberger, Memorandum to Bayron Gilchrist and Barbara Baird, Re: Responses to comments submitted by the California Trucking Association, dated April 1, 2021.

³ HSC § 40001(a) states: “Subject to the powers and duties of the state board, the districts shall adopt and enforce rules and regulations to achieve and maintain the state and federal ambient air quality standards in all areas affected by emission sources under their jurisdiction, and shall enforce all applicable provisions of state and federal law.”

⁴ HSC § 40440(a) states: “The south coast district board shall adopt rules and regulations that carry out the plan and are not in conflict with state law and federal laws and rules and regulations. Upon adoption and approval of subsequent revisions of the plan, these rules and regulations shall be amended, if necessary, to conform to the plan.”

⁵ HSC § 40703 states: “In adopting any regulation, the district shall consider, pursuant to Section 40922, and make available to the public, its findings related to the cost effectiveness of a control measure, as well as the basis for the findings and the considerations involved. A district shall make reasonable efforts, to the extent feasible within existing budget constraints, to make specific reference to the direct costs expected to be incurred by regulated parties, including businesses and individuals.”

⁶ HSC § 40000 states: “The Legislature finds and declares that local and regional authorities have the primary responsibility for control of air pollution from all sources, other than emissions from motor vehicles. The control of emissions from motor vehicles, except as otherwise provided in this division, shall be the responsibility of the state board.”

Ryan Bañuelos

Victor Juan

May 4, 2021

Page 3

796, 810), the doctrine of implied administrative powers is not without limitation. “It cannot be invoked where the grant of express powers clearly excludes the exercise of others, or where the claimed power is incompatible with, or outside the scope of, the express power. For a power to be justified under the doctrine, it must be essential to the declared objects and purposes of the enabling act -- not simply convenient, but indispensable. Any reasonable doubt concerning the existence of the power is to be resolved against the agency.” *Addison v. Dept. of Motor Vehicles* (2007) 69 Cal.App.3d 486, 498.

The District has not, and cannot, identify a law that grants it authority to adopt an ISR that regulates existing sources. And the fact that various HSC provisions clearly address indirect sources, stationary sources, and mobile sources in very different manners, means that the District cannot read an implied authority to regulate existing indirect sources from a general grant of authority to regulate emission sources as a whole. In addition, contrary to the Shute Memorandum’s claim that the Clean Air Act (“CAA”) “is irrelevant to the District’s authority to adopt the proposed rule,” the CAA ISR provisions are relevant to the scope of the District’s regulatory authority when the Legislature used the term “indirect source control program” in HSC §§ 40918 and 40440(b)(3), which is not a term defined in California law but is identical to the term used in the CAA which limits such programs to *new or modified* indirect sources. 42 U.S.C. § 7410(a)(5)(D). Reading the various sections of the HSC together with the CAA, it is clear that the Legislature did not grant the District authority to require existing, unmodified sources to comply with an indirect source control program.

Finally, HSC § 40440(a) specifically states that: “The south coast district board shall adopt rules and regulations that carry out the plan and are not in conflict with state law and federal laws and rules and regulations.” The District cannot argue that the CAA is irrelevant when the District only has authority to regulate in a way that is not otherwise preempted by federal law.

III. The Proposed Rules Are Preempted by Federal Law.

A. The Proposed Rules Are a Purchase Mandate Under the Clean Air Act.

Though the District has modified the Proposed Rules to add another scenario, that does not alleviate the preemption issue as the Proposed Rules still represent a purchase mandate. As explained in our prior letter, while the District has ostensibly designed the Proposed Rules to provide multiple compliance pathways, the actual effect is uniform—ZE trucks must be acquired. This is because, while certain scenarios do not require acquisition of a ZE vehicle (Scenarios 7 (pay mitigation fee), 11 (rooftop solar and mitigation fee), 15 (filter system installations) and 16 (filter purchases))⁷, the costs of these non-acquisition pathways are far higher than acquisition. In addition, newly added Scenario 7a still relies on the acquisition of ZE or NZE vehicles by someone, even if it is not the warehouses themselves who are required to acquire the vehicles. Staff Report at 61, 66-67. While Scenario 7a may somewhat reduce the cost of compliance with the rule, it does not do so in a way that eliminates the fact that the Proposed Rules constitute a purchase mandate.

