GLOSSARY

TERM DEFINITION

Alkylation The reaction of low-molecular-weight olefins with an isoparafin

to produce a saturated compound of high octane number.

Alkylate The product of an alkylation process.

Anhydrous Free from water.

Aqueous Formed from water, having a water base.

Aromatics Hydrocarbons which contain one or more benzene rings.

Barrel 42 gallons.

Blending One of the final operations in refining, in which two or more

different components are mixed together to obtain the desired

range of properties in the finished product.

Catalyst A substance that promotes a chemical reaction to take place but

which is not itself chemically changed.

Cracking The process of breaking down higher molecular weight

hydrocarbons to components with smaller molecular weights by the application of heat; cracking in the presence of a suitable catalyst produces an improvement in product yield and quality

over simple thermal cracking.

Distillation The process of heating a liquid to its boiling point and

condensing and collecting the vapor.

Flares Emergency equipment used to incinerate refinery gases during

upset, startup, or shutdown conditions.

Heat exchanger Process equipment used to transfer heat from one medium to

another.

Heater Process equipment used to raise the temperature of refinery

streams processing.

Hydrocarbon Organic compound containing hydrogen and carbon, commonly

occurring in petroleum, natural gas, and coal.

Hydrotreater A machine that treats hydrocarbons.

A process to catalytically stabilize petroleum products of Hydrotreating

feedstocks by reacting them with hydrogen.

Isomerization The rearrangement of straight-chain hydrocarbon molecules to

> form branch chain products; normal butane may be isomerized to provide a portion of the isobutane feed needed for the

alkylation process

Liquefied Petroleum Gas

(LPG)

Liquefied light end gases often used for home heating and cooking; this gas is usually 95 percent propane, the remainder being split between ethane and butane.

MTBE Methyl tertiary butyl ether; used in gasoline blending to meet

the reformulated gasoline specifications for oxygen content;

MTBE also raises the octane number of gasoline.

A crude distillation unit cut in the range of C₇-420°; naphthas Naphtha

are subdivided – according to the actual crude distillation cuts into light, intermediate, heavy, and very heavy virgin naphthas;

a typical crude distillation operation would be:

light naphtha

C₇-160° -160-280° -280-330° intermediate naphtha heavy naphtha 330-420° very heavy naphtha

Octane Measurement of the burning quality of the gasoline; reflects the

> Suitability of gasoline to perform in internal combustion engines smoothly without letting the engine knock or ping.

Olefins Hydrocarbons that contain at least two carbons joined by double

bonds; olefins do not naturally occur in crude oils but are

formed during the processing.

Palentological Prehistoric life.

Peak Hour This typically refers to the hour during the AM peak period

> (typically 7 AM to 9 AM) or the PM peak period (typically 4 PM to 6 PM) in which the greatest number of vehicles trips are generated by a given land use or are traveling on a given

roadway.

CHAPTER 8: ACRONYMS AND GLOSSARY

Reactor Vessels in which desired reactions take place.

Refinery gas Gas produced from refinery operations used primarily for

(fuel gas) combustion in refinery heaters and boilers.

Reformate One of the products from a reformer; a reformed naptha; the

naptha is then upgraded in octane by means of catalytic or

thermal reforming process.

Reformulated New gasoline required under the federal Clean Air Act and

California Air Resources Board to reduce emissions.

Reid Vapor Pressure The vapor pressure of a product determined in a volume of air

four times greater than the liquid volume at 100°F; Reid vapor pressure (RVP) is an indication of the vapor-lock tendency of a motor gasoline, as well as explosion and evaporation hazards.

Seiches A vibration of the surface of a lake or landlocked sea that varies

in period from a few minutes to several hours and which many

change in intensity.

Stripper or Splitter Refinery equipment used to separate two components in a feed

stream; examples include sour water strippers and naphtha

splitters.