⁷ Scenario 17 requires TRU plug installations and usage in cold storage facilities but is applicable only to cold storage warehouses.

Ryan Bañuelos

Victor Juan

May 4, 2021

Page 4

The Shute Memorandum attempts to argue that the Proposed Rules are not a purchase mandate, as the Proposed Rules would allegedly regulate the entirety of the indirect source (the warehouse), such as the rule at issue in *National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District*, 627 F.3d 730 (9th Cir. 2010) (“*NAHB*”), and are thus not preempted by the CAA. However, the rule in *NAHB* more broadly addressed site emission than the Proposed Rules and, as admitted by the District, the overwhelming majority of emissions that will be addressed by the Proposed Rules are from trucks making trips to the warehouses. Staff Report at 13 (“heavy duty trucks are the largest source of emissions, comprising more than 90% of the total PR 2305 inventory.”).

In weighing preemption, the *NAHB* court had a firm thumb on the scale: because the ISR at issue there was adopted *pursuant to* the CAA’s indirect source review program, the court had to “cautiously examine” whether one of the CAA’s provisions preempted another. *NAHB*, 627 F.3d at 737. The court in *NAHB* relied heavily on the fact that Rule 9510 was adopted under the CAA’s indirect source review program provision. *Id.* at 736 (“As we shall explain, however, *NAHB*’s claim of preemption does not follow from its premise. Even if Rule 9510 establishes standards or requirements, those requirements do not relate to the control of emissions from construction equipment. In so holding, we think it crucial that the District adopted Rule 9510 under the Act’s ‘indirect source review program’ provision, section 110(a)(5).”); *id.* at 739 (“Keeping in mind that Rule 9510 is a proper indirect source review program under section 110(a)(5), we proceed to examine the arguments *NAHB* makes, and the authorities it advances, in favor of preemption”); *id.* at 737 (“Because the plain language of the Act’s ‘indirect source review program’ provision, section 110(a)(5), authorizes Rule 9510, we must cautiously examine the Act before we conclude that another of its provisions, section 209(e)(2), preempts Rule 9510”). Here, the District cannot argue that the Proposed Rules are authorized by section 110(a)(5), as that authorizes ISRs for **new or modified sources** only. 42 U.S.C. § 7410(a)(5)(D). Indeed, the District has argued that the CAA and its authorities are entirely irrelevant. The District cannot rely on *NAHB* when its preemption conclusion was predicated on the ISR’s consistency with and authorization by the CAA.

The court in *NAHB* also relied on the fact that “[t]he ‘baseline’ amount of emissions, and the required reduction in emissions from that baseline, are both calculated in terms of the development as a whole. The Rule and the emissions reductions it requires are site-based rather than engine- or vehicle-based. See 42 U.S.C. 7410(a)(5)(c) (requiring that an indirect source review program be a ‘facility-by-facility’ review). It regulates an indirect source as a whole.” *NAHB*, 627 F.3d at 737. The Proposed Rules make no such attempt. The compliance obligation is entirely determined by the *number and type of trucks that visit the site*. Perhaps if the *NAHB* court had upheld an ISR that used only the number and type of construction vehicles as a proxy for the emissions of the development as a whole, the case would be determinative. But it did not. Instead the *NAHB* ISR concerned the total emissions from the completed development, rather than the specific vehicles for which there was a claimed purchase mandate. This is not the case with the Proposed Rules, which entirely rely on truck trips. The Shute Memorandum states that “[t]he proposed rule uses truck trips as a proxy for total warehouse emissions when setting the compliance obligation because the number of truck visits is representative of the total activity at,

Ryan Bañuelos

Victor Juan

May 4, 2021

Page 5

and emissions associated with, a warehouse.” The Memorandum cites the Staff Report at 27 (truck trips “serve[] as a proxy for *overall* warehouse activity and emissions” (emphasis added)) and at 35 (stating that “[t]rucks delivering or picking up goods from a warehouse are a proxy for total activity and emissions related to a warehouse” and structuring reporting requirements on that basis). However, nothing in the actual calculation of WATT or WPCO supports this claim and nothing in the *NAHB* decision approves of such “proxy” metrics. To calculate a facility’s WATT the relevant equation is $\text{WATT} = \text{Class 2b through 7 trucks trips} + (2.5 \times \text{Class 8 truck trips})$. The Staff Report states that “Larger Class 8 trucks carry more goods and have higher emissions and are thus weighted more heavily than smaller Class 2b to 7 trucks. The value of 2.5 was calculated by comparing the running exhaust emission rates of different truck classes in EMFAC that typically visit warehouses (Figure 6 below) for calendar year 2023 (after CARB’s Truck and Bus rule is fully phased in). The ratio between individual truck classes varies but is approximately 2.5 overall when comparing Class 8 to Class 2B to 7.” Staff Report at 28 (emphasis added). This explanation makes clear that the multiplier for the WATT calculation is based purely off of the increase in emissions from the trucks themselves based on class, not an assumed increased in activity at the warehouse due to Class 8 trucks calling there more frequently. Further, the WPCO, or WAIRE Point Compliance Obligation, is then calculated as $\text{WPCO} = \text{WATTs} \times \text{stringency} \times \text{Annual Variable}$. Thus, the claim that truck trips (and truck emissions) is merely used as a proxy for assuming overall emissions from a warehouse as an indirect source is not supported as a warehouse’s WPCO is based purely on emissions from trucks.

In addition, the District admits that the only source of emissions included in the baseline emissions inventory are mobile sources. Staff Report at 12 (“The sources of emissions associated with warehouses include the trucks that deliver goods to and from the facilities, yard trucks located at warehouses that move trailers, transport refrigeration units (TRUs)...and the passenger vehicles for warehouse employees. Additional emissions sources can include onsite stationary equipment (e.g., diesel backup generators or manufacturing equipment), and emissions from power plants that provide electricity for the warehouse – though these sources have not been included in the baseline emissions inventory.”). Thus, unlike *NAHB*, neither the baseline, nor the required compliance obligation (the WPCO) are site-based; both are based on mobile source emissions only.

The District’s attempt to shoe-horn itself into the *NAHB* category, when in fact it is attempting to adopt a purchase mandate, does not pass scrutiny. See *NAHB*, 627 F.3d at 739 (“What allows Rule 9510 to qualify as an indirect source review program under section 110(a)(5) is precisely what allows the Rule to avoid preemption under section 209(e)(2): its site-based regulation of emissions.”).

If the District were truly concerned with regulating total emissions from warehouses as an indirect source, it would collect information to determine what other emissions come from warehouses and how to reduce those emissions and provide pathways to compliance with the Proposed Rules that address emission reductions from sources related to warehouses other than vehicles (the only pathway that does this is the installation of solar panels). For these reasons, the District’s claim that the Proposed Rules, like the rule in *NAHB*, are merely intended to address emissions from warehouses as indirect sources, and not from vehicles, does not stand. The Proposed Rules impose

Page 6

requirements that relate to the control of emissions from mobile sources and are thus preempted under the CAA.

IV. The Proposed Rules Will Not Be Eligible for Inclusion in the State Implementation Plan (“SIP”).

The District states that the primary purpose of the Proposed Rules, specifically Proposed Rule 2305, is to achieve NO_x reductions that will contribute to the District’s goal of reaching attainment of the ozone National Ambient Air Quality Standards (“NAAQS”), as required by the CAA.⁸ The Proposed Rule will also result in reductions in Particulate Matter (“PM”) to help attain the PM NAAQS. In order to accomplish this, Proposed Rule 2305 must be included as a revision to the State Implementation Plan (“SIP”) and approved by both the California Air Resources Board (“CARB”) and the Environmental Protection Agency (“EPA”). SIP revisions may only be approved if the rule “complies with the provisions of the Clean Air Act and applicable federal regulations.” 42 U.S.C. § 7410(k). Because section 7410(a)(5) only permits states to submit ISR rules to the SIP which apply to new and modified sources, the District cannot submit, and EPA cannot approve, an ISR which applies to existing sources. *See Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 196 (“In the grants [of powers] and the regulation of the mode of exercise, there is an implied negative; an implication that no other than the expressly granted power passes by the grant; that it is to be expressed only in the prescribed mode....”). Nor can the District or CARB “provide necessary assurances” under section 7410(a)(2)(E) that “the State . . . will have adequate . . . authority under State (and as appropriate, local) law to carry out such implementation plan.” As explained above, the District has no authority to adopt an ISR on existing sources. For these reasons, Proposed Rule 2305 cannot be approved into the SIP and will not achieve the District’s goal of helping to attain the NAAQS for ozone and PM.

The District’s claim that, by approving “MOB-03 – Emissions Reductions at Warehouse Distribution Centers” in the 2016 Air Quality Management Plan (“AQMP”) both CARB and EPA have authorized the Proposed Rules is unreasonable. MOB-03 described general strategies in which the District would attempt to control emissions from warehouses, but did not specify the particular strategies that would be adopted, did not address the fact that these controls would be applied to existing sources, and repeatedly mentioned the option for voluntary actions to reduce emissions.⁹ CARB and EPA’s approval of a vague and generalized concept in the 2016 AQMP does not bless the Proposed Rules with legitimacy and legality now. Even if the District had authority under state law to adopt Proposed Rule 2305, which it does not, it will not be eligible for inclusion in the SIP and thus the District will not receive any of the benefits towards attainment that it expects from adoption of the Proposed Rule 2305.

⁸ Staff Report at 14.

⁹ South Coast Air Quality Management District, Final 2016 Air Quality Management Plan, March 2017, <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>, at 4-27 – 4-29 (stating that “[t]o the extent these actions are voluntary in nature and are sustained over a long-term basis and the emission reduction levels are maintained, the emission reductions may be credited as surplus reductions...into the SIP.”).

V. The Environmental Assessment (“EA”) Remains Insufficient and Changes to the Proposed Rules Necessitate Revision and Recirculation of the EA.

A. The EA Project Description is Deficient.

The District anticipates using the funds generated by its Mitigation Fee to subsidize a variety of programs, and specifically includes among them “a focus on grid upgrades on the utility side of the meter.” The various programs are a non-exclusive list of potential emission-reducing projects that might be funded or implemented. While these utility upgrades could be considered “merely permissive,” “[a]t a minimum, the District committed itself to allowing” mitigation funds to be used on such upgrades. *See California Unions for Reliable Energy v. Mojave Desert Air Quality Management District* (2009) 178 Cal.App.4th 1225, 1246 (*CURE*).

At a minimum, the failure to fully disclose these actions in the Final EA results in an inadequate project description. A project description that omits integral components of the project may result in an EIR that fails to disclose all of the impacts of the project. *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 829 (project description for sand and gravel mine omitted water pipelines serving project); *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 80. The “project” is “the whole of an action” that may result in either a direct physical environmental change or a reasonably foreseeable indirect change. CEQA Guidelines § 15378; *Habitat & Watershed Caretakers v. City of Santa Cruz* (2013) 213 Cal.App.4th 1277, 1297; *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1220. Project descriptions have been found inadequate when they failed to include discussion of necessary expansions to accommodate the contemplated project. *See San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713 (project description inadequate when it failed to discuss sewer lines and wastewater treatment expansion necessary for the contemplated housing development); *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 830 (project description for sand and gravel mine inadequate when it failed to describe or analyze the construction of water pipelines needed for operations); *Whitman v. Board of Supervisors* (1979) 88 Cal.App.3d 397 (project description for oil well inadequate for failure to describe or analyze associated pipeline). The District apparently now acknowledges that the compliance actions taken by covered entities under the Proposed Rules will result in increased production of electricity and other resources that may require “grid upgrades on the utility side of the meter.” The upgrades are a reasonably foreseeable component of the Project and must be analyzed.

The District is not excused from analyzing the effects of its actions merely by classifying such acts as mitigation. CEQA mandates a review of not only the impacts of the project, but also “the impacts of mitigation measures” if such measures “would cause one or more significant effects in addition to those that would be caused by the project as proposed.” *Save Our Peninsula Com. v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 130 (*Save Our Peninsula*) (citing CEQA Guidelines § 15126(c) [now § 15126.4(a)(1)(D)]).

Here, the EA completely fails to meaningfully address the potentially significant and foreseeable impacts of these necessary utility upgrades, which would include significant air pollution

Ryan Bañuelos

Page 8

emissions from construction of necessary grid infrastructure that run counter to the Proposed Rules' stated objectives. *CURE*, 178 Cal.App.4th at 1245; see CTA Letter re Scoping of Environmental Assessment. The EA also neglects to evaluate potentially significant impacts to agricultural and biological resources through land use conversions, geologic and hydrologic impacts due to increased lithium extraction activities, substantial increases in the demand for water supply, wastewater treatment, storm water drainage, energy, and solid waste services. *CURE*, 178 Cal.App.4th at 1236, CTA Letter re Scoping of Environmental Assessment.

As it stands, the Board is being asked to trade one impact for another without the barest disclosure of the scope or magnitude of impacts from the utility upgrades the District proposes to fund. The EA's failure to meaningfully disclose these potentially significant effects is unlawful. CEQA Guidelines § 15126.4(a)(1)(D); *see also CURE*, 178 Cal.App.4th at 1230-31 (air district's failure to analyze negative effects mitigation measure to reduce air pollution was unlawful); *Save Our Peninsula*, 87 Cal.App.4th at 130-32 (EIR unlawfully failed to analyze impacts of mitigation adopted "late in the environmental review process"); *Stevens v. City of Glendale* (1981) 125 Cal.App.3d 986, 991 (EIR unlawful because mitigation "involve[d] . . . new environmental impacts not considered in the draft EIR").

B. Changes to the Proposed Rules Necessitate Recirculation.

CEQA requires agencies to recirculate "[w]hen significant new information is added to an environmental impact report" after the close of the earlier public review period." Pub. Res. Code § 21092.1; CEQA Guidelines § 15088.5. In particular, recirculation is required where the omission of information has rendered the original draft EIR "fundamentally and basically inadequate and conclusory in nature." *See* CEQA Guidelines § 15088.5(a)(4) (*citing Mountain Lion Coalition v. Fish & Game Com.* (1989) 214 Cal.App.3d 1043).

An agency cannot simply release a draft EIR "that hedges on important environmental issues while deferring a more detailed analysis to the final [EIR] that is insulated from public review." *Mountain Lion Coalition*, 214 Cal.App.3d at 1052 (rejecting EIR with a corrected cumulative impacts analysis that was not recirculated); *see also Spring Valley Lake Assn. v. City of Victorville* (2016) 248 Cal.App.4th 91, 108 (revisions to EIR's air quality analysis required recirculation where they contained insufficient evidence to support agency's findings); *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 830 (recirculation required where "draft EIR inadequately addressed the subject and there was no meaningful public review and comment on the new assessment"); *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 Cal.App.4th 256, 266-67 (rejecting city's claim that a new addendum on energy impacts merely "amplifie[d]" information in the EIR).

Public review is critical "to test, assess, and evaluate the data and make an informed judgment as to the validity of the conclusions to be drawn therefrom." *Sutter Sensible Planning, Inc. v. Sutter County Bd. of Supervisors* (1981) 122 Cal.App.3d 813, 822 (internal quotation marks omitted); *see also Ultramar, Inc. v. South Coast Air Quality Management Dist.* (1993) 17 Cal.App.4th 689, 702-04. The District's hasty publication of the Final EA, just days before the Board's approval

Ryan Bañuelos

Page 9

hearing, deprived the public and technical experts of their ability to fulfill this critical oversight role. The District must recirculate the Final EA to allow meaningful public review.

VI. Conclusion.

We join in the comments of the Airlines for America, the California Taxpayers Association, and Scopelitis, Garvin, Light, Hanson & Feary, which provide further explanation for why the Proposed Rules are outside of the District's authority, preempted by the CAA and the Federal Aviation Administration Authorization Act ("F4A"), and constitute an improper tax. The District has not been granted the authority to impose a sweeping purchase mandate under the guise of an ISR regulation on existing, unmodified warehouses. While the District's goals of reducing air emissions in the Basin are laudable, the District has only the rulemaking authority invested in it by statute. Even if the Legislature had granted the District such authority, it is preempted by federal law. In addition, the accompanying Draft EA fails to meet the District's obligations under CEQA. For this reason, the District must revise the Proposed Rules and recirculate the EA before adoption.

Sincerely yours,

HOLLAND & KNIGHT LLP
